What's New in PNA Code Version A.10.00

- [Windows® Embedded Standard 7](#)
- [HiSLiP](#)
- [Integrated CalKit Editor](#)
- [Increased Number of Points to 100K](#)
- [Cal Kits saved and recalled using *.xkt format](#)
- [U8480 Power Sensors Supported](#)
- [Mechanical Devices: Copy Active Channel](#)
- [Search Within \(for Markers\)](#)
- [Dialog Transparency](#)
- [Move App to Back](#)
- [System time on PNA Status Bar](#)
- [Right-click menus on Status Bar](#)
- [Elimination of 3 Toolbars](#)
- [Enhanced MATLAB® functionality](#)

Notes

- This version includes changes from all versions listed below.
- See [new A.10.00 Programming Commands](#)

To see the PNA code version that is currently installed on the PNA, click **Help**, then **About Network Analyzer**

What's New in PNA Code Version A.09.90

- [SMC Phase Reference Cal from 10 MHz](#)
- [CalPod as ECal](#)
- [External SMU Device](#)
- Equation Editor enhancements

- [New marker functions](#)
 - [Use Short Names](#)
-

What's New in PNA Code Version A.09.85

- [Support for U2020 X-Series USB Power Sensors](#)
- [Delta Match Calibration](#) required on ALL N5231A, N5232A, and N5239A models.
- [Unguided TRL Cal](#) allowed on all PNA 4-port models
- [Noise Parameters](#)

What's New in PNA Code Version A.09.80

- **Standard Measurements**
 - [Calibrate All Channels](#)
 - [SE => Balanced Topology](#)
 - [Increased Segments in Power Sensor Loss Table](#)
 - [EXG Sources supported](#)
 - [CalPod](#)
 - **Application Enhancements**
 - [SMC with Phase Reference](#)
 - [Noise Receiver Cal with Power Sensor](#)
 - [PNA models with 50 GHz Noise Receivers](#)
-

What's New in PNA Code Version A.09.60

- New [N523xA models](#)
-

What's New in PNA Code Version A.09.50

Standard Measurements

- [Unguided Cals can access 95 Cal Kits](#)

- [Preference setting to list Recall files](#)
- [YouTube Videos](#)
- [Display Menu changes](#)
- [Undo/Redo](#)
- [Quick Start](#)
- [Quickly change Scale, Reference Level, and Position](#)
- [Redesigned Receiver Leveling dialog](#)
- New External Device configuration:
 - [Pulse Generators](#)
 - [DC Sources and Meters](#)
 - [DC Source Control dialog](#)

Application Enhancements

- [External Pulse Generator in Integrated Pulse App](#)
 - [IMoSpectrum in mmWave](#)
-

What's New in PNA Code Version A.09.42

May 2013: [Support for U2020X Power Sensors](#)

- [New N522x Models](#)

Standard Measurements - available on all Models / Options

- [Drag a trace to another window](#)

Application Enhancements

- [Copy Channels on all Applications](#)
- ["Src 2 out Port 2" factory configuration on PNA-X Opt 423.](#)
- [IMD f2 Tone using External Source / Combiner](#)

- [IMD and IM Spectrum Tone Power Leveling settings](#)
 - [IMD, IMDx, and IM Spectrum "Min" and "Max" parameters](#)
 - [Use a Power Table with mmWave SMC Measurements](#)
 - [mmWave; Mixer mode - 2-port test set on 4-port PNA](#)
 - [Guided Power Cal for SMC](#)
 - [ESG and PSG Sources for Phase Control](#)
-

What's New in PNA Code Version A.09.33

New Options

- [Source Phase Control](#) - Opt 088

Application Enhancements

- [FCA Update](#) - Opt 082, and 083

Standard Measurements - available on all Models / Options

- [Security for External Sources](#)
- [2-Port](#) and [4-Port](#) Fixture Extrapolation and Reverse Ports.
- [Phase Coherent "R over R" measurements](#)
- [Use Multiple Power Sensors for Guided Power Cal](#)
- [Perform Source Power Cal with PMAR Device](#)

Tip - Do you access the same PNA dialog often?

Your Favorites are always two keystrokes away. [Learn how.](#)

What's New in PNA Code Version A.09.31

- [Support for N1913A and N1914A Power Meters](#)
-

What's New in PNA Code Version A.09.30

- [N5247A - 67 GHz PNA-X](#)

Application Enhancements

- [Gain Compression on Converters \(GCX\)](#)
- [Support for Dual-Stage Converters in all Apps](#)

Standard Measurements - available on all Models / Options

- [Enhanced S-parameter Power Cal](#)
 - [Marker Display enhancements](#)
 - [Perform Source Power Cal at multiple power levels](#)
 - [IF Gain Setting](#)
 - [Receiver Overload/Compression Warning](#) and [Power OFF](#) Preferences
 - [Confirm changes on Meas Class dialog](#)
 - [DSP Version 5](#)
-

What's New in PNA Code Version A.09.22

- [Use any PNA-X Ports with Noise Figure Opt 028.](#)
-

What's New in PNA Code Version A.09.20

Application Enhancements

- [Integrated Pulse Measurements](#) (Opt 008)
- [Noise Figure using Standard PNA Receiver](#) (Opt 028)
- [Noise Figure on N5244A/45A](#) (Opt H29)
- [Edge and Level Trigger in Pulse](#)
- [Exclude SC12 Sweep for SMC \(Opt 082/083\)](#)
- [Include Phase with SMC](#) (PNA-X with Opt 083)
- [Fixturing in Apps](#)
- [Max Output Power for GCA](#) (Opt 086)

Standard Measurements - available on all Models / Options

- [Mechanical Device conflicts cause Channel Block \(NOT Channel Hold\)](#)
 - [PSAT Marker and Power Normal Operating Point Marker](#)
 - [Group Delay Aperture Setting](#)
 - [Active Background Display Color](#)
 - [Solid or Dotted Grid Lines](#)
 - [Point Sweep on PNA "C" Models](#)
 - [Fixture Power Compensation](#)
 - [Sweep Delay](#)
 - [Uncertainty equations using RSS Computations](#)
 - [Preset Power Preference Setting](#)
 - [Use Last Receiver Leveling Correction for SPC](#)
 - Data Save Enhancements
 - [Recall .SNP files to view as trace](#)
 - ["Save Data As" Dialog](#)
 - [Save Balanced Data as SNP files](#)
 - Characterize Adaptor Macro Rev. A.02.10
 - [Reverse S2P](#)
 - [Load the PNA Power Loss Table from an existing S2P file](#)
-

What's New in PNA Code Version A.09.10

- [Noise Figure on Converters \(NFX\)](#)
 - [AgileUpdate for Customer Releases](#)
 - [New Help, About Capabilities](#)
-

What's New in PNA Code Version A.09.00

- [External Device Configuration](#)

- [Power Meter as Receiver \(PMAR\)](#)
- [Power Offsets and Limits](#)
- [Display and Print Colors](#)
- [Scale Coupling](#)
- [Mechanical Device Settings](#)
- [Device side USB](#)
- [Increased Number of Channels to 200](#)
- [ECal User Chars Saved to PNA Disk Memory](#)

Application Enhancements

- [GCA Compression Analysis](#)
- [GCA Compression from Saturation](#)
- [Receiver Leveling on IMD, FCA, and GCA](#)
- [Embedded LO on SMC and IMDx](#)
- [Limited Port Mapping on IMD](#)
- [Point Averaging on FCA and IMD](#)
- [SMC Measurements with mmWave Modules](#)
- [mmWave Measurements with no Test Set](#)

What's New in PNA Code Version A.08.60

- [New 40 GHz and 50 GHz PNA-X Models](#)

What's New in PNA Code Version A.08.55

- [IMDx \(Swept and Spectrum\) for Converters](#)
 - [ADC Measurements in a Gain Compression channel.](#)
 - [New 13.5 GHz PNA-X Model](#)
-

What's New in PNA Code Version A.08.50

- [Fast Antenna Features for the PNA-X](#)
 - [Receiver Leveling](#)
 - [Phase Sweep](#) in iTMSA
 - [Up to 25 User Macros](#)
 - [Gain Compression Marker](#)
 - [Port Extensions enhancements](#)
 - [Electrical Delay enhancements](#)
 - [Extra Security enhancement](#)
 - Save [*.CSV](#) and [*.MDF](#) File Types
 - Noise Figure App enhancements:
 - [Scalar Noise Figure measurement](#)
 - [Incident Noise Power parameters](#)
 - MM Module enhancements:
 - [Power Level Control](#)
 - Supports [iTMSA](#)
 - [Max point count to 32,001](#)
 - [Faster Power Sweeps](#)
-

What's New in PNA Code Version A.08.35

- [New N5264A model](#)
-

What's New in PNA Code Version A.08.33

- [IMD Application](#) (Opt 087)
- [Fast Sweep Mode](#)
- [New Equation Editor functions](#)

- [20001 Segments in Power Loss Table](#)
 - [Data Format Units](#)
 - [Marker=>CW Freq Function](#)
 - [Up to 12 User Characterizations](#)
 - [Characterize Adaptor Macro 2.0](#)
-

What's New in PNA Code Version A.08.20

- [iTMSA](#)
 - [User Preferences dialog](#)
 - [Uncoupled Power Sweep](#)
 - [Equation Editor Import Functions](#)
 - [Wider Traces Preference](#)
 - [24 Traces per Window](#)
 - [LXI Compliance](#)
 - [GCA Enhancements](#)
 - [FCA - selectable ports](#)
 - [Support for N5261A and N5262A MM test sets](#)
 - [cXL Code Translation Software - Quick Link](#)
-

What's New in PNA Code Version A.08.00

- [Noise Figure Application \(Opt 029\)](#)
- [Gain Compression Application \(Opt 086\)](#)
- ['Sweep' Trigger Mode](#)
- [Custom Cal Window settings](#) (remote only)
- [New Equation Editor Functions](#)
- [Minimum Number of Points = 1](#)

MICROSOFT SOFTWARE LICENSE TERMS

WINDOWS EMBEDDED STANDARD 7

These license terms are an agreement between you and Agilent Technologies. Please read them. They apply to the software included on this device. The software also includes any separate media on which you received the software.

The software on this device includes software licensed from Microsoft Corporation or its affiliate.

The terms also apply to any Microsoft

- updates,
- supplements,
- Internet-based services, and
- support services

for this software, unless other terms accompany those items. If so, those terms apply.

If you obtain updates or supplements directly from Microsoft, then Microsoft, and not Agilent Technologies, licenses those to you.

As described below, using the software also operates as your consent to the transmission of certain computer information for Internet-based services.

By using the software, you accept these terms. If you do not accept them, do not use the software. Instead, contact Agilent Technologies to determine its return policy for a refund or credit.

If you comply with these license terms, you have the rights below.

1. USE RIGHTS

Use. The software license is permanently assigned to the device with which you acquired the software. You may use the software on the device.

2. ADDITIONAL LICENSING REQUIREMENTS AND/OR USE RIGHTS

a. Specific Use. Agilent Technologies designed the device for a specific use. You may only use the software for that use.

b. Other Software. You may use other programs with the software as long as the other programs

- directly supports the manufacturers specific use for the device, or
- provide system utilities, resource management, or anti-virus or similar protection.

" Software that provides consumer or business tasks or processes may not be run on the device. This includes email, word processing, spreadsheet, database, scheduling and personal finance software. The device may use terminal services protocols to access such software running on a server.

c. Device Connections. You may not use the software as server software. In other words, more than one device may not access, display, run, share or use the software at the same time.

You may use terminal services protocols to connect the device to a server running business task or processes software such as email, word processing, scheduling or spreadsheets.

You may allow up to ten other devices to access the software to use

- File Services,

- Print Services,
- Internet Information Services, and
- Internet Connection Sharing and Telephony Services.

The ten connection limit applies to devices that access the software indirectly through multiplexing or other software or hardware that pools connections. You may use unlimited inbound connections at any time via TCP/IP.

- d. Remote Access Technologies. You may access and use the software remotely from another device using remote access technologies as follows.

Remote Desktop. The single primary user of the device may access a session from any other device using Remote Desktop or similar technologies. A session means the experience of interacting with the software, directly or indirectly, through any combination of input, output and display peripherals. Other users may access a session from any device using these technologies, if the remote device is separately licensed to run the software.

Other Access Technologies. You may use Remote Assistance or similar technologies to share an active session.

Other Remote Uses. You may allow any number of devices to access the software for purposes other than those described in the Device Connections and Remote Access Technologies sections above, such as to synchronize data between devices.

- e. Font Components. While the software is running, you may use its fonts to display and print content. You may only

- embed fonts in content as permitted by the embedding restrictions in the fonts; and
- temporarily download them to a printer or other output device to print content.

- f. Icons, images and sounds. While the software is running, you may use but not share its icons, images, sounds, and media.

3. VHD BOOT. Additional copies of the software created using the software's Virtual Hard Disk functionality (VHD Image) may be pre-installed on the physical hard disk of the device. These VHD Images may only be used for maintaining or updating the software installed on the physical hard disk or drive. If the VHD Image is the only software on your device, it may be used as the primary operating system but all other copies of the VHD Image may only be used for maintenance and updating.

4. POTENTIALLY UNWANTED SOFTWARE. The software may include Windows Defender. If Windows Defender is turned on, it will search this device for spyware, adware and other potentially unwanted software. If it finds potentially unwanted software, the software will ask you if you want to ignore, disable (quarantine) or remove it. Any potentially unwanted software rated high or severe, will be automatically removed after scanning unless you change the default setting. Removing or disabling potentially unwanted software may result in

- Other software on your device ceasing to work, or
- Your breaching a license to use other software on this device

By using this software, it is possible that you will also remove or disable software that is not potentially unwanted software.

5. SCOPE OF LICENSE. The software is licensed, not sold. This agreement only gives you some rights to use the software. Agilent Technologies and Microsoft reserve all other rights. Unless applicable law gives you more rights despite this limitation, you may use the software only as expressly permitted in this agreement. In doing so, you must comply with any technical limitations in the software that allow you to use it only in certain ways. For more information, see the software documentation or contact Agilent Technologies. You may not:

- " work around any technical limitations in the software;
- " reverse engineer, decompile or disassemble the software;
- " make more copies of the software than specified in this agreement;
- " publish the software for others to copy;
- " rent, lease or lend the software; or
- " use the software for commercial software hosting services.

Except as expressly provided in this agreement, rights to access the software on this device do not give you any right to implement Microsoft patents or other Microsoft intellectual property in software or devices that access this device.

6. INTERNET-BASED SERVICES. Microsoft provides Internet-based services with the software. Microsoft may change or cancel them at any time.

a. Consent for Internet-Based Services. The device may contain one or more of the software features described below. These features connect to Microsoft or service provider computer systems over the Internet. In some cases, you will not receive a separate notice when they connect. For more information about these features, visit go.microsoft.com/fwlink/?linkid=104604.

By using these features, you consent to the transmission of this information. Microsoft does not use the information to identify or contact you.

Computer Information. The following features use Internet protocols, which send to the appropriate systems computer information, such as your Internet protocol address, the type of operating system and browser, the name and version of the software you are using, and the language code of the device where you installed the software. Microsoft uses this information to make the Internet-based services available to you. Agilent Technologies has elected to turn on the following features on the device.

- Plug and Play and Plug and Play Extensions. You may connect new hardware to your device. Your device may not have the drivers needed to communicate with that hardware. If so, the update feature of the software can obtain the correct driver from Microsoft and install it on your device.
- Web Content Features. Features in the software can retrieve related content from Microsoft and provide it to you. Examples of these features are clip art, templates, online training, online assistance and Appshelp. You may choose to switch them off or not use them.
- Digital Certificates. The software uses x.509 version 3 digital certificates. These digital certificates confirm the identity of user sending information to each other and allow you to encrypt the information. The software retrieves certificates and updates certificate revocation lists over the Internet.
- Auto Root Update. The Auto Root Update feature updates the list of trusted certificate authorities. You can switch off this feature.
- Windows Media Digital Rights Management. Content owners use Windows Media digital rights management technology (WMDRM) to protect their intellectual property, including copyrights. This software and third party software use WMDRM to play and copy WMDRM-protected content. If the

software fails to protect the content, content owners may ask Microsoft to revoke the software's ability to use WMDRM to play or copy protected content. Revocation does not affect other content. When you download licenses for protected content, you agree that Microsoft may include a revocation list with the licenses. Content owners may require you to upgrade WMDRM to access their content. Microsoft software that includes WMDRM will ask for your consent prior to the upgrade. If you decline an upgrade, you will not be able to access content that requires the upgrade. You may switch off WMDRM features that access the Internet. When these features are off, you can still play content for which you have a valid license.

- Windows Media Player. When you use Windows Media Player, it checks with Microsoft for
 - " compatible online music services in your region;
 - " new versions of the player; and
 - " codecs if your device does not have the correct ones for playing content.You can switch off this feature. For more information, go to: go.microsoft.com/fwlink/?LinkId=51331.
- Malicious Software Removal/Clean On Upgrade. Before installation of the software, the software will check and remove certain malicious software listed at www.support.microsoft.com/?kbid=890830 (Malware) from your device. When the software checks your device for Malware, a report will be sent to Microsoft about any Malware detected or errors that occurred while the software was checking for Malware. No information that can be used to identify you is included in the report. You may disable the software's Malware reporting functionality by following the instructions found at www.support.microsoft.com/?kbid=890830.
- Network Awareness. This feature determines whether a system is connected to a network by either passive monitoring of network traffic or active DNS or HTTP queries. The query only transfers standard TCP/IP or DNS information for routing purposes. You can switch off the active query feature through a registry setting.
- Windows Time Service. This service synchronizes with www.time.windows.com once a week to provide your device with the correct time. The connection uses standard NTP protocol.
- Search Suggestions Service. In Internet Explorer, when you type a search query in the Instant Search box or type a question mark (?) before your search term in the Address bar, you will see search suggestions as you type (if supported by your search provider). Everything you type in the Instant Search box or in the Address bar when preceded by a question mark (?) is sent to your search provider as you type. Also, when you press Enter or click the Search button, the text in the Instant Search box or Address bar is sent to the search provider. If you use a Microsoft search provider, use of the information sent is subject to the Microsoft Online Privacy Statement. This statement is available at go.microsoft.com/fwlink/?linkid=31493. If you use a third-party search provider, use of the information sent will be subject to the third party's privacy practices. You can turn search suggestions off at any time. To do so, use Manage Add-ons under the Tools button in Internet Explorer. For more information about the search suggestions service, see go.microsoft.com/fwlink/?linkid=128106.
- Consent to Update Infrared Emitter/Receiver. The software may contain technology to ensure the

proper functioning of the infrared emitter/receiver device shipped with certain Media Center-based products. You agree that the software may update the firmware of this device.

- Media Center Online Promotions. If you use Media Center features of the software to access Internet-based content or other Internet-based services, such services may obtain the following information from the software to enable you to receive, accept and use certain promotional offers:
 - certain device information, such as your Internet protocol address, the type of operating system and browser you are using, and the name and version of the software you are using,
 - the requested content, and
 - the language code of the device where you installed the software.
 - Your use of the Media Center features to connect to those services serves as your consent to the collection and use of such information.
 - Media Playback Updates. The software on the device may include media playback features which receives updates directly from the MSCORP Media Playback Update servers. If activated by your manufacturer, these updates will be downloaded and installed without further notice to you. The manufacturer is responsible for ensuring these updates work on your device.
 - Windows Update Agent. The software on the device includes Windows Update Agent (WUA). This feature enables your device to access Windows Updates either directly from MSCORP Windows Update server or from a server installed with the required server component and from the Microsoft Windows Update server. To enable the proper functioning of the Windows Update service in the software (if you use it) updates or downloads to the Windows Update service will be required from time to time and downloaded and installed without further notice to you. Without limiting any other disclaimer in these license terms or any license terms accompanying a Windows Update, you acknowledge and agree that no warranty is provided by Microsoft Corporation or their affiliates with respect to any Windows Update that you install or attempt to install on your device.
 - b. Use of Information. Microsoft may use the device information, error reports, and Malware reports to improve our software and services. We may also share it with others, such as hardware and software vendors. They may use the information to improve how their products run with Microsoft software.
 - c. Misuse of Internet-based Services. You may not use these services in any way that could harm them or impair anyone else's use of them. You may not use the services to try to gain unauthorized access to any service, data, account or network by any means.
7. **PRODUCT SUPPORT** . Contact Agilent Technologies for support options. Refer to the support number provided with the device.
8. **MICROSOFT .NET BENCHMARK TESTING**. The software includes one or more components of the .NET Framework (.NET Components). You may conduct internal benchmark testing of those components. You may

disclose the results of any benchmark test of those components, provided that you comply with the conditions set forth at go.microsoft.com/fwlink/?LinkID=66406.

Notwithstanding any other agreement you may have with Microsoft, if you disclose such benchmark test results, Microsoft shall have the right to disclose the results of benchmark tests it conducts of your products that compete with the applicable .NET Component, provided it complies with the same conditions set forth at go.microsoft.com/fwlink/?LinkID=66406.

9. **BACKUP COPY.** You may make one backup copy of the software. You may use it only to reinstall the software on the device.
10. **DOCUMENTATION.** Any person that has valid access to your device or internal network may copy and use the documentation for your internal, reference purposes.
11. **PROOF OF LICENSE.** If you acquired the software on the device, or on a disc or other media, a genuine Certificate of Authenticity label with a genuine copy of the software identifies licensed software. To be valid, this label must be affixed to the device, or included on or in Agilent Technologies software packaging. If you receive the label separately, it is not valid. You should keep the label on the device or packaging to prove that you are licensed to use the software. To identify genuine Microsoft software, see www.howtotell.com.
12. **TRANSFER TO A THIRD PARTY.** You may transfer the software only with the device, the Certificate of Authenticity label, and these license terms directly to a third party. Before the transfer, that party must agree that these license terms apply to the transfer and use of the software. You may not retain any copies of the software including the backup copy.
13. **NOTICE ABOUT THE H.264/AVC VISUAL STANDARD, THE VC-1 VIDEO STANDARD, THE MPEG-4 VISUAL STANDARD AND THE MPEG-2 VIDEO STANDARD.** This software may include H.264/AVC, VC-1, MPEG-4 Part 2, and MPEG-2 visual compression technology. If the software includes those visual compression technologies MPEG LA, L.L.C. requires this notice:

THIS PRODUCT IS LICENSED UNDER ONE OR MORE VIDEO PATENT PORTFOLIO LICENSES SUCH AS, AND WITHOUT LIMITATION, THE AVC, THE VC-1, THE MPEG-4 PART 2 VISUAL, AND THE MPEG 2 VIDEO PATENT PORTFOLIO LICENSES FOR THE PERSONAL AND NON-COMMERCIAL USE OF A CONSUMER TO (i) ENCODE VIDEO IN COMPLIANCE WITH THE ABOVE STANDARDS (VIDEO STANDARDS) AND/OR (ii) DECODE VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL AND NON-COMMERCIAL ACTIVITY OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE VIDEO UNDER SUCH PATENT PORTFOLIO LICENSES. NONE OF THE LICENSES EXTEND TO ANY OTHER PRODUCT REGARDLESS OF WHETHER SUCH PRODUCT IS INCLUDED WITH THIS PRODUCT IN A SINGLE ARTICLE. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE WWW.MPEGLA.COM.
14. **NOTICE ABOUT THE MP3 AUDIO STANDARD.** This software includes MP3 audio encoding and decoding technology as defined by ISO/IEC 11172-3 and ISO/IEC 13818-3. It is not licensed for any implementation or distribution in any commercial product or service.
15. **NOT FAULT TOLERANT.** The software is not fault tolerant. Agilent Technologies installed the software on the device and is responsible for how it operates on the device.
16. **RESTRICTED USE.** The Microsoft software was designed for systems that do not require fail-safe performance. You may not use the Microsoft software in any device or system in which a malfunction of the software would result in foreseeable risk of injury or death to any person. This includes operation of nuclear facilities, aircraft navigation or communication systems and air traffic control.
17. **NO WARRANTIES FOR THE SOFTWARE.** The software is provided as is. You bear all risks of using it. Microsoft gives no express warranties, guarantees or conditions. Any warranties you receive regarding the device or the software do not originate from, and are not binding on, Microsoft or its affiliates. When allowed by your local laws, Agilent Technologies and Microsoft exclude implied warranties of merchantability, fitness for a particular purpose and non-infringement.

18. LIABILITY LIMITATIONS. You can recover from Microsoft and its affiliates only direct damages up to two hundred fifty U.S. Dollars (U.S. \$250.00). You cannot recover any other damages, including consequential, lost profits, special, indirect or incidental damages.

This limitation applies to:

- " anything related to the software, services, content (including code) on third party internet sites, or third party programs, and
- " claims for breach of contract, breach of warranty, guarantee or condition, strict liability, negligence, or other tort to the extent permitted by applicable law.

It also applies even if Microsoft should have been aware of the possibility of the damages. The above limitation may not apply to you because your country may not allow the exclusion or limitation of incidental, consequential or other damages.

19. EXPORT RESTRICTIONS. The software is subject to United States export laws and regulations. You must comply with all domestic and international export laws and regulations that apply to the software. These laws include restrictions on destinations, end users and end use. For additional information, see www.microsoft.com/exporting.

20. ENTIRE AGREEMENT. This agreement, additional terms (including any printed-paper license terms that accompany the software and may modify or replace some or all of these terms), and the terms for supplements, updates, Internet-based services and support services that you use, are the entire agreement for the software and support services.

21. APPLICABLE LAW

a. United States. If you acquired the software in the United States, Washington state law governs the interpretation of this agreement and applies to claims for breach of it, regardless of conflict of laws principles. The laws of the state where you live govern all other claims, including claims under state consumer protection laws, unfair competition laws, and in tort.

b. Outside the United States. If you acquired the software in any other country, the laws of that country apply.

22. Third Party Programs. Microsoft provides the following copyright notices for third party software included in the software. These notices are required by the respective copyright holders and do not change your license to use this software.

Portions of this software are based in part on the work of Spider Systems ® Limited. Because Microsoft has included the Spider Systems Limited software in this product, Microsoft is required to include the following text that accompanied such software:

PNA User Accounts and Passwords

Important: When the PNA power is switched on, it AUTOMATICALLY logs into Windows using the default user name and password. You do NOT need to log on. This gives anyone full access to the analyzer. The following steps can be taken to increase security of your PNA.

- Require users to logon when the PNA computer is turned ON - [Learn how to enable this feature](#)
- Setup individual accounts on the PNA with varying level of access - Learn how to [Add or Change User Accounts and Passwords](#)

[Please read about Anti-virus protection for your PNA](#)

Existing User Accounts

The following user accounts already exist on new PNAs.

- **Default User Account** The Default User Account cannot be deleted. We recommend you change the password and, if desired, the user name. DO NOT FORGET YOUR NEW PASSWORD. If you choose to [require users to logon when the PNA is turned ON](#), you will not be able to start your PNA without it.
 - User name (not case sensitive): **PNA-USER**
 - Password (case sensitive): **pna**
- **PNA-SERVICE** This limited user account is created by Agilent for service purposes. Each PNA has a unique password for this account. Although allowed by Windows, please do not delete this account.

Notes

- You can create as many user accounts as you like.
- The user name is not case sensitive. The password IS case sensitive.
- The PNA local policies are set so that, if logon is required, you must retype the user name (and password) every time. Do not change the local policies on the PNA.

Add or Change User Accounts, Passwords, and require Logon

If the analyzer is in a secure environment, you can setup PNA users by name and grant various levels of access. This is particularly important when the PNA is remotely controlled or accessed over LAN.

You can designate a person as the administrator and then configure the PNA to allow others to use it with reduced permissions. That is, other people can be signed on to use the analyzer but they will not

have the ability to perform all of the administrative functions that you can as the administrator.

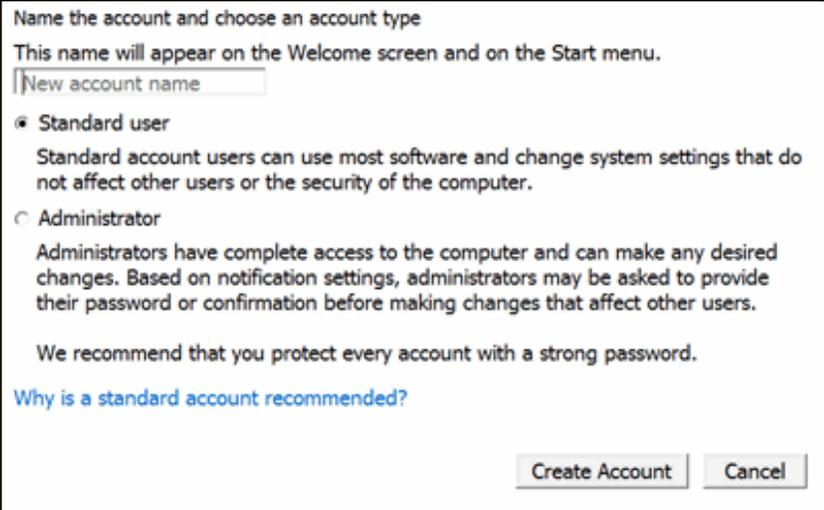

The following are examples of some of the functions that can be performed with these account types:

- **Administrator** - Can download and install drivers. Can save and delete all files.
- **Standard User** - Can save and delete state and data files. Can NOT save PNA [service adjustment](#) files.

Note: To connect and install a new ECal module, you must be logged on with an Administrator account. A user account with limited access will NOT allow an ECal module driver to be loaded. [Learn more.](#)

Learn more about [Microsoft User Account Permissions](#) (internet connection required).

How to add a user account and require logon

Windows 7
Click Start , then Control Panel
Click User Accounts
Click Manage another account.
CAUTION: Although allowed by Windows, do NOT allow an Administrator account without a password. Internet viruses look for, and exploit, this condition.
Click Create a new account.
Enter an account name.
Select an account type.
Click Create Account.

Note:

A standard user account will NOT allow an ECal module driver to be loaded. [Learn more.](#)

However, standard access users **ARE** able to install firmware.

Optional: Click **Create a password** to require the user to enter a password when logging on.

Last Modified:

25-Nov-2013	Updated for windows 7
14-Sep-2010	Updated default account
8-Apr-2008	Added Logon notes

PNA Computer Properties

The PNA uses a personal computer and a Windows operating system. The following are common tasks that you may need to perform on the PNA computer.

- [View or change Full Computer Name](#)
- [Check IP Address](#)
- [Check the amount of RAM](#)
- [Check CPU Speed](#)
- [Check HDD Capacity](#)
- [Set Time and Date](#)
- [Internal and External Speakers](#)

Other Administrative Task Topics

View or change Full Computer Name

Your PNA has a unique computer name that identifies it on a network. To view or change the computer name, you must first [minimize the PNA](#) application.

Windows 7
On the desktop, right-click My computer Icon
Click Properties
Scroll down to Computer name, domain, and workgroup settings .
To make changes, click Change Settings .

Note: To add your computer to a domain, or to set up the networking configuration, contact your company's I.T. department. This setup is custom for each company.

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

Check IP Address

If your PNA is connected to a LAN, you can view the IP address and other networking information.

1. [Minimize the PNA](#) application
2. Click **Start**
3. In the Search field, type **cmd**, then click **OK**
4. At a DOS prompt, type **ipconfig /all**

Check the amount of RAM

Random Access Memory (RAM) is the amount of working memory in your computer.

The amount of RAM in your PNA may limit your ability to upgrade firmware. See http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc

To view the amount of PNA RAM, you must first [minimize the PNA](#) application.

Windows 7
On the desktop, right-click My computer Icon
Click Properties
The amount of RAM appears under System

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

Check CPU Speed

The speed of the PNA processor (CPU) is a factor in determining how quickly the PNA processes data. Also, the CPU speed in your PNA may limit your ability to upgrade firmware. See http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc.

You can see which CPU is in your PNA by comparing your PNA rear-panel with the images at <http://na.tm.agilent.com/pna/cputype.html>.

Or, beginning with PNA Rev. A.09.10, on the PNA click **Help**, then **About Network Analyzer**. [Learn more.](#)

Or, you can do the following to check your PNA CPU speed:

1. [Minimize the PNA](#) application.
2. Then do the following:

Windows 7
On the desktop, right-click My computer Icon
Click Properties
The CPU speed appears under System

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

Check Hard Disk Drive (HDD) or Solid State Drive (SSD) Capacity

To view the capacity of drive space, you must first [minimize the PNA](#) application.

Then do the following:

Windows 7
On the desktop, right-click the Start button
Then Open Windows Explorer
In the left pane, click Computer
The amount of free drive space and capacity for each of the partitions appears.

[Learn how to determine your HDD part number](#) (Internet connection required).

Set Time and Date

To set the time and date on your PNA, you must first [minimize the PNA](#) application.

1. Move the cursor to the lower corner of the screen
2. When the taskbar appears, double-click on the displayed time. This opens the **Date/Time Properties** dialog box.
3. Change the date, time, and time zone as appropriate.

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

Internal Speaker

There is an internal sound card and speaker in the PNA. However, there is no audio output jack.

There may be times when you might want to control the speaker volume or turn the speaker OFF, such as when the PNA is generating errors. [Learn more about errors.](#)

To control the PNA speaker volume:

1. Press **System**, then **Service**, then **Utilities**, then **Speaker Volume**
 2. Enter a value between **0** (speaker OFF) and **100** (highest volume)
-

Last Modified:

5-Apr-2012	Remove Win 2000
17-Jun-2011	Modified speaker volume
30-Nov-2009	Added Help, About note.
26-Nov-2008	Added external speaker note
12-Mar-2008	Added link to support site
20-Sep-2007	Added speaker OFF

Run Error Check and Disk Defragmenter

When the PNA is shutdown unexpectedly or power is removed without first shutting down, large amounts of Hard Disk Drive space is rendered unusable. If shutdown in this manner enough times, the PNA could become unstable and no longer work.

This Hard Disk Drive space can be recovered by first running Windows **Error-checking** to find and correct errors on the disk, and then the **Disk Defragmenter** to recover Hard Disk Drive space.. These programs should be run routinely, about every 1 to 4 weeks, depending on how often the PNA is unexpectedly shutdown.

To learn more about Disk Defragmenter, see the Windows Help file.

Follow this procedure to run these programs:

Windows 7
On the desktop, double-click My Computer
In the upper pane, click Properties
Click the Tools tab

Error-checking

- Click **Check Now**.
- Check **Automatically fix file system errors**.
- Click **Start**.
- Click **Yes** to run disk check on next restart.
- Manually [restart the PNA](#). The disk check will run before Windows restarts.

Approximately every six months, check the second box in addition to the first box. The error-checking process takes much longer, but performs a more complete check.

Defragmentation

- Click **Defragment Now...**
- Click **Defragment** to begin the defragment process.
- Click **Close** when defragmentation is complete.

Recovering from PNA Hard Drive Problems

The leading cause of PNA failures is problems with the PNA Hard Disk Drive (HDD). These problems are usually preventable (see [Preventing PNA HDD Problems](#)), and in many cases, recoverable. The following could save you weeks of downtime and the cost of replacing your PNA HDD.

This document is now on the Agilent PNA Support Website: <http://na.tm.agilent.com/pna/>. When at this webpage, click the **Hard Drive Recovery** link.

If your PNA does experience a Hard Disk Drive Problem, you will not be able to access this Help file, but you may be able to access the Internet from another computer.

Wake PNA at Specified Time

Depending on the CPU that is used in your PNA-X, you may be able to start your PNA-X at a specified time every day. This feature allows the PNA-X to be shut down at night (saving energy), then wake the PNA-X at a specified time to allow sufficient warm-up time in the morning before being used.

To use this feature, the PNA-X must have a 2000 MHz CPU board. [See how to determine the CPU board.](#)

How to configure the PNA-X to wake at a specified time:

1. Connect a USB keyboard to the PNA-X.
2. [Restart](#) the PNA-X.
3. During power-up, press F2 on the keyboard at the moment it indicates to do so on the bottom of the PNA-X screen.
4. In the BIOS, go to **Configuration** then **Power Control Configuration**. Set **Resume On Time:** to **ON**, and set the **Resume Time:** to the desired wake-up time.
5. Press **F10** to Save, Exit, and restart the PNA-X.
6. At the end of the day, Shut Down (not hibernate or standby) the PNA-X.
7. The PNA-X will wake-up at the specified time.

Wake ON LAN (WOL)

Note: A utility can also be set to provide a WOL call. This is outside the scope of PNA Help. Search the internet for **WOL utility**.

To configure the PNA for Wake ON LAN (WOL)

Follow the above procedure for accessing the BIOS.

Then, in the BIOS:

For newer i7 and Celeron CPUs:

1. Go to **Chipset** menu, then **South Bridge**, then **SB PCH Options**.
2. Under the PCH LAN Controller, set WOL to **Enabled**.
3. Press **F10** to Save, Exit.

For all older CPUs:

1. Go to **Configuration** then **LAN Configuration**. Ensure that **Power Saving when S5** to **Disabled** (default setting).
2. Go to **Configuration** then **Power Control Configuration**. Set **PME Wake From S5** to **Enabled**.
3. Press **F10** to Save, Exit.

To must also do the following on the PNA:

1. From the PNA desktop, right-click **My Computer**, then **Management**.
 2. In the left pane, under **System Tools**, click **Device Manager**.
 3. in the right pane, click **+** in front of **Network Adapters**.
 4. Under **Network Adapters**, right click **Intel (R) 82577LRM Network Connection**, then **Properties**.
 5. On the **Power Management** tab, check to enable **Magic Packet from power off state**.
-

[Microsoft EULA](#)

Microsoft Windows on the PNA

Beginning in Sept. 2013, the PNA is shipped from the factory with **Windows[®] Embedded Standard 7** operating system. This OS supports both 32-bit and 64-bit applications. Therefore, the file structure has changed slightly. ONLY PNA models with Windows 7 can upgrade to FW A.10.00 and above.

[Learn about Windows 7 file locations on the PNA.](#)

VERY IMPORTANT Protect your hard drive!

The leading cause of PNA failures is problems with the PNA Hard Disk Drive (HDD). These problems are usually preventable, and in many cases, recoverable. [Learn more about protecting your PNA.](#)

Using USB

The PNA has USB ports on the front panel and on the rear panel. The main advantages of USB are “hot” connects and disconnects and fast data transfer speeds. Electronic Calibration modules are also available with USB connections.

The first time you plug a device into a USB port there is some wait time. Windows reports it is identifying the hardware, then searching for the correct driver, then installing the driver (if it was found).

Connecting that same device back into that same port later is quick and easy, but if you move the device to a different USB port, you will have to wait through the hardware ID and driver search again.

[Learn about USB limitations.](#)

LAN Connections

Windows supports DHCP and fixed IP addressing. Also, “Hot” connect and disconnect of the LAN cable, as well as a visual indicator of LAN status in system tray area, makes LAN connections more intuitive. In addition, the Hardware Wizard helps users with system hardware configuration.

Single and Double Click option

By default, Windows allows a single-click method of launching icons. To revert to double-clicking, click **Start**, then **Settings**, then **Control Panel**, then click **Mouse**. In the Mouse Properties dialog, select **Double-click to open an item**. Then click **OK**.

Windows Themes

The PNA application is designed for, and best viewed in, **Agilent Technologies** theme. To change the theme:

1. [Minimize the PNA application.](#)
2. Right-click on the Desktop, then click **Personalize**
3. Use the scrollbar, then select a Theme.

Printing

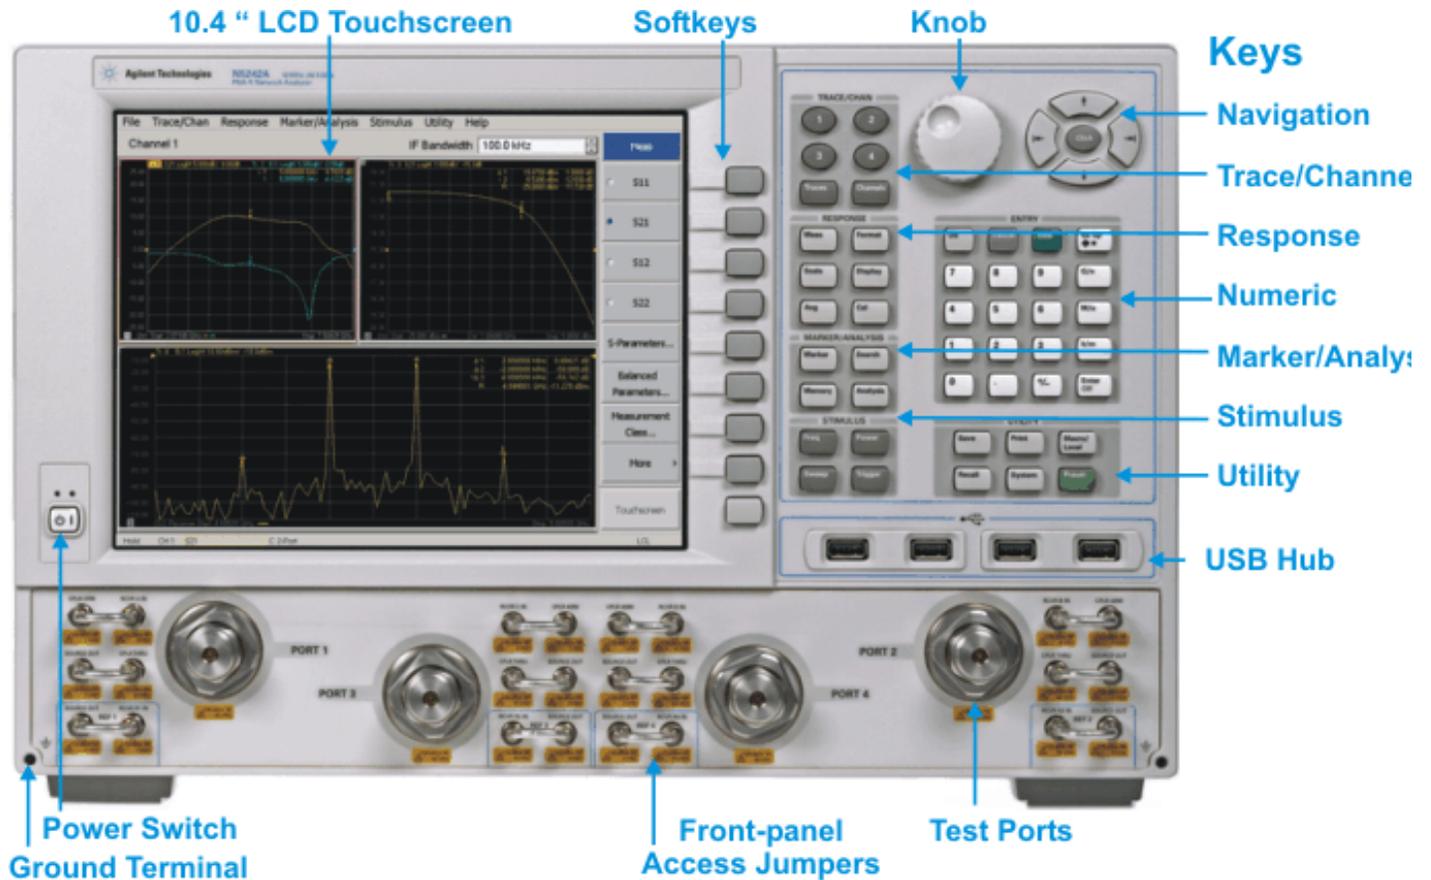

Adding a printer should be done outside of the PNA application. [Learn more.](#)

Familiar Hardkey layout, similar to Agilent 8720 and 8753 Network Analyzers

Back to the familiar layout, significantly different from legacy PNA models. Most measurement settings are made from the Stimulus Block and the Response Block.

Fully functional Hardkey/Softkey selections consistent with Menu (mouse) selections

Access ALL PNA settings from the front panel using hardkey/softkeys or from the Menu using a mouse. Both methods are consistent; learn the menu structure once, and it applies to both methods of UI navigation.

Power Switch

Used for choosing between power-on (|) and standby (O) state.

Learn to power ON and OFF the PNA.

Test Ports

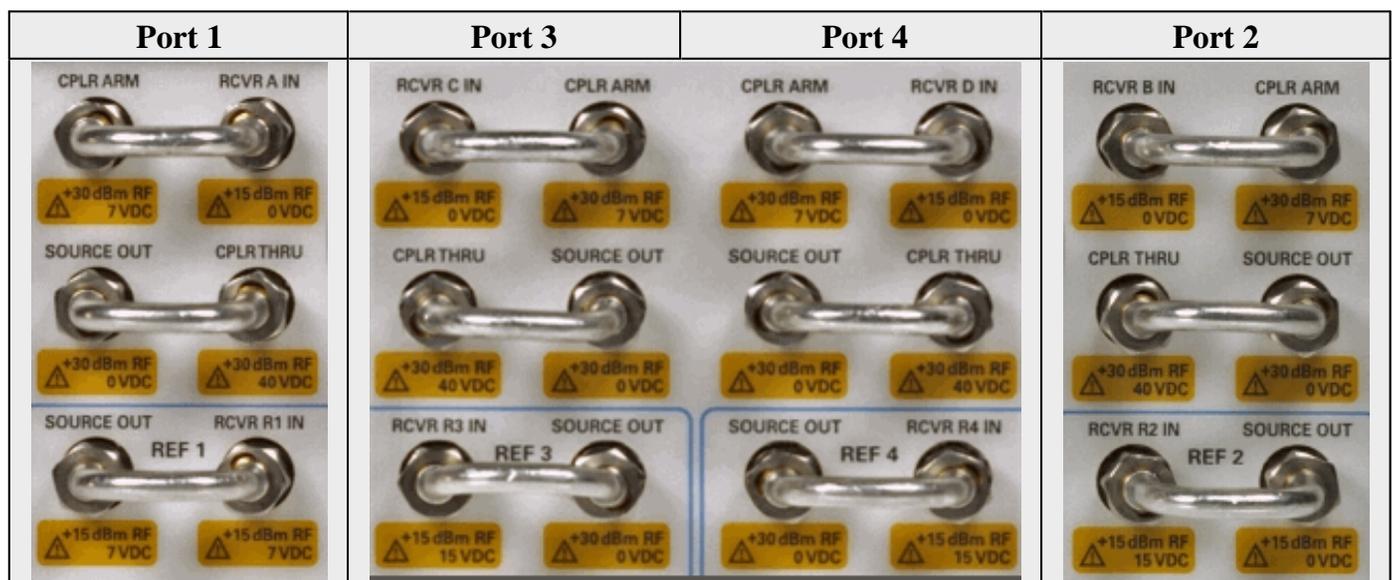

The models are available with 2 or 4 test ports.

See Specs for more information about the Test port connectors and Input damage levels.

Front panel Access Jumpers

These connectors provide direct access to the PNA source and receivers. This allows you to make a wide variety of measurements and improve dynamic range.

See front panel jumpers specifications

N5247A

Port 1 and Port 3 **SW SRC OUT - COMB IN** jumpers moved from rear-panel (J8 through J11) to front-panel to minimize path loss.

Important: All of the N5247A front-panel jumpers are **EXTREMELY FRAGILE** . Learn more .

USB Hub

This USB hub contains four USB ports to power your PNA peripherals. There are also four USB ports on the rear panel.

Limitation: The total power consumption for all eight USB ports is limited to 4.0 amps. If this limit is exceeded, all USB ports are disabled until a device is removed and power consumption falls below the limit. When first connected, Agilent ECal modules 8509x and N4431 draw significantly more current than other modules.

Note:

The **FIRST TIME** each USB device (ECal module, power sensor, and so forth) by serial number is connected to a specific PNA USB port, you must be logged in to the PNA with an **Administrator** account. Learn how .

When a **New Hardware Found** dialog appears, click **OK** to install the device.

After being installed, when that same USB device is connected to that same USB port, you can be logged in to the PNA with a Limited/User account.

Ground terminal

Connect a banana-type plug to this terminal for grounding to the PNA chassis.

No probe power

Probe power is **NOT** provided on PNA models. Learn more about Active Probing

Powering the PNA ON and OFF

The following is described in this topic:

- [How to...](#)
- [ON](#)
- [Shutdown](#)
- [Turn OFF Autostart](#)

Notes

During boot up of Windows or of the Network Analyzer application program, do **NOT** press keys on the front panel, rotate the RPG knob, or connect a USB device. Doing so **MAY** lead to a front panel lockup state.

If the PNA front-panel keypad or USB ports are not responding, **SHUTDOWN** or **RESTART** the PNA.

How to Log off, Shut down or Restart the PNA.

1. BRIEFLY press the front-panel PNA power button.
2. In the **What do you want the computer to do?** list, choose an action:
 - Log off (closes programs)
 - [Shut down](#)
 - Restart (shutdown and start)
3. Press **OK** to perform the action

Note: ONLY if the PNA is locked and you cannot operate the mouse or keypad - Press and hold the power button for at least four seconds. **This practice should be avoided!** Repeated shutdowns in this manner **WILL** damage the hard drive. [Learn more about damaging the PNA hard drive.](#)

ON Mode

- To turn ON the PNA press the power button.
- The power indicator will change to green when power is ON.

Turn OFF PNA Autostart

The PNA application (835x.exe) always starts automatically when power is turned ON. To cause the PNA to NOT Autostart, do the following:

1. Minimize the PNA application.
2. From Windows Explorer, navigate to and double-click the following file: C:/Program Files(x86)/Agilent/Network Analyzer/Service/Toggle_PNA_Autostart.exe

The script toggles the PNA Autostart mode ON and OFF.

Shutdown Mode

- In shut down mode the current instrument state is NOT automatically saved before the PNA is powered OFF.
- When the PNA is again powered ON, a full system boot-up is performed and the PNA powers-up in the [preset settings](#).
- A password may be required to resume PNA operation after being in Shutdown mode. [Learn more](#).
- To guarantee that your measurements meet the PNA specified performance, allow the PNA to **warm-up for 90 minutes** after the power indicator has turned green.
- The power indicator will change to yellow when power is OFF.

Note: If the PNA is locked and you cannot operate the mouse or keypad, shut down the PNA by pressing and holding the power button for at least four seconds.

This practice should be avoided! Repeated shutdowns in this manner WILL damage the hard drive. [Learn more about damaging the PNA hard drive.](#)

Unplugging the PNA

- Remove the power cord from the PNA ONLY when the power indicator is yellow, in either Hibernate or Shutdown mode. If the power cord is removed while the power indicator is green (PNA ON), damage to the hard drive is possible.
- The indicator will remain yellow for several seconds after the power cord has been removed.

25-Nov-2013	Updated folder location of toggle (win7)
3-May-2012	Removed hibernate
4-May-2011	Added N522xA models
3-Jun-2009	Updated for N5244A and N5245A

Traces, Channels, and Windows on the PNA

It is critical to understand the meaning of the following terms as they are used on the PNA.

- [Traces - Managing](#)
- [Channels - Managing](#)
- [Windows - Managing](#)

Other Quick Start topics

Traces

Traces are a series of measured [data points](#). There is no theoretical limit to the number of traces. However, the practical limit is the [maximum number of windows](#) times the maximum number of traces per window (24).

In addition, one memory trace can be stored and displayed for every data trace. [Learn more about Math / Memory traces](#).

Trace settings affect the presentation and mathematical operations of the measured data.

The following are Trace settings:

- [Parameter](#)
- [Format and Scale](#)
- [Smoothing](#)
- [Correction ON / OFF](#)
- [Electrical Delay](#)
- [Phase Offset](#)
- [Trace Math](#)
- [Markers](#)
- [Time Domain](#) (Opt 010)

Managing Traces

- [How to **Select** a trace](#)
- [How to **Delete** a trace](#)
- [How to **Move** a trace](#)
- [How to **Maximize** a trace](#)
- [How to **Create** a new trace](#)
- [How to **Change** the trace parameter](#)
- [How to display a custom **trace title**](#) (separate topic)
- [How to display a **wide** active trace](#) (separate topic)

How to Select a Trace

A trace must be selected (active) before its trace settings can be changed.

[How to know which trace is Active?](#)

Using front-panel

HARDKEY [softkey] buttons

1. For Traces 1-4, press the corresponding Hard Key
2. For other trace numbers, press **TRACES**
3. then [**Select Traces**]
4. Select a trace number in the [Entry toolbar](#).

PNA Menu using a mouse

1. Click the [Trace Status](#) label or trace.

How to Delete a Trace

Using front-panel

HARDKEY [softkey] buttons

1. For Traces 1-4, press the corresponding Hard Key
2. For other trace numbers, press **TRACES**
3. then **[Select Traces]**
4. Select a trace number in the [Entry toolbar](#).

PNA Menu using a mouse

1. Right-click the [Trace Status](#) label, then click Delete.

Programming Commands

How to Move a trace to a different window

You can **DRAG** a trace from one window to another, or...

Using front-panel

HARDKEY [softkey] buttons

1. Select the trace to move.
2. Press **TRACES**
3. then **[Move Trace]**
4. Select a window number in the following dialog.

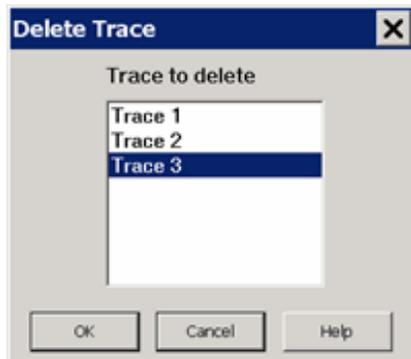

PNA Menu using a mouse

1. Right-click the [Trace Status](#) label, then click **Move Trace**.

Select, Delete, Move Traces dialog box help

This dialog is launched by clicking **Trace/Chan**, then **Trace**, then **Delete Trace**

The Select Trace dialog is launched by clicking **Trace/Chan**, then **Trace**, then **Select Trace**

Both the **Select Trace** and **Delete Trace** dialogs work the same.

Select a trace, then click **OK**.

Only ONE trace can be Selected or Deleted.

Note:

To EASILY select a trace, click the [Trace Status](#) label.

To EASILY delete a trace, right-click the Trace Status label, then click **Delete**.

Trace Max

Makes the active trace the ONLY trace on the display. All other traces are hidden.

How to do Trace Max

- Select **Trace**, then **Trace Max**.
- With Trace Max ON, select a different trace from the **Traces** softkeys to make that trace visible.
- To make all traces visible again select **Trace Max OFF**

Channels

Channels contain traces. The PNA can have up to **200 independent channels** (32 before A.09.00)

Channel settings determine **how** the trace data is measured . All traces that are assigned to a channel

share the same channel settings. A channel must be selected (**active**) to modify its settings. To select a channel, click the [Trace Status](#) button of a Trace in that channel. The following are channel settings:

- [Frequency range](#)
- [Power level](#)
- [Calibration](#)
- [IF Bandwidth](#)
- [Number of Points](#)
- [Sweep Settings](#)
- [Average](#)
- [Trigger](#) (some settings are global)

Managing Channels

How to Select a Channel

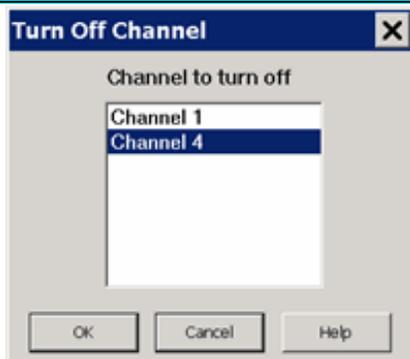

A channel must be selected (active) before its settings can be changed.

To make a channel active, [select a trace](#) in that channel.

How to Turn ON or OFF a Channel

Click **Trace/Chan**, then **Channel**, then **Turn On / Off** Channel.

Turn ON | OFF Channel dialog box help

Both the Turn **ON** and Turn **OFF** dialogs work the same.

Select a channel, then click **OK**. Only **ONE** channel can be selected

When turning ON a channel, the new channel is always the Standard [Measurement Class](#) with an

S11 trace.

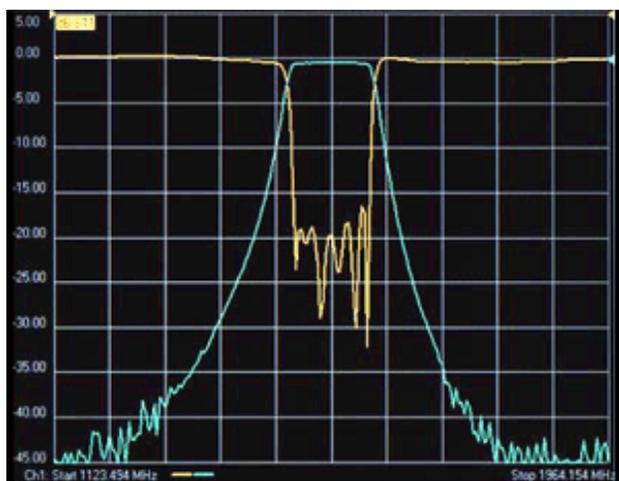

Note: To create more than one trace in a new channel, click Trace, then New Trace

Windows

Windows are used for viewing traces.

- The PNA can show an **UNLIMITED** number of windows on the screen (16 windows previous to PNA release 6.2) with the following limitations:
 - The COM property [MaximumNumberOfWindows](#) returns 1000 ('unlimited' is not a number).
 - The [SCPI status register](#) can only track the status of up to 576 traces.
- Each window can contain up to **24 traces** (8 traces previous to PNA release 8.2).
- Windows are completely independent of channels.
- Learn to [create and manage windows](#).
- See [Customize the PNA screen](#) to learn how to make other window settings.

The following is a window containing two traces. Both traces use the same channel 1 settings as indicated by the annotation at the bottom of the window.

PNA-X shows the window number in the lower-left corner of the window. The following shows window 5.

Managing Windows

How to make various window settings

New, Close, Tile, Cascade, Minimize, Maximize

Using front-panel

HARDKEY [softkey] buttons

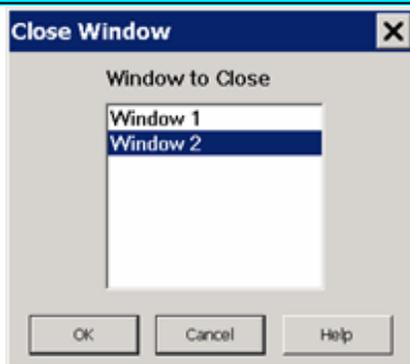

1. Press **RESPONSE**
2. then **[Display]**
3. then **[Windows]**

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Windows**

Programming Commands

Close Window dialog box help

Select a window, then click **OK**. The remaining windows are tiled.

Only ONE window can be selected.

Traces contained in a closed window are deleted.

Note: To EASILY close a window, right-click in the window (away from a trace) then select **Close Window**.

See [Customize the PNA screen](#) to learn how to make other window settings.

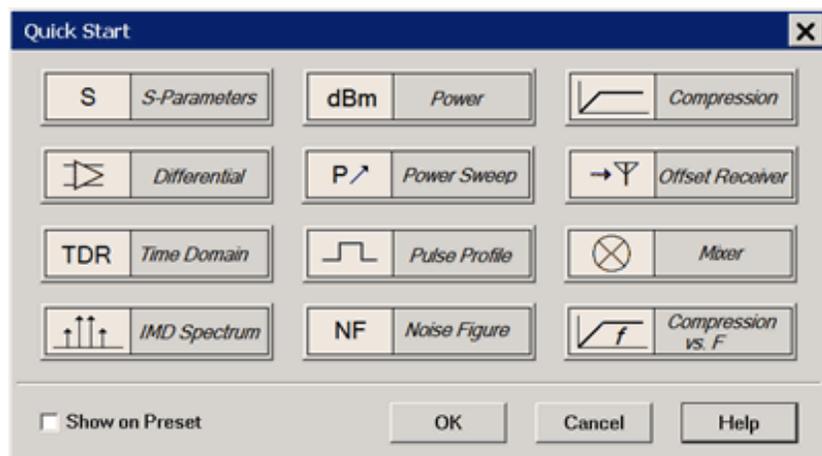

Last modified:

6-Apr-2012	Removed speed note
16-Mar-2012	Easy move trace
6-Dec-2011	Edit close window
21-Jul-2011	Moved some content to Customize.
4-Sep-2008	Removed legacy content
1-May-2008	Increased max number of traces per window
15-Oct-2007	MX New settings
9/19/06	MQ Modified for unlimited number of windows

Quick Start Dialog

Beginning with A.09.50, you can optionally see the following dialog when the PNA is Preset.

- Click a button to quickly setup the measurement type.
- The buttons appear ONLY if that option is installed on the PNA.

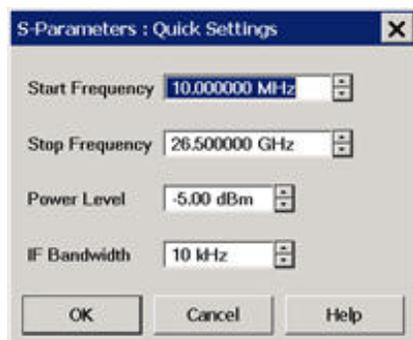

Click the image to learn more about each measurement.

- Clear **Show on Preset** to no longer see this dialog when Preset.
 - To see the dialog again, press **Preset**, then **[Quick Start]**.
-

S-Parameters

Required:
None

Creates S11 and S21 measurements in a single channel and window.

Enter:

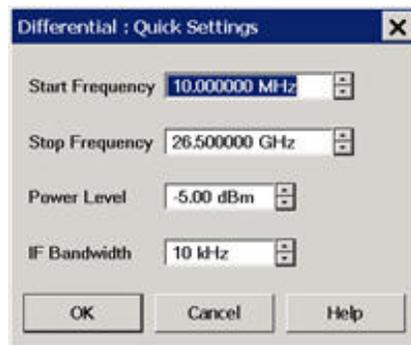

- [Start/Stop frequency](#)
- [Power Level](#)
- [IF Bandwidth](#).

Learn more about [S-parameter measurements](#).

Differential

Option
Required:
None

Creates Sdd11 and Sdd21 measurements in a single channel and window.

Enter [Start/Stop frequency](#), [Power Level](#), and [IF Bandwidth](#).

Learn more about [Differential \(Balanced\) measurements](#).

Time Domain

Option
Required:
010

Creates an S11 measurements and enables Time Domain.

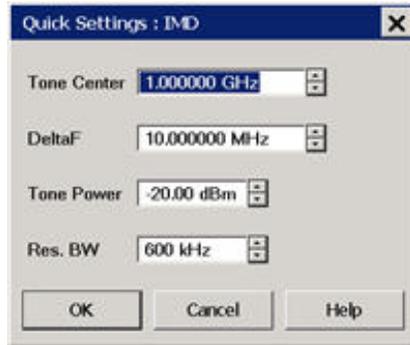

Enter [Start/Stop Time](#)

Learn more about [Time Domain measurements](#).

Creates an IM Spectrum measurement.

IMD
Option
Required:
087

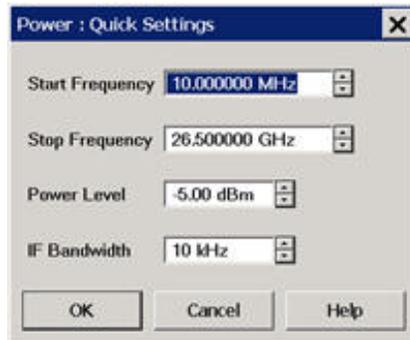

Enter [Tone Center](#), [DeltaF](#), [Tone Power](#), and [Res. BW](#)

Learn more about [IM Spectrum](#) measurements.

Power
Option
Required:
None

Creates R1 and B receiver measurements in a single channel and window. This allows you to view the DUT input power (R1) and output (B) power.

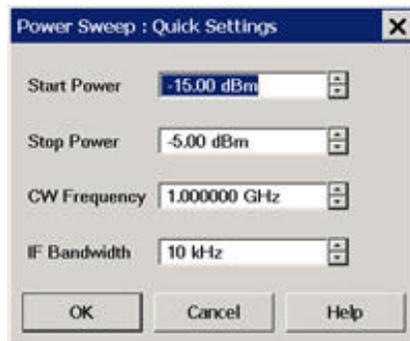

Enter [Start/Stop frequency](#), [Power Level](#), and [IF Bandwidth](#).

Learn more about [Unratioed Receiver measurements](#).

Power Sweep
Option
Required:
None

Creates a power sweep while viewing R1, B, and S21 measurements in a single channel and window. This allows you to view the DUT input power (R1), output power (B), and DUT gain (S21).

Enter [Start/Stop power](#), [CW Frequency](#), and [IF Bandwidth](#).

Learn more about [Power Sweep measurements](#).

Creates a pulsed stimulus at 1 GHz while viewing R1, and B receivers in a single channel and window. This allows you to view the pulse stimulus at the DUT input and output.

Pulse Profile

Option
Required:
008

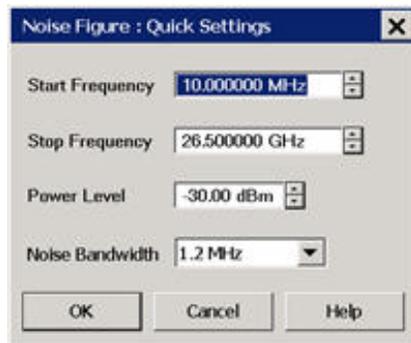

Enter [CW Frequency](#), [Power Level](#), Stop Time, [Pulse Width](#) and [Period](#).

Learn more about [Integrated Pulse Measurements](#).

Creates a standard NF measurement.

Noise Figure

Option
Required:
028/029

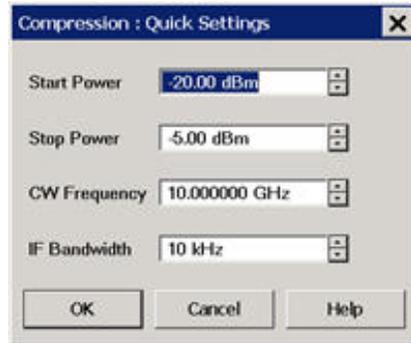

Enter [Start/Stop frequency](#), [Power Level](#), and [Noise Bandwidth](#).

Learn more about [Noise Figure measurements](#).

Creates a power sweep while viewing S21 (gain) with Compression Markers.

Compression

Option
Required:
None

Enter [Start/Stop power](#), [CW Frequency](#), and [IF Bandwidth](#).

Learn more about [Gain Compression Markers](#).

Offset Receiver

Option
Required:
080

Creates Frequency Offset Measurement while viewing R1 and B receivers in a single channel and window.

Enter Source [Start/Stop frequency](#) and [Power Level](#).

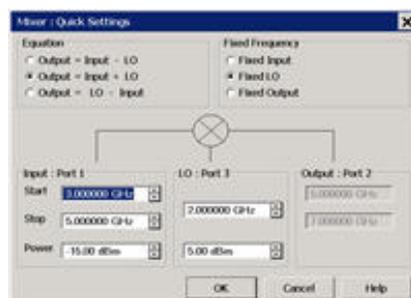

Enter Receiver [Start/Stop frequency](#) and [IF Bandwidth](#).

Learn more about [FOM](#).

Mixer

Option
Required:
082/083

Creates a Insertion Loss (SC21) measurement.

Enter Input, LO, and Output Frequencies and configuration.

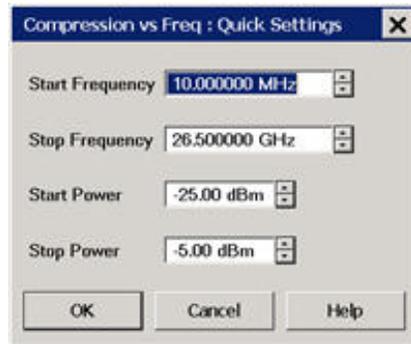

Learn more about [SMC Measurements](#)

Creates an CompOut21 (Gain Compression)

Compression vs Frequency

Option
Required:
086

measurement.

Enter [Start/Stop frequency](#), and Start/Stop [Power Level](#).

Learn more about [Gain Compression App](#)

23-Sep-2011 New topic

Basic Measurement Sequence

The following process can be used to setup all PNA measurements:

Step 1. Set Up Measurements

Reset the analyzer, create a measurement state, and adjust the display.

Step 2. Optimize Measurements

Improve measurement accuracy and throughput using techniques and functions.

Step 3. Perform a Measurement Calibration

Reduce the measurement errors by performing a calibration.

Step 4. Analyze Data

Analyze the measurement results using markers, math operations, and limit tests.

Step 5. Print, Save or Recall Data

Save or print the measurement data.

Frequency Blanking

For security reasons, you can prevent frequency information from appearing on the PNA screen and printouts.

How to set Frequency Blanking

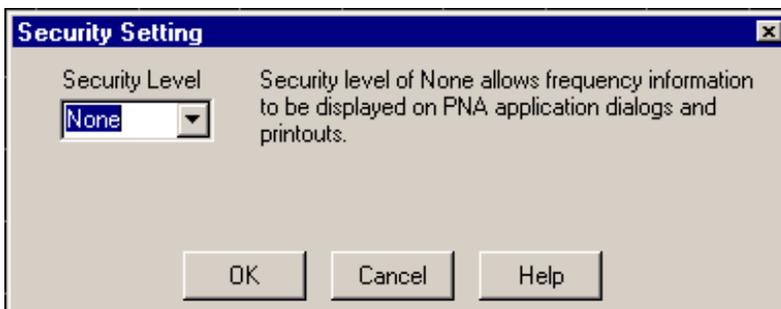

Using front-panel HARDKEY [softkey] buttons

1. Press **SYSTEM**
2. then [**Security**]

Using a mouse with PNA Menus

1. Click **Utility**
2. then **System**
3. then **Security**

← Programming Commands →

Security Setting dialog box help

Notes

- To learn how to erase memory before moving your PNA out of a secure area, see <http://na.tm.agilent.com/pna/security.html>.
- An ECal Data Wipe Utility destroys all user data per US DoD 5220.22-M. Learn more at <http://na.tm.agilent.com/pna/apps/applications.htm>
- PNA 'Undo' is disabled with **High** and **Extra** security levels. [Learn more](#).

Security Levels

None - All frequency information is displayed on the screen and printouts.

Low security level - Frequency information is blanked from the following:

- Display annotation
- Calibration properties
- All tables
- All toolbars
- All printouts
- [External sources](#) - See Also: [Preference to Deactivate External Devices on Preset](#). **Note:** Frequency Blanking is fully supported ONLY on Agilent MXG sources with option 006. On MXG models without option 006 and all PSG models, the window state is turned OFF. When the “local” button is clicked on the source, then frequency is re-displayed.

High security level - Low security level settings PLUS:

- [GPIB console](#) is inactive

Extra security level - High security level settings PLUS:

- All ASCII [data saving](#) capability (.snp, .prn, .cti) is saved without frequency information. The X-axis information is replaced with data point numbers. Before A.08.50, saving these file types was NOT allowed.
- [Mixer setup files](#) (*.mxr) can NOT be saved.

For ALL security levels:

Frequency information is **NOT** blanked from the following:

- [Service Adjustment Programs](#)
- Your COM or SCPI programs.

Instrument State and Cal Sets

The security level is always saved and recalled with an instrument state. However, the instrument state may contain a Cal Set or link to a Cal Set. [Learn more](#). This may influence the security level when the instrument state is recalled. Here is how.

- When a new Cal Set is created at the end of a calibration, the current system security level is stored with it.
- The only way to change an existing Cal Set's security level is by writing a new calibration into the Cal Set.

- When later applied to a channel, if the Cal Set has a **higher** security level than the current system security level, the system security level will become upgraded to that of the Cal Set.
- When saving an instrument state to either a *.csa or *.cst file, the security levels of the system and Cal Set are saved separately. When recalled, the higher security level of the two is applied.
- To view the security level of a Cal Set, see [Cal Set Properties](#).

Re-displaying frequency information

- When in **Low** security level, do any of the following:
 - Revisit this dialog box and select **None**
 - Perform an [instrument preset](#)
 - Recall an Instrument State/Cal Set with security level of **None**.
- When in **High** or **Extra** security level, do any of the following:
 - Perform an [instrument preset](#)
 - Recall an Instrument State/Cal Set with security level of **None**.

17-Jul-2007	Added Extra setting

Internal Second Source

The following PNA models include an internal second source.

Model	Total # of Ports
PNA-X Opt 224	<u>2</u>
ALL PNA-X models N522xA Opt 400's	4

How to use the second source

- Set frequency using the [Frequency Offset Opt 080 dialog](#).
- Set power using the [Advanced Power dialog](#).
- [Source power calibration](#) of the second source is performed as usual.
- Using FCA, [click the LO button](#) to set frequency and power.
- The [specifications](#) of the second source are the same as source 1.

Benefits / Uses of the second source

- Up to five times faster than stepping an external source.
- Measure Mixers with internal swept or fixed LO.
- Measure TOI or Intermodulation distortion.

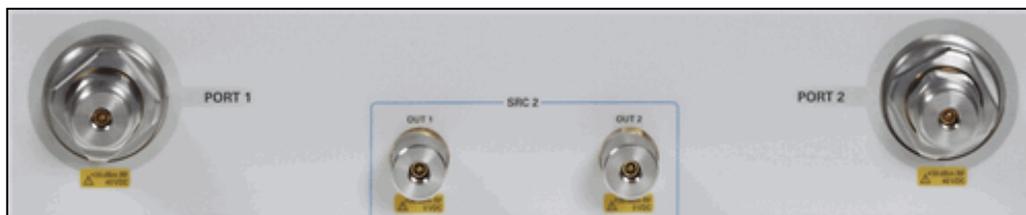

Internal Second Source Restrictions

Source 1 and Source 2 are available at specific ports as follows:

4-port models

- Source 1 power is available at Port 1 OR Port 2; NOT at both ports simultaneously.
- Source 2 power is available at Port 3 AND Port 4; BOTH ports simultaneously. (Although it is possible, the PNA firmware typically prevents both ports from sweeping simultaneously for measurement integrity purposes.)
- Other routing configurations are possible using the [RF Path Configurator](#).

PNA-X Opt 224 (PNA-X 2-port model):

- Source 1 power is available at **Port 1** OR **Port 2**; NOT at both ports simultaneously.
- Source 2 (**SRC 2**) power is available at **Out 1** AND **Out 2**; BOTH ports simultaneously.
- Other routing configurations are possible using the [RF Path Configurator](#).

Remotely Accessing the Internal Second Source

See [Remotely Specifying a Source Port](#).

PNA Preferences

PNA preferences are settings that survive a Preset or PNA Shutdown. PNA Preferences are listed on this page with links to locations that provide more information.

How to set PNA Preferences

Using front-panel HARDKEY [softkey] buttons

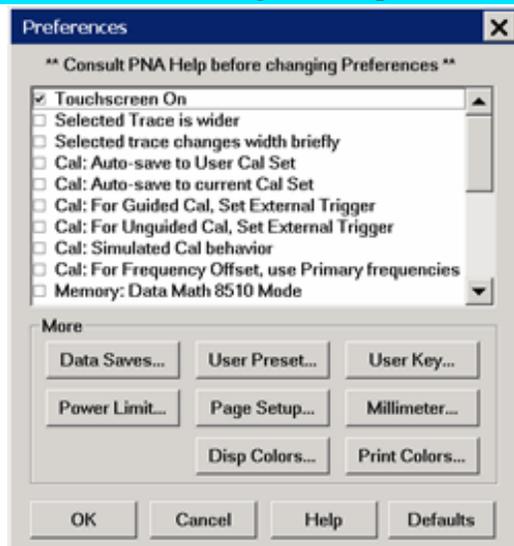

1. Press **SYSTEM**
2. then [**Configure**]
3. then [**More**]
4. then [**Preferences**]

PNA Menu using a mouse

1. Click **Utility**
2. then **System**
3. then **Configuration**
4. then **Preferences**

◀ Programming Commands ▶

Preferences dialog box help

PNA Preferences survive a Preset and a system reboot.

A checked box makes the following statements true unless stated otherwise.

Note: The default setting is listed first.

Touchscreen ON. Selections can be made by touching the screen.

Touchscreen ON. Selections can NOT be made by touching the screen.

Selected Trace is wider. The selected trace is the narrow, default size.

Selected Trace is wider. The active (selected) trace is always wider.

Selected trace changes width briefly. The selected trace does NOT change width briefly.

Selected trace changes width briefly.

This setting only affects calibrations performed using SCPI or COM. Cals performed from the User Interface ALWAYS offer a choice to save to a named Cal Set.

Cal: Auto-save to User Cal Set With Rev 6.0 we implemented a change that defaults to saving completed calibrations to Cal Registers instead of User Cal Sets.

Cal: Auto-save to User Cal Set Always automatically save completed calibrations to an auto-named User Cal Set. **Caution:** this can cause a lot of save User Cal Sets. [Learn more.](#)

The following message appears when both the Cal Set choices above and below are selected:

"Cal: Auto-save preferences conflict "

Auto-save to User Cal Set (above)- or - **Auto-save to current Cal Set.**(below)

Uncheck one of these.

This setting only affects calibrations performed using SCPI or COM. Cals performed from the User Interface ALWAYS offer a choice to save to a named Cal Set.

Cal: Auto-save to current Cal Set

Cal: Auto-save to current Cal Set Always automatically save a completed Cal to the Cal Set that is currently selected on the specified channel, which could be the channel Cal Register. If the channel does not yet have a selected Cal Set, the Cal will be saved to a new User Cal Set with an automatically-generated name.

Cal: For Guided (and unguided)Cal, set external trigger. With Rev 6.0 we implemented a change that allows the measurement of Cal Standards during a Guided Cal to be externally triggered when [trigger source](#) is set to External.

Cal: For Guided Cal (and unguided), set external trigger. Do NOT allow the measurement of Cal standard to be externally triggered. All Guided Cal Standard measurements are triggered internally regardless of the trigger source setting. [Learn more.](#)

Cal: For Unguided Cal, set external trigger.

Cal: For Unguided Cal, set external trigger. Same as above, except for Unguided Cals.

With A.09.50, this preference is no longer necessary. Use **For Guided Cal, set external trigger.**

For SCPI behavior only. [Learn more.](#)

Cal: Simulated Cal Behavior

Cal: For Frequency Offset, use Primary Frequencies

Cal: For Frequency Offset, use Primary Frequencies Use when making mmWave measurements without a test set. [Learn more.](#)

Memory: Data Math 8510 Mode Standard PNA data processing chain.

Memory: Data Math 8510 Mode Simulate the Agilent 8510 data processing chain as it pertains to Trace Math and Memory. [Learn more.](#)

Meas: Mathematical offset for receiver attenuation The reported test port receiver power is mathematically offset by the amount of receiver attenuation. Default for all models.

Meas: Mathematical offset for receiver attenuation The reported test port receiver power is NOT mathematically offset by the amount of receiver attenuation.

[Learn more.](#)

Meas: Mathematical offset for source attenuation The reported reference receiver power is mathematically offset by the amount of source attenuation.

Meas: Mathematical offset for source attenuation The reported reference receiver power is NOT mathematically offset by the amount of source attenuation.. [Learn more.](#)

Meas: RF power On during frequency sweep retrace The PNA leaves RF power ON during a retrace of single-band frequency or segment sweeps.

Meas: RF power On during frequency sweep retrace Turn RF power OFF during a retrace of single-band frequency or segment sweeps. [Learn more.](#)

Meas: Power Sweep Retrace At the end of a power sweep, while waiting to trigger the next sweep, the PNA maintains source power at the start power level.

Meas: Power Sweep Retrace Maintain source power at the STOP power level. [Learn more.](#)

Sets the scope of External Trigger Output signal properties. The PNA is **Preset** after changing this setting.

Meas: External Trigger OUT is Global Channels can have different External Trigger OUT settings. Default for PNA-X and N522xA models. On the Trigger Setup dialog, **Trigger Mode = Point** is ignored for external triggering.

Meas: External Trigger OUT is Global All channels have same External Trigger OUT settings. Default for PNA “C” and PNA-L models. Aux Trig OUT properties apply to all channels except the Per Point setting. To set Per Point for specific channels: On the [Trigger Setup](#) dialog, set **Trigger Scope** = Channel, under **Channel Trigger State**, select the channel, and set **Trigger Mode** = Point.

[See External Triggering dialog.](#)

Meas: Port 1 Noise Tuner Switch set to External The Noise Figure port 1 DPDT switch is set to EXTERNAL. This setting always provides incident power through the front panel loop.

Meas: Port 1 Noise Tuner Switch set to External The Noise Figure switch is set to INTERNAL, which is one method to make accurate S-parameter measurements when an ECal module is connected as a Noise Tuner.

Note: This preference is NOT available on PNA models with a Built-in Noise Tuner.

The Noise Figure App will throw the switch as needed. However, External Test Sets (in Multiport mode) rely on this switch being set to External. [Learn more about the Noise Tuner switch.](#)

Meas: Draw failed trace segments in red Failed data points (dots) are drawn in red.

Meas: Draw failed trace segments in red (default) Failed segments are drawn in red. [Learn more.](#)

For SCPI behavior only. [Learn more.](#)

Report source unlevelled events as errors Source unlevelled events are reported as errors.

Report source unlevelled events as errors Source unlevelled events are NOT reported as errors.

Ext Device: de-activate on PRESET and recall. External devices are de-activated when the PNA is Preset or when a Instrument State is recalled.

Ext Device: de-activate on PRESET and recall. External devices remain active when the PNA is Preset or when a Instrument State is recalled.

[Learn more about External Devices.](#)

On PRESET set two-point group delay aperture Group delay aperture is set to 11 points.

On PRESET set two-point group delay aperture Group delay aperture set to 2 points. [Learn more.](#)

On Preset turn power ON Instrument Preset always turns source power ON.

On Preset turn power ON When the current source power setting is OFF, source power remains OFF after Preset. When the current power setting is ON, source power is turned ON after

Preset. [Learn more.](#)

Turn Source Power Off when receiver is overloaded. Power remains ON when a receiver is overloaded.

Turn Source Power Off when receiver is overloaded. Turn OFF power to ALL ports when a receiver is overloaded. A notification dialog appears. Click **OK**, then lower the power level, then turn power ON. (Click **Stimulus**, then **Power**)

Report when receiver is overloaded A warning message is displayed on the PNA screen indicating that a receiver is overloaded or in compression. The displayed data is probably not accurate. One error per sweep appears and is reported in the [Error Log](#).

Report when receiver is overloaded Do NOT show overload warnings on the screen or report these errors in the error log.

The **More** buttons launch dialogs that contain predefined preferences:

Define Data Saves -

While not explicitly called Preferences, all of these settings survive a shutdown. [Learn more.](#)

User Preset

Specify the Instrument State file that the PNA will use when Preset. [Learn more.](#)

User Key

Sets softkey preferences. [Learn more.](#)

Page Setup

Standard printer settings (Paper, Orientation, and Size) do NOT survive a PNA shutdown.

All other settings DO survive a PNA shutdown. [Learn more.](#)

Millimeter settings

Sets MM Wave configurations. [Learn more.](#)

Power Limit

Sets Power Limits and Offsets. [Learn more.](#)

Disp Colors

Sets PNA display items to custom colors. [Learn more.](#)

Print Colors

Sets PNA print items to custom colors. [Learn more.](#)

Dialog Transparency

Some PNA dialogs can be viewed in various levels of transparency. [Learn more.](#)

Although they are called preferences, the following settings do NOT survive a PNA shutdown.

Calibration	UI Setting
Show or not, the first 'Method' Page of the Cal Wizard.	Cal Preferences
Set and order default Cal Types	Cal Preferences
Perform orientation of the ECal module during calibration?	ECal Wizard
Specify ECal port mapping when orientation is OFF	ECal Wizard
Show or hide custom Cal Windows during Cal	Cal Window (remote commands only)

Last Modified:

12-Aug-2013	Added dialog transparency (10.0)
18-Jul-2013	Reworded Noise tuner Switch pref
29-Apr-2013	Fixed receiver attenuation typo
14-Mar-2013	Red trace segment limit is default
11-Oct-2012	Edited for built-in noise tuner
5-Apr-2012	Added math to attn note
22-Feb-2012	Added note to Ext trigger for cals
29-Dec-2011	Added checkbox images
10-Sep-2010	Added Cal windows
26-Aug-2010	Added overload preferences
24-Mar-2010	Removed Error messages button
31-Jul-2009	Added External Device, primary FOM, draw failed segments, Power Limit, disp colors, print colors (9.0)
6-Feb-2009	Added new Cal set selection
22-Apr-2008	Added UI
10-Apr-2008	Added RemoteCalStorage and replaced AuxTrigger properties

Using VNC to Control the PNA User Interface

VNC (Virtual Network Computing) allows you to control the User Interface of a PNA from any PC. The PNA display appears on the connected PC display. Mouse and keyboard control can occur from both the PNA and PC, although not simultaneously.

Note: For similar functionality, use Windows **Remote Desktop**. see the Windows help file for more information.

Both the PNA and PC must be connected to the same network. The responsiveness of the PNA while using VNC is dependent of the speed of your internet connection.

Every PNA is shipped with VNC installed. However, you must download and install the VNC software onto the PC.

The following procedures can help you configure VNC to view and control the PNA application from your PC.

On the PNA, run VNC Server

To do this:

1. Click View, then Minimize Application.
2. Click **Start**, then **All Programs**, then **TightVNC**, then **Tight VNC Server (Application Mode)**, then **Launch VNC Server**.
 - When the server is running, the  icon is visible in the lower right corner of the display. If not visible, click the up arrow to expand the list of icons.
 - The first time you run VNC Server, you must first set a password to control access from remote PCs.

On the PC, run VNC Viewer

To do this:

1. Download from <http://www.tightvnc.com/> and install TightVNC on the PC.
2. From the PC Desktop, click **Start**, then **Programs**, then **TightVNC**, then **TightVNC Viewer**
3. When prompted for the Hostname, type the [full computer name](#) or [IP address](#) of the PNA.
4. When prompted for the password, type the password you set when configuring VNC on the PNA.

25-Nov-2013 Updated for Win 7
15-Apr-2008 Updated for tightVNC

LXI-1.1 and VXI-11.3 Compliance

PNA-X, N522x, and PNA-C models that were shipped with PNA version A.08.20 or higher are LXI-1.1 and VXI-11.3 compliant.

LXI-1.1 Compliance

A PNA is LXI-1.1 compliant if the  logo appears on the PNA splash screen when the PNA application starts.

Learn more about LXI at <http://www.lxistandard.org/>

VXI-11.3 Compliance

To be compliant with VXI-11.3, the PNA must have been either:

- Shipped from the factory with PNA version A.08.20 or higher, or
- Had the Hard Disk Drive (HDD) upgraded since about June 2008 when A.08.20 was released and using PNA Rev. A.08.20 or higher.

Learn more about VXI at <http://www.vxi.org/>

LAN Status

When a LAN connection is used with the PNA, the LAN Status dialog allows you to see the IP address and other LAN connection properties.

How to view LAN Status

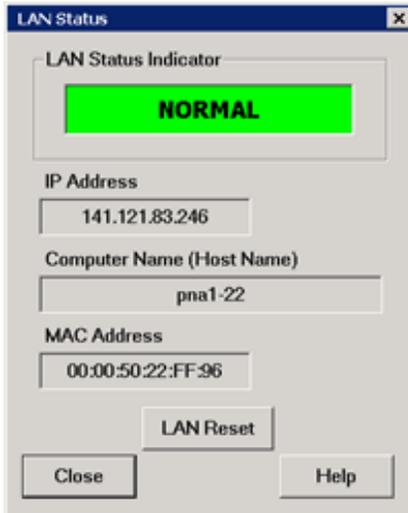

Using front-panel HARDKEY [softkey] buttons

1. Press **SYSTEM**
2. then **[Configure]**
3. then **[More]**
4. then **[LAN Status]**

Using a mouse with PNA Menus

1. Click **Utility**
2. then **System**
3. then **Configure**
4. then **More**
5. then **LAN Status**

 **Programming Commands** 

LAN Status dialog box help

Indicator Shows the current status of the LAN connection.

NORMAL - Indicates that the PNA LAN is ready for communication.

IDENTIFY - Indicates that a remote computer has invoked an LXI identification operation on the PNA using the web-based interface or [LXIDeviceIDState](#) COM property.

FAULT - Indicates that the PNA LAN interface is not connected to the Internet.

IP Address Shows the current IP address of the PNA

Computer Name Shows the full computer name of the PNA. [Learn how to change this.](#) If you see the IP address listed here, that means there is no DNS server specified in the network setup.

MAC Address Shows the unique address of the PNA computer. Also known as HostID.

LAN Reset Provides a LAN Configuration Initialize (LCI) mechanism. Press to return the following settings to factory default conditions:

- **IP Address Configuration (DHCP):** Enabled
- **ICMP Ping Responder:** Enabled
- **Web Password for configuration:** Resets the password for the factory default account (Agilent) to 'agilent'. If the **pna-admin** account had been renamed by the PNA owner, this function creates a new Administrator account named **pna-admin** and sets its password to 'agilent'. Learn more about [User names and Passwords.](#)

Web Server Software

If your PNA is LXI Class C compliant ([see above](#)), you can connect to the PNA using a web browser

over an internet connection.

To do this, when the above dialog indicates a **NORMAL** condition:

1. From a web browser, type **http://<your_PNA_computer_name>**. For example, to connect to the fictitious PNA in the dialog above, type: **http://pna1-22**
2. Type the log on User Name and Password
3. You will see the following welcome screen with connection links.

The screenshot shows the web interface for an Agilent Technologies PNA Series Network Analyzer. The page is titled "Welcome to your Web Enabled PNA" and features the LIXI logo. A sidebar on the left contains navigation buttons: Welcome Page, Print Page, Get Data, Links/Download/Upload/Reset, Send Remote Command, Send Remote Program, Shutdown/Restart, and View Configuration. The main content area is divided into two sections: "Information about this Web-Enabled PNA" and "Advanced Information about this Web-Enabled PNA".

Windows 7 File Locations

With Windows 7, data file locations have been changed from previous Windows Operating Systems.

State files and most data file storage locations:

- Windows XP: c:\program files\agilent\network analyzer\documents
- Windows 7: c:\users\public\documents\network analyzer

PNA firmware executable file locations:

- Windows XP: c:\program files\agilent\network analyzer
- Windows 7: c:\program files (x86)\agilent\network analyzer

Support file locations

- Windows XP: c:\program files\agilent\network analyzer
- Windows 7: c:\programdata\agilent\network analyzer

These file locations can be queried remotely.

SCPI Command: [SYSTem:CONFigure:DIRectory?](#)

COM Command: [DirectoryPath Property](#)

Dialog Transparency

Beginning with PNA release A.010.0, most PNA dialogs can be made to appear with various amounts of transparency. This allows you to view the PNA traces through the dialog as you make dialog settings.

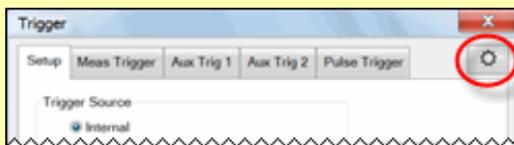

How to set Transparency Level

There are FOUR ways to make the transparency level setting:

1. Right-click in any non-control area of a dialog that allows transparency to see the following selections:

2. In tabbed dialogs, cycle through the above transparency settings by pressing the following button multiple times.

3. Launch the Transparency dialog (below) from the [Preferences](#) dialog.

4. Launch the Transparency dialog by doing the following:

Using front-panel

HARDKEY [softkey] buttons

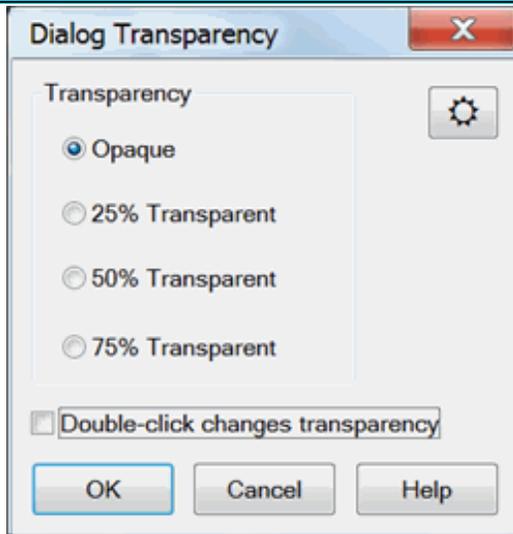

1. Press **DISPLAY**
2. then **[More]**
3. then **[Dialog Transparency]**

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Dialog Transparency**

This setting is not programmable

Dialog Transparency dialog box help

Note: This single Transparency setting applies to ALL supported PNA dialogs.

- Opaque (NOT Transparent) - Default setting
- 25% Transparency
- 50% Transparency
- 75% Transparency

Double-click changes transparency - When checked, cycle through the above transparency settings by double-clicking in any non-control area of a dialog that allows transparency.

Notes

- The transparency setting is stored as a [PNA Preference](#).
- The setting survives a PNA Shutdown and Preset
- It is NOT saved and recalled with instrument state.

Other Quick Start Topics

PNA Documentation

This Help file, which is embedded in the PNA, is the **Users Guide and Programming Manual for the PNA**. The help file is automatically updated on the PNA when firmware is updated. Only the PNA [Installation and Quick Start Guide](#) is shipped with new PNA instruments.

Hardcopy manuals are no longer available for purchase with the PNA.

All PNA documentation, including the **latest online Web Help version** of this Help file, and a printable .PDF version of the Help file, are available at <http://na.tm.agilent.com/pna/help/index.html>.

Printing Help

Beginning with the PNA 5.2 release (March 2005), we once again offer a .pdf version of PNA Help. Download the .pdf file from <http://na.tm.agilent.com/pna/help/index.html>. You can still print individual PNA Help topics by clicking the Print icon at the top of the PNA Help window.

Copying Help to your PC

With the Help system on your PC, you can read about the PNA while away from it. You can also Copy and Paste programming code from this Help system directly into your programming environment.

The Help file is located on your PNA hard-drive at **C:/ Winnt/ Help/ PNAHelp.chm**. If both the PNA and PC are connected to LAN, you can [map a drive](#) and copy the file directly.

The Help file can also be downloaded from <http://na.tm.agilent.com/pna/help/index.html>.

Launching Help

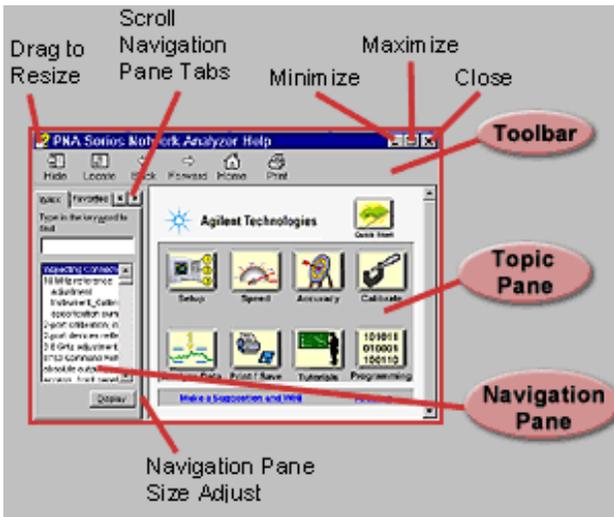

The Help system can be launched in three ways:

1. From the front panel Help button.
2. From the **Help** drop-down menu
3. From [Dialog Box](#) Help

Navigating Help

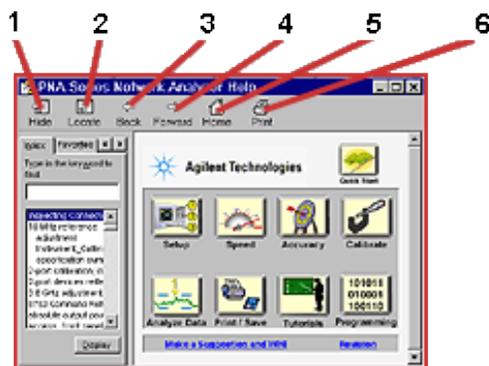

The Help Window contains 3 panes (regions):

1. [Toolbar](#) Pane
2. [Topic](#) Pane
3. [Navigation](#) Pane

Toolbar Pane

The Toolbar is at the top of all Help windows. It allows you to resize the window, browse and print the selected topic.

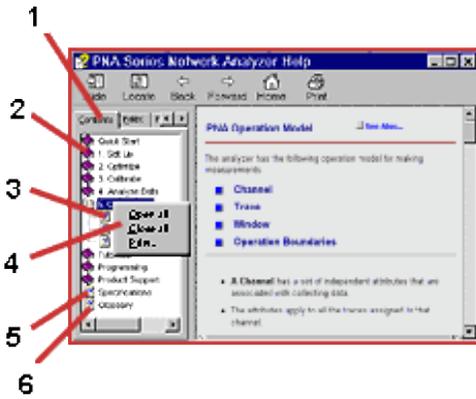

1. Hide or show the navigation pane
2. Locate the topic in the table of contents
3. Back to topic visited previously
4. Forward again if **Back** was clicked
5. Go to the Home page.
6. Print the topic pane.

Navigation Pane

Click the following tabs in the Navigation Pane to access information in the Help system:

- [Table of Contents Tab](#)
- [Index Tab](#)
- [Search Tab](#)
- [Favorites Tab](#)

(Table of)Contents Tab

1. Click tab to select Table of Contents.
2. Click a book to access related topics.
3. Click to display a topic.
4. Right click to access menu.
5. Click to display specifications
6. Click to display glossary

Index Tab

The index tab allows you to type a keyword and go to only the most applicable topics.

1. Click tab to select index.
2. Type keyword to find topics of interest.
3. View suggested topics. (Double-click to display topic.)
4. Click to display topic.

Search Tab

TIP: To Search any topic for a keyword, press **Ctrl** and **F**.

[Perform a Google search of the online version of PNA Help.](#)

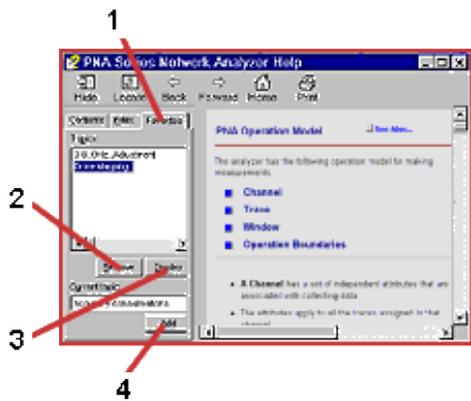

The following rules apply for using full-text search:

- Searches are not case-sensitive.
- You can search for any combination of letters (a-z) and numbers (0-9).
- Punctuation marks (period, colon, semicolon, comma, and hyphen) are ignored during a search.
- You can group the words of your search using double quotes or parentheses. Examples: "response calibration" or (response calibration). This requirement makes it impossible to search for quotation marks.
- Use Wildcard expressions:
 - To search for one undefined character use a question mark (?). For example, searching for **cal?** will find **calc** and **calf**.
 - To search for more than one undefined character use an asterisk (*). Searching for **Cal*** will find **calibration** and **calculate**.
- Use Boolean operators to define a relationship between two or more search words.

Search for	Example	Results will show topics containing:
Two words in the same topic	response AND calibration	Both the words "response" and "calibration".
Either of two words in a topic	response OR calibration	Either the word "response" or the word "calibration" or both.
The first word without the second word in a topic	response NOT calibration	The word "response" but not the word "calibration".
Both words in the same topic, close together.	response NEAR calibration	The word "response" within eight words of the word "calibration".

Favorites Tab

The favorites tab allows you to store (bookmark) the topics you refer to most often so that they can be recalled easily.

1. Click tab to view stored topics in Favorites.
2. Remove selected topic.
3. Display selected topic.
4. Add (store) current topic.

Topic Pane

The Topic pane allows you to view the contents of the selected topic.

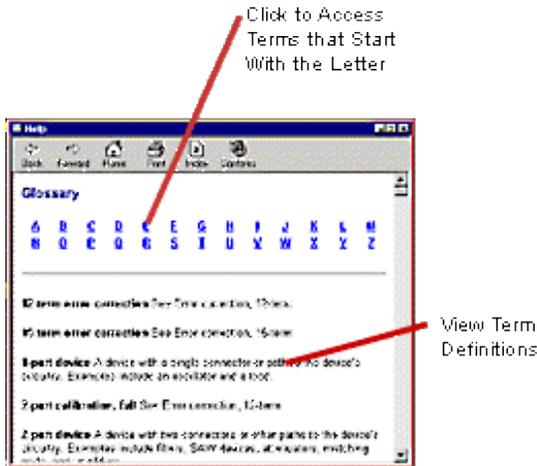

Help Languages

Beginning with PNA Rev A.08.00, PNA Help is offered in English ONLY.

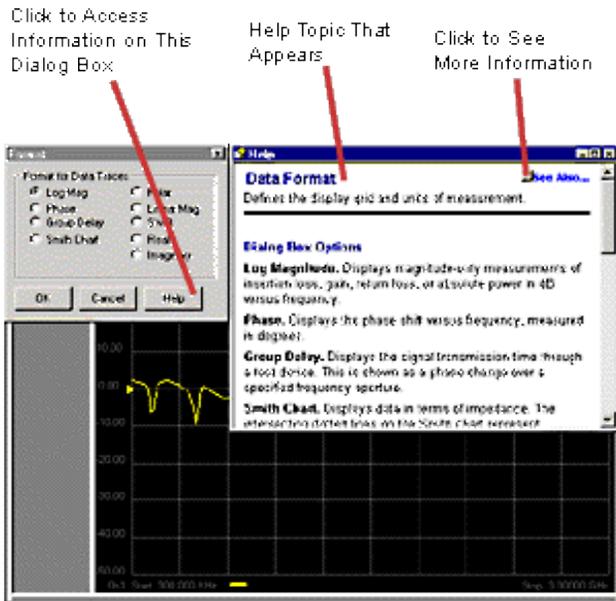

Glossary

The [Glossary](#) holds definitions of words, in alphabetical order.

Note: Click on a word in **green** text throughout Help to see the glossary definition.

Dialog Boxes

Documentation Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED "AS IS," AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, AGILENT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. AGILENT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR ANY INFORMATION CONTAINED HEREIN. SHOULD AGILENT AND THE USER HAVE A SEPARATE WRITTEN

AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT WILL CONTROL.

Suggestions Please!

Please let us know about your experience using PNA Help. Send your comments to:

pna_help@am.exch.agilent.com. Comment about any aspect of the help system. Here are a few areas that you might consider:

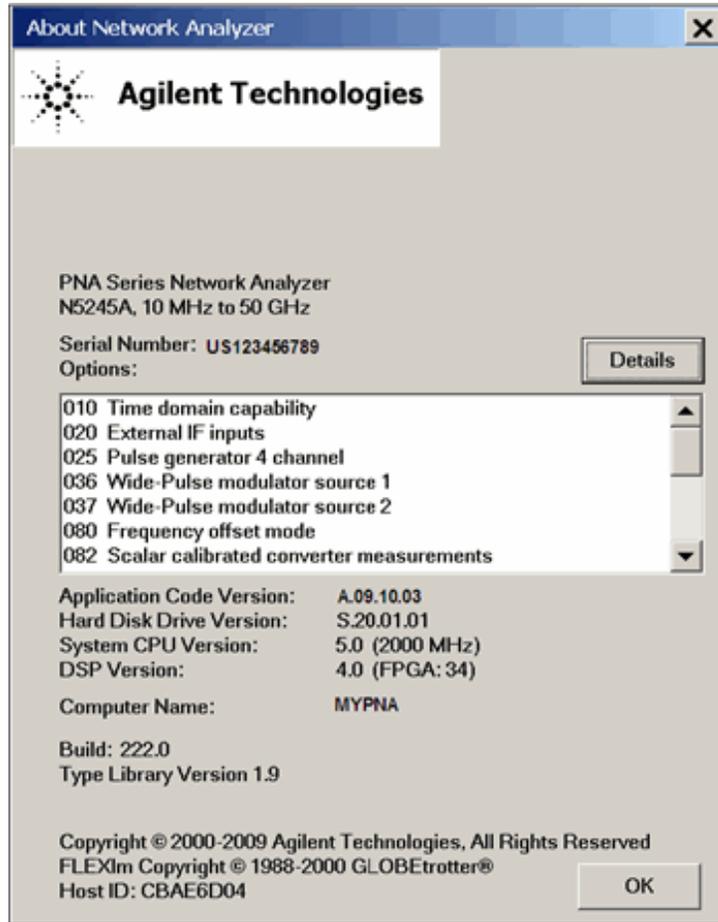

- Does anything appear to be broken?
- Did you find what you were looking for?
- Was the information you found helpful?
- Any suggestions as to how we can improve the help system?

Your comments go directly to the help system authors. For help with technical questions, please refer to [Technical Support](#).

Help - About Network Analyzer

Click **Help**, then **About Network Analyzer** to learn the following about your PNA:

Programming Commands

- Model number ([see list of PNA models](#))
- Frequency range
- Serial number
- Installed options ([Learn how to install software options](#))
- Application Code (firmware) Version
- Hard Disk Drive Version
- System CPU Version - [Learn more](#)
- DSP (Digital Signal Processor.) Version. [Contact Agilent](#) to upgrade the DSP. See DSP Version changes

below.

- Computer Name - [Learn more](#). This is also reported on the [LAN Status / LXI Compliance dialog](#).

DSP Version changes

For PNA-X, the DSP board number along with the FPGA version, provides access to the following features or causes the following settings to change:

DSP Board	FPGA Version	Changes
4	27	Enabled FastCW triggering
4	34	Enabled configurable (polarity and type) for PulseSyncIn external trigger signals.
5	xx*	<p>IF Frequencies – The default values are changed.</p> <p>IFAntiAliasFilter - The Narrow and Wide settings are changed.</p> <p>Note: Programs that control the following DSP filter settings, or state files that are saved with these settings, will yield different results when run or recalled on PNAs with DSP 4 versions versus DSP 5 versions.</p> <ul style="list-style-type: none">• Stage1 frequency (Max=38 MHz for DSP 5).• Stage2 Coefficient setting is IGNORED with DSP 5 Versions.• ADC Capture Mode Max data points increased to PNA Max.

*With DSP board 5, FPGA version is upgraded with firmware. This requires more time for FW installation.

Search PNA Help

Search is limited to <http://na.tm.agilent.com/pna/help/latest/>

[See Google Search Help](#)

Preset the PNA

When you Preset the PNA, it is set to known, or preset conditions. You can use the factory default preset conditions, or define your own User Preset conditions.

- [Preset \(Default\) Conditions](#)
- [User Preset Conditions](#)

[See other 'Setup Measurements' topics](#)

Preset Default Conditions

How to Preset the PNA

Tip: Press the **Preset** button to start the PNA application if it is not already running.

Using front-panel HARDKEY [softkey] buttons

1. Press **Preset**

PNA Menu using a mouse

1. Click **Utility**
2. then **Preset**

[Programming Commands](#)

User Preset Conditions

The analyzer can be **preset** to either **factory default** conditions or **User Preset** conditions.

How to set User Preset

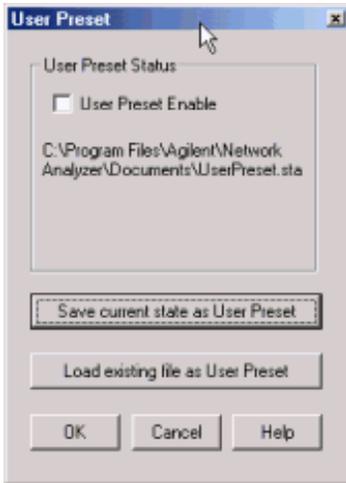

Using front-panel HARDKEY [softkey] buttons

1. Press **SAVE**
2. then **[User Preset]**

PNA Menu using a mouse

1. Click **Utility**
2. then **User Preset**

[Programming Commands](#)

User Preset dialog box help

With a User Preset saved and enabled, when the PNA is Preset, the User Preset settings are recalled instead of the factory default settings. Calibration data is NOT recalled with a User Preset. [Learn more about instrument state settings.](#)

User Preset Enable

Check - The PNA is preset to **User Preset** conditions when the Preset button is pressed.

Clear - The PNA is preset to **Default** conditions when the Preset button is pressed.

Save current state as User Preset Click to store the current instrument state as the User Preset conditions. File is stored as c:\users\public\network analyzer\documents\UserPreset.sta.

Load existing file as User Preset Click to retrieve an instrument state to be used as the User Preset conditions.

Measurement Classes

Measurement Classes are categories of measurements that can coexist on a channel.

- [What are Measurement Classes](#)
- [How to assign a Measurement Class to a Channel](#)
- [Measurement Class Dialog Box Help](#)

[See other 'Setup Measurements' topics](#)

What are Measurement Classes

The following table shows the Measurement Classes currently available for the PNA. Within each of these classes there are a number of measurements.

Measurement Classes are categories of measurements that can coexist on a channel. A measurement from one class can NOT reside in a channel with a measurement from another class. For example, a Noise Figure measurement can NOT reside in a channel that is currently hosting Scalar Mixer Measurements.

The Measurement Class dialog is accessed in the following ways:

How to assign a Measurement Class to a Channel

Using front-panel

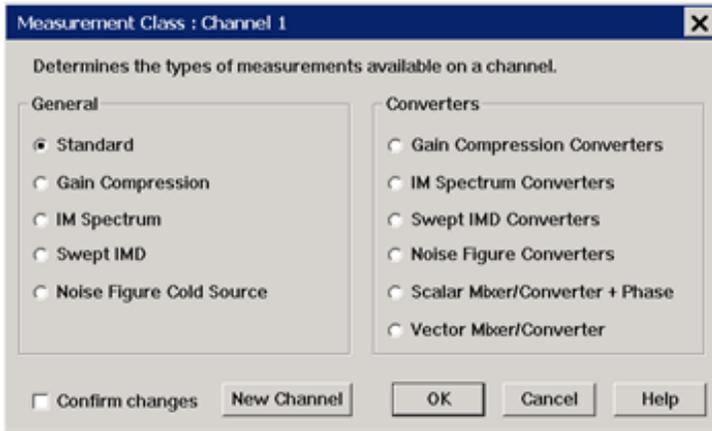

HARDKEY [softkey] buttons

1. Press **MEAS**
2. then [**Measurement Class**]

PNA Menu using a mouse

1. Click **Trace/Chan**
2. then **Measurement Class**

[Programming Commands](#)

Measurement Class dialog box help

Measurements in a measurement class can NOT coexist in a channel with a measurement of a different measurement class.

Select a measurement class for the active channel or new measurement channel.

- The **Standard** measurement class contains S-Parameters, Balanced parameters, and Receiver measurements.
- All other measurement classes are commonly called "[Applications](#)".

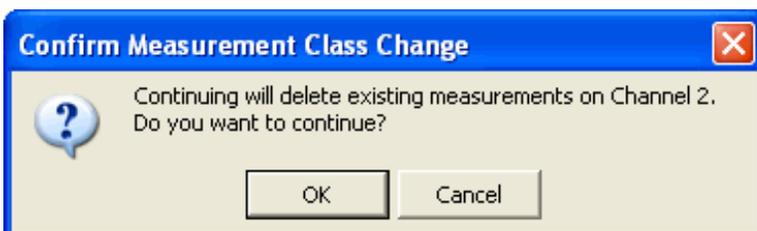

Title Bar Indicates the active channel to which the measurement class will be assigned.

Confirm changes

- Check (default setting) to launch the Confirm Measurement Class Change dialog.
- Clear to perform the 'OK' actions without confirmation. This setting survives a Preset and PNA Shutdown.

New Channel Click to create the measurement class in a new channel and new window. A default measurement for that class is created in the channel.

To change the measurement, click **Trace**, then select a new measurement.

Choose to do the following:

- **OK** - Delete the existing measurements in the active channel. Create the new measurement class, and default measurement, in that channel.
 - **Cancel** - Do not create the new measurement class. Leave the old measurements (and class) in that channel and return to the Measurement Class dialog box.
-

Last Modified:

6-Aug-2010	Added Confirm changes
1-Jul-2010	Added Standard vs Application
22-Mar-2010	Updated dialog image
3-Sep-2008	Removed legacy content
18-Jun-2007	MX New topic

Measurement Parameters

This topic contains the following information:

- [S-Parameters](#) (pre-selected ratios)
- [Ratioed](#) (choose your own ratio)
- [Unratioed Power](#) (absolute power)
- [How to Select a Measurement Parameter](#)

[Learn about Balanced Measurements](#)

[See other 'Setup Measurements' topics](#)

S-Parameters

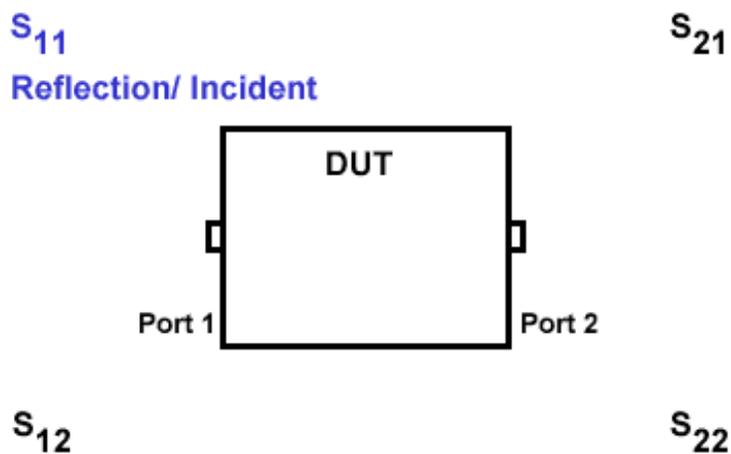

S-parameters (scattering parameters) are used to describe the way a device modifies a signal. For a 2-port device, there are **four S-Parameters**. The syntax for each parameter is described by the following:

S out - in

out = PNA port number where the device signal output is measured (receiver)

in = PNA port number where the signal is applied (incident) to the device (source)

Move the mouse over each S-parameter to see the signal flow:

For two-port devices:

- When the source goes into port 1, the measurement is said to be in the **forward** direction.
- When the source goes into port 2, the measurement is said to be in the **reverse** direction.

The analyzer automatically switches the source and receiver to make a forward or reverse measurement. Therefore, the analyzer can measure all four S-parameters for a two-port device with a single connection.

See the [block diagram](#) (including receivers) of your PNA.

Common Measurements with S-Parameters

Reflection Measurements (S11 and S22)

- Return loss
- Standing wave ratio (SWR)
- Reflection coefficient
- Impedance
- S₁₁, S₂₂

Transmission Measurements (S21 and S12)

- Insertion loss
- Transmission coefficient
- Gain/Loss
- Group delay
- Deviation from linear phase
- Electrical delay
- S₂₁, S₁₂

Receiver Measurements

All PNA models have test port receivers and reference receivers. See the [block diagram](#) of your PNA.

For 4-port models...

- R1, R2, R3, and R4 are reference receivers. They measure the signal as it leaves the PNA source.
 - R1 measures the signal out of Port 1
 - ...
 - R4 measures the signal out of Port 4
- A, B, C, and D are test port receivers. They measure the signal out (or reflecting off) of the DUT.

- A measures the signal into PNA Port 1
- B measures the signal into PNA Port 2
- C measures the signal into PNA Port 3
- D measures the signal into PNA Port 4

Receivers can also be specified using Logical Receiver Notation. [Learn more.](#)

Note: Beginning with PNA Rev. 7.22, you can use the internal ADC (Analog-Digital Converters) as measurement receivers. [Learn more.](#)

Ratioed Measurements

Ratioed measurements allow you to choose your own ratio of any two receivers that are available in your PNA. S-parameters are actually predefined ratio measurements. For example S11 is A/R1.

The following are common uses of ratioed measurements:

- Comparing the phase between two paths of a device. An example could be something simple like a power splitter or more complicated like a dual-channel receiver.
- Measurements that require a higher dynamic range than the analyzer provides with S-parameters.

Your PNA **MAY** have front-panel jumper cables that go directly to measurement receivers. Learn about the [front-panel jumpers](#) on your PNA.

Unratioed (Absolute Power) Measurements

The unratioed power parameter measures the absolute power going into any of the receivers that are available on your PNA.

The reference receivers are internally configured to measure the source power for a specific PNA port. Performing an absolute power measurement of a reference receiver using a different source port will measure very little power unless the front panel jumpers are removed and signal is applied directly to the receiver. An example of this would be an R1 measurement using port 2 as the source.

- [Measuring phase](#) using a single receiver yields meaningless data. Phase measurements must be a comparison of two signals.
- Averaging for Unratioed parameters is computed differently from ratioed parameters. [Learn more.](#)
- Choose **Unguided Cal**, then **Response Cal** if ONLY unratioed parameters are being measured. If S-parameters are also being measured, then SmartCal will calibrate the test port receivers in use.

How to create a NEW trace

The only measurements that can be created are those in the same measurement class as is currently assigned to the active channel. To create a measurement other than these, first assign the appropriate measurement class to a new or existing channel. [Learn how.](#)

Using front-panel

HARDKEY [softkey] buttons

1. Press TRACE 1, 2, 3, OR 4

PNA Menu using a mouse

1. Click Trace/Chan
2. then New Trace

Programming Commands

How to CHANGE the active trace

The only measurements that can be selected are those in the same measurement class as is currently assigned to the channel. To select a measurement other than these, first select the appropriate measurement class to a new or existing channel. [Learn how.](#)

1. Press MEAS
2. then select a new parameter

1. Click Response
2. then Measure
3. then select a new parameter

Programming Commands

New / Change Measurement dialog box help

Note: The only measurements that are available are those in the [measurement class](#) currently assigned to the active channel. Other measurements are NOT compatible.

To create a measurement other than these, first assign the appropriate measurement class to a new or existing channel. [Learn how.](#)

Click a tab to create or change measurements.

- When creating NEW measurements, you can choose more than one.
- When changing an EXISTING measurement, you can choose ONLY one.

Tabs

S-Parameter Select a predefined ratioed measurements. [Learn more about S-parameters.](#)

Topology / Mapping / Stimulus SE: 1 BAL: 2-3 Single End			<input type="button" value="Change"/>

Receivers Select receivers to make Ratioed and Unratioed (absolute power) measurements. [Learn more about receiver measurements.](#)

S-Parameter	Balanced	Receivers	
Activate: <input checked="" type="checkbox"/>	Numerator	Denominator	Source Port
	A	1.0	Port1
Activate: <input type="checkbox"/>	B	1.0	Port1
Activate: <input type="checkbox"/>	C	1.0	Port1
Activate: <input type="checkbox"/>	D	1.0	Port1
Activate: <input type="checkbox"/>	R	1.0	Port1
Activate: <input type="checkbox"/>	R1	1.0	Port1

Ratioed Check **Activate** to create or change a measurement. Select a receiver for the Numerator, select another receiver for the Denominator, then select a source port for the measurement.

The **Source port** is ALWAYS interpreted as a logical port number.

For convenience, the table is populated with common choices.

- [Learn about External Test Sets and Ratioed Measurements](#)
- [Learn more about Ratioed Measurements.](#)

Unratioed Same as Ratioed, but select **1** as the Denominator.

- [Learn More about Unratioed Measurements.](#)
- See the [block diagram](#) of receivers in YOUR PNA.
- The internal ADCs (Analog-Digital Converters) can be used as measurement receivers. [Learn more.](#)

Receiver Notation

With PNA [Rev 6.2](#), receivers can be also selected using logical receiver notation. This "8510-style" notation makes it easy to refer to receivers with an [External Test Set](#) connected to the PNA.

- **aN** - Reference receiver for logical port N
- **bN** - Test port receiver for logical port N

For example:

- For **Ratioed** measurements: "b12/a1" refers to the logical test port 12 receiver / the logical port 1 reference receiver.
- For **Unratioed** measurements: "b10" refers to the logical test port 10 receiver.

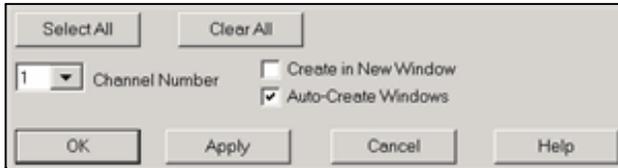

The PNA-style notation (A, B, R1 and so forth) can still be used to refer to the PNA **physical** receivers. [Learn more.](#)

However, ratioed measurements **MUST** use the same notation to refer to both receivers; either the physical receiver notation (A, R1) or the logical receiver notation (aN, bN). For example, the following mixed notation is **NOT** allowed: A/b3 and a5/R2.

Programming

When entering receiver letters using programming commands, neither logical or physical receiver notation are case sensitive.

Channel / Window Selections

These selections are NOT AVAILABLE when changing an EXISTING measurement. [Learn how to change a measurement.](#)

Channel Number Select the channel for the new traces.

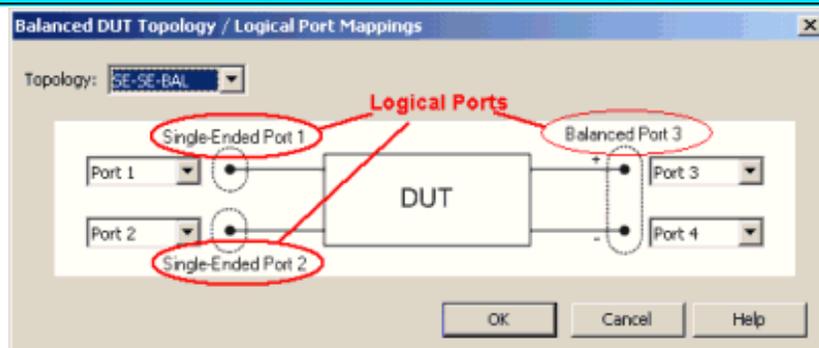

Create in New Window

- Check to create new traces in a new window.
- Clear to create new traces in the active window. When the PNA [traces per window limitation](#) has been reached, no more traces are added.

Auto-Create Windows Check to create new traces in as many windows as necessary. See PNA [number of windows limitation](#).

[About Measurement Parameters](#) (top of page)

Balanced DUT Topology / Logical Port mappings dialog box help

See this dialog for [Integrated True Mode Stimulus Application](#) (iTMSA).

Create or edit DUT Topology and Logical Port Mapping.

A Logical Port is a term used to describe a physical PNA test port that has been remapped to a new port number.

- Any **Two** physical PNA ports are mapped to **One Balanced** Logical port
- Any **One** PNA physical port is mapped to **One Single-Ended** Logical port

Note: These selections apply to ALL measurements in the channel. If the device topology is changed, any existing measurements in the channel that are incompatible with the new topology will be automatically changed to one that is compatible.

Topology: Describes your DUT as you would like it tested. The following device topologies can be measured by a multiport PNA.

- **Balanced / Balanced**
(2 logical ports - <4 actual ports>)
- **Single-ended / Balanced**
(2 logical ports - <3 actual ports>)
- **Single-ended - Single-ended / Balanced**
(3 logical ports - <4 actual ports>)

These topologies can be used in the reverse (<==) direction to measure:

- **Balanced / Single-ended** topology
- **Balanced / Single-ended - Single-ended** topology

For example, to measure a **Balanced / Single-ended** topology, measure the S12 (reverse direction) of a **Single-ended / Balanced** topology.

- Learn about [Logical Port mapping when using an External Test Set](#).
- Learn more about [Balanced Measurements](#)
- Balanced parameters can be saved to SNP files. [Learn more](#).

Last modified:

5-Feb-2013 Added unratioed Cal note
16-Mar-2012 Minor edits to notation
29-Apr-2011 Added images
2-Mar-2010 Link to SNP files
10/11/06 Added new UI
9/19/06 MQ Added logical receiver notation and Multiport meas toolbar.
9/12/06 Added link to programming commands

Frequency Range

Frequency range is the span of frequencies you specify for making a device measurement.

- [How to Set Frequency Range](#)
- [Zoom](#)
- [CW Frequencies](#)
- [Frequency Resolution](#)
- [Frequency Band Crossings](#)

[See other 'Setup Measurements' topics](#)

How to set Frequency Range

There are two ways to set the frequency range:

- A. Specify the **Start** and **Stop** frequencies of the range.
- B. Specify the **Center** frequency and desired **Span** of the range.

See the [frequency ranges of all PNA models](#)

Using front-panel HARDKEY [softkey] buttons

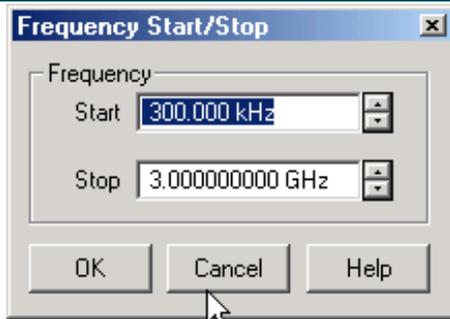

1. Press **FREQUENCY**

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Frequency**

[Programming Commands](#)

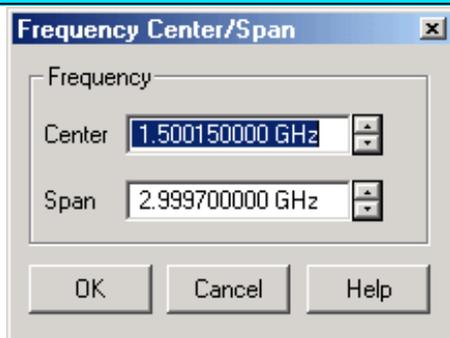

Frequency Start/Stop dialog box help

Start Specifies the beginning frequency of the swept measurement range.

Stop Specifies the end frequency of the swept measurement range.

Frequency Center/Span dialog box help

Center Specifies the value at the center of the frequency sweep. This value can be anywhere in the analyzer range.

Span Specifies the span of frequency values measured to either side of the center frequency.

Zoom

Zoom allows you to easily change the start and stop frequencies or start and stop power levels in a [power sweep](#).

Zoom operates on the [Active Trace](#) and all traces in the same channel as the active trace, regardless of the window in which they appear.

How to Zoom in a measurement window

1. Left-click the mouse or use a finger, then drag across a portion of a trace.
2. Release the mouse or lift the finger and the following menu appears:
3. Select from the following:
 - **Zoom** - changes the channel stimulus settings to the left and right border values of the Zoom selection
 - **Zoom xy** - changes the channel stimulus settings as above. In addition, the Y-axis scale of the active trace changes to the approximate scale of the Zoom selection.
 - **Zoom Full Out** - changes the channel stimulus settings to the full span of the current calibration. If no calibration is ON, then the stimulus settings are changed to the full span of the PNA model.

Notes

- The stimulus settings are changed for **ALL** traces in the active channel, regardless of the window in which they appear.
- If markers are in the selected area, they remain in place.
- If markers are in the unselected area, they are moved to the right or left edge of the new span. When Zoom Full Out is selected, the markers are moved back to their original location.

Zoom is NOT available for the following:

- Smith Chart or Polar [display formats](#)
- [CW Time](#) and [Segment sweep type](#)
- [Frequency Offset Measurements](#)
- [FCA Opt 083 Measurements](#)

CW Frequencies

Measurements with a [CW Time sweep](#) or [Power sweep](#) are made at a single frequency rather than over a range of frequencies.

How to set CW Frequency

1. Set [Sweep Type](#) to **CW Time** or **Power**.

You can also set CW frequency from within the Sweep Type dialog box.

Using front-panel

HARDKEY [softkey] buttons

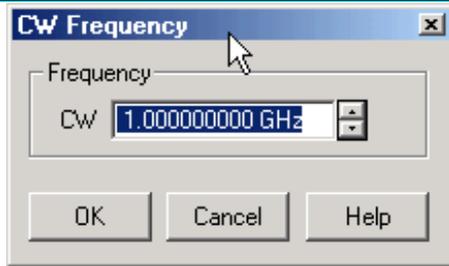

2. Press **FREQ**
3. then **[CW]**

PNA Menu using a mouse

2. Click **Stimulus**
3. then **Frequency**
4. then **CW Frequency**

◀ Programming Commands ▶

CW Frequency dialog box help

CW Type a value and the first letter of the suffix (k,m,or g) or use the up and down arrows to select any value within the range of the PNA.

Frequency Resolution

The resolution for setting frequency is 1 Hz.

Frequency Band Crossings

The frequency range of the PNA covers several internal frequency bands. The higher the frequency range of the PNA, the larger the number of bands. The source power to your DUT turns off as the stimulus frequency is swept through these band crossings. To learn more, see [Power ON and OFF during Sweep and Retrace](#).

The listed frequencies in the following tables are the stop frequency of the specified band, and the start

frequency of the following band.

You can download a [PNA Band Structure Readout](#) utility that lists the band crossings for your PNA.

Frequency band crossings are different for the following models:

- [PNA-X Models](#)
- [N522xA Models](#)
- [N523xA Models](#)

PNA-X (Band Stop Frequencies)

- [Power ON and OFF during Sweep and Retrace](#)

[See other 'Setup Measurements' topics](#)

Power Settings

The test port output power is specified over frequency. See the [Power Range specifications](#) for your PNA.

How to make Power settings

Use one of the following methods to set port power. Only the menu can be used to launch the [Power and Attenuators](#) dialog box.

Using front-panel HARDKEY [softkey] buttons

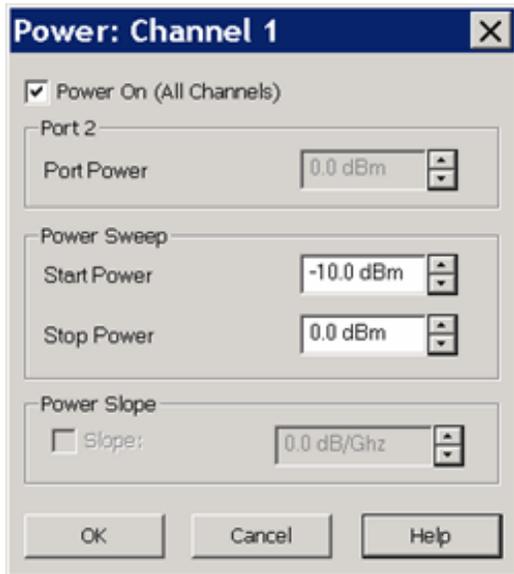

1. Press **POWER**
2. then **[Power]** or **[Power and Attenuators]**

Using a mouse with PNA Menus

1. Click **Stimulus**
2. then **Power** or [Power and Attenuators](#)

[Programming Commands](#)

[Power dialog box help](#)

Basic control of PNA source power for a specific port.

See [advanced control of source power and attenuation](#).

Power On (All Channels) Check to enable source power for all channels. Only turns power ON if channel power setting is ON or Auto. [See Advanced Power.](#)

Port 'n' Active source port for which power is being set.

Port Power Sets the power level for the specified port.

- To accurately set the power level at any point after the test port, perform a [Source Power Calibration](#).
- See the [specified power range of your PNA model](#).

Power Sweep

Start / Stop Power Set the start and stop power values of a power sweep.

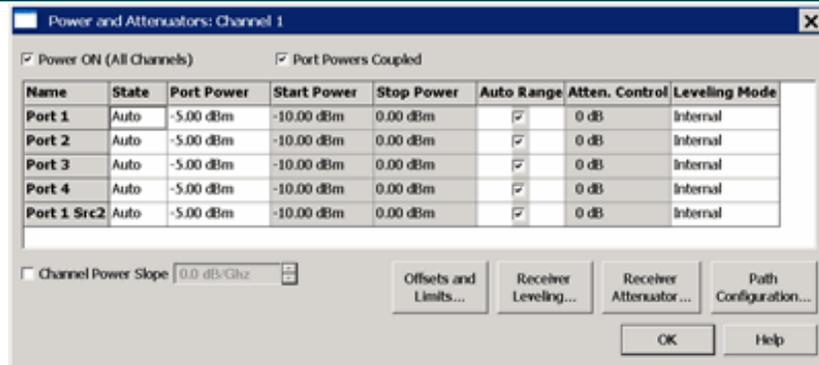

- These settings are only available when [Sweep Type](#) is set to Power Sweep.
- Uncoupled power sweep power can be set from the [Advanced Power dialog box](#).
- You can **Zoom** to easily change the start and stop power levels in a power sweep. [Learn how.](#)
- [Learn more about Power Sweep.](#)

Power Slope

Helps compensate for cable and test fixture power losses at increased frequency.

Slope Select to set the power slope. Clear to set power slope OFF. [Learn more about power slope.](#)

Power and Attenuators dialog box help

Defines and controls the PNA source power and attenuation for the active channel.

Beginning with PNA Rev. 7.21, external sources can be controlled from this dialog. [Learn more.](#)

Power On (All Channels) Check to enable source power for all channels. Only turns power ON if channel power setting is ON or Auto.

Port Powers Coupled

- **Coupled** (checked) The power levels are the same at each test port. Set power at any test port and all test ports change to the same power level.
- **Uncoupled** (cleared) The power levels are set independently for each test port. Uncouple power, for example, if you want to measure the gain and reverse-isolation of a high-gain amplifier. The power required for the input port of the amplifier is much lower than the power required for the output port. A power sweep can also be performed with uncoupled power. Learn more about [Setting Independent Port Power](#)

Name Lists the PNA test ports.

State

- **Auto** Source power is turned ON at the specified test port when required by the measurement. This is the most common (default) setting. See also [Power ON and OFF during Save / Recall, User Preset, and Preset.](#)
- **ON** Source power is ALWAYS ON, regardless of measurements that are in process. Use this setting to supply source power to a DUT port that always requires power, such as an LO port. This could turn OFF

power at another test port. [Learn about internal second source restrictions.](#)

- **OFF** Source power is never ON, regardless of the measurement requirements. Use this setting to prevent damage to a sensitive DUT test port.

Port Power Sets the power level at the output of the source.

- To accurately set the power level at any point after the test port, perform a [Source Power Calibration](#).
- See the [specified power range of your PNA model](#).
- See [ECal Module Compression Level](#)

Start / Stop Power Available ONLY when sweep type is set to Power Sweep. Set the start and stop power values of a power sweep. [Learn more about Power Sweep.](#)

- In PNA release 6.04 you can specify whether to maintain source power at either the start power or stop power level at the end of a power sweep. [Learn more.](#)
- In PNA release 8.20, a power sweep can be performed with [uncoupled power](#). Different power ranges can be swept in the forward and reverse directions.

Auto Range Check to allow the PNA to select the [optimum attenuation value](#) to achieve the specified test port power.

Clear to manually set the attenuation for each port. Type or select the attenuation value in the adjacent Attenuator Control box.

When using manual attenuation (Auto Range cleared), Port Power can be set within a 60 dB range. For example:

- With 0 dB of manual attenuation, Port Power can be set from -30 dBm to +30 dBm.
- With 10 dB of manual attenuation, Port Power can be set from -40 dBm to +20 dBm, and so forth.

Important Note: The available power range can also be adjusted AUTOMATICALLY by a Source Power Calibration, Guided Power Cal, or Power Compensation. If you are NOT seeing the range that you expect, or the correct power level at your DUT, view the Power Offset column in the [Power Limits and Offsets dialog](#).

Attenuator Control When Port Powers are Uncoupled, manual attenuator control allows you to set a wide range of power levels by setting the attenuation. [See Setting Independent Port Power.](#)

Also use manual attenuation control when a measurement requires a very good impedance match with the source, such as with oscillators or conditionally unstable amplifiers. Choose an

attenuation level of 10 dB or more to ensure the best source match.

- The PNA does not allow attenuators or other mechanical switches to switch continuously. [Learn more.](#)
- When Port Powers are Coupled, changing one port Attenuation Control value changes all port values.
- Attenuators are located between the source and the test port. Power to the reference receiver is not attenuated and is therefore higher than at the test port by the amount of attenuation. This will make uncalibrated measurements that use a reference receiver appear as though there is added attenuation at the test device. [See the PNA Block diagram.](#)

Note: Because the reference receiver is not in the attenuation path, there is more power at the reference receiver than at the test port by the amount of source attenuation.

By default, ALL PNA models mathematically offset the reported power at the reference receivers by the amount of source attenuation. [See Block diagram.](#)

With PNA release 7.2, a preference can be set to NOT mathematically offset the reported power of the reference receiver by the amount of source attenuation.

Learn how to [set the preference.](#)

Leveling Mode

- **Internal** Standard ALC leveling. Power level within an attenuator setting is limited to the ALC Range. [See Source Unleveled.](#)
- **Receiver Rx** Select a Reference receiver to use for leveling the source. [Learn more.](#)
- **Open Loop** (Used during pulse conditions with the internal source modulators). NOT available on [N523x models](#). No leveling is used in setting the source power. The lowest settable power, without attenuation, is limited to -30dBm. The source power level accuracy is very compromised. Use a source power calibration to make the source power somewhat more accurate.

Channel Power Slope

Helps compensate for cable and test fixture power losses at increased frequency. With power slope enabled, the port output power increases (enter positive value) or decreases (enter negative value) as the sweep frequency increases.

Slope Select to set the power slope. Clear to set power slope OFF.

Power slope is computed and applied from 0 GHz – not from the measurement start frequency. For example, with the following measurement settings:

- Start / Stop Freq: 10 GHz to 20 GHz
- Power level: 0 dBm
- Slope: 1 dB/GHz

The power into the DUT from 10 GHz to 20 GHz is 10 dBm sloping to 20 dBm

Offset and Limits Launches the [Power Offset and Limits](#) dialog.

Receiver Leveling Launches the [Receiver Leveling](#) dialog.

Receiver Attenuator Launches the [Receiver Attenuator](#) dialog.

Path Configurator Launches the [Path Configurator](#) dialog.

Source Unleveled

When the power level that is required at a test port is **higher** than the PNA can supply, a Source Unleveled [error message](#) appears on the screen and the letters LVL appear on the [status bar](#).

To perform a power sweep, the range of power is usually limited to the range of the Automatic Leveling Control (ALC) loop. (The PNA-X allows a very wide power range using **Open Loop**).

PNA specifications guarantee the ALC power range over which the PNA can supply power without an unleveled indication. However, the actual achievable power range on your PNA is probably greater than the specified range.

How to calculate the specified achievable power range

From the specifications for the frequency span from 15 GHz to 20 GHz:

- Max Leveled Power = **-8 dBm**
- Power Sweep Range (ALC) = **-17 dB**

For this frequency range the specified power range is calculated as:

- Max = **-8 dBm**
- Min = (-8)-(-17) = **-25 dBm**

When using Source Attenuators:

- with 10dB of attenuation, this becomes **-18 dBm** to **-35 dBm**
- with 20dB of attenuation, this becomes **-28 dBm** to **-45 dBm**, and so forth.

[See the output power specs for your PNA.](#)

To resolve an unlevelled condition, change either the Test Port Power or Attenuator setting. If an Unlevelled condition exists within the specified power range, [contact Technical Support](#).

Important Note: The available power range can also be adjusted AUTOMATICALLY by a Source Power Calibration, Guided Power Cal, or Power Compensation. If you are NOT seeing the range that you expect, or the correct power level at your DUT, view the Power Offset column in the [Power Limits and Offsets dialog](#).

Setting Independent Port Power

The PNA allows you to [uncouple port power](#) and specify different power levels at each test port. There are a few things to consider when setting independent port powers.

- Does your required high and low power levels fall within the specified Min and Max power range of the PNA? [See Unlevelled Indicator](#). If they do not, you may need to use the internal Source Attenuators.
- Does the PNA have source attenuators? If so, how many source attenuators? Some PNA models have one attenuator for each port. In most multiport PNA systems, the attenuators are shared by at least two test ports. See [PNA Options](#) to see the availability and range of source attenuation on your PNA.

Note: To prevent premature wear, the PNA does not allow attenuators or other mechanical switches to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are NOT allowed to sweep (Blocked).

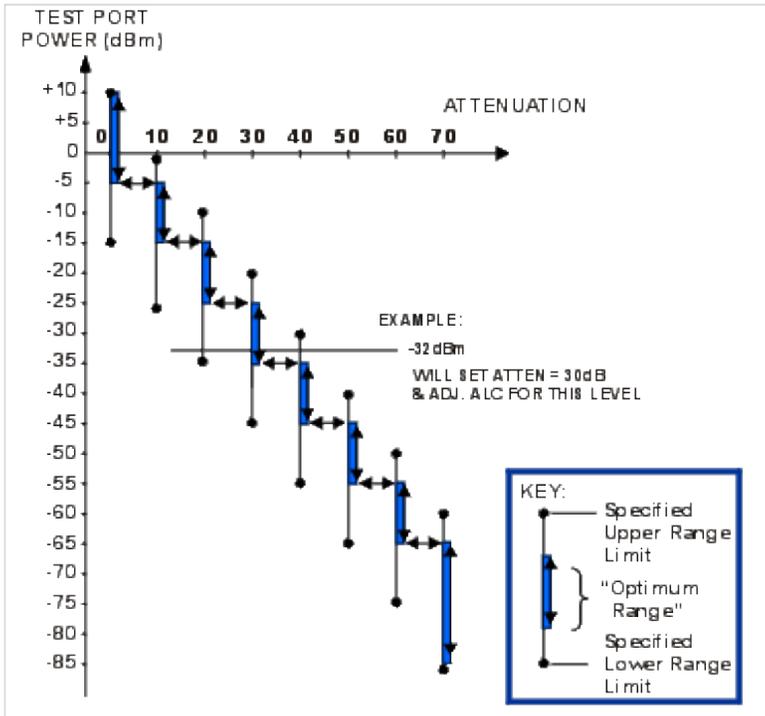

Learn how to [view the settings of all mechanical devices](#) in the PNA.

Optimum Attenuation Value

The attenuator has different positions, allowing a wide range of power levels. The number of power ranges available is determined by the source attenuation installed in your PNA. See [PNA Options](#) to see the availability and range of source attenuation on your PNA.

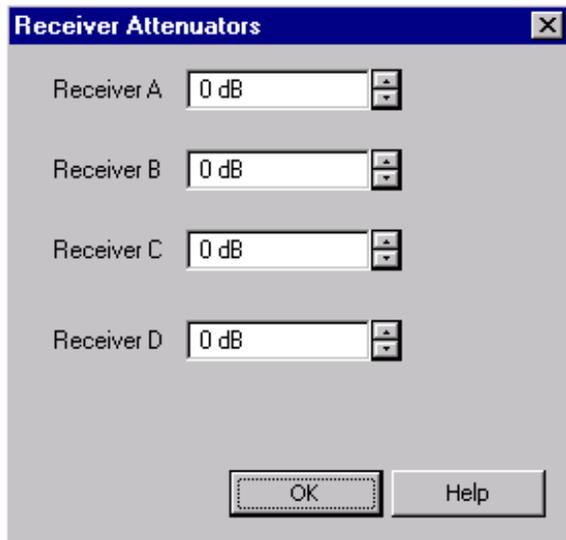

- Each range has a total specified span (25 dB in the following Attenuation Values graphic).
- The optimum setting is the middle of the range. This range provides the best accuracy and performance of the source leveling system. The optimum ranges are the blue regions in the following graphic.
- An attenuator setting can be selected manually or automatically. If automatic is selected, the blue optimum ranges (shown in the following graphic) are used.

(Attenuator ranges vary, this particular range is 70 dB)

Note: Error correction is fully accurate only for the power level at which a measurement calibration was performed. However, when changing power within the same attenuator range at which the measurement calibration was performed, ratioed measurements can be made with nearly full accuracy (non-ratioed measurements with less accuracy).

Receiver Attenuators dialog box help

Receiver Attenuators are offered as an option. [Learn more.](#)

Type or select independent attenuation values for each receiver.

- Receiver A is at Test Port 1
- Receiver B is at Test Port 2
- Receiver C is at Test Port 3
- Receiver D is at Test Port 4

Receiver Attenuation is used to protect the PNA test port receivers from damage or compression. Receiver attenuation causes the reported power at the receiver to be less than the power at the test port by the specified amount of attenuation.

Note: Beginning with PNA release 7.2, a preference can be set to mathematically offset (or NOT) the reported power at the test port receivers by the amount of receiver attenuation. By default, All PNA models offset the display.

Learn how to [set the preference.](#)

When an [external test set](#) is connected, Receiver Attenuation control is only available for the physical receivers in the PNA. Switching receiver attenuation using [logical receiver notation](#) is NOT allowed.

CAUTION! You can damage the analyzer receivers if the power levels exceed the maximum values.

- See [Technical Specifications](#) for the maximum input power to a receiver and receiver compression.

- See [Receiver attenuation values for your PNA model](#).

Power ON and OFF during Save / Recall, User Preset, and Preset

To protect your DUT from being inadvertently powered ON, the following RF Power ON/OFF settings occur:

[Instrument State Save/Recall](#)

If power is OFF when an instrument state is saved, then power will always be OFF after the instrument state is recalled.

If power is ON when an instrument state is saved, and the current power setting is OFF, then power will be OFF after the instrument state is recalled.

[User Preset](#)

If power is OFF when a User Preset is saved, then power will always be OFF after a User Preset.

If power is ON when a User Preset is saved, and the current power setting is OFF, then power will be OFF after a User Preset.

[Preset](#)

Instrument Preset sets power ON by default.

This can be changed with a [Preference setting](#) so that, if the current power setting is OFF, then power will be OFF after Preset.

Power ON and OFF during Sweep and Retrace

The frequency range of the PNA covers several internal frequency bands. The higher the frequency range of the PNA, the larger the number of bands. For example, a 9 GHz PNA has 6 frequency bands, a 50 GHz PNA has 25 frequency bands. See the [frequency band crossings](#).

Power to the DUT is turned OFF during band changes to avoid causing power spikes to the DUT.

Retrace occurs when the source gets to the end of your selected frequency span and moves back to the start frequency. Power to the DUT is again turned OFF when **retracing** across frequency bands.

Therefore, the following occurs for various stimulus settings:

1. **Single band sweep** - The power to the DUT is always ON, even during retrace. Beginning with PNA release 6.04, [a preference setting](#) can turn power OFF during a retrace. Only available in single band frequency and segment sweeps.

2. **Multi-band sweep** - The power to the DUT is turned OFF while sweeping across a band crossing. It is turned OFF again during retrace.
3. **Power sweep** - Because power sweep is always done at a single frequency, the frequency is always within a single band and the source power is always ON. At the end of a power sweep, power is immediately set to the start power.
Beginning with PNA release 6.04, this behavior can be changed with [a preference setting](#).
4. **Single sweep:**
 - Manual trigger mode - At the end of a multiband sweep, power is turned OFF during retrace, and then power is turned back ON before arming for the next trigger.
 - Hold mode - Power can be ON or OFF depending on when and how Hold mode is entered. However, power can be immediately turned OFF manually or remotely.

Caution: Avoid expensive repairs to your PNA. Read [Electrostatic Discharge Protection](#).

Receiver Leveling

Receiver Leveling adjusts the source power until the measured receiver power is equal to the Port Power.

In this topic:

- [Overview](#)
- [Receiver Leveling Process](#)
- [Features and Limitations](#)
- [How to make Receiver Leveling settings](#)
- [Receiver Leveling dialog box help](#)
- [Initial Power Selection](#)

See other '[Setup Measurements](#)' topics

Overview

Receiver Leveling uses PNA receiver measurements to adjust the source power level across a frequency or power sweep. Before each measurement sweep, a variable number of background sweeps are performed to repeatedly measure power at the receiver for each stimulus point. Those power measurements are then used to adjust the source power level and achieve greater source power level accuracy.

This is similar to a [Source Power Calibration](#) which makes a **single sweep** to measure source power. The source power correction values are applied for all subsequent measurement sweeps. Because Receiver Leveling is performed for **every measurement sweep**, it provides more accurate source power levels, but also takes longer to perform each measurement sweep.

Receiver Leveling Process

Leveling sweeps are performed in the background (not visible) before every measurement sweep to measure and apply source correction data.

1. For each leveling sweep, source power is applied at each data point and measured by the specified receiver. [Learn how the initial power level is selected.](#)
2. The deviation is calculated between the measured power and the port power.

3. The deviation is applied to the current source power, and the updated source power levels are applied on the following leveling sweep.
4. This process continues until the receiver power at each data point has achieved the port power within the specified tolerance value, or until the specified number of leveling sweeps (iterations) has been reached.

Features and Limitations

- Receiver Leveling can be used with most [sweep types](#), including Segment sweep and Power sweep. See [Wide Power Sweep with Receiver Leveling](#).
- Receiver Leveling is ALWAYS enabled for the controlled source when [Phase Control](#) (Opt 088) is enabled.
- Receiver Leveling is available for standard S-parameter measurements and with [FCA](#), [GCA](#), and [IMD](#) applications.
- Turn ON Receiver Leveling **before** or **after** doing a Calibration. When turned ON before calibrating, it is turned OFF during the calibration, then back ON after calibration.
- Power Offset on the [Offsets and Limits dialog](#) can be used when there exists an additional attenuator or booster amplifier in the source path. An offset should be set to improve the leveling speed. This power offset is automatically used to set the port power.

Use Receiver Leveling for the following:

- Correcting for short term drift when using an external component, such as a booster amplifier. The booster amplifier must be connected to the front-panel jumpers, in front of the reference receiver. See the Block diagram for your PNA, located at the end of every [Specifications document](#).
- Extending the accuracy of power leveling at very low powers where the internal detector may be too noisy.
- Providing controlled power during [Pulsed measurements](#) in an open loop mode.
- Controlling the power at the outputs of [MM-Wave heads](#).

How to make Receiver Leveling settings

Start the [Power and Attenuators](#) dialog box as follows:

Using front-panel HARDKEY [softkey] buttons

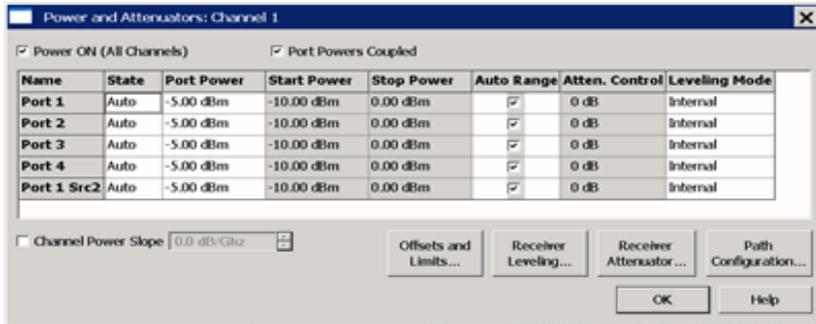

1. Press **POWER**
2. then [**Power and Attenuators**]

Using a mouse with PNA Menus

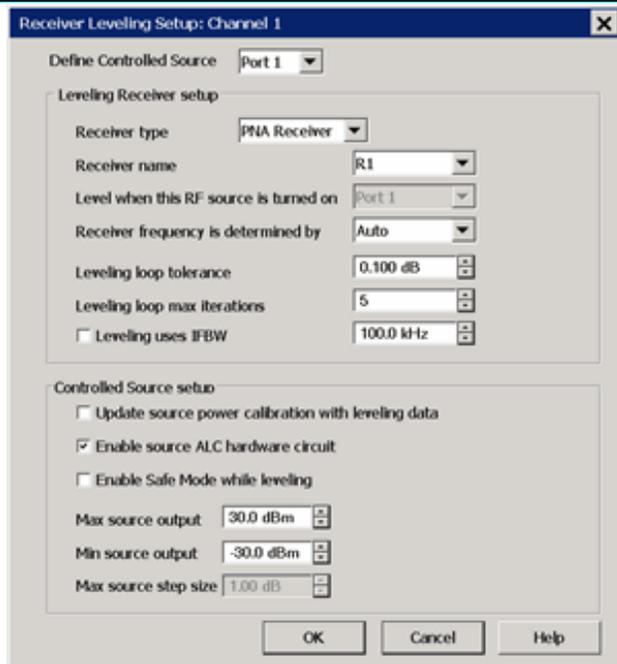

1. Click **Stimulus**, then **Power**
2. then [Power and Attenuators](#)

 [Programming Commands](#) 

3. On the Power and Attenuators dialog, press **Receiver Leveling**.

Receiver Leveling dialog box help

[Learn about Receiver Leveling](#) (scroll up).

Define Controlled Source (Port)

Each source port to be leveled is configured individually. Select a source to be configured for receiver leveling. Choose from: Port 1, Port 2, Port 3, Port 4, or any active external RF or DC source. [Learn more about External Devices](#).

Leveling Receiver Setup

Receiver Type Receiver type does an initial sort to make it easier to select a receiver. Choose from: PNA Receiver or Ext. Device ([PMAR](#)).

Receiver Select a receiver to be used to level the specified source.

For PNA Receiver type, choose from any PNA receiver using standard or receiver notation.

To level power at the source output or DUT input choose the reference receiver for the source port. For example, to level the source power at port 1, then choose "R1". To level power at the DUT output, choose the receiver that is used to measure the DUT output. If the DUT output is connected to port 2, then select "B" or "b2". [Learn about Receiver Notation.](#)

When [Phase Control](#) is enabled, the ratioed receivers used in Phase Control are selected and can NOT be changed. However, the Reference Source CAN also be selected for Receiver Leveling.

For Ext Device type, choose a configured PMAR device.

Level when this RF source is turned ON: The Controlled Source is selected automatically and can NOT be changed.

Receiver frequency is determined by: Available ONLY when the selected receiver is a PNA Receiver or power meter. This setting determines which receiver frequencies are measured. Choose from:

- **Auto** - always uses the frequency range that is assigned to the measurement receiver.
- **FOM Receiver** - FOM Receiver frequency range. Learn more about [Frequency Offset Mode.](#)
- **FOM Source** - FOM Source frequency range.
- **DUT Input** - Mixer/Converter input frequency range.
- **DUT Output** - Mixer/Converter output frequency range.

Leveling Loop Tolerance The source is considered leveled when each stimulus data point has achieved the power level +/- (plus or minus) this tolerance value.

Leveling Loop Max Iterations If every stimulus data point does NOT achieve the port power after this number of leveling sweeps, the measurement sweep occurs using the correction values obtained from the last leveling sweep. The message: **Not settled, noisy trace** appears when the Max Iterations is reached. If you see this message, you can increase the Max Iterations, reduce the IFBW, or increase the Tolerance setting.

Leveling IFBW Available only for PNA receivers. By default, the IFBW for the leveling sweeps is set to 100 kHz. [Learn more about IFBW.](#)

- Increase this value to make faster, but noisier leveling sweeps.

- Decrease this value to make slower, more repeatable leveling sweeps.
- Uncheck the box to use the same IFBW as the measurement sweeps.

Controlled Source Setup

Update source power calibration with leveling data Available only when using an RF Source and PNA receiver.

- When checked, the latest correction data is copied to the Source Power Cal correction array. When Leveling Mode is switched back to Internal (on the Power and Attenuators dialog), [Source Power Cal](#) is automatically turned ON using this correction data.
- When cleared, Source Power Cal is NOT turned ON when Leveling Mode is switched back to Internal.

Enable Source ALC hardware circuit Available only when a PNA source is selected.

- When checked, PNA internal leveling hardware is used. (Recommended)
- When cleared, [Open Loop hardware](#) is used. NOT available on [N523x models](#).

Enable Safe Mode while leveling

To protect your DUT, these settings control the extent to which the source power will be changed to achieve the port power as measured at the reference receiver. These settings could be necessary when using external components with a large variation in frequency response (flatness).

When checked:

- The Min source output is used as the initial power level for the leveling loop process.
- The controlled source is never stepped more than the Max source step size.

When cleared:

- The initial power for the leveling loop may be determined by the Min source output, the Max source output, the last setting of the leveling loop, or the target value of the leveling loop. [See Initial Power below](#).
- The Max source step size is ignored.

Max source step size When Safe Mode is enabled, the change in source power at each data point from one sweep to the next is limited to this value. For example, assume Safe Mode is enabled,

and Max Power Step is set to 1 dB. On the first leveling sweep, the first data point measures 3 dB lower than the port power, then source power for data point 1 will be increased by 1 dB for the next sweep, and likely for the following two sweeps.

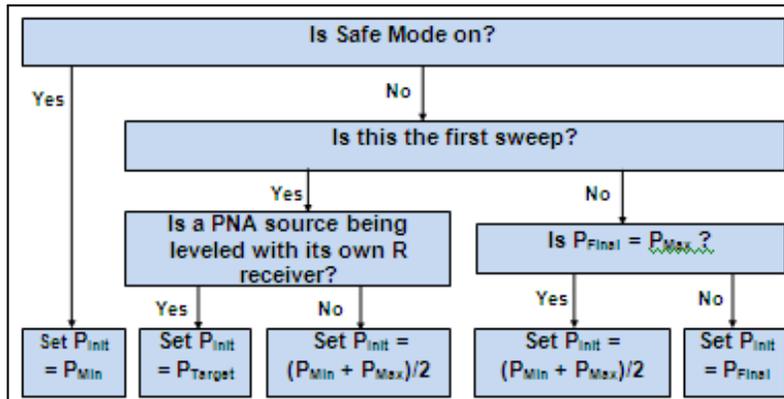

Max source output Always limits the maximum power out of the source to this value. The message: **Power set to Max Power** appears when this limit is reached.

If the maximum port power out of the PNA is reached at any time during the leveling sweeps, the following message appears: **Power set to user power limit.**

Min source output Always limits the minimum power out of the source to this value. The message: **Power set to Min Power** appears when this limit is reached. When Safe Mode is enabled, this value is used as the initial power level for the leveling loop process

Initial Power Selection

For each displayed data point, the leveling algorithm must select an initial power to begin the iteration process. This value is chosen as follows:

Where:

P_{Init} = the initial power for the iteration process.

P_{Final} = the final power setting from the previous leveled sweep.

P_{Min} = the minimum controlled source output level as specified in the Receiver leveling setup.

P_{Max} = the maximum controlled source output level as specified in the Receiver leveling setup.

P_{Target} = the target power level for the selected leveling receiver.

22-Jul-2013	Fixed typo
3-May-2012	Removed C models
7-Sep-2011	Significant changes with A.09.50
12-May-2011	Added before or after cal
15-Mar-2011	Added ratioed receivers (9.33) - Open loop not on C models
16-Sep-2010	Removed note about commands for LSPC.
26-Aug-2010	Added link to wide power sweep topic
11-Mar-2010	Added Use Last checkbox (A.09.20)
10-Feb-2009	MX New topic (A.08.50)

Sweep Settings

A sweep is a series of consecutive data point measurements taken over a specified sequence of stimulus values. You can make the following sweep settings:

- [Sweep Type](#)
 - [Linear / Log](#)
 - [Power Sweep](#)
 - [CW Time](#)
 - [Segment Sweep](#)
 - [Phase](#)
- [Sweep Time](#)
- [Sweep Setup](#)
 - [Stepped vs Analog](#)
 - [Fast Sweep](#)
 - [Dwell and Delay](#)
 - [Standard vs Point Sweep](#)

See [Triggering](#) and other 'Setup Measurements' topics

How to set Sweep Type

Using front-panel

HARDKEY [softkey] buttons

1. Press **SWEEP**
2. then [**Sweep Type**]

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Type**

[Programming Commands](#)

Sweep Type dialog box help

Note: Sweep Settings are not applied until either **OK** or **Apply** is pressed.

Channel The active channel when Sweep Type was selected. Sweep settings will be applied to this channel.

Sweep Type

Linear Frequency Sets a linear frequency sweep that is displayed on a standard grid with ten equal horizontal divisions.

- **Start** Sets the beginning value of the frequency sweep.
- **Stop** Sets the end value of the frequency sweep.
- **Points** Sets the number of data points that the PNA measures during a sweep. Range: 2 to 20001. (Default is 201).

Log Frequency The source is stepped in logarithmic increments and the data is displayed on a logarithmic x-axis. This is usually slower than a continuous sweep with the same number of points.

- **Start** Sets the beginning value of the frequency sweep.
- **Stop** Sets the end value of the frequency sweep.
- **Points** Sets the number of data points that the PNA measures during a sweep. Range: 2 to 20001. (Default is 201).

Power Sweep Activates a power sweep at a single frequency that you specify. [Learn about power sweep](#)

- **Start** Sets the beginning value of the power sweep.
- **Stop** Sets the end value of the power sweep.
- **CW Frequency** Sets the single frequency where the PNA remains during the measurement sweep.

CW Time Sets the PNA to a single frequency, and the data is displayed versus time. [Learn more.](#)

- **CW Frequency** Sets the frequency where the PNA remains during the measurement.
- **Sweep Time** Sets the duration of the measurement, which is displayed on the X-axis.
- **Points** Sets the number of data points that the PNA measures during a sweep. Range: 2 to 20001.(Default is 201).

Segment Sweep Sets the PNA to sweep through user-defined sweep segments. [Learn how to make these settings.](#)

- **Independent Power Levels** Check to set the source power level for each segment. [Test port uncoupling](#) is also allowed.
- **Independent IF Bandwidth** Check to set the IF bandwidth for each segment.
- **Independent Sweep Time** Check to set the duration of the measurement for each segment.
- **X-Axis Point Spacing** Check to scale the X-Axis to include only the segments. [Learn more.](#)
- **Allow Arbitrary Segments** Check to allow arbitrary frequencies (overlapped or reverse sweeps). [Learn more](#)
- **Show Table** Shows the table that allows you to create and edit segments.
- **Hide Table** Hides the segment table from the screen.

Phase Sweep the phase of one or more sources relative to another source. Choose values between -360° and +360°. [Learn more.](#)

- **Start** Sets the beginning value of the phase sweep.
- **Stop** Sets the end value of the phase sweep.
- **CW Frequency** Sets the single frequency where the PNA remains during the sweep.

OK Applies setting changes and closes the dialog box.

Apply Applies setting changes and leaves the dialog box open to make more setting changes.

Cancel Closes the dialog. Setting changes that have been made since the last Apply button click are NOT applied.

Power Sweep

A power sweep either increases or decreases source power in discrete steps. Power sweep is used to characterize power-sensitive circuits, with measurements such as gain compression.

In the Sweep Type dialog, specify Start power, Stop power, and CW Frequency. Power can be swept over any attainable range within the [PNA ALC range](#).

Note: If the PNA has source attenuators, and the attenuation must be changed in order to achieve the requested start and stop power, click **Stimulus**, then **Power** then [Power and Attenuators](#).

The PNA does NOT allow a single power sweep over a range that requires attenuator switching. However, two power sweeps can be performed in different channels. The attenuators will not be allowed to switch continuously, but triggering can be performed using single or group triggering. [Learn more](#).

The remaining power settings apply in power sweep mode:

- Test Port Power setting is not available.
- Port Power can be coupled or uncoupled.
- Attenuator Control is always Manual.
- Power Slope (dB/GHz) is ignored (output frequency is CW).
- Click **Stimulus** then **Sweep**, then [Number of Points](#) to change the step size of the power sweep.

Notes:

- Using a [preference setting](#), you can specify whether to maintain source power at either the start power or stop power level at the end of a power sweep.
- Beginning with PNA Rev. A.08.50, Power Sweep has been optimized for speed. For highest measurement accuracy during a power sweep, it may be necessary to increase the [Dwell Time](#) to allow the source more time to settle.
- You may be able to perform a **60 dB power sweep** with Receiver Leveling. [Learn how](#).

Segment Sweep

Segment Sweep activates a sweep which consists of frequency sub-sweeps, called segments. For each segment you can define independent power levels, IF bandwidth, and sweep time.

Once a measurement calibration is performed on the entire sweep or across all segments, you can make calibrated measurements for one or more segments.

In segment sweep type, the analyzer does the following:

- Sorts all the defined segments in order of increasing frequency
- Measures each point
- Displays a single trace that is a composite of all data taken

Restrictions for segment sweep:

- The frequency range of a segment is not allowed to overlap the frequency range of any other segment.
- The number of segments is limited only by the combined number of data points for all segments in a sweep.
- The combined number of data points for all segments in a sweep cannot exceed 20001.
- All segments are FORCED to have power levels within the same attenuator range to avoid premature wear of the mechanical step attenuator. See [Power Level](#).

How to make segment sweep settings

**Using front-panel
HARDKEY [softkey] buttons**

1. Press **SWEEP**
2. then [**Sweep Type**]

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Type**

Programming Commands

Insert Segment - adds a sweep segment before the selected segment. You can also click the "down" arrow on your keyboard to quickly add many segments.

Delete Segment - removes the selected segment.

Delete All Segments - removes all segments.

Note: At least ONE segment must be ON or [Sweep Type](#) is automatically set to **Linear**.

To Modify an Existing Segment

To make the following menu settings available, you must first show the segment table.

Click **View**, point to **Tables**, then click **Segment Table**.

	STATE	START	STOP	POI	IFBW	P1 PwR	P2 PwR	TIME
1	ON	20.000000 MHz	1.000000 GHz	21	10.0 kHz	17.00 dBm	0.00 dBm	2.474 msec
2	ON	1.000000 GHz	4.000000 GHz	21	35.0 kHz	17.00 dBm	0.00 dBm	630.000 µsec

The above graphic shows the Segment table with all independent settings selected, including source power uncoupled (two power settings).

STATE Click the box on the segment to be modified. Then use the up / down arrow to turn the segment ON or OFF.

START Sets start frequency for the segment. Click the box and type a value and the first letter of a suffix (**KHz**, **Mhz**, **GHz**). Or double-click the box to select a value.

STOP Sets stop frequency for the segment. Click the box and type a value and the first letter of a suffix (**KHz**, **Mhz**, **GHz**). Or double-click the box to select a value.

Note: The segment table truncates the frequency resolution. To verify the frequency resolution that you input, create a marker at the start or stop frequency settings.

POINTS Sets number of data points for this segment. Type a value or double-click the box to select a value.

To set IFBW, Power, and Sweep Time independently for each segment:

1. On the **Sweep** menu, click **Sweep Type**, then **Segment Sweep**.
2. Check the appropriate **Sweep Properties** boxes
3. Then click the box and type a value or double-click the box and select a value.

Note: If the following are NOT set, the entire sweep uses the channel IFBW, Power, and Time settings.

IFBW Sets the [IF Bandwidth](#) for the segment.

POWER Sets the [Power level](#) for the segment. You can also UNCOUPLE the test port power. See [Power Coupling](#).

TIME Sets the [Sweep time](#) for the segment.

X-Axis Point Spacing - Segment Sweep ONLY

This feature affects how a segment trace is drawn on the screen.

How to select X-Axis Point Spacing

On the [Sweep Type](#) dialog box, click **Segment Sweep**

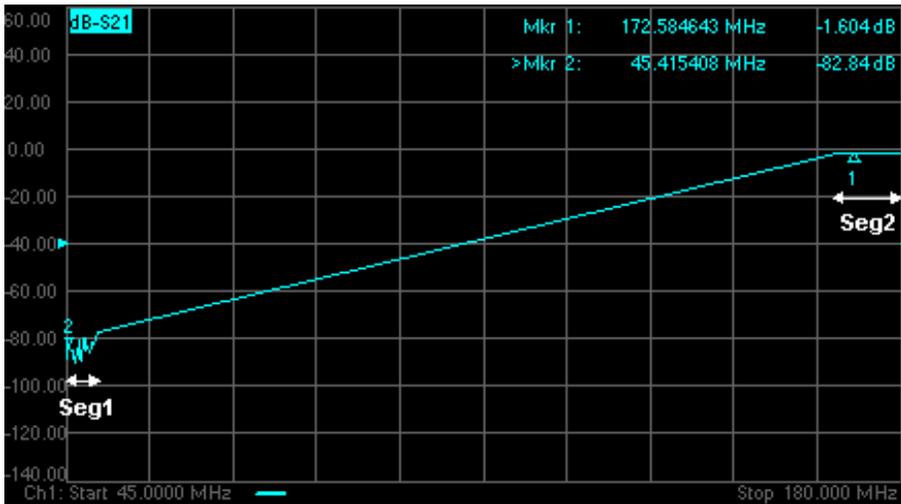

Then check **X-Axis Point Spacing**

- **Without X-axis point spacing**, a multi-segment sweep trace can sometimes result in squeezing many measurement points into a narrow portion of the x-axis.

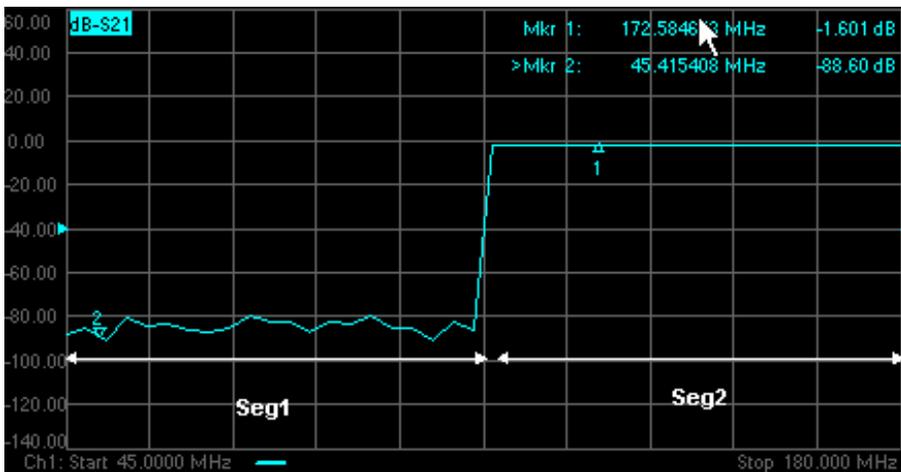

- **With X-axis point spacing**, the x-axis position of each point is chosen so that all measurement points are evenly spaced along the x-axis.

For example, given the following two segments:

	STATE	START	STOP	POINTS
1	ON	45.000000 MHz	50.000000 MHz	21
2	ON	170.000000 MHz	180.000000 MHz	21

Without X-Axis Point Spacing

With X-Axis Point Spacing

Arbitrary Segment Sweep

This feature allows arbitrary frequencies to be entered into the segment sweep table. With this capability, segments can have:

- overlapping frequencies.
- the stop frequency less than the start frequency (reverse sweep).

How to enable Arbitrary Segment Sweep

1. On the [Sweep Type](#) dialog box, click **Segment Sweep**
2. Check **Allow Arbitrary Segment Sweep**

Notes:

- Unusual results may occur when using arbitrary sweep segments with markers, display settings, limit lines, formatting, and some calibration features.
- When Allow Arbitrary Segment is checked, [X-axis point spacing](#) is automatically turned ON.

Sweep Time

The PNA automatically maintains the fastest sweep time possible with the selected measurement settings. However, you can increase the sweep time to perform a slower sweep.

How to set Sweep Time

Using front-panel HARDKEY [softkey] buttons

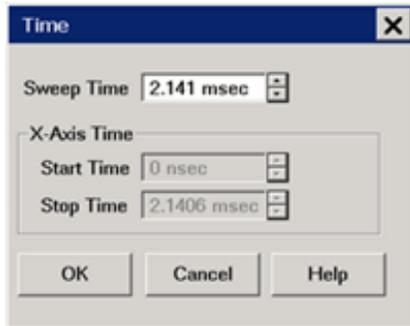

1. Press **SWEEP**
2. then **[Time]**

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Time**

Programming Commands

Time dialog box help

Sweep Time Specifies the time the PNA takes to acquire data for a sweep. The maximum sweep time of the PNA is 86400 seconds or 1 day. [Learn about other settings that affect sweep speed.](#)

Note: If sweep time accuracy is critical, use ONLY the up and down arrows next to the sweep time entry box to select a value that has been calculated by the PNA. Do NOT type a sweep time value as it will probably be rounded up to the closest calculated value. This rounded value will not be updated in the dialog box.

X-Axis Time Set Start and Stop time to be displayed on the X-axis. These settings are ONLY available for [Pulse Profile](#) measurements.

- The actual sweep time includes this acquisition time plus some "overhead" time.
- The PNA automatically maintains the fastest sweep time possible with the selected measurement settings. However, you can increase the sweep time using this setting.
- Enter **0** seconds to return the analyzer to the fastest possible sweep time.
- The Sweep Time setting is applied to the active channel.
- The sweep time is per sweep. A full 2-port cal requires two sweeps, both using the specified sweep time. [Learn more.](#)
- A **Sweep Indicator**  appears on the data trace when the Sweep Time is 0.3 seconds or greater, or if trigger is set to [Point](#). The indicator is located on the last data point that was measured by the receiver. If the indicator is stopped (point sweep mode) the source has already stepped to the next data point.

Sweep Setup

How to make Sweep Setup settings

Using front-panel

HARDKEY [softkey] buttons

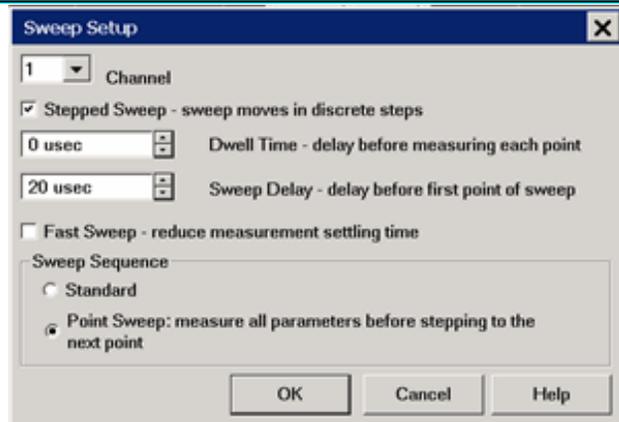

1. Press **STIMULUS**
2. then [**Sweep**]
3. then [**Sweep Setup**]

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Setup**

Programming Commands

Sweep Setup dialog box help

Channel Specifies the channel that the settings apply to.

Stepped Sweep When checked (Stepped Sweep) the PNA source is tuned, then waits the specified Dwell time, then takes response data, then tunes the source to the next frequency point. This is slower than Analog Sweep, but is more accurate when testing electrically-long devices.

When cleared (Analog Sweep) the PNA takes response data AS the source is sweeping. The sweep time is faster than Stepped, but could cause measurement errors when testing electrically-long devices.

When the dialog checkbox is cleared, the PNA could be in either Analog or Step mode. The mode can change from sweep to sweep. There is **NO way** to determine whether the PNA is in Analog or Stepped Sweep. If you want to be sure what the current sweep mode is, then switch it to Stepped.

Stepped sweep is automatically selected for a number of reasons. Here are some of the reasons:

- [IF Bandwidth](#) is at, or below, 1 kHz.
- [Source Power Correction](#) is ON unless doing CW measurement.
- When more than one source is turned ON ([multisource PNA models](#)).
- When step mode is a faster way to take the data.
- For all [FOM](#) and [FCA](#) measurements.
- For all [ADC measurements](#).
- For all [MMwave measurements](#).

Dwell Time Specifies the time the source stays at each measurement point before the analyzer takes the data. Only applies to stepped sweep. The maximum dwell time is 100 seconds. See also [Electrically Long Devices](#).

Sweep Delay Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to Dwell Time (per point) and [External Trigger delay](#) if enabled.

Fast Sweep NOT available on [N5264A](#) and [N523xA](#) models. When checked, in Analog Sweep mode the PNA source settling times are shortened in both frequency and power-control (ALC) circuits. In Stepped Sweep mode, the settling time at ALL data points are shortened. This nearly doubles the sweep speed at preset conditions, but at the expense of frequency accuracy and a few dB of amplitude variation. For ratioed measurements, such as S-Parameters, these errors substantially ratio out.

- By default, Fast Sweep is always OFF to provide maximum accuracy and stability.
- Fast Sweep is NOT allowed with [Power Limit](#) enabled.
- **Note:** PNA performance specifications do NOT apply in Fast Sweep.

Alternate Sweeps This selection is no longer available from the user interface. The inherent [crosstalk](#) on the PNA is sufficient without this feature. Remotely, this setting is still available and sweeps can be performed alternately. However, receivers can NOT be turned off individually on the PNA-X, N522xA, or N523xA models.

Sweep Sequence

Standard Sweep When checked, the PNA sweeps all data points for each source port in turn. For a 2-port PNA, this means that all data points are swept in the forward direction, then all data points are swept in the reverse direction. Even when NO reverse parameters are displayed (S22 or S12), reverse measurements are necessary when a full 2-port calibration is correcting the channel. This is the default behavior. [Learn more.](#)

Point Sweep Available ONLY on standard S-parameter channels. When checked, the PNA measures all parameters at each frequency point before stepping to the next frequency. The display trace is updated as each data point is measured.

- Point sweep usually results in slower sweeps and is useful only in rare circumstances.
- Point sweep is the same as stepped sweep mode on the 8510 and 8530.

Trigger

A trigger is a signal that causes the PNA to make a measurement sweep. The PNA offers great flexibility in configuring the trigger function.

View the interactive [Trigger Model](#) animation to see how triggering works in the PNA.

- [How to Set Trigger](#)
- [Source](#)
- [Scope](#)
- [Channel Settings](#)
- [Restart](#)
- [External and Auxiliary Triggering](#) (separate topic)

[See other 'Setup Measurements' topics](#)

How to set Triggering

Using front-panel HARDKEY [softkey] buttons

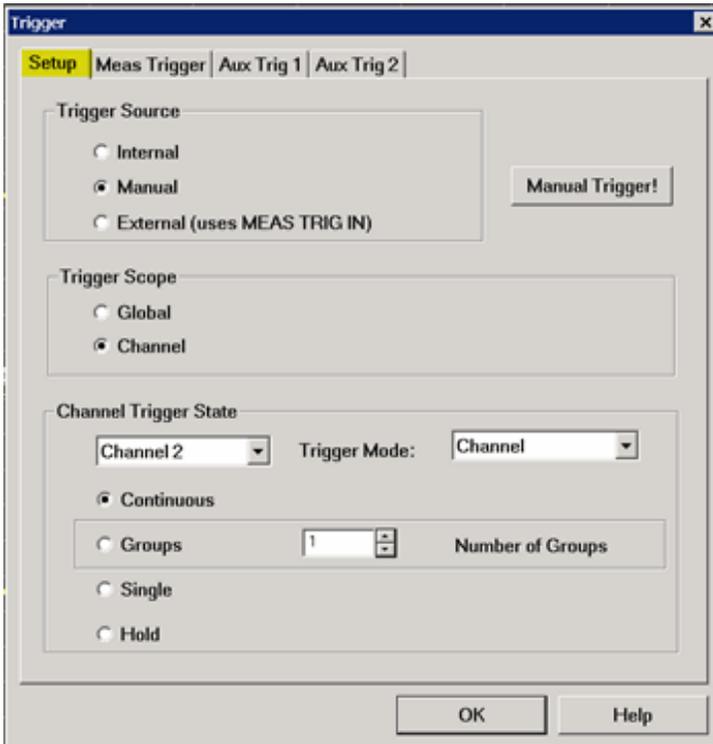

1. Press TRIGGER
2. then [Trigger...]

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Trigger**
3. then **Trigger**

[Programming Commands](#)

Note: The **Continuous**, **Single**, and **Hold** settings apply ONLY to the active channel. These settings are available from the Trigger menu, Active Entry keys, and softkeys

Trigger Setup dialog box help

View the interactive [Trigger Model](#) animation to see how triggering works in the PNA.

Trigger Source

These settings determine **where** the trigger signals originate for all existing channels. A valid trigger signal can be generated only when the PNA is not sweeping.

Internal Continuous trigger signals are sent by the PNA as soon as the previous measurement is complete.

Manual One trigger signal is sent when invoked by the Trigger button, the active toolbar, or a programming command.

External Trigger signals sent out or received from various connectors on the rear panel. [Learn more about External and AUX Triggering.](#)

Manual Trigger! - Manually sends one trigger signal to the PNA. Available ONLY when Manual trigger is selected.

Trigger Scope

These settings determine **what** is triggered.

Global All channels not in Hold receive the trigger signal [Default setting]

Channel Only the next channel that is not in Hold receives the trigger signal. This is not obvious or useful unless Trigger Source is set to Manual. This setting enables [Point Sweep](#) mode.

Channel Trigger State

These settings determine **how many** trigger signals the channel will accept.

Continuous The channel accepts an infinite number of trigger signals.

Groups The channel accepts only the number of trigger signals that is specified in the Number of Groups text box, then goes into Hold. Before selecting groups you must first increment the Number of Groups text box to greater than one.

Number of Groups Specify the number of triggers the channel accepts before going into Hold. If in Point Sweep, an entire sweep is considered one group.

First increment to desired number, then select 'Groups'.

Single The channel accepts ONE trigger signal, then goes into Hold.

Another way to trigger a single measurement is to set [Trigger Source](#) to Manual, then send a **Manual trigger**. However, ALL channels are single triggered.

Hold The channel accepts NO trigger signals.

Trigger Mode

These settings determine what EACH signal will trigger.

Sweep and **Point** modes are available ONLY when both [Trigger Source](#) = MANUAL or EXTERNAL AND [Trigger Scope](#) = CHANNEL.

- **Channel** Each trigger signal causes **ALL traces** in that channel to be swept in the order specified below.
- **Point** Each Manual or External trigger signal causes one data point to be measured. Subsequent triggers go to the same trace until it is complete, then other traces in the same channel are swept in the order specified below. When in Groups or Single trigger, the count is decremented by one after ALL data points on ALL traces in the channel are measured. See Also, the (point) [Sweep Indicator](#) and [SCPI Triggering example](#) for use with External.
- **Trace** Available ONLY when [Point Sweep](#) is selected. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously. Trace triggering is NOT permitted when a channel is using a 2 port (or

more) S-Parameter calibration.

- **Sweep** Each Manual or External trigger signal causes **ALL traces that share a source port** to be swept in the order specified below. When in Groups or Single trigger, the count is decremented by one after ALL traces in ALL directions are swept.

When multipoint correction is ON, which requires sweeps in more than one direction, traces on the screen will not update until all of the relevant directions have been swept. For example, with all four 2-port S-Parameters displayed:

- When Full 2-port correction is ON, trigger 1 causes NO traces to update; trigger 2 causes ALL S-Parameters to update. [Learn more about sweeps with correction ON.](#)
- When correction is OFF, trigger 1 causes S11 and S21 to update; trigger 2 causes S22 and S12 to update.

Trace Sweep Order

For ALL Trigger Modes, trigger signals continue in the same channel until all traces in that channel are complete. Triggering then continues to the next channel that is not in HOLD.

Traces within each channel are always swept in the following order:

- Traces are swept sequentially in source-port order. For example, in a channel with all four 2-port S-parameters, first the source port 1 traces (S11 and S21) are swept simultaneously. Then the source port 2 traces (S22 and S12) are swept simultaneously.
- In addition, when [Alternate sweep](#) is selected, traces are swept sequentially in source-port / receiver-port order. In the above example, first the S11 trace is swept, then S21, then S12, then S22.

Restart (Available only from the Trigger menu) Channels in Hold are set to single trigger (the channel accepts a single trigger signal). All other settings are unaffected, including decrementing trigger Groups.

Overview

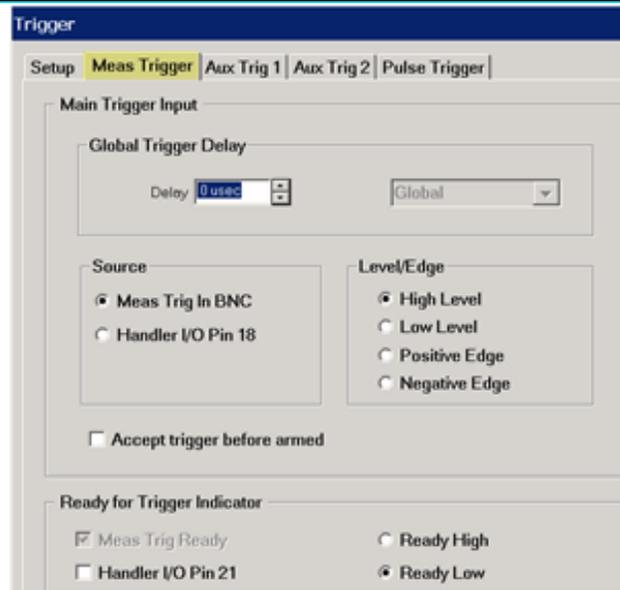

Ready Signals versus Trigger Signals

A 'Ready for Trigger' signal is different from a Trigger signal. The ready signal indicates that the instrument sending the signal is ready for measurement. The instrument receiving the ready signal would then send a trigger signal, indicating that the measurement will be, or has been, made. Usually the slower instrument sends the trigger signal.

Learn more about each type of triggering signal:

- [Meas Trig RDY and Meas Trig IN](#) - This pair of signals is easy to use and limited in ability to configure.
- [AUX TRIG OUT and AUX TRIG IN](#) - These two pair of connectors and signals are highly configurable. Use them to synchronize with any number of devices and equipment.

Meas (External) Trigger dialog box help

[See how to access the Trigger Dialog](#)

Meas Trig RDY and Meas Trig IN

The [MEAS TRIG](#) connectors are located on the PNA rear-panel.

These signals can be used when the PNA is communicating with a slow mechanical device. A material handler is very mechanical and takes a relatively long time to load and discharge parts. Here is how these signals work together to communicate:

1. The PNA sends a 'Ready' signal when it is ready to make a measurement.
2. The external device sends a trigger signal to the PNA when it is ready for a measurement.
3. Additional signals are available on the PNA Handler I/O to indicate that the PNA sweep has ended, and that the handler can setup for the next measurement. See [Material Handler I/O description](#).

Dialog Settings

To cause the PNA to respond to Meas Trig IN or Handler I/O signals, select **External** on the [Trigger Setup tab, Source](#) setting.

Also on the Trigger Setup tab, Scope setting, choose whether one external trigger signal will apply to ALL channels (Global) or one trigger signal per Channel. The following settings apply accordingly.

Main Trigger Input

Global / Channel Trigger Delay After an external trigger is received, the start of the sweep is held off for this specified amount of time plus any inherent latency.

- When [Trigger Scope](#) = Channel, the delay value is applied to the specified channel.
- When Trigger Scope = Global, the same delay value is applied to ALL channels.

Source The PNA accepts Trigger IN signals through the following rear-panel connectors:

- [Meas Trig IN BNC](#)
- [Handler I/O Pin 18](#)

Level / Edge

High Level The PNA is triggered when it is armed (ready for trigger) and the TTL signal at the select input is HIGH.

Low Level The PNA is triggered when it is armed (ready for trigger) and the TTL signal at the select input is LOW.

Positive Edge After the PNA arms, it will trigger on the next positive edge. If [Accept Trigger Before Armed](#) is set, PNA will trigger as soon as it arms if a positive edge was received since the last data was taken.

Negative Edge After the PNA arms, it will trigger on the next negative edge. If [Accept Trigger Before Armed](#) is set, PNA will trigger as soon as it arms if a negative edge was received since the last data was taken.

Accept Trigger Before Armed When checked, as the PNA becomes armed (ready to be triggered), the PNA will immediately trigger if any triggers were received since the last taking of data. The PNA remembers only one trigger signal. All others are ignored.

- When this checkbox is cleared, any trigger signal received before PNA is armed is ignored.
- This feature is only available when positive or negative EDGE triggering is selected.
- Configure this setting remotely using [CONTrol:SIGNal](#) (SCPI) or [ExternalTriggerConnectionBehavior](#) (COM).

Ready for Trigger Indicator (OUT)

On the PNA, when External is selected on the Trigger Setup tab, then both Meas Trig IN and Meas Trig Ready (OUT) are enabled.

Choose a connector to send the PNA Ready OUT signal:

- [Meas Trig RDY](#)
- [Handler I/O p21](#)

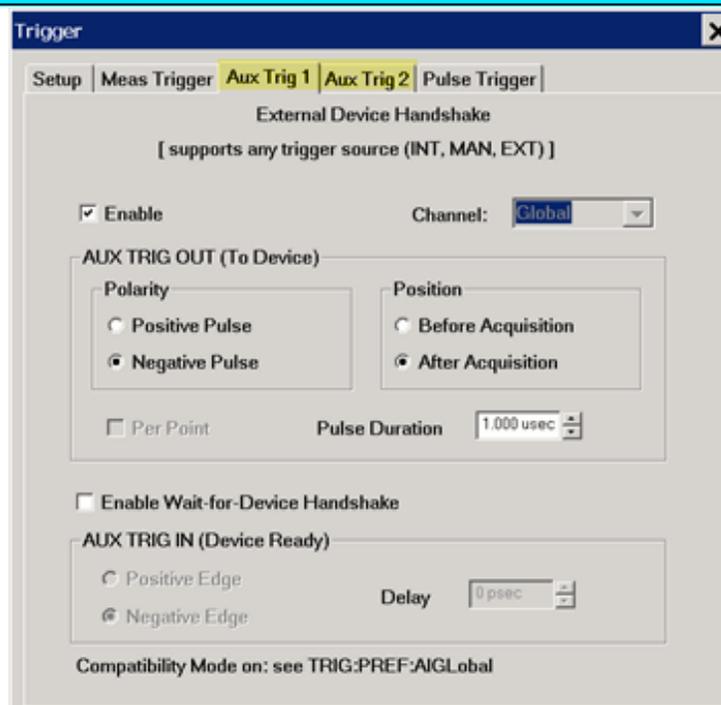

Choose Polarity of the 'Ready OUT' signal.

- **Ready High** - TTL High indicates the PNA is ready for trigger
- **Ready Low** - TTL Low indicates the PNA is ready for trigger (default setting).

See Also

- [Pulse Trigger Tab](#)
- [Learn how to External Trigger during Calibration](#)

Aux Trig 1 - Aux Trig 2 dialog box help

[See how to access the Trigger Dialog](#)

Note: When an External Source is configured as an External Device, the PNA automatically controls all trigger settings. Do NOT make additional trigger settings. [Learn more.](#)

AUX TRIG OUT and AUX TRIG IN

See the AUX TRIG (1&2) connectors on the [PNA rear-panel](#).

These signals are highly configurable. They can be used with all types of external devices to send and receive signals. However, it is important to note that either Aux Trig INPUT does NOT trigger the PNA. That signal must be selected. See step 2 in the following procedure.

1. An external source sends a 'Ready' signal to the PNA (at the Aux Trig IN connector) when it is settled at a frequency.
2. After receiving the Ready signal, the PNA begins the measurement when it receives a Trigger signal from the specified [Trigger Source](#):
 - **Internal** - Measurement begins immediately.
 - **Manual** - Measurement begins when the PNA Trigger button is pressed.
 - **External** - Measurement begins when [Meas Trig In](#) signal is received from an external device. This must be configured independently.
3. The Aux Trig OUT signal can be configured to be sent either just BEFORE the measurement is made or AFTER the measurement is complete. When communicating ONLY with an external source, the Aux Trig OUT signal should be sent AFTER the measurement is complete to indicate that the external source can setup for the next measurement.

Dialog Settings

The Aux Trig 1 and Aux Trig 2 tabs are identical. Two pair of connectors are available to allow two external devices to be controlled simultaneously.

Enable Check to use the Aux1 or Aux2 connectors to output signals to an external device.

Channel: This setting is controlled by a [PNA Preference setting](#).

- **Global** - ALL Aux Trig settings apply to ALL channels. The Per Point setting (see below) is made on the [Trigger Setup tab](#) which also applies to ALL channels.
- **Channel** - ALL Aux Trig settings apply to the specified channel. Each channel can be configured independently.

AUX TRIG OUT (To Device)

The following settings control the properties of the signals sent out the rear panel [AUX TRIG OUT \(1&2\) connectors](#):

Polarity

Positive Pulse Outgoing pulse is positive.

Negative Pulse Outgoing pulse is negative.

Position

Before Acquisition Pulse is sent immediately **before** data acquisition begins.

After Acquisition Pulse is sent immediately **after** data acquisition is complete.

Per Point Check to cause a trigger output to be sent for each data point. Clear to send a trigger output for each sweep.

When the Aux Trig - "[Global](#)" [PNA Preference](#) is selected, then the Point setting is made on the [Trigger Setup tab](#). It then applies to ALL channels. When more than one channel is present, the channel setting that was made last is used.

Pulse Duration Specifies the duration of the positive or negative output trigger pulse.

Enable Wait-for-Device Handshake

When checked, the PNA waits indefinitely for the input line at the rear panel [AUX TRIG IN \(1&2\) connectors](#) to change to the specified level before acquiring data. This signal indicates that the external device is ready for PNA data acquisition. If the signal arrives before the PNA is ready to acquire data, it is latched (remembered).

When NOT checked, the PNA does not wait, but outputs trigger signals when the PNA is ready.

This signal does NOT trigger the PNA. The trigger signal is generated from [Trigger Sources](#): Internal, Manual, or External.

IN (READY)

Positive Edge PNA responds to the leading edge of a pulse on the Aux1 or Aux2 In connector.

Negative Edge PNA responds to the trailing edge of a pulse on the Aux1 or Aux2 In connector.

Delay Time that the PNA waits after receiving the Handshake input before data acquisition begins.

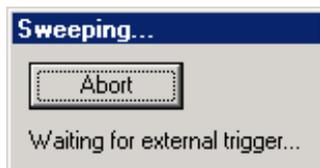

See Also

- See how to use these connectors to [synchronize with External Sources](#).
- [Pulse Triggering](#)

Note: Beginning with PNA Rev 6.0, Guided and Unguided Calibration CAN be performed in External Trigger mode. With this optional behavior, while Trigger Source is set to External, trigger signals must be sent for Calibration sweeps. This behavior does not apply to FCA calibrations.

You can [set a Preference](#) to revert to pre-6.0 behavior - the PNA calibrates using Internal trigger signals while Trigger Source is set to External.

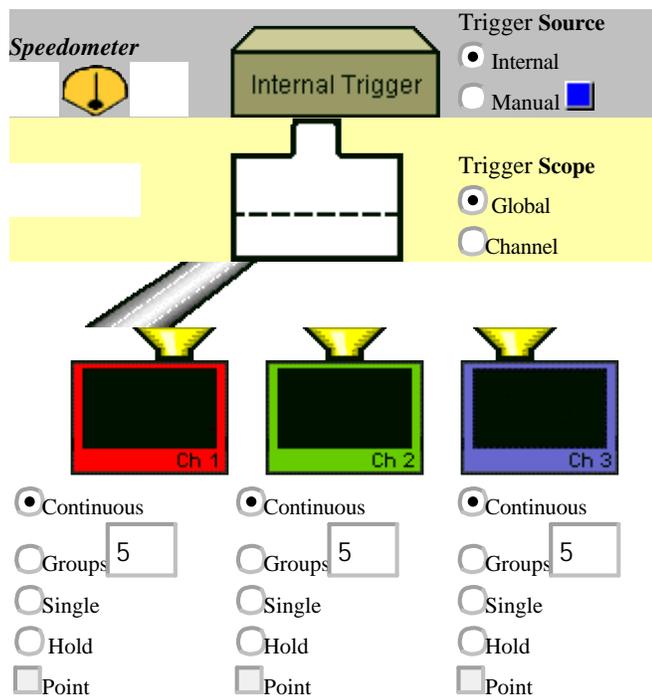

The following dialog box appears on the PNA screen while the PNA is waiting for an External trigger signal.

Click **Abort** to cancel the wait for a trigger signal.

[About the trigger model](#)

Read [Text description](#) of triggering behaviors.

This model does not include the new [Sweep trigger mode](#).

Data Format

A data format is the way the PNA presents measurement data graphically. Pick a data format appropriate to the information you want to learn about the test device.

- [How to set Format](#)
- [Rectangular \(Cartesian\) Display Formats](#)
- [Polar](#)
- [Smith Chart](#)

[See other 'Setup Measurements' topics](#)

How to set the Display Format

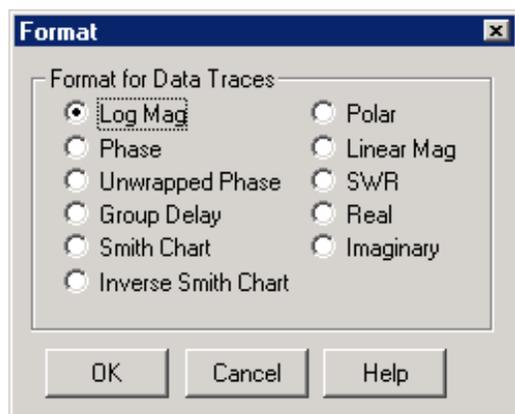

Using front-panel HARDKEY [softkey] buttons

1. Press **FORMAT**

PNA Menu using a mouse

1. Click **Response**
2. then **Format**

[Programming Commands](#)

Format dialog box help

- [Log Mag](#)
- [Phase / Unwrapped Phase](#)
- [Group Delay](#)
- [Smith / Inverse Smith Chart](#)
- [Polar](#)
- [Linear Mag](#)
- [SWR](#)
- [Real](#)
- [Imaginary](#)

Rectangular Display Formats

Seven of the nine available data formats use a rectangular display to present measurement data. This display is also known as Cartesian, X/Y, or rectilinear. The rectangular display is especially useful for clearly displaying frequency response information of your test device.

- Stimulus data (frequency, power, or time) appears on the X-axis, scaled linearly
- Measured data appears on the Y-Axis.

Log Mag (Logarithmic Magnitude) Format

- Displays Magnitude (no phase)
- Y-axis: dB
- Typical measurements:
 - Return Loss
 - Insertion Loss or Gain

Phase Format

Measures the phase of a signal relative to the calibration reference plane with a range of +/- 180 degrees.

- Displays Phase (no magnitude)
- Y-axis: Phase (degrees)
- The trace 'wraps' every 180 degrees for easier scaling.
- Typical Measurements:
 - [Deviation from Linear Phase](#)

Unwrapped Phase

- Same as Phase, but without 180 degree wrapping.

Note: Phase is unwrapped by comparing the phase from one data point to the next. If the phase difference between two points is greater than 180 degrees, or if the phase of the first data point is greater than 180 degrees from DC, then the phase measurement is probably NOT accurate.

Group Delay Format

- Displays signal transmission (propagation) time through a device
- Y-axis: Time (seconds)
- Typical Measurements:
 - Group Delay

See Also:

[Group Delay](#) (Measurement)

[Comparing the PNA Delay Functions.](#)

[Phase Measurement Accuracy](#)

Linear Magnitude Format

- Displays positive values only
- Y-axis: Unitless (**U**) for ratioed measurements
Watts (**W**) for unratioed measurements.
- Typical Measurements:
 - reflection and transmission coefficients (magnitude)
 - time domain transfer

SWR Format

- Displays reflection measurement data calculated from the formula $(1+\rho)/(1-\rho)$ where ρ is reflection coefficient.
- Valid only for reflection measurements.
- Y axis: Unitless
- Typical Measurements:
 - SWR

Real Format

- Displays only the real (resistive) portion of the measured complex data.
- Can show both positive and negative values.
- Y axis: Unitless
- Typical Measurements:
 - time domain
 - auxiliary input voltage signal for service purposes

Imaginary Format

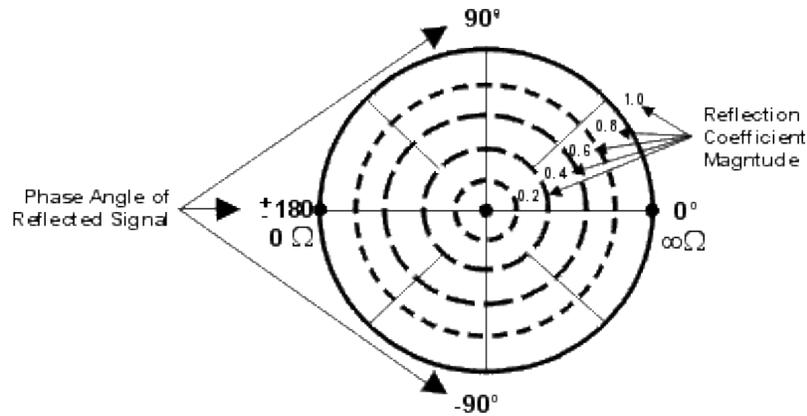

- Displays only the imaginary (reactive) portion of the measured data.
- Y - axis: Unitless
- Typical Measurements:
 - impedance for designing matching network

Polar Format

Polar format is used to view the magnitude and **phase** of the reflection coefficient (Γ) from your S_{11} or S_{22} measurement.

You can use Markers to display the following:

- Linear magnitude (in units) or log magnitude (in dB)
- Phase (in degrees)

- The dashed circles represent reflection coefficient. The outermost circle represents a reflection coefficient (Γ) of 1, or total reflected signal. The center of the circle represents a reflection coefficient (Γ) of 0, or no reflected signal.
- The radial lines show the phase angle of reflected signal. The right-most position corresponds to zero phase angle, (that is, the reflected signal is at the same phase as the incident signal). Phase differences of 90° , $\pm 180^\circ$, and -90° correspond to the top, left-most, and bottom positions on the polar display, respectively.

Smith Chart Format

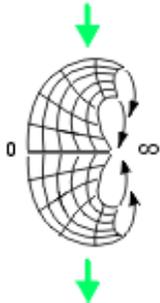

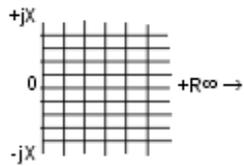

The Smith chart is a tool that maps the complex reflection coefficient (Γ) to the test device's impedance.

In a Smith chart, the rectilinear impedance plane is reshaped to form a circular grid, from which the series resistance and reactance can be read ($R + jX$).

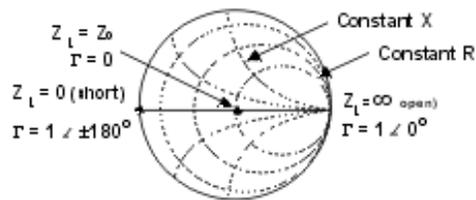

You can use Markers to display the following:

- Resistance (in units of ohms)
- Reactance as an equivalent capacitance (in units of farads) or inductance (in units of henrys)

Rectilinear Impedance Plane

Smith Chart

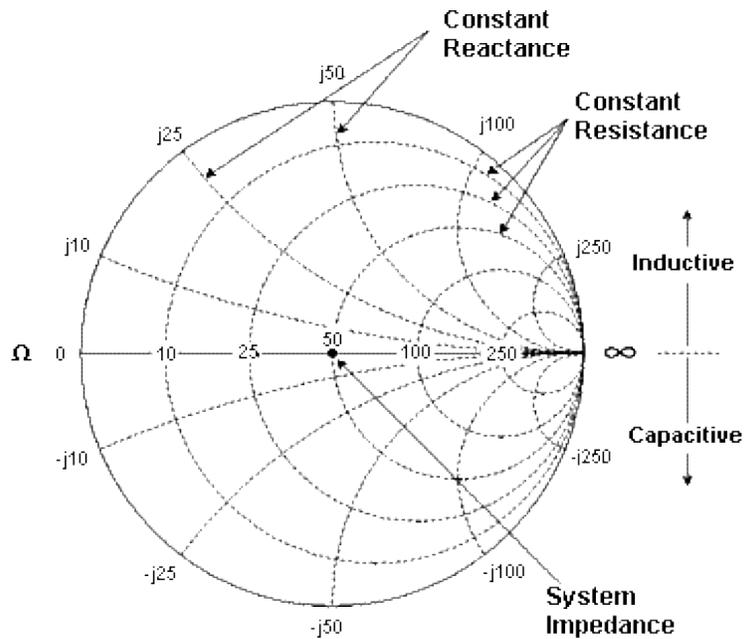

Inverse Smith Chart (also known as Admittance)

Same as standard Smith Chart , except:

- The plot graticule is reversed right-to-left.
- Admittance (in units of siemens) instead of resistance.

Interpreting the Smith Chart

- Every point on the Smith Chart represents a complex impedance made up of a real resistance (r) and an imaginary reactance ($r+jX$)
- The horizontal axis (the solid line) is the real portion of the impedance - the resistance. The center of the horizontal axis always represents the system impedance. To the far right, the value is infinite ohms (open). To the far left, the value is zero ohms (short)
- The dashed circles that intersect the horizontal axis represent constant resistance.
- The dashed arcs that are tangent to the horizontal axis represent constant reactance.
- The upper half of the Smith chart is the area where the reactive component is positive and therefore inductive.
- The lower half is the area where the reactive component is negative and therefore capacitive.

Scale

The Scale, Reference Level and Reference Position settings (along with [Format](#)) determine how the data trace appears on the PNA screen.

- [Scale, Reference Level and Position](#)
- [Scale Coupling](#)
- [Magnitude Offset](#)

[See other 'Setup Measurements' topics](#)

Scale, Reference Level and Position

The Scale, Reference Level and Reference Position settings (along with format) determine how the data trace appears on the PNA screen.

How to set Scale, Reference Level, and Position

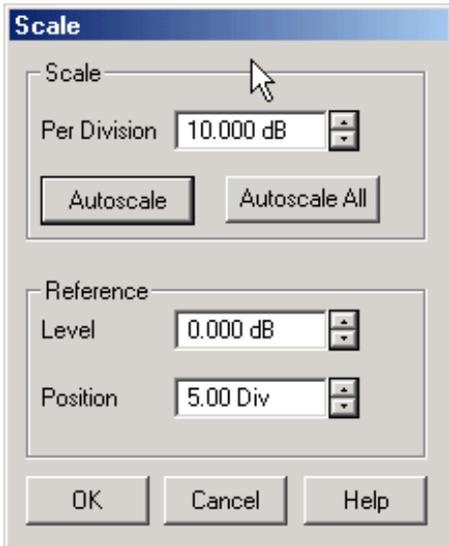

Using front-panel HARDKEY [softkey] buttons

1. Press **SCALE**

PNA Menu using a mouse

1. Click **Response**
2. then **Scale**
3. then **Scale**

[Programming Commands](#)

Scale dialog box help

Note: Beginning with PNA Rev. 9.0, the scale settings are set to couple with other traces in each window. The following settings assume that Scale Coupling is set to OFF. [Learn more about Scale Coupling.](#)

Scale

Per Division Sets the value of the vertical divisions of a rectangular display format. In Polar and Smith Chart formats, scale sets the value of the outer circumference. Range: 0.001dB/div to 500 dB/div.

Tip: Click on the Y-axis labels, then use a mouse scroll wheel to change scale in preset increments. Or Right-click on **Y-axis** annotation to change Scale.

Autoscale - Automatically sets value of the vertical divisions and reference value to fit the ACTIVE data trace within the grid area of the screen. The stimulus values and reference position are not affected.

The analyzer determines the smallest possible scale factor that will allow all the displayed data to fit onto 80 percent of the vertical grid.

The reference value is chosen to center the trace on the screen.

Tip: Double click on the Y-axis labels to autoscale the active trace.

Autoscale All Automatically scales ALL data traces in the ACTIVE WINDOW to fit vertically within the grid area of the screen.

Reference

Level In rectangular formats, sets the value of the reference line, denoted by  on the PNA screen. Range: -500 dB to 500 dB.

In Polar and Smith chart formats, reference level is not applicable.

Tip: Click on the Y-axis labels, then drag up or down to change the reference level in preset increments.

Position In rectangular formats, sets the position of the reference line. Zero is the bottom line of the screen and ten is the top line. Default position is five (middle).

In Polar and Smith chart formats, reference position is not applicable.

Tip: Click on the triangle , then drag up or down to change the reference position in preset increments.

Scale Coupling

With Scale Coupling enabled, traces that have the same format will have the same Scale, Reference Level, and Reference Position. You can choose to couple the scale of traces that are in the same window, couple the scale of all traces in all windows, or to have NO coupling.

How to set Scale Coupling

1. Right-click on the Y-axis labels of a window
2. then select **Scale Coupling**

OR

Using front-panel HARDKEY [softkey] buttons

1. Press **SCALE**
2. then **More**
3. then **Scale Coupling**

PNA Menu using a mouse

1. Click **Response**
2. then **Scale**
3. then **Scale Coupling**

 **Programming Commands** 

Scale Coupling dialog box help

Allows traces that share the same [format](#) to have the same [Scale](#), [Reference Level](#) and [Reference Position](#).

Coupling Method

Off - No coupling. Traces are scaled individually. Default setting.

Window - All traces with the same format in each selected window share the same scale settings.

All - All traces in ALL selected windows with the same format share the same scale settings.

- When **Window** or **All** coupling is enabled, the scale settings for the active trace are assumed by other coupled traces with the same format.
- When there are traces with a different format present, all traces with that format assume the trace settings of the lowest-numbered trace of that format.
- Once enabled, scale settings for all coupled traces with the same format can be changed with any coupled trace being active.

Selected Windows

Available when either the **Window** or **All** method is selected. Selected windows will participate in scale coupling. All windows are selected by default. Clear a checkbox to 'Opt-out' of scale coupling for that window.

About Autoscale and Scale Coupling

Autoscale (not Autoscale All) affects the active trace in the active window. All traces that are coupled to this trace assume the new scale settings of the active trace. This could cause some traces to NOT show on the screen.

Autoscale All with Coupling Method...

- **Off** - All traces in the active window are autoscaled independently.
- **Window** - All traces in each selected window are autoscaled to fit within a common set of scaling factors.
- **All** - All traces in all selected windows are autoscaled to fit within a common set of scaling factors.

Magnitude Offset

Magnitude Offset allows you to offset the magnitude (not phase) data by a fixed and / or sloped value in dB. If the display format is Linear Magnitude or Real (unitless), the conversion from dB is performed and the correct amount of offset is implemented.

How to set Magnitude Offset

Using front-panel

HARDKEY [softkey] buttons

1. Press **SCALE**
2. then **[More]**
3. then **[Magnitude Offset]**

PNA Menu using a mouse

1. Click **Response**
2. then **Scale**
3. then **Magnitude Offset**

Programming Commands

Magnitude Offset dialog box help

The Magnitude offset setting affects only the active trace.

Offset Offsets the entire data trace by the specified value.

Slope Offsets the data trace by a value that changes with frequency. The offset slope begins at 0 Hz.

For your convenience, the offset value at the start frequency is calculated and displayed.

See where this operation is performed in the [data processing chain](#).

Pre-configured Measurement Setups

- [Pre-configured setups for NEW measurements](#)
- [Pre-configured arrangements for EXISTING measurements](#)

Before reading this topic, it is important to understand [Traces, Channels, and Windows](#) in the PNA.

[See other 'Setup Measurements' topics](#)

Pre-configured Setups for NEW Measurements

Each of the following setups **creates new traces**. Existing traces and their settings will be lost, unless you first save them.

How to select a pre-configured measurement setup

Using front-panel HARDKEY [softkey] buttons

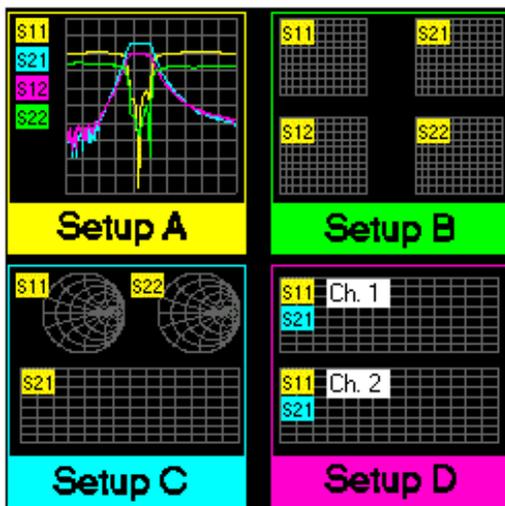

1. Press **DISPLAY**
2. then **[Measurement Setups]**

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Meas Setups**

No programming commands exist for this feature

The following are the four pre-configured measurement setups:

Arranging Existing Measurements

The following arrangements place EXISTING measurements into pre-configured Window arrangements using a sort algorithm.

How to select an Existing measurement arrangement

Using front-panel HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then [**Layout**]
3. then choose from the following...

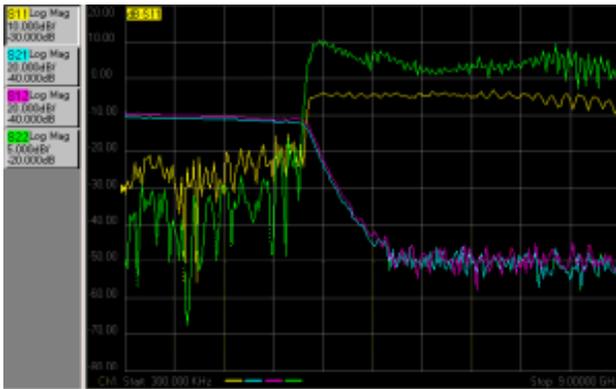

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then choose from the following...

◀ Programming Commands ▶

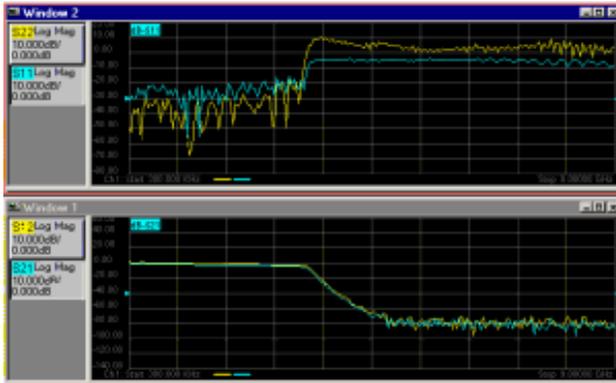

Overlay 1x

This configuration places all existing traces in a single window, all overlaid on each other.

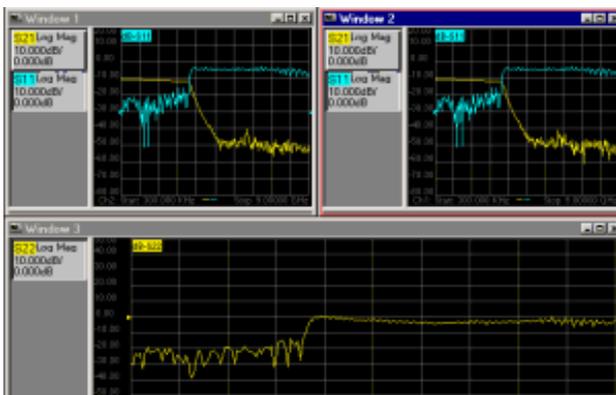

Stack 2x

This configuration places all existing traces in two "stacked" windows.

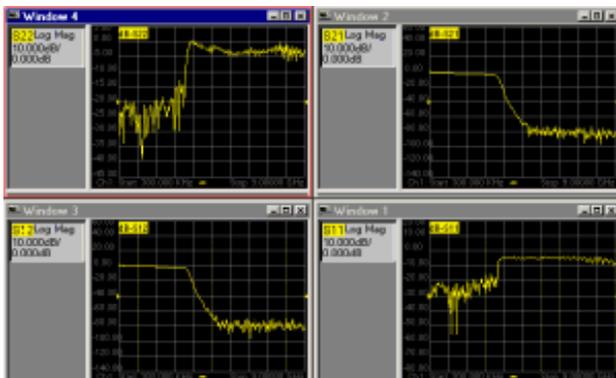

Split 3x

This configuration places all existing traces in three windows, two on top and one below.

Quad 4x

This configuration places all existing traces in four windows, one window in each screen quadrant.

Sort Algorithm

The sort algorithm for the Arrange Windows feature is designed to:

- Divide traces among windows based on their properties
- Group traces with common properties

The algorithm sorting is based on the following trace properties, in order of priority:

1. Format: circular (polar or Smith) versus rectilinear (log mag, lin mag, group delay, etc.)
2. Channel number
3. Transmission versus reflection

Note: The PNA [traces per window limitation](#) overrides this algorithm. An error occurs if the arrange selection cannot be completed with the current number of traces on the screen.

PNA-X RF Path Configurator

Allows you to configure hardware components that are available with selected [PNA-X options](#).

N522xA and N523x models do NOT have the RF Path Configurator.

How to access Path Configurator

Using HARDKEY [softkey] buttons:

1. Press TRACE/CHAN
2. then [Channel]
3. then [Hardware Setup]
4. then [Path Config...]

PNA Menu using a mouse:

1. Click **Trace/Chan**
2. then **Channel**
3. then **Hardware Setup**
4. then **Path Config...**

Programming Commands

The following image shows configuration with PNA-X Opt 423 (4-port, internal 2nd source, combiner, and mechanical switches). Your PNA-X may not include these options.

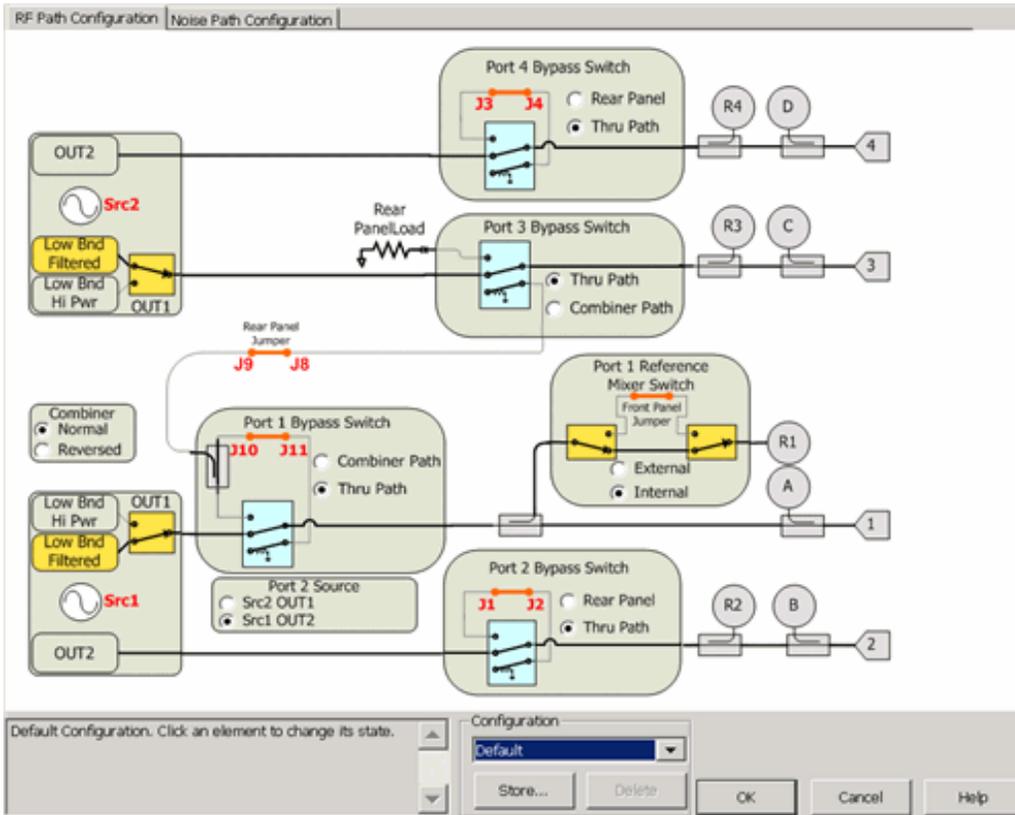

See Also

[IF Path Configuration](#)

[PNA-X specs](#) for block diagrams

[Internal Second Source limitations](#)

[PNA Configurations and Options](#)

Path Configuration dialog box help

See [Noise Figure tab](#) of the Path Configuration.

Note: With [selected PNA-X options](#), pulse modulation is available ONLY on **OUT1** of Src 1 and Src 2. [See block diagram.](#)

Different paths can be configured for each channel.

Configuration

Select, store, and delete factory configurations or user-defined configurations. Configurations are stored on the PNA hard drive.

Any configuration can be saved, and later recalled, from this dialog. Click **Store**, type a configuration name, then click **OK**.

Text area Displays text describing the physical connections required to complete the configuration. The text for factory configurations can NOT be edited. Text is saved as part of the configuration.

Cancel Closes the dialog and returns the configuration settings to the state they were in when the dialog was opened. Cancel does NOT undo **Store** and **Delete** actions that were performed while the dialog was open.

Notes

- Click or touch anywhere within a box on the screen to cycle through the available settings.
- Some switch settings alter graphics in areas other than where the switch is thrown.
- **If you don't hear switches clicking**, this could be why:
 - Electronic switches are **orange** on the path configuration dialog. These switches do not make noise when being thrown. Mechanical switches are **blue**.
 - The channel is not sweeping.
 - The following selections do NOT throw switches, but simply indicate how to connect jumper cables by drawing red lines on the dialog:
 - Combiner (Normal/Reversed)
 - Port 2 Source (Src2 OUT1/Src1 OUT2)

Note: To prevent premature wear, the PNA does not allow attenuators or other mechanical switches to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are NOT allowed to sweep (Blocked).

Learn how to [view the settings of all mechanical devices](#) in the PNA.

- Red lines are jumpers on the front or rear panel.
- **Src1 / Src2 Settings:**
 - **Low Bnd Filtered** (default setting) reduces harmonics below 3.2 GHz on OUT1 of both **Src1** and **Src2**.
 - **Low Bnd Hi Pwr** setting does not use the filtering which causes higher power below 3.2 GHz. See Max Leveled Power in the [specifications](#) for your PNA-X model.
 - Each source optionally has [pulse modulation](#) capability.
 - **Note:** Pulse modulation is available ONLY on **OUT1** of Src 1 and Src 2. [See block diagram](#). Your PNA must also have Pulse options. [Learn more](#).
- [Copy channel](#) feature also copies path configuration settings.
- Path Configuration is saved and recalled as part of an [instrument state](#).

Factory Configurations

Note: Recalling a stored configuration will over-write MANY RF and [IF path configuration](#) settings. Make your measurement settings AFTER recalling a stored configuration, NOT before.

Port 1 2-tone Routes Source 2 through the internal combiner to create a two-tone signal out port 1. The standard jumper configuration is used. This is the configuration that is used to make [IMD measurements](#).

Src 2 Out Port 2 (Option 423 ONLY) Routes Source 2 (OUT1) to port 2 using an external cable attached to the rear-panel J8 to J1. This allows source power at port 1 AND port 2 simultaneously. Source power is NOT available at port 3. [Learn more about Internal Second Source capability](#).

2 port Dual Source (Option 224 ONLY) Routes Source 2 (OUT1) to port 2 using an external cable attached to the rear-panel J8 to J1. This allows source power at port 1 AND port 2 simultaneously. This also allows pulsed measurements to be performed on both ports 1 and 2.

Hot S-parameters The rear panel jumpers must be manually reconfigured to allow the source 2 signal to be routed through the thru path of the internal combiner. Source 2 is used to drive the AUT into compression, so the highest possible output power is required. Source 1, routed through the coupled path of the combiner, is used for S-parameter measurements, so a small signal is sufficient. These two signals are combined but the frequencies are usually offset.

Source Phase Control (Opt 088)

Option 088 allows you to control the phase of a PNA source or an external source. Two sources are required.

- [Overview](#)
- [Features and Limitations](#)
- [Phase Control Use-Cases](#)
- [How to make Phase Settings](#)
- [Calibration and Phase Control](#)
- [Active Load Pull Examples](#)

[See other 'Setup Measurements' topics](#)

Overview

The Source Phase Control feature provides a specific phase difference between two sources. The phase difference can be fixed (for example, at 90 degrees), or swept between two arbitrary phase values (for example, from 0 to 360 degrees).

This feature is allowed on ALL PNA-X models, and any N522xA model with either two internal sources or an external source and configurable test set.

Any combination of PNA internal or external sources may be used. One source is selected as the controlled source and the other source is the reference source. You select the two sources by selecting the ports at which the sources are available. The choice of ports is limited for you on the Phase Control dialog. [Learn about these limitations.](#)

In addition to selecting source ports, you also select the receivers to be used to measure the phase for the sources. This can be test port receivers or the reference receivers for the specified source ports. The receivers measure the relative phase of the sources, then adjust the phase of the controlled source, then remeasure until the phase difference is within the tolerance that you specify.

Phase can also be set without using any receivers. This is called 'Open Loop' mode. In this mode, the phase of the controlled source is set once, and iterations are not done, resulting in phase that is less accurate and stable compared to using receivers to measure and set phase. Use Open Loop mode when you need to use the receivers to measure other parameters.

The phase of the controlled source can be swept relative to the reference source. The phase difference

between the controlled and reference source is incremented and iterated on consecutive data points. Before starting the Phase Control dialog, select Sweep Type = Phase Sweep. [Learn how](#).

When the phase of a source is controlled, the power of that source is also controlled using [Receiver Leveling](#). Instead of the normal receiver-leveling mode where only one receiver is used, when phase control is active the ratio of two receivers is used to level the power of the controlled source. This is useful for making active load-pull measurements as described below. In Open Loop mode, neither the phase nor the power of the source is controlled.

Features and Limitations

- Phase Control is allowed ONLY in a standard [S-parameter](#) channel.
- Phase Control can be used with [Wideband pulse measurements](#) - NOT in narrow-band pulse mode.
- [Point Averaging](#) is NOT allowed.
- **External sources** are supported. Learn how to [Configure an External Device](#). Phase can be controlled on Agilent MXG, PSG, ESG and EXG sources. The external source must be routed through the rear panel so that a reference receiver can measure its phase. Use the [Path Configuration dialog](#) to make switch settings and [enable FOM mode](#).
- [Remote commands](#) are available that allow the phase and power of each point to be set individually, much like in source power calibration. Use these commands if you need to create a specific pattern of amplitude/phase states, such as characterizing the load-pull of an amplifier.

Phase Control Use-Cases

Phase control and phase sweep is useful in the following applications:

Active load control

Provide a controlled, electronically-settable impedance to the output port of a DUT under fixed or swept-frequency conditions. Some examples are: measuring the gain and output power of an amplifier with a known load, and measuring the output from a directional detector with a known load.

The reference source is applied to the DUT input port, and the controlled source is applied to the DUT output port as a reverse input wave. The phase and power level of the controlled source is set relative to the forward output wave of the DUT (which is determined by the reference source), so that any arbitrary load impedance (γ) can be set.

Optionally, the phase of the controlled source can be swept with a constant frequency, so that the phase of γ rotates while the magnitude of γ remains constant. The ratio of reverse input wave and forward output wave as viewed on a Smith chart or polar display would appear as a circle. This capability can be combined with external load-pull software to create traditional load-pull power contours.

Phase-controlled sources

Set the phase and magnitude of one source relative to a reference source, to provide differential, quadrature, or arbitrary phase-offset signals at a fixed or swept frequency. Typically, another instrument, receiver, or detector would be required to measure the response of the DUT.

How to make Phase Control settings:

Using front-panel HARDKEY [softkey] buttons

1. Press **SWEEP**
2. then **[More]**
3. then **[Phase Control]**

Using a mouse with PNA Menus

1. Click **Stimulus**
2. then **Sweep**
3. then **More**
4. then **Phase Control**

To perform a Phase Sweep:

1. Press **SWEEP**
2. then **[Sweep Type]**
3. then **[Phase]**

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Type**
4. then **Phase Sweep**

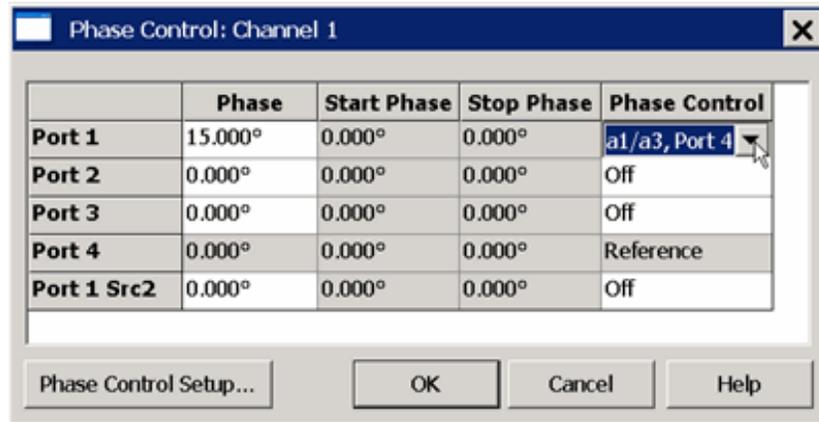

To select (view) a Phase format: ([Learn more](#))

1. Press **FORMAT**
2. then **[Phase]**

1. Click **Response**
2. then **Format**
3. then **Phase, Unwrapped Phase, or Smith**

Programming Commands

Phase Control dialog box help

Phase Specify any Fixed Phase setting.

Start / Stop Phase Available when Sweep Type is set to Phase Sweep. [Learn how](#). Enter the Start and Stop phase values in degrees.

Phase Control Click in the port cell to be controlled, then choose from the following:

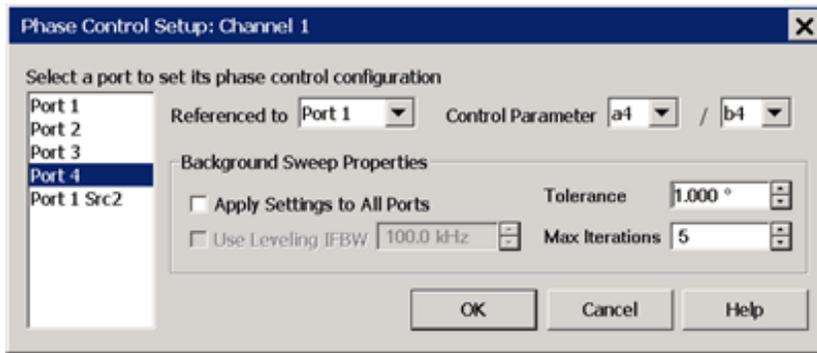

- **Off** - Phase is NOT set or controlled.
- **Open Loop** - Phase and power is set, but receivers are NOT used to measure and iterate the phase or power of the source. Therefore, the setting of phase is not as accurate or stable. Open Loop mode can be used with phase sweep (for example, from 0 to 360 degrees). However, each sweep may not start at 0 degrees. NO settings on the following Phase Control Setup dialog are used in Open Loop.

Note: After selecting Open Loop, set each source to **ON** (not Auto) using the [Power and Attenuators dialog](#).

- **<rec/rec>, reference port (Controlled)** - Phase and power is measured and iterated to within the specified tolerance. Click **Phase Control Setup** to specify the source ports, the receivers, and iteration properties to use to control phase. Use the [Receiver Leveling](#) feature to set the power iteration properties. The source or receiver being leveled can NOT be changed in the Receiver Leveling dialog.
- **Reference** is displayed to indicate the specified reference port. You can also perform receiver leveling on the reference source. [Learn how](#).

Phase Control Setup Click to launch the Phase Control Setup dialog.

Phase Control Setup dialog box help

Select a port to set its phase control configuration This is the 'controlled' port.

Referenced to Select a source port to be used as a phase reference for the controlled port.

The two internal PNA sources are available ONLY at specific ports. These choices are limited for you on the Phase Control dialog. For example on a 4-port PNA-X, the possible port pairings are: 1/3, 1/4, 2/3, or 2/4. Port 1 can NOT be paired with Port 2, and Port 3 can NOT be paired with Port 4. [Learn more about these limitations.](#)

Control Parameter Select the receivers to be used to measure the phase and power of the sources.

- The LEFT receiver (a4 in the above image) measures the controlled source.
- The RIGHT receiver (b4 in the above image) measures the reference source.

The swept phase or phase offset will be the difference between these two receivers. Use either standard notation (A, R1) or logical receiver notation (a1,b1). [Learn more.](#)

Select the receivers based on your application. You are responsible to make sure that your DUT configuration routes the signals of interest to the correct receivers. Otherwise, the phase will not be properly controlled. For example, if you select the configuration in the above dialog, both Port 4 (controlled source) and Port 1 (reference source) must be connected and measured by the Port 4 (a4 and b4) receivers. This would typically be at your DUT output. See the [Active Load Pull Example](#) below.

Background Sweep Properties

Background sweeps are phase and power measurements that are made, but the results are not displayed. For each data point, when subsequent measurements are within the specified tolerance, that point is considered settled. If consecutive phase or power measurements of the same data point are NOT within the specified tolerance before the Max Iterations is reached, then one of the following messages are displayed:

- Phase leveling warning: phase not settled.

- Phase leveling warning: power not settled.
- Phase leveling warning: phase and power not settled.

Apply Settings to All Ports When checked, the specified settings are used for all background sweeps for all phase-controlled ports. When cleared, the following three settings are specified independently for each port pair.

Use Leveling IFBW (NOT available for this release).

Tolerance When consecutive phase measurements of the same data point are within this value of each other, then the phase measurement is considered settled.

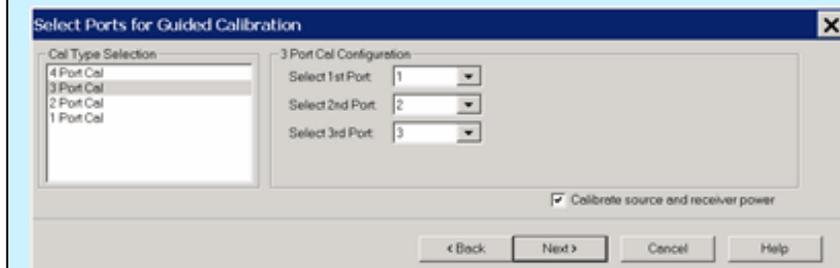

Max Iterations Sets the maximum number of background phase measurements to perform in order to achieve settling. If the phase is not sufficiently settled after these measurements, then the closest value is used.

Calibration and Phase Control

Calibrate only those ports that are used for a phase control measurement. For example, if using ports 1 and 3 for phase control, then do NOT calibrate all four ports. If other ports are calibrated, then even ports 1 and 3 may not yield acceptable results.

Important

During the Guided Calibration, at the Select Ports dialog, check the [Calibrate source and receiver power](#) checkbox. Otherwise, the calibration may not be accurate.

After performing calibration, the phase is aligned and the power is accurate at the calibration plane.

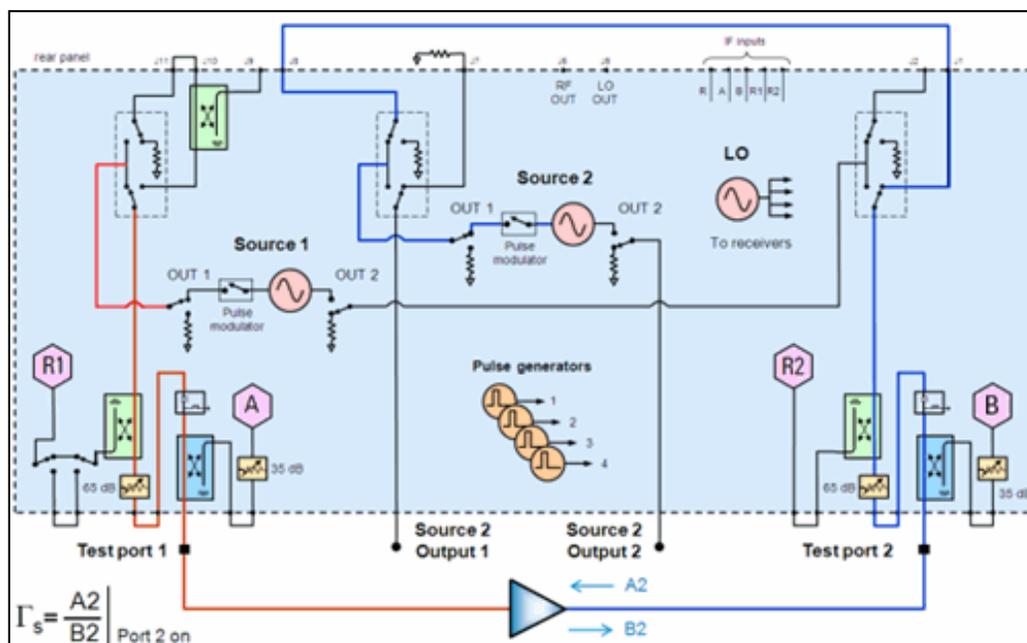

Active Load Control Example (4-port PNA-X)

[See setup using a 2-port 2-source PNA-X.](#)

<input checked="" type="checkbox"/> Power ON (All Channels) <input type="checkbox"/> Port Powers Coupled		Name	State	Port Power	Start Power	Stop Power	Auto Range	Source Atten.	Leveling Mode
Port 1	Auto	-5.00 dBm	-10.00 dBm	0.00 dBm	<input checked="" type="checkbox"/>	0 dB	Internal		
Port 2	Auto	-5.00 dBm	-10.00 dBm	0.00 dBm	<input checked="" type="checkbox"/>	0 dB	Internal		
Port 3	Auto	-5.00 dBm	-10.00 dBm	0.00 dBm	<input checked="" type="checkbox"/>	0 dB	Internal		
Port 4	Auto	-2.00 dBc	0.00 dBc	0.00 dBc	<input type="checkbox"/>	10 dB	a1/b1		

Active Load Control with 2-Port 2-Source PNA-X Models

1. Connect a rear-panel jumpers cable from J8 to J1.
2. On the Phase Control Setup dialog, select **Port 2** as the controlled source and **Port1 Src 2** as the reference source.
3. On the [Path Configuration dialog](#), on the Configuration box, select **2- port dual source**.
4. Select the Control Parameter (receivers) **a2 / b2**.

Customize the PNA Screen

You can customize your PNA screen by showing or hiding the following display elements. All of these selections are made from the PNA **Response > Display** menu.

- [Layout](#) (Separate topic)
- [Windows](#) (Separate topic)
- [Measurement Setups](#) (Separate topic)
- [Display Labels](#)
- [Marker Display](#) (Separate topic)
- [Tables](#)
- [Toolbars](#)
- [Status and Title Bars](#)
- [Display Colors](#) (Separate topic)
- [Grid: SOLID | Dotted](#)
- [System Date and Time](#)
- [Minimize Application](#)

See Also

[Expanded display capabilities of the PNA-X](#)

[Traces, Channels, and Windows on the PNA](#)

How to show/hide the Status Bar and Title Bars

Using front-panel

HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then [**Tables and Toolbars**]
3. then [**Status Bar or Title Bars**]

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Toolbars**
4. then **Status Bar or Title Bars**

[Programming Commands](#)

Status Toolbar

Status CH 1: S11 No Cor

When enabled, the status bar is displayed along the bottom of the PNA screen. The primary status bar shows the following:

TIP: Right-click on many of these items in the status bar for quick access to settings.

- [Channel Trigger State](#) (Cont, Groups, Single, Hold)
- Active channel
- Measurement parameter for the active trace
- [Trace Math](#)
- [Error correction](#) for the active trace
- [Averaging Factor](#) for the active channel
- [Smoothing](#) Percentage
- [Transform](#) (On)
- [Gating](#) (On)
- IF Gating Enabled for [Pulsed App](#): (G)
- Manual IF Filtering for Pulsed App: (F)

- Delay if invoked using [Phase Offset](#), [Electrical Delay](#), or [Port Extensions](#).
- Loss if invoked using [Magnitude Offset](#) or [Port Extensions](#).
- GPIB status: Local (LCL), Remote Talker Listener (RMT), or System Controller (CTL).
- Error Status: (LVL, LCK, etc)
- System Date and Time - Can be set ON or OFF.

Note: A second level status bar appears when using [External Test Set Control](#) or [Interface control](#).

The status bar state (ON or OFF) will not change when the PNA is Preset.

Title Bars

The Title bar shows the window number and Minimize / Maximize icons.

- Checked - Title bars for all PNA windows are shown.
- Cleared - Title bars for all PNA windows are hidden. This allows more room to display measurement results.

Toolbars

You can display different toolbars to allow you to easily set up and modify measurements.

How to display Toolbars

Using front-panel

HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then **[Tables and Toolbars]**
3. then **[Toolbars]**

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Toolbars**

Programming Commands

List of toolbars

- [Active Entry](#)
- [Softkeys](#)

- [Markers](#)
- [Time Domain](#)
- [Port Extension](#)
- [All Off](#) (NOT on softkeys)

Note: There is also a Cal Set toolbar available for [Monitoring Error Terms](#)

Beginning with PNA Rev. A.10.0, the Measurement, Sweep Control, and Stimulus toolbars were eliminated.

Active Entry Toolbar

When used with softkeys, this area allows numeric values to be entered for settings. From the keyboard, enter G for Giga, M for Mega or milli, K for kilo, and so forth.

Softkeys

Softkeys are automatically turned ON when one of the 'function' hardkeys is pressed. This setting allows you to turn the softkeys OFF to show more measurement space on the screen. The softkeys will reappear when another function hardkey is pressed.

Markers Toolbar

The markers toolbar allows you to set up and modify markers. It shows:

- Marker number
- Stimulation value
- Marker functions:
 - Delta
 - Start/Stop
 - Center/Span

Tip: To use the Front Panel Knob to change marker position, first click the **Stimulus** field of the marker toolbar. Then turn the knob.

[Learn more about Markers](#)

Time Domain toolbar

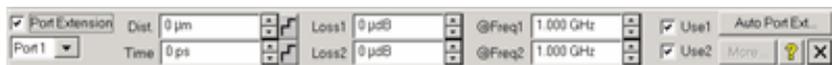

The Time Domain toolbar allows you to do the following:

- Turn Transform and Gating ON / OFF
- Change the Start / Stop times for both Transform and Gating
- **More...** launches the [Time Domain Transform](#) dialog box
- **X** Closes the toolbar

The front panel **Tab** key steps through all of the settings on all of the toolbars on the display. If Tab does not work, press one of the Active Toolbar (color) keys.

Port Extension toolbar

The Port Extension toolbar allows you to set Port Extensions while viewing the measurement trace. Learn more about [Port Extensions](#).

All Off

This allows you to **hide all toolbars** with a single selection. NOT available on sofkeys.

Tables

Tables are displayed at the bottom of the selected window.

How to display tables

Each window can display only one table at a time.

Click **Hide Table** to turn OFF the table.

Using front-panel

HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then **[Tables and Toolbars]**
3. then **[Tables]**

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Tables**

 **Programming Commands** 

List of tables

- [Marker Table](#)
 - [Limit Line Table](#)
 - [Segment Table](#)
-

Marker Table

You can display a table of marker settings. These settings include the:

- Marker number
- Marker reference (for delta measurements)
- Frequency
- Time and Distance (for Time Domain measurements)
- Response

Learn more about [Markers](#)

Limit Line Table

You can display, set up, and modify a table of limit test settings. These include:

- Type (MIN, MAX, or OFF)

- Beginning and ending stimulus values
- Beginning and ending response values

Learn more about [Limit Lines](#).

Segment Sweep Table

You can display, set up, and modify a table of segment sweep settings. These include:

- State (On/Off)
- Start and Stop frequencies
- Number of Points
- IF Bandwidth (if independent levels)
- Power Level (if independent levels)
- Sweep Time (if independent levels)

Learn more about [Segment sweep](#)

Display Labels

How to show and hide Display items

Using front-panel HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then [**Labels**]

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **Labels**

[Programming Commands](#)

List of Display Labels

- [Window Title](#)
- [Trace Title](#)

- [Trace Status](#)
 - [Frequency, Stimulus](#)
-

Window Title

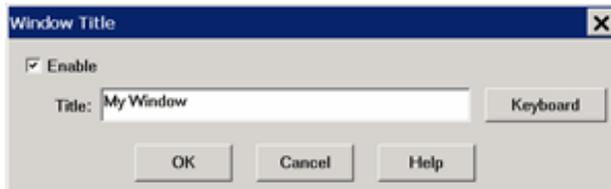

You can create and display a title for each **window**.

- The limit is set by the number of windows that are displayed.
- The title (My Window) is annotated in the upper-left of the window as follows:

How to enter a Window Title

1. Click in the window to make the window active.
2. Click **Response**, then **Display**, then **Labels**, then **Window Title**.

3. Click **Enable**, then type the trace title. Click **Keyboard** to type with a mouse.
 4. To remove the trace title, clear the **Enable** checkbox, or delete the text from the dialog entry.
-

Trace Title

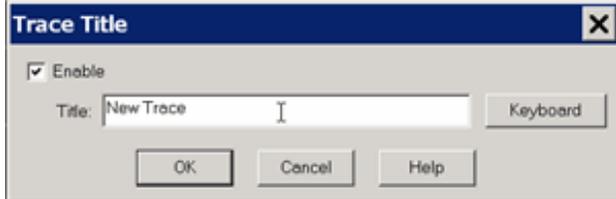

A Trace Title overwrites the Measurement Parameter in the [Trace Status](#) area, the [Status Bar](#), and [hardcopy prints](#).

- This title has priority over [Equation Editor](#) titles.
- The practical limit is about 70 characters if there is only one trace.
- Spaces are accepted but not displayed; use underscores.
- The title is annotated as follows:

A screenshot of a trace title bar. The text "Tr 1 New Trace LogM 10.00dB/ 0.00dB" is displayed in yellow on a black background.

How to enter a Trace Title

1. Click the [Trace Status](#) label to select a trace.
2. Click **Response**, then **Display**, then **Labels**, then **Trace Title**.

3. Click **Enable**, then type the trace title. Click **Keyboard** to type with a mouse.
4. To remove the trace title, clear the **Enable** checkbox, or delete the text from the dialog entry.

Trace Status

	<p>Trace status is annotated at the top of each window.</p> <p>The highlighted trace number indicates the Active Trace.</p> <p>Click the title to select a trace.</p>
---	---

Trace Status shows the following:

- Trace number (Tr x). This is the trace number of the channel; NOT the window trace number which is used in many programming commands.
- Measurement parameter. This can be replaced with a custom **Trace Title** (see below).
- Format
- Scaling factor
- Reference level

[How to show/hide Trace Status](#)

Frequency/Stimulus

Frequency/stimulus information is displayed at the bottom of each window on the screen. It shows:

- Channel number
- Start value
- Stop value

[How to show/hide Frequency/Stimulus information](#)

How to set PNA Grid and Clock display settings

Using front-panel

HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then [**More**]

PNA Menu using a mouse

1. Click **Response**
2. then **Display**
3. then **More**

[Programming Commands](#)

Grid: **SOLID** | Dotted

Set whether to display ALL open window grid lines in solid or dotted lines. The selected setting is shown in CAPS. Once set, new windows are created using this setting. Grid lines return to **SOLID** when the PNA is Preset.

Set the color of the grid using [Display Colors](#).

[How to display grid settings](#)

System Date and Time (also known as Clock)

The PNA system date and time can be shown in the far right corner of the status bar.

The format is: year-mo-day hr:min and can NOT be changed.

[Learn how to set the PNA time](#)

[How to show/hide the PNA clock](#)

Minimize Application

The Network Analyzer application can be minimized to show the desktop and Windows taskbar.

1. Click **File**
2. then **Minimize Application**

To restore the PNA application, click the PNA application on the Windows taskbar.

Copy Channels

Copy channels allows you to make a duplicate channel of the same [Measurement Class](#) and with the same stimulus conditions as an existing channel.

- [Why Copy Channels](#)
- [How to Copy Channels](#)
- [List of Channel Settings](#)

Note: Beginning with A.09.40, Copy Channels CAN be used with [PNA Applications](#), such as FCA, Gain Compression, or Noise Figure.

Other Setup Measurements Topics

Why Copy Channels

Copy channel settings if you need to create several channels that have slightly different settings.

For example, if you have an amplifier that you want to characterize over a frequency span with several different input power levels.

Follow these steps:

1. Create one measurement with your optimized channel settings.
2. Copy that channel to new channels.
3. Change the power level on the new channels.

The alternative to using Copy Channels is to create new default measurements on new channels. Then change every channel setting to your new requirement. This is very time consuming and thus shows the benefit of the Copy Channels feature.

How to Copy Channels

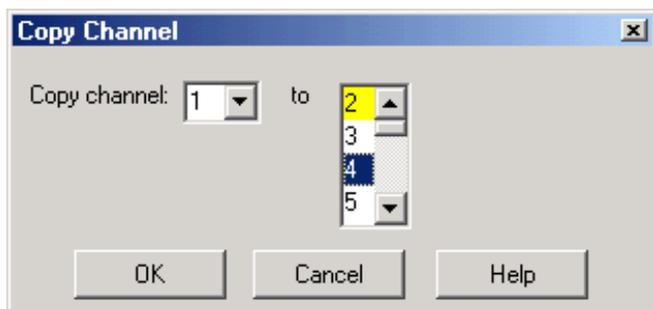

Using front-panel HARDKEY [softkey] buttons

1. Press TRACE/CHAN
2. then [Channel]
3. then [More]
4. then [Copy Channel]

PNA Menu using a mouse

1. Click **Trace/Chan**
2. then **Channel**
3. then **Copy Channel**

Programming Commands

Copy Channel dialog box help

Copies an existing channel's settings to another channel. Measurement traces from the source channel are NOT copied.

Copy channel (also known as '**Source**' channel): Select a channel to copy.

to (also known as '**Destination**' channel): Scroll to select a channel to copy settings to. Compatible channel numbers that are currently being used are highlighted. They can be selected and overwritten.

The following are compatible destination channels:

- A channel that does not yet exist. The new channel is created with the channel's default measurement.
- A channel of the **same** [Measurement Class](#) as the source. The existing measurements remain on the destination channel.
- A channel of any Measurement Class that contains no measurements. Again, the destination channel is created with the channel's default measurement.

Notes:

- You can copy channel settings to ONLY one new or existing channel. Repeat this operation to copy to more than one channel.
- The source channel is ALWAYS copied to the Active window. If you want the destination channel in a separate window, first create a compatible new measurement in a new window. Then make sure it is the Active window before you copy the channel into it.
- The measurement in the destination channel becomes the active measurement.

For example:

1. **Source** channel 1: Standard S21 measurement
2. **Destination** NEW channel 2
3. **Result:** Source channel 1, S21 Measurement AND channel 2, S11 measurement. Both with same stimulus settings and in the same window. Channel 2, S11 measurement is the active measurement.

For more information see [Traces, Channels, and Windows on the PNA](#)

List of Channel Settings

DC Source Control

When a DC Source (power supply) is configured as an External Device, the new DC source can be controlled from the PNA using this dialog. [Learn how to configure the DC Source as an External Device.](#)

- [How to start the DC Source Control dialog](#)
- [The DC Source Control dialog box](#)
- [The DC Limits dialog box](#)

Other Setup Measurements Topics

How to start the DC Source Control dialog

To set the X-axis to display the DC source, click **Response, Display, Labels, Select X-Axis**, then select the DC Source to display.

Using front-panel

HARDKEY [softkey] buttons

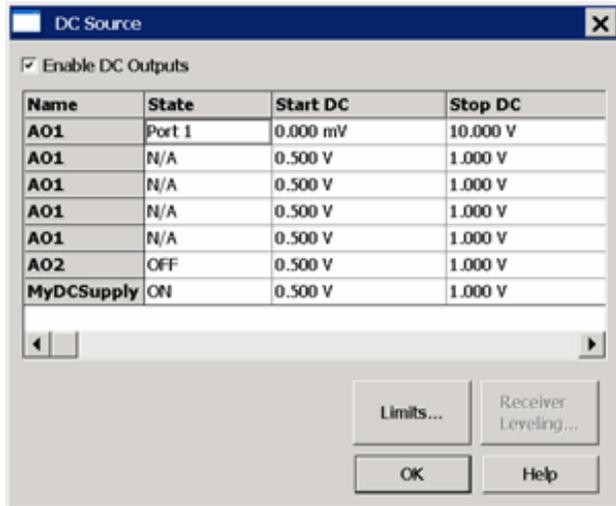

1. Press **SWEEP**
2. then **[More]**
3. then **[DC Source]**

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **DC Source**

◀ Programming Commands ▶

DC Source Control dialog box help

Name Lists the names of the configured DC Sources. In the above image:

- **A01** and **A02** are internal PNA DC sources that are available on the rear-panel Power I/O connector (Pins 3 and 4). [Learn more.](#)
- **MyDCSupply** is the name of an external DC Source. [Learn how to setup and configure an External DC Source and DC Meter.](#)

State Set the state of the DC source.

- **ON** DC Source is always ON.
- **OFF** DC source is always OFF.
- **Per Port** The Name selection for that DC source expands to allow an Port <n> / N/A setting for each PNA port. When the RF source for that port <n> is ON, then the DC source for port <n> is also ON. Select 'N/A' to turn the DC Source OFF for that port.

For example: In the above image...

- A01 will be ON when the RF source at Port 1 is ON, stepping from 0 to 10V.
- A01 will be OFF when all other RF source ports are ON.
- A02 will always be OFF
- MyDCSupply will always be ON, stepping from .5V to 1.0 V each sweep.

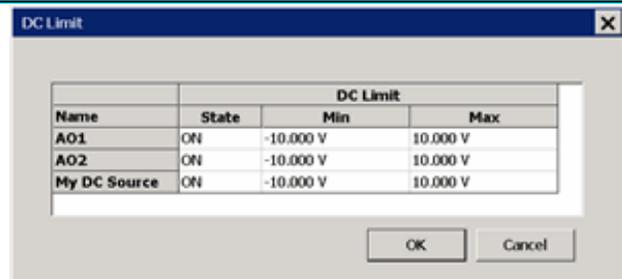

Start / Stop DC Set the start and stop voltages of the DC source. The PNA will step the voltage of the DC source from Start to Stop in increments = $(\text{Stop} - \text{Start}) / \text{Number of data points}$.

Buttons

Limits Click to start the DC Limits dialog.

Receiver Leveling For future use.

DC Limits dialog box help

Select the Minimum and Maximum voltages to which the specified DC sources can be set by the PNA.

ADC Measurements

The PNA is equipped with two ADC (Analog to Digital Converter) inputs on the rear-panel [Power I/O connector](#) (Pins 7 and 8). These ADC inputs can be used as measurement receivers and display measurements on the PNA screen.

- Analog Inputs (AI1 and AI2) can be used for measuring from -10V to +10V. These inputs can be considered auxiliary receivers and used in a similar way as S-Parameter receivers.
- Analog Output Sense inputs (AOS1 and AOS2) can be used to measure the corresponding DAC outputs.
- Analog Ground input (AIG) can be used to measure the instruments analog ground (PNA-X only).

Two DAC outputs are supplied on the [Power I/O connector](#) (Pins 3 and 4). These DAC outputs are controlled from the [DC Source Control dialog](#).

[Learn how to configure an external DC Source or DC Meter.](#)

How to create ADC receiver measurements

1. Press **TRACES**
2. then **[New Traces]**
3. then **[Receivers tab]**

1. Click **Trace/Chan**
2. then **New Trace**

Programming Commands

New Trace (ADC) dialog box help

Note: Sweep speed slows dramatically when measuring more than two ADC receivers.

On the [New Trace dialog](#), click the **Receivers** tab.

Activate - check any empty line to create a trace.

Numerator - select from the following:

- **AI1** or **AI2**- Input 1 or 2
- **AOS1** or **AOS2** - Output sense 1 or 2
- **AIG** - Analog ground (PNA-X only)

Denominator - NOT available (ONLY unratiod measurements)

Source Port - The ADC receiver is measured when the specified source port is sweeping. Select None to always measure the ADC receiver.

ADC receiver traces are labeled as shown in the following images:

- The ADC1 input is being measured, with 2 as the source port.
- The Y axis is U (unitless).
- The default trace [format](#) is Real (linear).
- To change the X-axis to display the ADC parameters, click **Response**, then **Display**, then **Labels**, then **Select X-Axis**, then select the ADC.

ADC Traces and other useful PNA functions

Although most PNA functions work with ADC traces, the following may be especially useful.

- [Equation Editor](#) can be used with the trace data. Although the PNA-X ADC is measuring voltage (-10V to +10V range in 14 bits), by using a trace formula, this voltage can represent other types of measurement parameters (such as current, temperature, or a scaled voltage). [See PAE example.](#)
- [Trace averaging](#) and [Trace Smoothing](#) can be used to remove trace noise.
- [Dwell time](#) can be used to allow for settling.

PNA Functions Not Supported

- Calibration for ADC receivers is NOT supported.
 - Not supported in [Noise Figure application](#)
-

Last Modified:

2-Aug-2012	Added noise figure
21-Feb-2012	Added DAC outputs and DC source control

Undo/Redo Settings

If you make an incorrect setting, you can quickly recover by selecting Undo. If you then incorrectly Undo a setting, you can Redo the undone setting.

- Undo and Redo applies ONLY to [selected PNA settings](#).
- The Undo stack remembers 16 levels of Undo-able settings.

How to Undo or Redo a setting

Tips:

- Click or touch the Undo and Redo Icons:

Undo Redo

- Undo/Redo can be stored to a User Key or Favorite softkey. [Learn more](#).
- With a mouse, right-click on the Softkeys or on the Entry toolbar.
- With a keyboard:
 - Undo....Ctrl+Z
 - Redo....Ctrl+Y

Using front-panel HARDKEY [softkey] buttons

1. Press **SYSTEM**
2. then [**Undo**]
3. then [**Undo**] <setting>
or [**Redo**] <setting>

PNA Menu using a mouse

1. Click **Utility**
2. then **Undo**
3. then **Undo**<setting>
or **Redo** <setting>

SCPI and COM programming and Undo/Redo:

- There are NO Programming commands to invoke Undo/Redo
- Programing commands are NOT Undo-able.

- The Undo stack is cleared when programming commands are sent to the PNA.

Clear Undo History

To clear the Undo stack, press **System**, then **Service**, then **Utilities**, then **Click Undo History**.

Undo and Security

- Undo/Redo is disabled with **High** and **Extra** security levels. [Learn more](#).
- State files that are saved for Undo/Redo purposes (for example: Preset) are deleted when any of the following occur:
 - The PNA Security level is changed
 - The PNA App is started or closed.

Selected Undo-able settings

You can Undo or Redo the following **PNA settings**:

Note: There are several PNA settings that are NOT Undo-able. Because of this, when you attempt to Undo a long sequence of operations, it is unlikely that the original state can be recreated exactly.

- [Preset](#)
- [File Recall](#)
- Frequency Settings:

11-Mar-2013	Removed Re-save state
6-Feb-2012	New topic

Dynamic Range

Dynamic range is the difference between the analyzer receiver's maximum input power and the minimum measurable power (noise floor). For a measurement to be valid, input signals must be within these boundaries.

Increasing dynamic range is important if you need to measure very large variations in signal amplitude, such as filter bandpass and rejection. The dynamic range is shown below for an example measurement.

To help reduce measurement uncertainty, the analyzer dynamic range should be greater than the response that the DUT exhibits. For example, measurement accuracy is increased when the DUT response is at least 10 dB above the noise floor. The following methods can help you increase the dynamic range.

- [Increase the Device Input Power](#)
- [Reduce the Receiver Noise Floor](#)
- [Improving Dynamic Range using the Front-Panel Jumpers](#)

[Other topics about Optimizing Measurements](#)

Increase Device Input Power

Increase the DUT input power so that the analyzer can more accurately detect and measure the DUT output power. However, use caution - too much power can damage the analyzer receiver or cause compression distortion.

Caution! Receiver input damage level: +15 dBm.

[See how to increase input power to the device](#)

Tip: You can further increase dynamic range by using an external booster amplifier to increase the input power to the DUT. See [High Power Amplifier Measurements](#).

Reduce the Receiver Noise Floor

You can use the following techniques to lower the noise floor and increase the analyzer's dynamic range.

- Reduce crosstalk between the PNA receivers when measuring signals close to the noise floor. See [Receiver Crosstalk.](#))
- Use **Sweep Averaging** - learn more about [Sweep Average](#)
- Reduce the **IF Bandwidth** - learn more about [IF Bandwidth.](#)
- In [Segment sweep](#) mode each segment can have its own IF bandwidth. For example, when measuring a filter:
 - In the passband, the IF bandwidth can be set wider for a fast sweep rate, as long as high-level trace noise is kept sufficiently small.
 - In the reject band, where noise floor contributes significantly to measurement error, the IF bandwidth can be set low enough to achieve the desired reduction in average noise level.

Improving Dynamic Range using the Front-Panel Jumpers

Direct Access

The simplest method to improve dynamic range is to remove a RCVR 'n' IN [front-panel jumper](#) and route the DUT output directly into that PNA receiver. This bypasses the directional coupler and limits the ability to provide Full Error Correction because the signal can not be applied in the reverse direction.

Refer to the [PNA specifications](#) to learn the dynamic range that is available with direct receiver access.

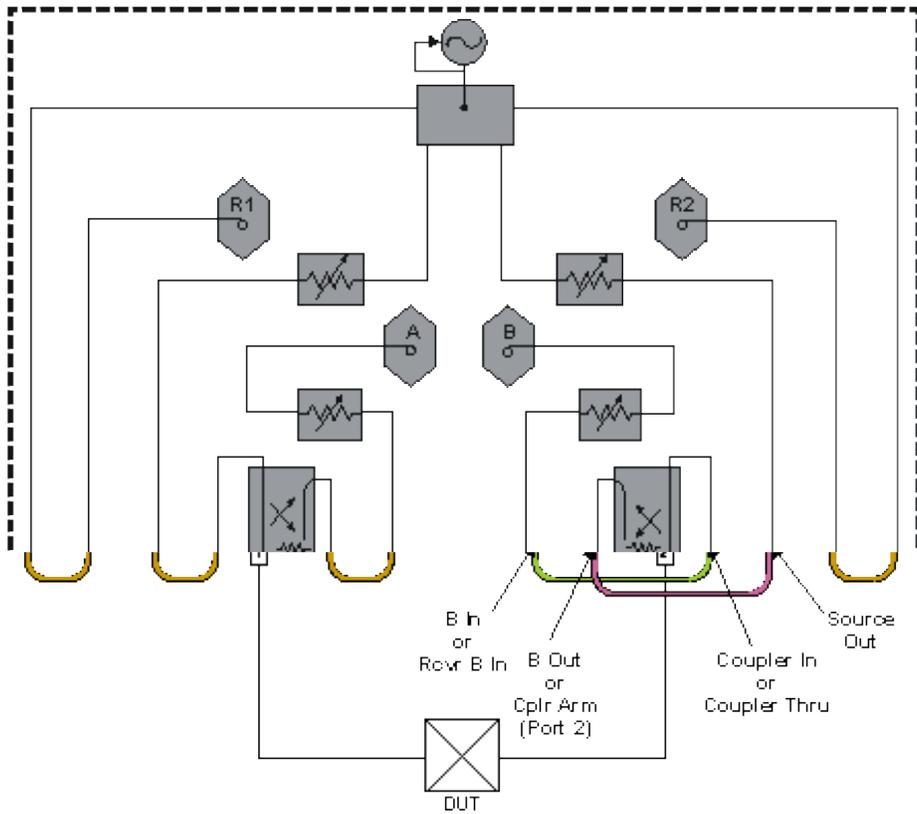

Reverse the directional coupler

Another method to improve dynamic range is to reverse the signal path in the test-port coupler and bypass the loss typically associated with the coupled arm.

As shown in the following graphic, the signal is applied to Port 2. The signal bypasses the coupled arm via the jumper cable connected to the Coupler Thru (or Coupler In) and the Receiver B In (or B In) ports.

When making measurements in reverse direction, the system dynamic range is degraded by 15 dB.

Note: Your analyzer's block diagram may contain different components than shown below. To see the block diagram for your PNA model, see the bottom of the [specs/data sheet](#).

[Specifications](#)

Last Modified:

- 5-Jan-2011 Removed old E835x std reference
- 5-Aug-2008 Combined several topics

Number of Points

A data point is a sample of data representing a measurement at a single stimulus value. You can specify the number of data points that the PNA measures across a sweep. (A "sweep" is a series of consecutive data point measurements, taken over a sequence of stimulus values.)

The PNA sweep time changes proportionally with the number of points. However, the overall measurement cycle time does not. See [Technical Specifications](#) for more information on how the number of points, and other settings, affect the sweep time.

How to change the number of data points

Select a number or click Custom to invoke a [dialog box](#)

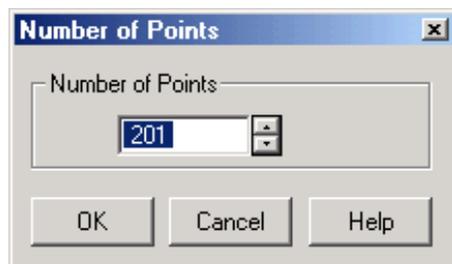

Using front-panel HARDKEY [softkey] buttons

1. Press **SWEEP**
2. then **[Number of Points]**

Using a mouse with PNA Menu

1. Click **Stimulus**
2. then **Sweep**
3. then **Number of Points**

← Programming Commands →

Number of Points dialog box help

Specifies the number of data points that the analyzer gathers during a measurement sweep. You can specify any number from **1** to **100,001**. The default value is 201.

Note: Some [measurement classes](#) may have different maximum points limitations.

Two data points are required for [Time Domain](#).

Tips:

- To achieve the greatest trace resolution, use the maximum number of data points.
- For faster throughput use the smallest number of data points that will give you acceptable resolution.
- To find an optimized number of points, look for a value where there is not a significant difference in the measurement when you increase the number of points.
- To ensure an accurate measurement calibration, perform the calibration with the same number of points that will be used for the measurement.

Phase Measurement Accuracy

You can increase the accuracy of phase measurements by using the following PNA features

- [Electrical Delay](#)
- [Phase Offset](#)
- [Spacing Between Frequency Points \(Aliasing\)](#)

See Also

[Port Extensions](#)

[Comparing the PNA Delay Functions](#)

[Phase Control](#)

[Phase Coherent Measurements](#)

[Learn more about Phase measurements](#)

Electrical Delay

Electrical delay is a mathematical function that simulates a variable length of lossless transmission line.

Use the electrical delay feature to compensate for the linear phase shift through a device. This feature allows you to look at only the [deviation from linear phase](#) of the device.

You can set the electrical delay independently for each measurement trace.

How to set Electrical Delay

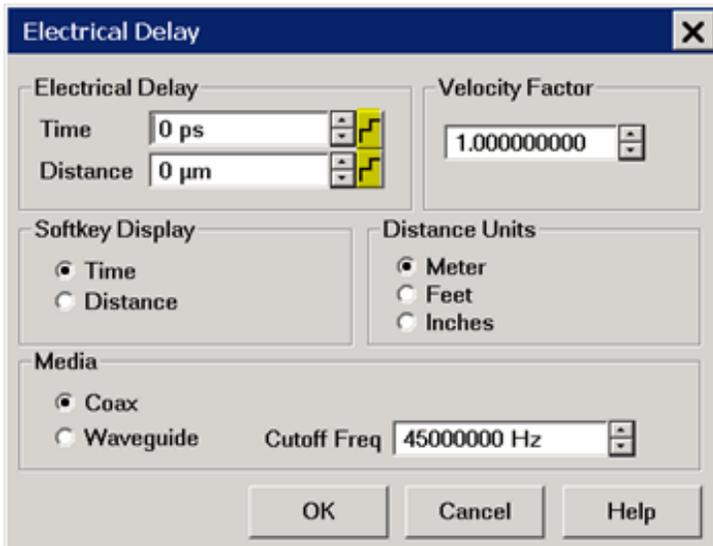

Using front-panel HARDKEY [softkey] buttons

1. Press **SCALE**
2. then **[Electrical Delay]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Scale**
3. then **Electrical Delay**

[Programming Commands](#)

Electrical Delay dialog box help

Electrical Delay Specifies the value of delay added or removed, in Time or Distance. This compensates for the linear phase shift through a device. You can set the electrical delay independently for each measurement trace.

Click the Step  icon next to either Time or Distance to start the [Step Size dialog](#).

Velocity Factor Specifies the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum.

Velocity factor can also be set from the [Port Extensions](#) dialog and [Time Domain Distance Marker Settings](#).

Softkey Display Allows you to enter delay in either Time or Distance using the softkeys and [Active Entry toolbar](#).

Distance Units Select from Meters, Inches, or Feet. The step size will not change automatically when this value is changed. [Learn more about Step Size](#).

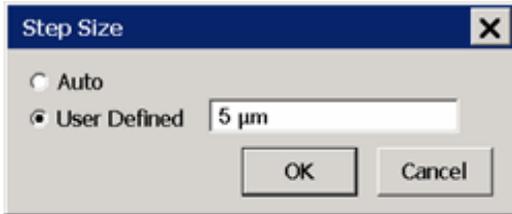

Media

Coax Select if the added length is coax. Also specify the velocity factor of the coax.

Waveguide Select if the added length is waveguide. Also specify the low frequency cutoff of the waveguide.

Cutoff Freq Low frequency cutoff of the waveguide.

Learn about [Electrical Delay](#) (scroll up)

Step Size dialog box help

Changes the step size that occurs when the Time or Distance up/down arrows are pressed on the Electrical Delay dialog.

Auto Step Size is set to the default value.

User Defined Enter a step size value, then click OK.

This value remains the same when the units are changed. For example if a step size of 12 is entered on this dialog, then you change the units from Inches to Feet, the step size of 12 inches becomes 12 feet, not 1 feet. Therefore, change the units first, then set the step size.

Phase Offset

Phase offset mathematically adjusts the phase measurement by a specified amount, up to 360°. Use this feature in the following ways:

- **Improve the display of a phase measurement.** This is similar to the way you would change the reference level in an amplitude measurement. Change the phase response to center or align the response on the screen.
- **Emulate a projected phase shift in your measurement.** For example, if you know that you need to add a cable and that the length of that cable will add a certain phase shift to your measurement, you can use phase offset to add that amount and simulate the complete device measurement.

How to set Phase Offset

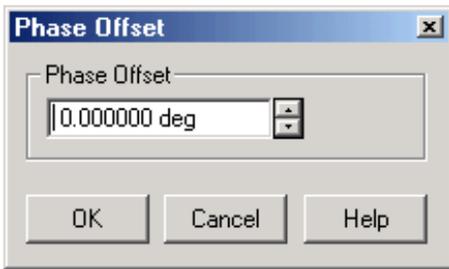

Using front-panel HARDKEY [softkey] buttons

1. Press **SCALE**
2. then **[Phase Offset]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Scale**
3. then **Phase Offset**

◀ Programming Commands ▶

Phase Offset dialog box help

Phase Offset Type a value or use the up and down arrows to select any value up to 360 degrees.

Learn about [Phase Offset](#) (scroll up)

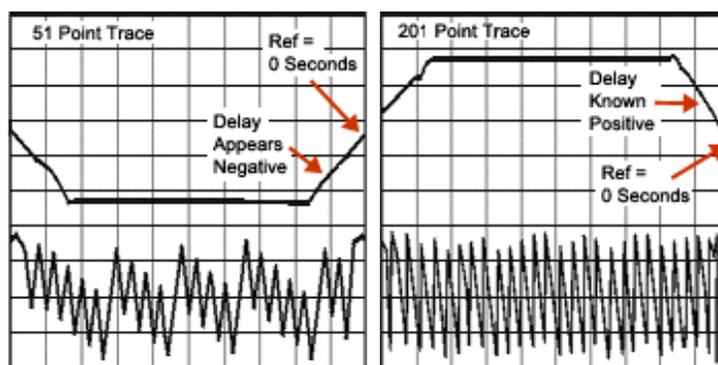

Spacing Between Frequency Points (Aliasing)

The analyzer samples data at discrete frequency points, then connects the points, creating a trace on the screen.

If the phase shift through a device is $>180^\circ$ between adjacent frequency points, the display can look like the phase slope is reversed. This is because the data is undersampled and aliasing is occurring.

If you are measuring group delay and the slope of the phase is reversed, then the group delay will change sign. For example, the following graphic shows a measurement of a SAW bandpass filter.

- The left measurement has 51 points and indicates the group delay is negative, which is a physical impossibility. That is, the response is below 0 seconds reference line.
- The right measurement shows an increase to 201 points which indicates the group delay is positive. That is, the response is above the 0 seconds reference line.

Tip: To check if aliasing might be occurring in a measurement, either [increase the number of points](#) or [reduce the frequency span](#).

Phase-Coherent Measurements

Coherent phase means that the measurement does NOT have random phase. Coherent-phase measurements require the comparison of phase between two sources that are sweeping simultaneously. It also requires that two receivers are measuring the two sources simultaneously.

This capability is available in the PNA-X using several applications:

- [iTMSA](#) (Opt 460) provides phase-coherent Balanced measurements.
- [Phase Control](#) (Opt 088) provides phase-coherent CW or Phase Sweep measurements.
- **R/R measurements** can provide simple phase-coherent measurements.

How to make phase-coherent R/R (R over R) measurements

To make a phase-coherent R/R measurements, both sources must be ON simultaneously, and the receiver measurements must be made on the same sweep. On a 4-port PNA-X, the two sources are NOT available at all PNA ports simultaneously. It is important to [learn these restrictions](#). Also, both receiver measurements must be made on the same sweep.

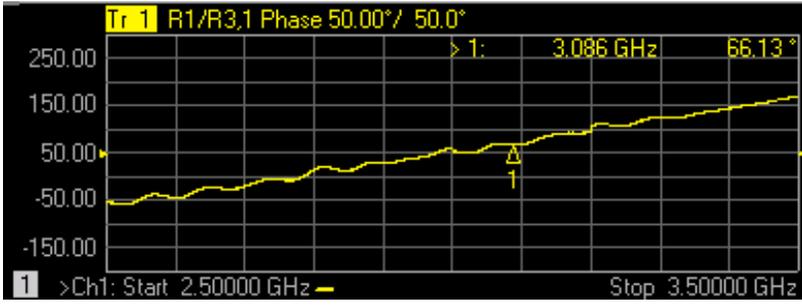

1. Create a ratioed receiver measurement using two reference receivers. [Learn how](#). For example, you might create an R1/R3 measurement, specifying the source port as either 1 or 3.

2. The source port that is selected above is turned on automatically. The other source port (port 3 in this case) must be turned ON manually using the [Power and Attenuators dialog](#).

Name	State
Port 1	Auto
Port 2	Auto
Port 3	ON
Port 4	Auto

3. Select a phase format. [Learn how](#).

Electrically-Long Device Measurements

A signal coming out of a device under test may not be exactly the same frequency as the signal going in to a device at a given instant in time. This can sometimes lead to inaccurate measurement results. You can choose between two techniques to eliminate this situation and increase measurement accuracy.

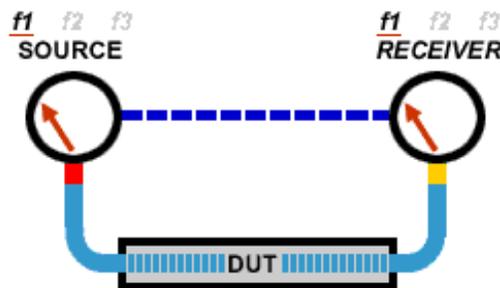

- [Why Device Delay May Create Inaccurate Results](#)
- [Solutions to Increase Measurement Accuracy](#)
 - [Slow the Sweep Speed](#)
 - [Add Electrical Length to the R Channel](#)

Other topics about Optimizing Measurements

Why Device Delay May Create Inaccurate Results

The following graphic shows an example of this situation:

- In the network analyzer, the source and receiver are **phase** locked together and sweep simultaneously through a span of frequencies.
- The signal flow through the Device Under Test (DUT) is shown as different colors for different frequencies.
- You can see as a stimulus frequency travels through the **DUT**, the analyzer tunes to a new frequency **just before** the signal arrives at the receiver. This causes inaccurate measurement results.

If the analyzer is measuring a long cable, the signal frequency at the end of the cable will lag behind the network analyzer source frequency. If the frequency shift is appreciable compared to the network analyzer's IF **detection** bandwidth (typically a few kHz), then the measured result will be in error by the rolloff of the IF filter.

Note: There is no fixed electrical length of a device where this becomes an issue. This is because there are many variables that lead to measurement speed. When high measurement accuracy is critical, lower the sweep speed until measurement results no longer change.

Solutions to Increase Measurement Accuracy

Choose from the following methods to compensate for the time delay of an electrically long device.

Slow the Sweep Speed

The following methods will slow the sweep speed.

- [Increase the Sweep Time](#)
- [Increase the Number of Points](#)
- [Use Stepped Sweep](#)
- [Set Dwell Time](#)

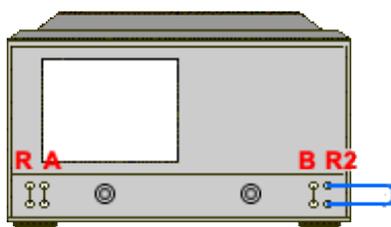

Add Electrical Length to the R Channel

Note: This method applies to PNA models with front panel loops.

Instead of slowing the sweep, you can compensate for the electrical length of a cable or fixture.

- Remove the R-channel jumper on the front panel of the analyzer.
- Replace the jumper with a cable of about the same length as the device under test.
 - Add the cable on the R1 channel for S_{11} and S_{21} measurements.
 - Add the cable on the R2 channels for S_{22} and S_{12} measurements.
- Set the analyzer for a fast sweep.

Configuration for S_{22} and S_{12} Measurements

This method balances the delays in the reference and test paths, so that the network analyzer's ratioed transmission measurement does not have a frequency-shift error.

Note: This method works well if the delay is in a cable or fixture. For devices with long delays, this method is only suitable for uncalibrated measurements.

Reflection Accuracy on Low-Loss 2-Port Devices

To make accurate reflection measurements that have a 1-port calibration, you should terminate the unmeasured port.

- [Why Terminate the Unmeasured Port](#)
- [How to Terminate the Unmeasured Port](#)
- [Resulting Measurement Uncertainty](#)

Other topics about Optimizing Measurements

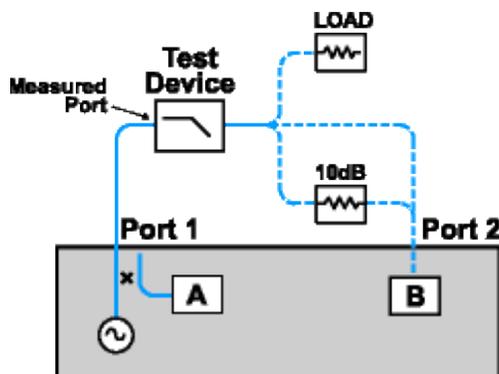

Why Terminate the Unmeasured Port

A 2-port calibration corrects for all 12 twelve error terms. A 1-port calibration corrects for directivity, source match and frequency response, but not load match. Therefore, for highest accuracy, you must make the load match error as small as possible. This especially applies for low-loss, bi-directional devices such as filter passbands and cables. You do not need to be concerned with load match when you are measuring a device with high reverse isolation, such as an amplifier.

How to Terminate the Unmeasured Port

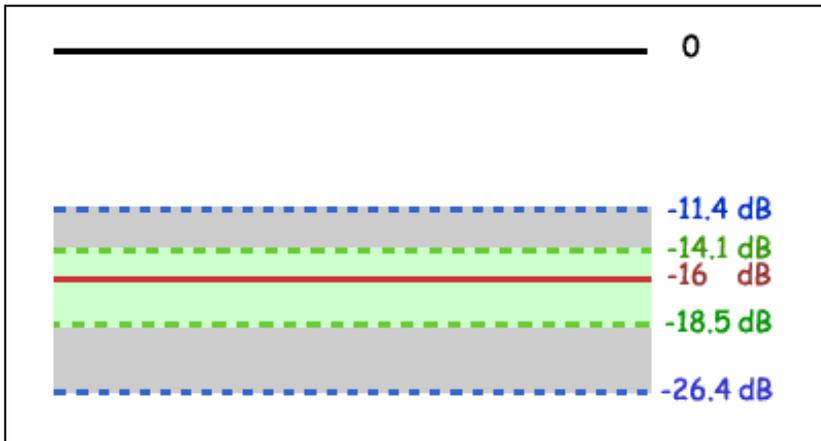

Use one of the following methods:

- Connect a high-quality termination load (from a calibration kit, for example) to the unmeasured port of your device. This technique yields measurement accuracy close to that of a Full SOLT 2-port calibration.
- Connect the unmeasured port of your device directly to the analyzer, inserting a 10 dB precision attenuator between the device output and the analyzer. This improves the effective load match of the analyzer by approximately twice the value of the attenuator, or 20 dB.

Resulting Measurement Uncertainty

The following graph illustrates the measurement uncertainty that results from terminating **with** and **without** a precision 10 dB attenuator on the output of the test device.

Legend

- Filter Reflection
- Uncertainty **with** attenuator
- Uncertainty **without** attenuator

The calculations below show how adding a high-quality 10 dB attenuator improves the load match of the analyzer.

Note: The corresponding linear value is shown in parentheses.

Network Analyzer:

$$\text{Load match (NA}_{LM}) = 18 \text{ dB } (.126)$$

$$\text{Directivity (NA}_{D}) = 40 \text{ dB } (.010)$$

Filter:

$$\text{Insertion loss (F}_{IL}) = 1 \text{ dB } (.891)$$

$$\text{Return loss (F}_{RL}) = 16 \text{ dB } (.158)$$

Attenuator:

$$\text{Insertion loss (A}_{\text{IL}}) = 10 \text{ dB (.316)}$$

$$\text{SWR (A}_{\text{SWR}}) = 1.05 (.024)$$

$$32.26 \text{ dB Return Loss}$$

Calculations:

	Without Attenuator	With Attenuator
ρ_{NA}	$= (\text{F}_{\text{IL}}) * (\text{N}_{\text{ALM}}) * (\text{F}_{\text{IL}})$ $= (.891) * (.126) * (.891)$ $= .100$	$= (\text{F}_{\text{IL}}) * (\text{A}_{\text{IL}}) * (\text{N}_{\text{ALM}}) * (\text{A}_{\text{IL}}) * (\text{F}_{\text{IL}})$ $= (.891) * (.316) * (.126) * (.316) * (.891)$ $= .010$
$\rho_{\text{Attenuator}}$	NA	$= (\text{F}_{\text{IL}}) * (\text{A}_{\text{SWR}}) * (\text{F}_{\text{IL}})$ $= (.891) * (.024) * (.891)$ $= .019$
Worst Case Error (EWC)	$= \rho_{\text{NA}}$ $= .1$	$= \rho_{\text{NA}} + \rho_{\text{Attn.}}$ $= .01 + .019$ $= .029$

Uncertainty Adds	$= -20\log(\text{F}_{\text{RL}}) + (\text{EWC}) + (\text{NAD})$ $= -20\log(.158) + (.100) + (.010)$ $= \mathbf{11.4 \text{ dB}}$	$= -20\log(\text{F}_{\text{RL}}) + (\text{EWC}) + (\text{NAD})$ $= -20\log(.158) + (.029) + (.010)$ $= \mathbf{14.1 \text{ dB}}$
-------------------------	--	--

Uncertainty Subtracts	$= -20\log(\text{F}_{\text{RL}}) - (\text{EWC}) - (\text{NAD})$ $= -20\log(.158) - (.100) - (.010)$ $= \mathbf{26.4 \text{ dB}}$	$= -20\log(\text{F}_{\text{RL}}) - (\text{EWC}) - (\text{NAD})$ $= -20\log(.158) - (.029) - (.010)$ $= \mathbf{18.5 \text{ dB}}$
------------------------------	--	--

Measurement Stability

There are several situations that can cause unstable measurements. To ensure that you are making repeatable measurements, you can use various methods to create a stable measurement environment.

- [Frequency Drift](#)
- [Temperature Drift](#)
- [Inaccurate Measurement Calibrations](#)
- [Device Connections](#)

Other topics about Optimizing Measurements

Frequency Drift

The analyzer frequency accuracy is based on an internal 10 MHz frequency oscillator. See [Technical Specifications](#) for stability and aging specifications.

If your measurement application requires better frequency accuracy and stability, you can override the internal frequency standard and provide your own high-stability external frequency source through the 10 MHz Reference [Input connector on the rear panel](#).

Temperature Drift

Thermal expansion and contraction changes the electrical characteristics of the following components:

- Devices within the analyzer
- Calibration kit standards
- Test devices
- Cables
- Adapters

To reduce the effects of temperature drift on your measurements, do the following.

- Switch on the analyzer 1/2 hour before performing a measurement calibration or making a device measurement.
- One hour before you perform a measurement calibration, open the case of the calibration kit and take the

standards out of the protective foam.

- Use a temperature-controlled environment. All specifications and characteristics apply over a 25 °C \pm 5 °C range (unless otherwise stated).
- Ensure the temperature stability of the calibration kit devices.
- Avoid handling the calibration kit devices unnecessarily during the calibration procedure.
- Ensure the ambient temperature is \pm 1°C of the measurement calibration temperature.

Inaccurate Measurement Calibrations

If a measurement calibration is inaccurate, you will not measure the true response of a device under test. To ensure that your calibration is accurate, you should consider the following practices:

- Perform a measurement calibration at the points where you connect the device under test, that is, the reference plane.
- If you insert any additional accessory (cable, adapter, attenuator) to the test setup after you have performed a measurement calibration, use the port extensions function to compensate for the added electrical length and delay.
- Use calibration standards that match the definitions used in the calibration process.
- Inspect, clean, and gage connectors. See [Connector Care](#).

See [Accurate Measurement Calibrations](#) for more detailed information.

Device Connections

Good connections are necessary for repeatable measurements. To help make good connections, do the following:

- Inspect and clean the connectors for all of the components in the measurement setup.
- Use proper connection techniques.
- Avoid moving the cables during a measurement.

Noise Reduction Techniques

Random electrical noise which shows up in the analyzer receiver chain can reduce measurement accuracy. The following PNA functions help reduce trace noise and the noise floor which can lead to better dynamic range and more accurate measurements.

Note: The trace noise in microwave PNAs becomes worse below 748 MHz and is especially obvious between 10 MHz and 45 MHz. See [Reduce IFBW](#).

- [Averaging](#)
- [IF Bandwidth](#)
- [Trace Smoothing](#)

See Also

[Group Delay](#)

[Increase Dynamic Range](#)

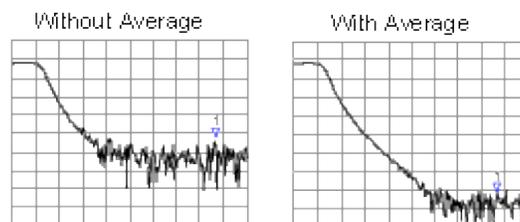

[PNA data processing map](#).

Other topics about Optimizing Measurements

Averaging

Averaging is a feature that reduces the effects of random noise on a measurement. The PNA computes **each data point** based on the average of several measurements. You determine the number of measurements by setting the Average factor. The higher the average factor, the greater the amount of noise reduction.

Effects of Sweep Average

Both **Averaging** and [IF Bandwidth](#) can be used for the same benefit of general noise reduction. For minimizing very low noise, Averaging is more effective than reducing IF bandwidth. Generally, Averaging takes slightly longer than IF bandwidth reduction to lower noise, especially if many averages are required. Also, changing the IF bandwidth after calibration results in [uncertain accuracy](#).

How to Set Averaging

Using front-panel HARDKEY [softkey] buttons

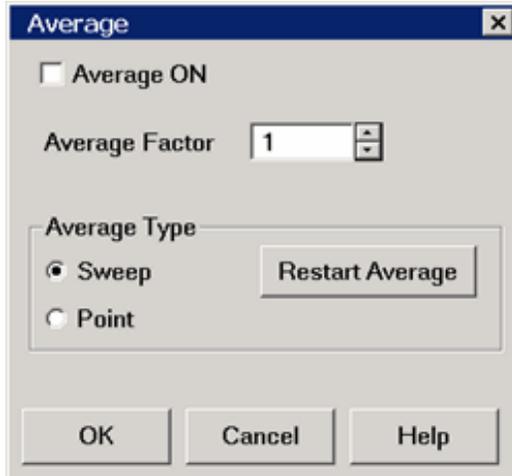

1. Press **AVG**
2. then [**Averaging**]

Using a mouse with PNA Menus

1. Click **Response**
2. then **Avg**
3. then **Average**

Programming Commands

Average dialog box help

Average ON Check to enable Averaging.

Average Factor Specifies the number of measurements that are averaged. Range of 1 to 65536 (2^{16}).

Average Type

Sweep Each data point is based on the average of the same data point measured over consecutive sweeps. When the number of sweeps = Average Factor, the averaging continues following the [Sweep Averaging formula](#).

(Sweep) Restart Begins a new set of measurements that are used for the average. Applies only to Sweep averaging - NOT Point.

Point Each data point is measured the number of times specified by the Average Factor, and then averaged, before going to the next data point.

- On subsequent sweeps, averaging is automatically restarted by measuring each data point again the number of times specified by the Average Factor.
- Because measurements occur quickly in the background, the Average Counter is NOT updated.
- Point averaging is NOT available in [Gain Compression](#), or [Noise Figure](#) Apps.

Notes

- An **Average Counter** appears on the screen when Sweep averaging is selected, displaying the number of sweeps that has been averaged. The effect on the signal trace can be viewed as the Average Factor increases. This can assist in the selection of the optimum number of sweep averages. The Average Counter is NOT updated for **Point** averaging.
- **Channel-wide scope-** Averaging is enabled and the factor is set for all measurements in a channel. The Average counter is displayed for each channel.
- **Calibration** - Because averaging is a mathematical process that occurs after the raw measurement is made, averaging can be turned ON before or after calibration without invalidating the error correction terms. If averaging is ON before calibration, the measurement of calibration standards are averaged measurements. More time is needed to perform the calibration, but there will be less noise in the resulting error correction terms. Subsequent corrected measurements will also have less noise error. In addition, noise is further reduced by turning Averaging ON after calibration. [See the PNA data processing map.](#)
- **PNA Triggering** is implemented separately from Averaging. For example, setting averaging factor to 4 has NO effect on the number of triggers that are required to achieve 4 sweeps or 4 data points.
- **Unratioed** measurements - Although averaging unratioed (single receiver) measurements is allowed, you may see unexpected results.
 - The noise floor does not drop when averaging unratioed measurements as on ratioed measurements.
 - Phase results may tend toward 0. This is because phase measurements are relative by nature. Measuring absolute phase with a single receiver appears random. Averaging random positive and negative numbers will tend toward 0.

Sweep Averaging Formula

$$\text{NewAvg} = (\text{NewData}/n) + [\text{OldAvg} * (n-1/n)]$$
 'where n = average factor'

From the formula, you can see that data from the first **n** sweeps continues to be included in the results of subsequent sweeps. Its effect is increasingly smaller but never diminishes to zero. For example, with $n = 5$, the average of the 5 sweeps is displayed. On the 6th sweep, you see $4/5$ the average of the first 5 sweeps plus $1/5$ the new sweep.

The effects of older data can be eliminated by clicking **Restart**.

[Learn more about Averaging](#) (scroll up)

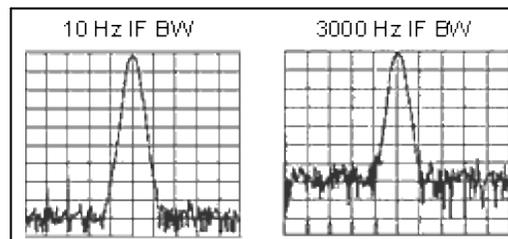

IF Bandwidth

The PNA converts the received signal from its source to a lower intermediate frequency (IF). The bandwidth of the IF bandpass filter is adjustable from 40 kHz (for most PNA models) down to a minimum of 1 Hz.

Reducing the IF receiver bandwidth reduces the effect of random noise on a measurement. Each tenfold reduction in IF bandwidth lowers the noise floor by 10 dB. However, narrower IF bandwidths cause longer sweep times.

- **Channel wide** - IF bandwidth can be set independently for each channel
- **Segment sweep** - IF bandwidth can be set independently for each segment of segment sweep.
- **Calibration** - Changing the IF bandwidth after calibration will cause a ['C-delta' correction level](#), which means that calibration accuracy is uncertain.

Effect of Reducing IF Bandwidth

How to set IF Bandwidth

Using front-panel HARDKEY [softkey] buttons

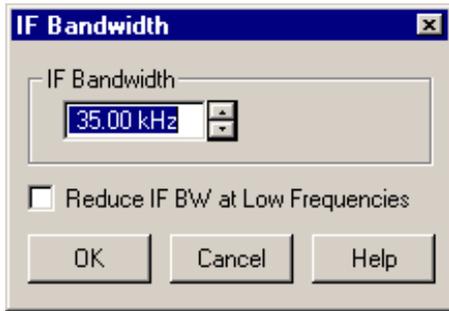

1. Press **Avg**
2. then **[IF Bandwidth]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Avg**
3. then **IF Bandwidth**

[Programming Commands](#)

[IF Bandwidth dialog box help](#)

IF Bandwidth Specifies the IF (receiver) bandwidth. The value of IF bandwidth is selected by scrolling through the values available in the IF bandwidth text box. The IF BW is set independently for each channel.

The list of selectable IF Bandwidths is different depending on PNA model.

The following values are common to all models:

- **1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k**

In addition, the following values are PNA Model specific:

5230A/C Opts 020, 025, 120, 125, 140, 145, 146, 240, 245, 146

- **50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k**

N5230A/C Opts 220, 225, 420, 425, 520, 525:

- **50k | 70k | 100k | 150k | 200k | 250k**

E836x models:

- **35k | 40k**

PNA-X and N522x:

- **50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k | 1M | 1.5M | 2M | 3M | 5M | 7M | 10M | 15M**

- For the highlighted IFBW settings (1 MHz and above):

- 1 MHz to **5 MHz** settings are available ONLY with [DSP version](#) 4.0 and above.
- 7 MHz to **15 MHz** settings are available ONLY with [DSP version](#) 5.0 and above.
- These settings are used to make [wideband pulsed](#) measurements. They do NOT provide faster

sweep speeds for non-pulsed measurements.

- A slight shift (1dB or more) in Log Mag traces may be seen when switching in and out of these bandwidths.
- Available in [Step sweep](#) mode only - NOT available in Analog sweep.

Reduce IF BW at Low Frequencies

On PNA models with a maximum frequency of 20 GHz and higher, the trace noise becomes worse below about 400 MHz. This is especially obvious between 10 MHz and 45 MHz and also when Time Domain is ON. [See PNA models / maximum frequencies.](#)

When this box is checked, the PNA uses a smaller IF Bandwidth than the selected value at frequencies indicated below.

This setting:

- can be made for each channel.
- is ON (checked) by default.
- also applies to [segment sweep](#).

Use the following calculations to determine the actual IF Bandwidth that is used. If the result is NOT a selectable IF BW, the next higher selectable value is used.

In the following table and example, the next band starts at .01 Hz above the Stop Frequency. This is indicated with '+'.

Stop Frequency	PNA Model						
	N5241A N5242A	N5221A N5222A	N5244A N5245A	N5224A N5225A	N5247A	N5227A	N5234A N5235A
14 MHz	0.05	0.05	0.005	0.005	0.005	0.005	0.025
19 MHz	0.05	0.05	0.005	0.005	0.005	0.005	0.025
27 MHz	0.05	0.05	0.01	0.005	0.01	0.005	0.025
38 MHz	0.05	0.05	0.01	0.005	0.01	0.005	0.025
53 MHz	0.05	0.05	0.015	0.005	0.015	0.005	0.025
75 MHz	0.1	0.1	0.025	0.025	0.025	0.025	0.025
105 MHz	0.1	0.1	0.05	0.025	0.05	0.025	0.025
146 MHz	0.14	0.1	0.1	0.025	0.1	0.025	0.025
175 MHz	0.14	0.1	0.15	0.025	0.15	0.025	0.025
205 MHz	0.29	0.29	0.15	0.15	0.15	0.15	0.025
250 MHz	0.5	0.29	0.25	0.15	0.25	0.15	0.025

396 MHz	1	1	0.5	0.5	0.5	0.5	1
396+ MHz and above	1	1	1	1	1	1	1

Example:

On a N5224A, the selected IF BW is 30 KHz.

With **Reduce IF BW at Low Frequencies** checked, the actual IF Bandwidths used are:

- From 53+ MHz to **175 MHz**: $30,000\text{Hz} * .025 = 750 \text{ Hz}$ (next higher selectable value: **1 kHz**.)
- From 175+ MHz to **250 MHz**: $30,000\text{Hz} * .15 = 4.5 \text{ kHz}$ (next higher selectable value: **5 kHz**.)
- From 250+ MHz to 396 MHz: $30,000\text{Hz} * .5 = 15 \text{ kHz}$
- From 396+ MHz to stop sweep = 30 kHz

OK Selects the IF BW value shown in the text box.

[Learn about IF Bandwidth](#) (scroll up)

Trace Smoothing

Trace smoothing averages a number of **adjacent** data points to smooth the displayed trace. The number of adjacent data points that get averaged together is also known as the smoothing aperture. You can specify aperture as either the number of data points or the percentage of the x-axis span.

Trace Smoothing reduces the peak-to-peak noise values on broadband measured data. It smooths trace noise and does not increase measurement time significantly.

Because Trace Smoothing follows Format in the PNA data processing map, the formatted data is smoothed. Smoothing is automatically turned off if the format is Polar or Smith Chart.

[Learn more about Data Format Types.](#)

[See the PNA data processing map.](#)

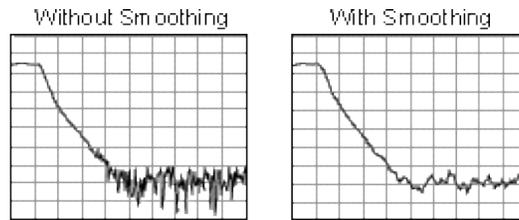

Tips:

- Start with a high number of display points and reduce until you are confident that the trace is not giving misleading results.
- Do not use smoothing for high-resonance devices, or devices with wide trace variations. It may introduce

misleading information.

- Smoothing is set independently for each trace.

Effects of Smoothing on a Trace

How to set Trace Smoothing

Using front-panel HARDKEY [softkey] buttons

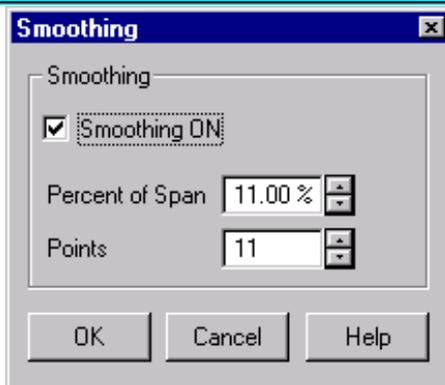

1. Press **Avg**
2. then [**Smoothing**]

Using a mouse with PNA Menus

1. Click **Response**
2. then **Avg**
3. then **Smoothing**

◀ Programming Commands ▶

Smoothing dialog box help

Smoothing ON When checked, applies smoothing to the displayed trace.

Percent of Span Specify percent of the swept stimulus span to smooth. For example, for a trace that contains 100 data points, and specify a percent of span = 11%, then the number of data points

that are averaged is 11.

Points Specify the number of adjacent data points to average.

Crosstalk

Crosstalk is energy leakage between analyzer signal paths. This can be a problem with high-loss transmission measurements. Although the [crosstalk specification](#) of the PNA is exceptional, you can reduce the effects of crosstalk by doing the following:

- [Set the Sweep to Alternate](#)
- [Perform an Isolation Calibration](#)

Other topics about Optimizing Measurements

Set the Sweep to Alternate

This selection is longer available from the user interface. [Learn more.](#)

Perform an Isolation Calibration

For transmission measurements, a response and isolation measurement calibration helps reduce crosstalk because the analyzer measures and then subtracts the leakage signal during the measurement calibration. The calibration improves isolation so that it is limited only by the noise floor.

Note: Isolation is never performed on a Smart (Guided) Calibration. [Learn more.](#)

Generally, the isolation error falls below the noise floor. So when you are performing an isolation calibration you should use a noise reduction technique such as sweep averages or reducing the IF bandwidth.

Effects of Accessories

Accessories in a configuration may affect the results of a device measurement. You can choose between two analyzer features that reduce the effects of accessories

- [Power Slope to Compensate for Cable Loss](#)
- [Gating to Selectively Remove Responses](#)

Other topics about Optimizing Measurements

Power Slope to Compensate for Cable Loss

If you have a long cable or other accessory in a measurement configuration where a power loss occurs over frequency, apply the power slope function. This function increases the analyzer source power by a rate that you define (dB/GHz).

1. In the **Channel** menu, click **Power**.
2. If the slope function is not already switched on, click the **Slope** check box.
3. In the **dB/GHz** box, enter the rate that you want the source power to increase over the frequency sweep. Click **OK**.

Gating to Selectively Remove Responses

Gating is a feature in the time domain (option 010) that allows the analyzer to mathematically remove responses. You can set the gate for either a reflection or transmission response, but you will see different results.

- **Gating a reflection response** isolates a desired response (such as a filter's return loss), from unwanted responses (such as adapter reflections or connector mismatches).
- **Gating a transmission response** isolates a specific path in a multipath device that has long electrical lengths.

See [Time Domain Gating](#) for more information.

Achieve Fastest Sweep

You can achieve the fastest measurement sweep by adjusting the following:

- [Sweep Settings](#)
- [Noise Reduction Settings](#)
- [Measurement Calibration Choice](#)
- [Unnecessary Functions](#)

Other topics about Optimizing Measurements

Sweep Settings

Consider changing each of the following settings as suggested.

- [Frequency Span](#) - Measure only the frequencies that are necessary for your device.
- [Segment Sweep](#) - Use segments to focus test data only where you need it.
- [Switch Off Stepped Sweep](#) - Use linear swept mode to minimize sweep time when possible.
- [Auto Sweep Time](#) - Use this default to sweep as quickly as possible for the current settings.
- [Number of Points](#) - Use the minimum number of points required for the measurement.

For more information on how number of points and other settings affect sweep cycle time, see [Technical Specifications](#).

Noise Reduction Settings

Using a combination of these settings, you can decrease the sweep time while still achieving an acceptable measurement.

- [IF Bandwidth](#). Use the widest IF bandwidth that will produce acceptable trace noise and [dynamic range](#).
- [Average](#). Reduce the average factor, or switch Average off.

Measurement Calibration Choice

Choose the appropriate type of calibration for the required level of accuracy.

When full 2-port error correction is applied, the PNA takes both forward and reverse sweeps to gather all 12 error correction terms. This occurs even with a single S11 measurement displayed. All displayed measurements are updated as the second sweep is performed. Both sweeps are performed using the specified sweep time.

When calibrating greater than 2 ports, the following formula is used to determine the number of sweeps required:

- $N * (N-1)$ where N = the number of ports.

When full 3-port calibration is applied, 6 sweeps are required; forward and reverse for each port pair. With full 4-port correction, 12 sweeps are required, and so forth.

To limit the measurement time, perform ONLY the level of calibration that your measurements require. For example, if making only an S11 measurement, perform a 1-port calibration on that port.

Sweep speed is about the same for uncorrected measurements and measurements done using a response calibration, or one-port calibration. For more information see [Select a Calibration](#).

Unnecessary Functions

The analyzer must update information for all active functions. To achieve an additional increase in sweep speed, switch off all of the analyzer functions that are not necessary for your measurement application.

- [Delete Unwanted Traces](#)
- [Switch Off Unwanted Markers](#)
- [Switch Off Smoothing](#)
- [Switch Off Limit Testing](#)
- [Switch Off Math Functions](#)

Analyzer sweep speed is dependent on various measurement settings. Experiment with the settings to get the fastest sweep and the measurement results that you need.

Switch Between Multiple Measurements

If you need to make multiple measurements to characterize a device, you can use various methods to increase throughput. Experiment with these methods to find what is best for your measurement application needs.

- [Set Up Measurements for Increased Throughput](#)
 - [Arrange Measurements in Sets](#)
 - [Use Segment Sweep](#)
 - [Trigger Measurements Selectively](#)
- [Automate Changes Between Measurements](#)
- [Recall Measurements Quickly](#)

Other topics about Optimizing Measurements

Set Up Measurements for Increased Throughput

To achieve optimum throughput of devices that require multiple measurements, it is helpful to know the operation of the PNA. This knowledge allows you to set up the measurement scenarios that are best for your applications.

[Learn more about Traces, Channels, and Windows on the PNA](#)

Arrange Measurements in Sets

If you arrange measurements to keep the complete set of device measurements in one instrument state, you can save them so that you can later recall a number of measurements with one recall function.

See [Pre-configured Measurement Setups](#) for more information.

Use Segment Sweep

Segment sweep is helpful if you need to change the following settings to characterize a device under test.

- Frequency Range

- Power Level
- IF Bandwidth
- Number of Points

The segment sweep allows you to define a set of frequency ranges that have independent attributes. This allows you to use one measurement sweep to measure a device that has varying characteristics.

See [Segment Sweep](#) for more information.

Trigger Measurements Selectively

You can use the measurement trigger to make measurements as follows:

- Continuously update only the measurements that have rapidly changing data.
- Occasionally update measurements that have infrequently changing data.

For example, if you had four channels set up as follows:

- Two channels measuring the data that is used to tune a filter
- Two channels measuring the data for the out-of-band responses of the filter

You would want to constantly monitor only the measurement data that you use for tuning the filter. If you continuously update all of the channels, this could slow the response of the analyzer so that you would not be able to tune the filter as effectively.

Note: You must either trigger the infrequent measurement manually or with remote interface commands.

To trigger measurements selectively:

This procedure shows you how to set up two different measurements with the following behavior:

- Channel 1 measurement will continuously update the data.
- Channel 2 measurement will occasionally update the data.

1. In the **Windows** menu, click **Meas Setups, Setup D**.

Set Up a Measurement Trigger for Continuous Updates

2. In the **Sweep** menu, click **Trigger, Trigger...**
3. Under **Trigger Source**, click **Internal**.
4. Under **Channel Trigger State**, select **Channel 1**, and click **Continuous**.

Set Up a Measurement Trigger for Occasional Updates

5. Under **Channel Trigger State**, select **Channel 2**, and click **Single, OK**.
 - o If you want the analyzer to trigger more than a single sweep, click the **Enable Groups** check box and enter the number of sweeps.
6. In the **System** menu, click **Keys, Trigger**.

Update the Measurement

7. Click on the lower window to make Channel 2 the **active channel**.
8. On the active entry toolbar, click the type of trigger you set up.
 - o Click **Single** if you set up the analyzer for a single sweep per trigger.
 - o Click **Groups** if you set up the multiple sweeps per trigger.

Note: A trace must be active for you to initiate a trigger for that measurement.

Automate Changes Between Measurements

If there are slight differences between the various measurements that you need to characterize a device, you may find that it is faster to change the measurement settings using programming.

Recall Measurements Quickly

The most efficient way to recall measurements is to recall them as a set of measurements (instrument state).

- It only takes a short time longer to recall an instrument state that includes multiple measurements, than it does to recall an instrument state with only one measurement.
- Each recall function has time associated with it. You can eliminate that time by setting up the measurements as a set so you can recall them as a set.

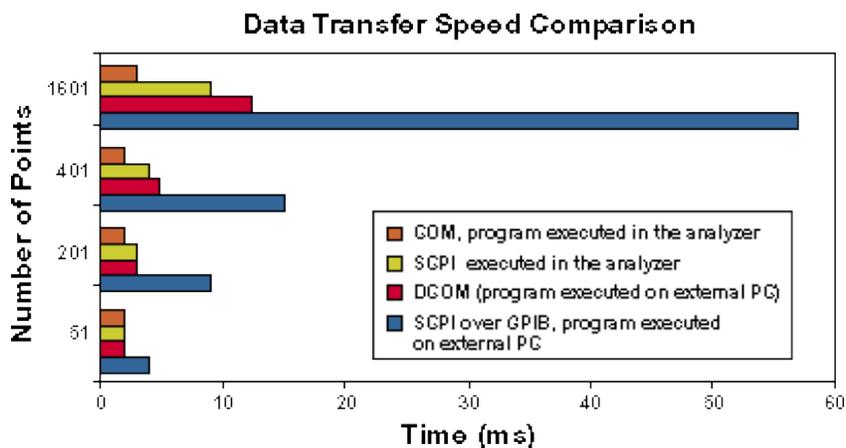

See [Save and Recall Files](#) for more information.

Data Transfer Speed

When testing devices remotely using COM or SCPI, the following techniques can be used to transfer data quickly between the PNA and remote computer, helping you achieve the best measurement throughput.

- Use [single sweep \(trigger\) mode](#) to ensure that a measurement is complete before starting a data transfer.
- **Transfer the minimum amount of data** needed. For example, a trace with a few points, using segment sweep rather than a full trace with many linearly spaced points. Also, use markers instead of trace transfers.
- **Choose the REAL data format** to provide the fastest transfer speed when using SCPI programs for automated applications.
- **Use SCPI over LAN** for applications that are automated with SCPI programs.
- **Use COM programs** to provide the fastest transfer speed when using an automated application. See [Data Transfer Time](#) specifications.

Note: The following data is obsolete, but still serves to illustrate the relative speed between COM and SCPI.

[Other topics about Optimizing Measurements](#)

Using Macros

Macros are executable programs that you write, load into the analyzer, and then run from the analyzer. You can have up to 25 macros set up to run on the analyzer.

- [How to Setup Macros](#)
- [How to Run Macros](#)
- [Macro Example](#)

How to Setup Macros

Using front-panel HARDKEY [softkey] buttons

1. Press **MACRO**
2. then **[Macro Setup]**

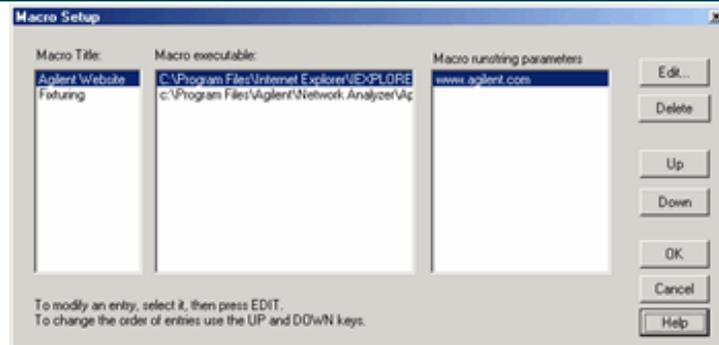

Using a mouse with PNA Menus

1. Click **Utility**
2. then **Macro**
3. then **Macro Setup**

In the Macro Setup dialog box:

1. Create an executable program and save it on the PNA hard drive. See [SCPI](#) or [COM](#) example programs in VBScript.
2. Use a mouse or the front-panel 'down-arrow' to select a blank line below the last entry. (There may be NO entry.)
3. Click **Edit** to start the [Edit Macro Setup](#) dialog.
4. In the **Macro Title** box, type a descriptive title for your macro.
5. Click **Browse**.
6. Change **Files of Type**.
7. Find and select your executable file. Change **Files of Type** if necessary.
8. Click **OK** on the Edit Macro Setup dialog.
9. Click **OK** on the Macro Setup dialog.
10. Press **MACRO** to run. It may be necessary to first Preset the PNA to see your macro in the menu.

Macro Setup dialog box help

Macro setup allows you to create up to 25 macros that can be launched from the PNA application.

An external keyboard is required to enter the Macro Title and the Run string parameters.

To add a Macro, use a mouse or the front-panel 'down arrow' (NOT the 'Down' key) to select a blank line. Then click **Edit**.

Macro Title Shows the titles that appear in the softkeys and menu when you press the Macro key. These titles are associated with the executable files and should be descriptive so you can easily identify them.

Macro Executable Lists the complete path to the executable file. To follow the example of launching the Agilent PNA Series Home Page, the path to the executable could be "C:/Program Files/Internet Explorer/iexplore.exe".

Macro Runstring Parameters Lists the parameters that get passed to the program that is referenced in the executable file. Again following the example of launching the PNA Series Home Page, you could assign the runstring parameters "http://www.agilent.com/find/pna".

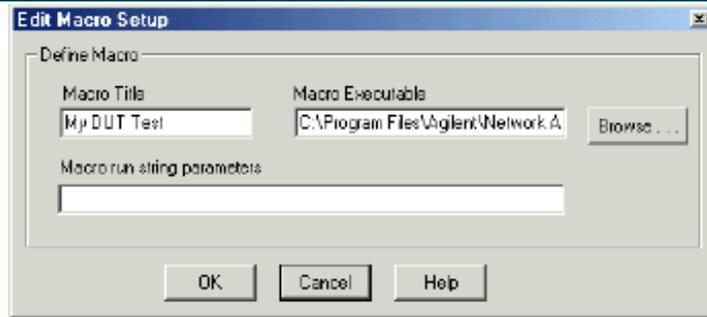

Edit Invokes the [Macro Edit dialog box](#).

Delete Deletes the selected macro.

Up Allows you to reorder the macros, moving the selected macro up one line. This order determines how they appear in the PNA Menu and in the softkeys and when you press the Macro front-panel key.

Down Moves the selection down one line in the list of macros.

Macro Edit dialog box help

Macro Title Add a title that appears in the softkeys and menu.

Macro Executable Set the complete path to the macro executable file. Click **Browse** to navigate to the macro executable file and establish the complete path to the file.

Macro run string parameters Optionally add parameters that are passed to the program referenced in the executable file.

[See Macro Setup dialog box](#)

How to Run Macros

Using front-panel HARDKEY [softkey] buttons

1. Press **MACRO**
2. then select the macro to run

Using a mouse with PNA Menus

1. Click **Utility**
2. then **Macro**
3. then select the macro to run

◀ Programming Commands ▶

Macro Example

The following is an example Visual Basic Scripting (vbs) program that you can copy, install, and run on your PNA.

Note: Print these instructions if viewing in the analyzer. This topic will be covered by the Macro Setup dialog box.

1. Copy the following code into a Notepad file.
2. Save the file on the analyzer hard drive in the **C:/Documents** folder. Name the file **FilterTest.vbs**
3. Close Notepad
4. [Setup the macro in the PNA](#)
5. [Run the macro](#)

```
'Start copying here
'This program creates a S21 measurement, with Bandwidth
'markers for testing a 175MHz Bandpass filter
'It is written in VBscript using COM commands

Set PNA = CreateObject("AgilentPNA835x.Application")
PNA.Preset
Set chan=PNA.activechannel
Set meas=PNA.activemeasurement
Set limts = meas.LimitTest
Set trce = PNA.ActiveNAWindow.ActiveTrace

meas.ChangeParameter "S21",1
chan.StartFrequency = 45e6
chan.StopFrequency = 500e6
trce.ReferencePosition = 8
PNA.TriggerSignal = 3

'Do Test
for t=1 to 5
call measure
call compare
next
msgbox("Done Testing")

sub measure
msgbox("Connect Device " & t & " and press OK")
PNA.ManualTrigger True
meas.SearchFilterBandwidth
end sub

sub compare
BW = meas.FilterBW
if bw>6.5e7 then msgbox("Failed BW: " & BW)
Loss = meas.FilterLoss
if loss>5 then msgbox("Failed Loss: " & Loss)
end sub
'End copying here
```

3-May-2012	Removed c models
17-Feb-2009	Added 25 limit
4-Sep-2008	Removed legacy content

Select a Calibration Type

The following calibration types are available in the PNA.

Cal Type	Interface	Accuracy	Thru Methods allowed
TRL Family	Both	Very High	All except Unknown Thru
SOLT	Both	High	All
Enhanced Response	SmartCal	High	Defined Thru or Flush Thru
QSOLT (Quick SOLT)	SmartCal	Medium	Defined Thru or Flush Thru
1-Port Reflection	Both	High	Not Applicable
Open/Short Response	Unguided	Low	Not Applicable
Thru Response	Unguided	Low	Known Thru or Flush Thru

[Learn how to select a default Cal Type.](#)

Other Cal Types (Separate Topic)

- [Source and Receiver Power Cals](#)

[See other Calibration Topics](#)

TRL Family

Application: Used to accurately calibrate any pair of ports when calibration standards are not readily available.

Note: A [Delta Match Cal](#) may be required.

- [Learn more about TRL family cal](#)
- For more information on modifying standards, see [Calibration Standards](#).

Calibration Method: [SmartCal](#), [Unguided Calibration](#)

General Accuracy: Very High

Standards Required: THRU, REFLECT, LINE or similar combination

Systematic Errors Corrected:

- Directivity
 - Source match
 - Isolation ([see exceptions](#))
 - Load match
 - Frequency response transmission tracking
 - Frequency response reflection tracking
-

SOLT

Application: Used to accurately calibrate any number of ports.

General Accuracy: High

Calibration Method: [SmartCal](#), [Unguided Calibration](#), [ECal](#)

Standards Required: (SHORT, OPEN, LOAD, THRU) or ECal module

Systematic Errors Corrected (on all ports):

- Directivity
 - Source match
 - Isolation ([see exceptions](#))
 - Load match
 - Frequency response transmission tracking
 - Frequency response reflection tracking
-

Enhanced Response

Application: Used to calibrate two ports when only measurements in one direction (forward OR reverse) are required. Measurements are faster because a second sweep is NOT required.

- Reflection Standards (OPEN, SHORT, LOAD) are connected to the source port to be calibrated.
- [Defined THRU](#) or [Flush THRU](#) standard is connected between port pairs.
- Much quicker than SOLT when using a mechanical cal kit. ECal can also be used.

To select Enhanced Response:

For a standard S-parameter Cal, select **SmartCal** in the Cal Wizard.

Then, for all cals:

1. At the 'Select DUT Connectors page', check [Modify Cal](#), then click **Next**.
2. Under 'Cal Type', select **Enhanced Response**.

Enhanced Response cal also be selected as the default Cal Type using [Cal Preferences](#).

General Accuracy: High

Calibration Method: [SmartCal](#), [ECal](#)

Standards Required: (SHORT, OPEN, LOAD, [Defined THRU](#) or [Flush THRU](#))

Systematic Errors Corrected:

- Directivity (source port)
- Source match (source port)
- Isolation ([see exceptions](#))
- Load match (receiver port) - used only to produce transmission tracking term.
- Frequency response transmission tracking (receiver port).

- Frequency response reflection tracking (source port).
-

QSOLT (Quick SOLT)

Application: Used to quickly calibrate any number of ports. Developed specifically for use with [external multiport test sets](#).

Note: A [Delta Match Cal](#) is required to cal test ports that do not have a dedicated reference receiver.

- Reflection Standards (OPEN, SHORT, LOAD) are connected to only ONE of the ports to be calibrated. The lower port number of the ports to be calibrated is selected by default. This can be changed through the [Modify Cal / Cal Type](#) setting.
 - [Defined THRU](#) or [Flush THRU](#) standards are connected from the reflection standard port to the remaining ports to be calibrated.
 - Much quicker than SOLT when using a mechanical cal kit.
 - Based on TRL math.
-

General Accuracy: Not as high as SOLT

Calibration Method: [SmartCal](#), [ECal](#)

Standards Required: (SHORT, OPEN, LOAD, [Defined THRU](#) or [Flush THRU](#))

Systematic Errors Corrected:

- Directivity
 - Source match
 - Isolation ([see exceptions](#))
 - Load match
 - Frequency response transmission tracking
 - Frequency response reflection tracking
-

1-Port (Reflection)

Application: Used to accurately calibrate any single test port for reflection measurements only.

Calibration Method: [SmartCal](#), [Unguided Calibration](#), [ECal](#)

General Accuracy: High

Standards Required: (SHORT, OPEN, LOAD) or ECal module

Systematic Errors Corrected:

- Directivity
 - Source match
 - Frequency response reflection tracking
-

Open / Short Response

Application: Used to quickly calibrate any single test port for reflection measurements only.

Calibration Method: [Unguided Calibration](#)

General Accuracy: Low

Standards Required: OPEN or SHORT

Systematic Errors Corrected:

Frequency response reflection tracking

Thru / Transmission Response (Isolation Optional)

Application: Used to quickly calibrate any pair of test ports for transmission measurements only.

Isolation is not usually recommended. Learn more about [Isolation](#)

Calibration Method: [Unguided Calibration](#) and Guided Cal from the 'Select DUT Connectors page', check [Modify Cal](#), then click **Next**.

General Accuracy: Low

Standards Required: THRU

Isolation: One LOAD for each PNA test port.

Systematic Errors Corrected:

- Frequency response transmission tracking
 - Isolation
-

Calibration Wizard

The Calibration Wizard allows you to choose a Calibration method and then perform the calibration.

- [How to Start Calibration Wizard](#)
- [SmartCal \(Guided Calibration\)](#)
- [Unguided Calibration](#)
- [Saving a Calibration](#)

Other Cal Topics

How to start Calibration Wizard

Using front-panel HARDKEY [softkey] buttons

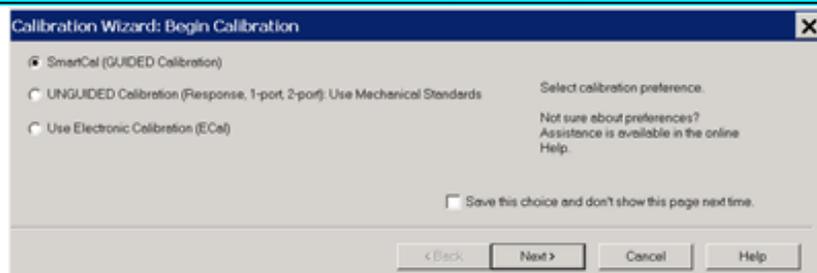

1. Press **CAL**
2. then [**Start Cal**]
3. then [**Cal Wizard**]

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal Wizard**

[Programming Commands](#)

Calibration Wizard Begin dialog box help

Select the calibration method:

[SmartCal \(Guided Calibration\)](#)

This method provides a step-by-step "wizard" interface. You describe the connectors on your DUT and the cal kits you will use; it walks you through the most accurate calibration possible.

- Supports ALL Cals **EXCEPT** simple open, short, and thru response Cals . See Also [TRL Calibration](#)
- Use a different Cal Kit (**including ECal**) for each port.

Unguided Calibration

This method provides a familiar calibration interface, but with limited capability. You choose the type of cal to perform; it allows you the flexibility to measure the standards in any order.

- Supports all Cals **EXCEPT** full 3-port, full 4-port.
- Only one Cal Kit can be used.
- Can NOT use Offset Load standard.

Why do we offer the Unguided Cal?

The Unguided Cal is familiar to legacy 8510 and 8753 customers. However, in those analyzers, you selected the cal kit, but not the connector type or gender. Therefore, the calibration engine did NOT know if the connectors were [insertable](#) or non-insertable. In the case of non-insertable, many people would use an undefined 'bullet' THRU and ignore the measurement inaccuracy.

The PNA Guided Cal Wizard asks for the DUT connectors and guides you through the most accurate calibration possible.

Use Electronic Calibration

- This method provides fast, software-controlled calibrations.
- Only one ECal module can be used. Use SmartCal when more than one ECal module is needed.
- See Also: [Perform a 4-Port Cal with a 2-Port ECal Module](#)

Save Preferences

- Clear to continue to see this page on subsequent calibrations.
- Check to save your calibration method choice and no longer see this page. To make this dialog re-appear, click **Response**, then **Cal**, then **Start Cal**, then **Cal Preferences**.
- Learn more about [Calibration Preferences](#).

The Calibration Window / Channel

During a Guided Calibration, a 'Cal Window' is created for you to view the connection of calibration standards before standards are measured. This Cal Window uses a new Cal channel that is created and duplicates the settings in the channel being calibrated. [Correction is ALWAYS OFF](#) for the displayed calibration channel. At the completion of the calibration, the calibration channel and window are deleted.

With PNA Rev. 7.50.27, the measurement of calibration standards can be performed while viewing any PNA window configuration you choose. The Cal Window is appended to your Custom Cal Window setting, and all windows are visible and sweeping below the Cal Wizard before the Measure (cal standard) button is pressed. The windows to be viewed and channels to be swept during the cal process are specified using [Remote commands](#). [See an example](#).

The new Cal Window settings do not work in a FCA channel.

SmartCal (Guided Calibration)

A Guided Calibration automatically determines the calibration type and suggests a calibration kit that matches your DUT connectors. Guided Calibration can perform the following Cal Types:

- ALL Cals **EXCEPT Open, Short, and Thru Response** Cals.
- ECal on one or more ports, beginning with [PNA firmware revision 5.24](#).
- TRL - [Learn how to do TRL cals](#)

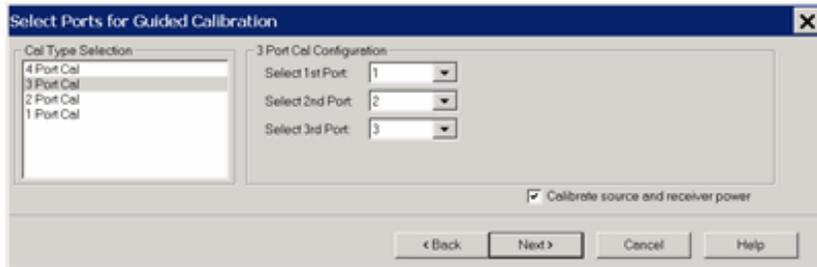

◀ Programming Commands ▶

Note: SmartCal DOES allow you to measure calibration standards in any order. However, you must click **Next** and **Back** without measuring standards until you get to the standard you want to measure.

The PNA displays the following dialog boxes when performing a Guided calibration on standard channels.

To learn about Calibrations for Application channels, refer to the help topic for the [Application](#).

Select Ports for Guided Calibration dialog box help

Allows you to select ports to calibrate.

Cal Type Selection Select the number of ports to calibrate.

N Port Cal Configuration If not calibrating all PNA ports, specify which ports to calibrate.

Calibrate source and receiver power Check to perform a Guided Power Calibration. [Learn more.](#)

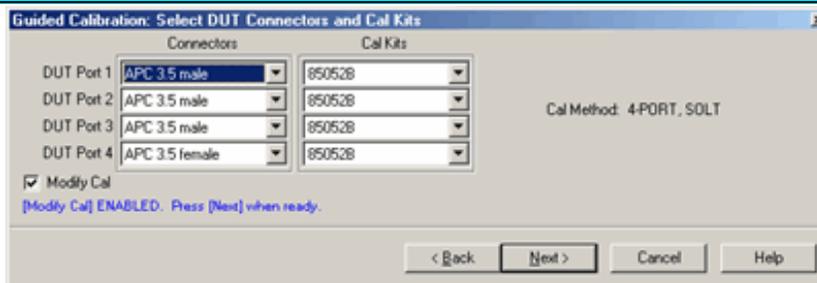

See Also: [Use Multiple Power Sensors to perform a Guided Power Cal](#)

Show Advanced Settings (Orientation & Thru Cal Section) Available only for [ECal](#).

Back Return to [Cal Wizard Begin](#) dialog. If you did not see the 'Cal Wizard Begin' dialog but want to, click **Back**, then clear the [Save Preferences](#) checkbox.

For greater than 4-port calcs, see [External Test Set calibration - Select Cal Type](#).

Select DUT Connectors and Cal Kits dialog box help

Allows you to select the connector type and Cal Kit for each DUT port to be calibrated.

Connectors To change selection, click the connector field for each DUT port.

If your DUT connectors are **not listed**, you can create your own connector type and calibration kit file. The PNA includes the following example cal kits that can be used as a template. See [Calibration kits](#) for more information.

- If using a gendered (male and female) connector type, select **Type A** as the connector type.
- If using a connectorless device such as on-wafer probes., select **Type B** as the connector type.

Cal Kits Select the Cal Kit to be used to calibrate each test port. The list for each DUT Port displays kits having the same connector type as the DUT.

Identical ECal models connected? ECal modules can be distinguished by serial number. This can have implications on your remote [SCPI](#) programs.

Cal Kit Notes

85056K

The 85056K definitions in the PNA are for 2.92mm standards (2.4mm plus 2.92 adapters). To calibrate 2.4 mm connectors using the 85056K cal kit, select 85056A as the cal kit when you need the sliding load. Otherwise, select 85056D as the cal kit. Both the 85056A and the 85056D kits contains exactly the same standards as the 85056K cal kit WITHOUT the adapters.

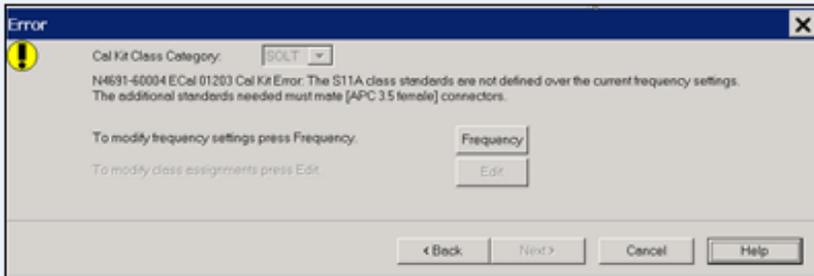

TRL

- To perform a [TRL Cal](#), assign a TRL Cal Kit to the lowest port number of each port pair.
- When selecting a TRL Cal Kit on a PNA-L model that requires a Delta Match Cal, and a [Global Delta Match Cal](#) is not available, the Cal type will be set to SOLT and a "Could not find a Global Delta Match Cal." message is displayed on the dialog box. If the selected Cal Kit will not support SOLT, the **Next** button will not be available. Then you must select a different Cal Kit to proceed or **Cancel** and perform a Global Delta Match Cal.

Modify Cal Check, then click Next, to [Modify Cal](#) (Standards AND Thru Method).

For greater than 4-port cals, see External Test Set calibration - Select DUT Connectors.

Error dialog box help

The current cal kit does not cover the current frequency range of the measurement. Do one of the following to correct the problem:

Cal Kit Class Category Choose from SOLT and TRL. Not available with ECal modules. Click **Edit** to modify the appropriate class assignments.

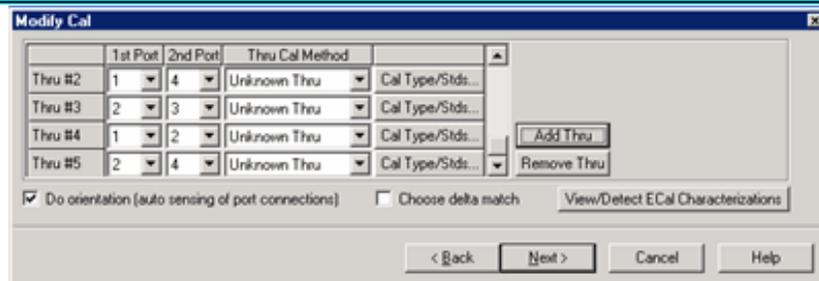

Frequency Change the frequency range of the active channel.

Edit Modify the class assignments so that a different standard is selected.

Back Select a different Cal Kit that covers the required frequency range.

Cancel Exit the Cal Wizard

Modify Cal dialog box help

Thru #n

Lists the proposed Thru connections to be made during the calibration process. You can change these Thru connections to better suit your test setup.

- The proposed Thru connections are listed automatically.
- Additional Thru connections can be selected for higher accuracy. [Learn more](#).

Add Thru

Click to add a Thru connection. [Learn more](#)

Remove Thru

Select a Thru by clicking the "Thru #N" field or the "1st Port / 2nd Port" field. Then click "Remove Thru". This selection is NOT available if the selected Thru is required for the calibration.

1st Port / 2nd Port

Click to select the two ports to be included in the Thru connection. The order of the port numbers is not critical.

Thru Cal Method

Lists the available Thru Cal methods for the specified port pairs.

[Learn about the Thru Cal Method choices.](#)

Cal Type/ Stds

Click to invoke the [View / Modify Properties of Cal dialog box](#)

Do orientation - Appears ONLY if an ECal module is selected for use.

When this box is checked (default) the PNA automatically senses the model and direction in which an ECal module port is connected to the PNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range.

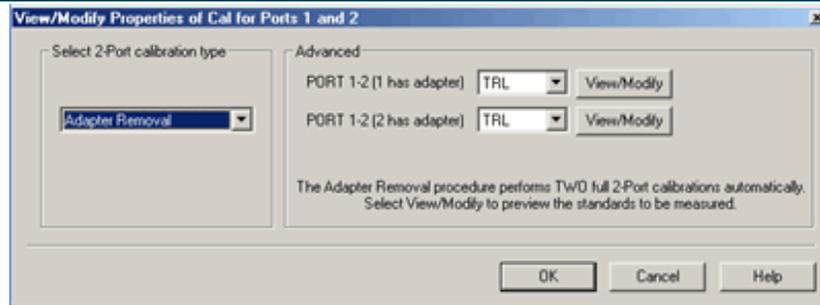

Choose delta match - Available when a Delta Match Cal is required.

- Check, then click **Next** to invoke the [Select Cal Set for Delta Match](#) dialog box.
- Clear - The Cal Wizard uses the [Global Delta Match Cal](#) if available.

View/Detect ECal Characterizations - Appears ONLY if an ECal module is selected for use.

Click to invoke the [View ECal Modules and Characterizations](#) dialog box. Displays a list of ECal modules that are connected to the PNA.

View/Modify Properties of Cal for Ports... dialog box help

Select calibration type

Another chance to change the Thru method.

[Learn about the Thru Cal Method choices.](#)

Advanced

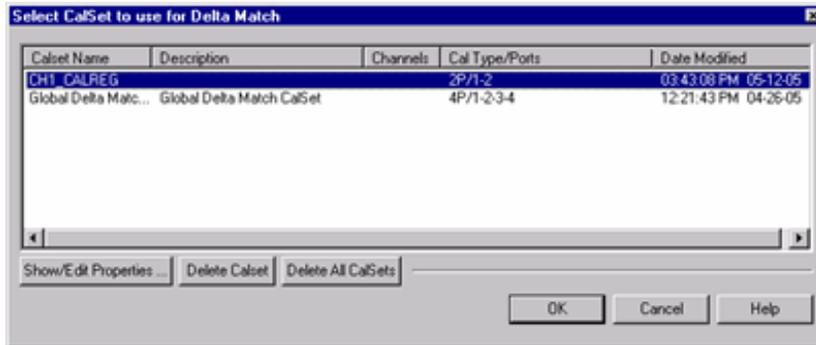

Select the cal method for each connector of the Thru pair.

- [TRL](#) - Available ONLY when a TRL cal kit was selected for the lowest port number of the port pair.
- [QSOLT](#) Available ONLY when "Defined Thru" or "Flush Thru" is selected. "**QSOLT 2 <= 1**" refers to the receive port 2 and source port 1 (where reflection standards are connected).
- [Enhanced Response](#) Available ONLY when "Defined Thru" or "Flush Thru" is selected. "**EnhResp 2 <= 1**" refers to the receive port 2 and source port 1.
- [Transmission Response](#) Available ONLY when "Defined Thru" or "Flush Thru" is selected, when Mechanical Cal is selected, and when 2 ports are being calibrated. "**TransResp 2 <= 1**" refers to the receive port 2 and source port 1.

View Modify Click to invoke the [Preview and Modify Calibration Selections](#) dialog box.

Note: Changes made to the Cal Kit through this dialog are **temporary** that last only for this calibration. To make permanent changes to the Cal Kit, perform [Advanced Modify Cal Kits](#).

Select Cal Set for Delta Match dialog box help

This dialog box appears when a Delta Match Cal is required and [Choose delta match](#) was selected. [Learn more.](#)

Displays the Cal Sets that meet the requirements of the Delta Match Cal.

Select either a User Cal Set or [Global Delta Match Cal](#).

If there is no suitable choice for a Delta Match Cal:

1. Click **Cancel**, then **Cancel** again to quit the Cal Wizard.
2. Perform either a [Global Delta Match Cal](#) or a SOLT cal and save the result in a User Cal Set.
3. Start the Cal Wizard to re-initiate this calibration.
4. Select the Global Delta Match Cal or User Cal Set.

Calibration Steps dialog box help

Note: Beginning in PNA Rev. 6.0, calibration can be performed with External triggers. [Learn more.](#)

As each new cal step prompt appears, the traces are setup for the next standard measurement. Also, sweeps are triggered continuously until the Measure button is pressed. This way you can view the integrity of the standard connection.

Prompts for standards to be measured.

Measure Click to measure the standard.

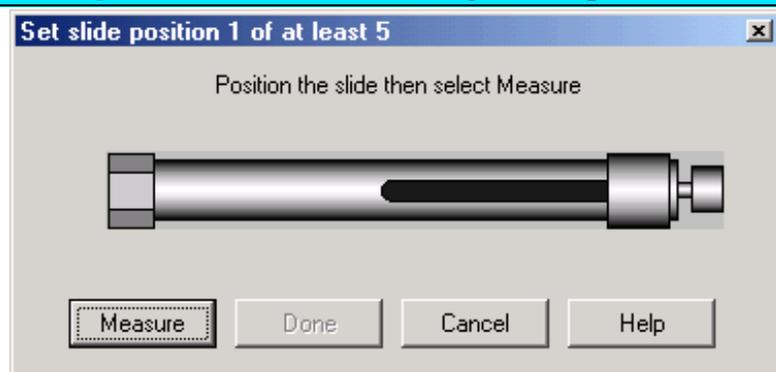

Done Click **after** a standard is re-measured and all measurements for the calibration are complete.

Next Click to continue to the next calibration step. Does **NOT** measure the standard.

If a standard is NOT measured, a warning appears and **Done** will not be available after the last Cal step.

Note: Smart (Guided) Cal allows you to measure calibration standards in any order. However, you must click **Next** and **Back** without measuring standards until you get to the standard you want to measure.

Sliding Load Measurement dialog box help

Allows you to measure the sliding load standard.

To ensure an accurate calibration, carefully follow the instructions that were provided with your sliding load.

To Measure a Sliding Load:

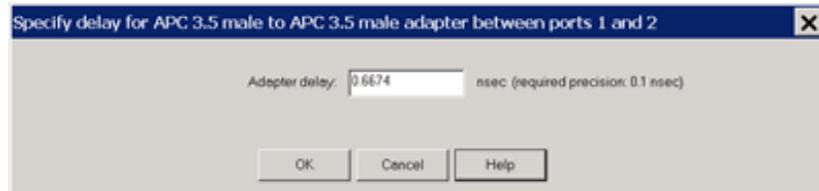

1. Connect the sliding load to the measurement port.
2. Position the sliding element, then click **Measure**. Do not move the sliding element until measurement is complete.
3. Measure the sliding load for at least **five** and up to **seven** positions for best accuracy.

Note: The positions of the sliding element should cover the full length of the slide, but be unequally spaced to reduce the possibility of overlapping data points. Most sliding loads have

marks for each slide position.

4. Click **Done** after the final measurement.
5. Remove sliding load from the measurement port.
6. Measure the remaining standards.

Specify delay dialog box help

This dialog appears ONLY when [Adapter Removal](#) or [Unknown Thru](#) calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

Adapter delay To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here. The required precision value is the accuracy that is required to characterize the delay value.

Nominal phase offset (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

For FCA/Mixer calibrations, this dialog box appears twice: once for the input frequencies and once for the output frequencies. The values can be slightly different.

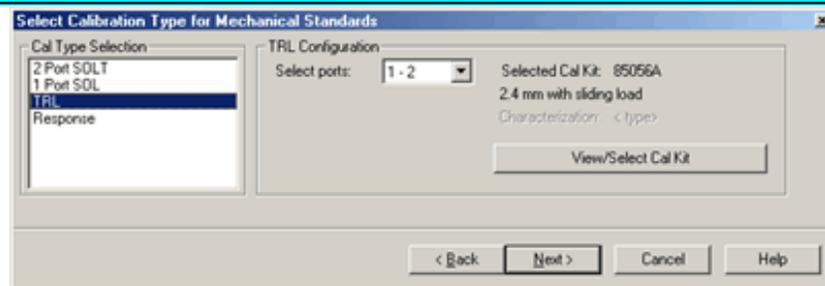

The [Calibration Complete](#) dialog box appears after all standards are measured.

Unguided Calibration

The PNA displays the following dialog boxes when performing an Unguided calibration:

Select Calibration Type for Mechanical Standards dialog box help

Unguided calibration does **NOT** support cals greater than 2 ports or **E**Cal calibrations.

Calibration Type Selection

- 2-Port SOLT
- 1-Port SOL
- TRL - [Learn more about TRL](#)
- **Response** - Reflection and Thru (if the active measurement is transmission)

Cal Configuration If not calibrating all PNA ports, specify which ports to calibrate.

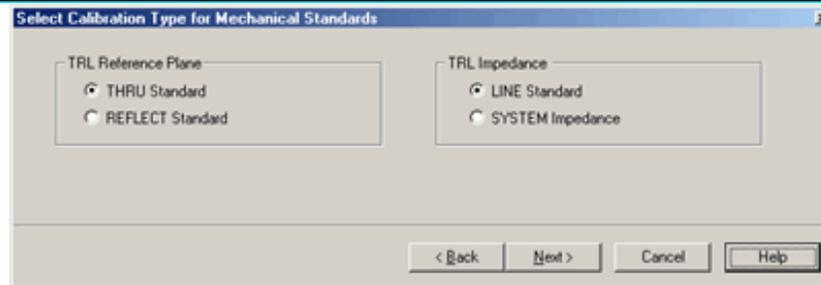

Back Return to [Cal Wizard Begin](#) dialog. If checked, you can clear the [Save Preferences](#) checkbox to see the Begin page when the Cal Wizard begins.

View/Select Cal Kit Click to invoke the [Select Cal Kit dialog box](#).

Note: Beginning with A.09.50, when selecting a Cal Kit with an impedance other than 50 ohms (Waveguide = 1 ohm), it is **NO LONGER NECESSARY** to change the [System Impedance](#) setting before performing a calibration. The impedance for the calibration is now derived from the Cal Kit impedance.

Next Click to continue to [Measure Mechanical Standards](#) dialog box.

Select Cal Type dialog box help

This dialog box only appears if the selected Cal Type is TRL in the previous dialog box.

TRL Reference Plane Select which standard to use to establish the position of the measurement reference plane.

THRU Standard Select if the THRU standard is zero-length or very short.

REFLECT Standard Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined.

TRL Impedance

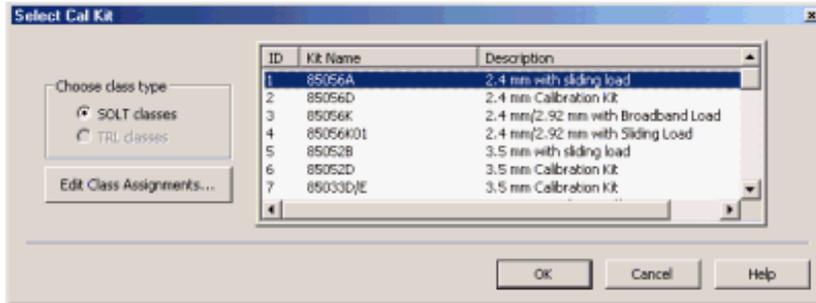

LINE Standard Specifies that the characteristic impedance of the LINE standard should be used as the system impedance. This ignores any difference between Offset Z0, Offset Loss, and System Z0.

SYSTEM Impedance Transforms the LINE standard impedance and loss to that of the system impedance for use with the calibration error terms. The TRL calibration will first compute the error terms assuming the LINE standard impedance is the system's characteristic impedance (same as previous LINE selection), then modify the error terms to include the impedance transformation. This should only be used with coax since the skin effect model used is a coaxial model.

[Learn how to change System Z0.](#)

To learn to substitute other calibration kits, see [Advanced Modify Cal Kits](#)

Select Cal Kit dialog box help

Displays the calibration kit files available for Unguided calibration. Select the desired calibration kit file and click **OK**.

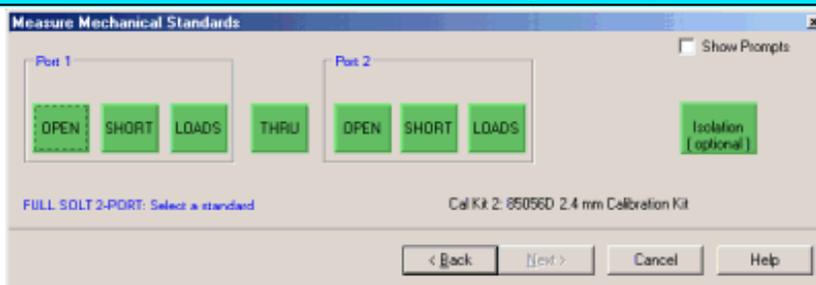

Choose class type

Edit Class Assignments Allows modification of the selected Cal Kit class assignments.

- To learn to substitute other calibration kits, see [Advanced Modify Cal Kits](#)
- Unguided Cal can access only mechanical cal kits #1 through #95, although more cal kits can imported. [Learn how.](#)

Note: Beginning with A.09.50, when selecting a Cal Kit with an impedance other than 50 ohms (Waveguide = 1 ohm), it is **NO LONGER NECESSARY** to change the [System Impedance](#) setting before performing a calibration. The impedance for the calibration is now derived from the Cal Kit impedance.

Measure Mechanical Standards dialog box help

Note: Beginning in PNA Rev. 6.0, calibration can be performed with External triggers. [Learn more.](#)

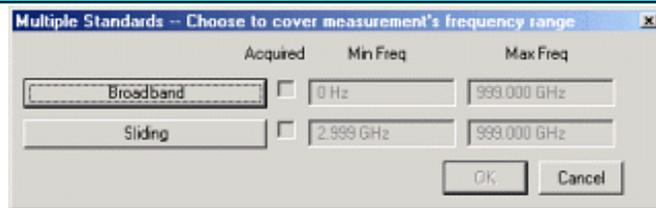

Displays the calibration kit file and standards required for the calibration.

- Standards may be connected and measured in any order.

- Connect the standard to the measurement port and click its associated green button. A check mark indicates the standard has been measured.
- If a standard type contains multiple standards, the [Multiple Standards dialog box](#) opens to display the multiple standards included in the calibration kit file.
- If a sliding load is included in the calibration kit file, the [Sliding Load dialog box](#) opens to perform the measurement with the standard.
- **Reflection Response** Select EITHER Open or Short standard, then click **Next**.
- **Isolation** Requires one load for each test port of the PNA. [Learn more about Isolation](#). Use when your measurement requires maximum dynamic range (> 90 dB). See also [Isolation Portion of 2-Port Calibration](#).
- **Normalize** Available when performing a response cal for any measurement. After Normalize is pressed and the Cal is complete, the data trace is flat when the same physical connections are present on the port. This is similar to [Data/Memory](#), except that the response cal is [saved with Cal data](#) and can be applied to other like measurements. Data/Memory is still available after using Normalize. You would usually connect a THRU standard when calibrating a transmission measurement, and a SHORT standard when calibrating a reflection measurement.

Show Prompts Check to provide a reminder for the required connection when you click on the standard.

Multiple Standards dialog box help

Select the standards to be measured.

Note: You may see both male and female standards. The Unguided cal has no knowledge of the gender of your connector types. **Choose the gender of your DUT connector; NOT the test port.** Then click OK.

To modify this calibration class to show only one standard, on the Calibration menu, click **Advanced Modify Cal Kits**. Select the Cal kit and click **Edit Kit**. In **Class Assignment**, click **Edit**. Learn more about [Modify Calibration Class Assignments](#).

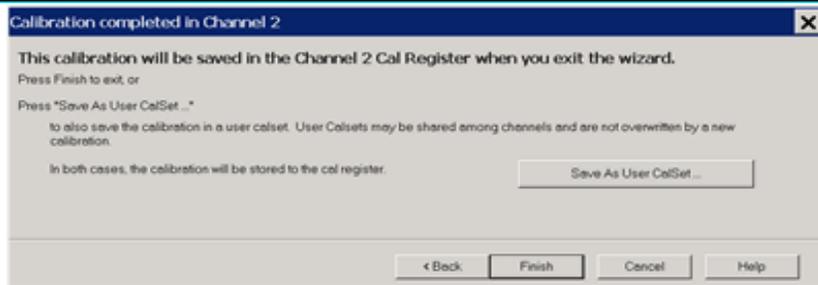

- Connect the standard to the measurement port and click its associated button. A check mark in the **Acquired** box indicates the standard has been measured.
- To cover the entire frequency range, you may need to measure more than one standard. The order in

which the standards are measured is important. The last standard that is measured will override the others in respect to the frequency range of the standard definition. **Example:** In the case of measuring both a broadband load and a sliding load, you would measure the sliding load last. This is because the frequency range of the sliding load is a subset of the broadband load.

Saving a Calibration

SmartCal, ECal, and Unguided Calibrations end with the following dialog box:

Calibration Completed dialog box help

Finish Save to the channel's calibration register.

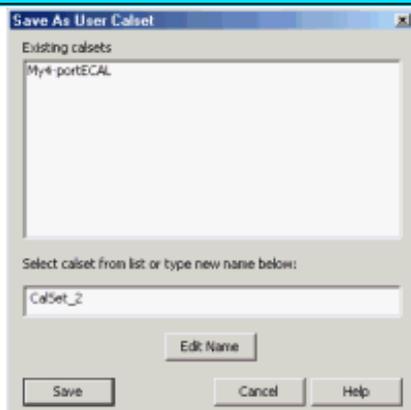

Save As User Cal Set Invokes the [Save as User Cal Set dialog box](#) AND save to the channel's calibration register.

Guided Power Calibration

Beginning with PNA firmware release A.09.30, Source and Receiver Power Calibration can be performed during a standard S-parameter Guided Calibration. This power cal provides the following enhancements over the standard source and receiver power calibration:

- A source and receiver power cal can be performed for all PNA ports with a single power sensor connection.
- [Multiple power sensors](#) can be used to cover wide frequency ranges.
- The receivers are corrected automatically.
- Optionally compensates for an adapter that may be used to connect the power sensor.
- Provides [optional match-corrected power measurements](#).
- Source and Receiver power correction is stored to the Cal Set along with S-parameter correction.

Note: A Guided Power Calibration is not accurate when [Frequency Offset Mode](#) is enabled.

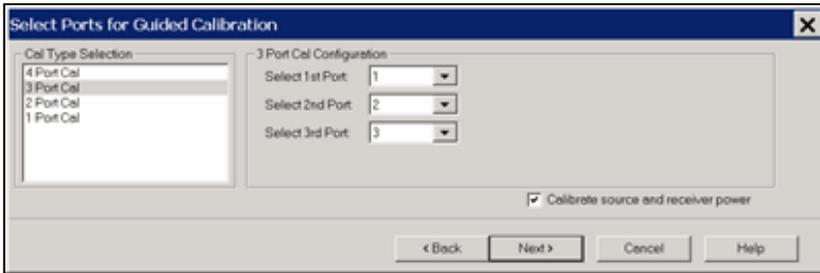

Learn more about the standard [Source](#) and [Receiver](#) Power Cals.

How to perform a Guided Power Cal

1. In a [Standard \(S-parameter\)](#) channel, setup your measurements (sweep type, frequency range, IFBW, and so forth). A special version of this feature is available on mmWave SMC measurements. [Learn more](#).
2. Connect the Power Meter / Sensor the same as a standard Source Power Cal. [Learn more](#).
 - See [Supported Power Meters](#)
 - See [Important first-time USB connection note](#).
3. Start the **Cal Wizard**, then select **Guided (Smart) Cal**. [Learn how](#).

◀ Programming Commands ▶

On the following **Select Ports** dialog, check **Calibrate source and receiver power**, then click **Next**.

Two Cal Wizard pages later, complete the following dialog.

Power Cal Settings dialog box help

Note: A **Use Power Table** checkbox (not shown) is available when a mmWave SMC measurement is active. [Learn more](#).

Power Cal at: Select the source port for which a Power Calibration will be performed. The source and receiver correction will be transferred to all other sources and receivers involved in the S-parameter measurements.

Use Multiple Sensors NOT available with SMC measurements.

Check this box to use one or more power sensors that are [configured as PMAR devices](#). This dialog is replaced with the [Multiple Sensors](#) dialog. See following image.

When "Use Multiple Sensors" is cleared (default setting), click [Power Meter Settings](#) to configure the power meter.

De-embed (power sensor) adapter When the power sensor connector is NOT the same type and gender as the DUT connector for the specified port, then for optimum accuracy, extra cal steps are required to measure and correct for the adapter that is used to connect the power sensor to the reference plane.

Clear this box to NOT compensate for the added adapter.

Check this box to perform extra calibration steps to measure and correct for the adapter.

Then select the **Power Sensor Connector** type and gender of the power sensor. "Ignored" does NOT compensate for the added adapter, just as if the checkbox were cleared.

When this connector matches the DUT connector for the same port, then the PNA assumes that there is no adapter. Extra cal steps are NOT required and the Cal Kit selection is not available.

Otherwise, select the **Cal Kit** to be used to calibrate at the adapter.

See [Accuracy Settings](#) below.

Power Cal Settings - Use Multiple Sensors dialog box help

Sensor	Start	Stop	Adapter	Connector	Cal Kit	
NB487A	10.000000 MHz	50.000000 GHz	<input checked="" type="checkbox"/> Use	1.00 mm female	85058A Databased	Remove
VB486A	50.000000 GHz	75.000000 GHz	<input checked="" type="checkbox"/> Use	1.00 mm female	85058A Databased	Remove
WB486A	75.000000 GHz	110.000000 GHz	<input checked="" type="checkbox"/> Use	1.00 mm female	85058A Databased	Remove

Notes

"Multiple sensors" are allowed ONLY on standard channels and during a [Cal All calibration](#).

The power sensors that are used as "multiple sensors" MUST be configured [PMAR devices](#).

Power Cal at: Select the source port for which a Power Calibration will be performed. The source and receiver correction will be transferred to all other sources and receivers involved in the S-parameter measurements.

Sensor Settings Click to start the Sensor Settings dialog, used to [ADD / Configure an External Device](#).

Sensor Grid

Sensor Select the power sensor and the associated **Start** and **Stop** frequency range.

Adapter When the power sensor connector is NOT the same type and gender as the DUT connector for the specified port, then for optimum accuracy, extra cal steps are required to measure and correct for the adapter that is used to connect the power sensor to the reference plane.

Clear this box to NOT compensate for the added adapter.

Check this box to perform extra calibration steps to measure and correct for the adapter. Then

specify the **Power Sensor Connector** type and gender of the power sensor. When this connector matches the DUT connector for the same port, then extra cal steps are NOT required, and the Cal Kit selection is not available. Otherwise, select the **Cal Kit** to be used to calibrate at the adapter.

Remove Click to remove the power sensor from the list.

Add Sensor Click to add a new line, then click the down-arrow to select a sensor. If a power sensor does NOT appear in the list, click the **Sensor Settings** button to configure a power sensor.

Accuracy

Tolerance When consecutive power sensor readings are within this value of each other, then the reading is considered settled.

Max Number of Readings Sets the maximum number of readings the power sensor will take to achieve settling. Each power reading is "settled" when either:

- Two consecutive readings are within this **Tolerance** value or
- When the **Max Number of Readings** has been met.

The readings that were taken are averaged together to become the "settled" reading.

Programming Commands

Power Sensor Connection step dialog box help

Power Level Set the power level at which the Source Power Cal is to be performed.

It is usually best to perform the Source Power Cal at 0 dBm because the power sensor is calibrated at that level. If 0 dBm is not achievable for your measurement, then set to the power level with the lowest level of measurement noise.

Turn OFF Match Correction

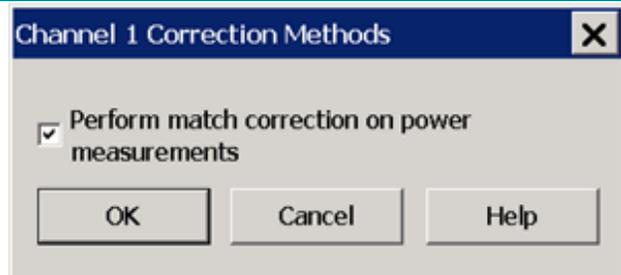

During a Guided Power Cal, the match between the power sensor and the PNA source port is

measured. The source power correction array is compensated to account for the measured mismatch. In addition, the reference receiver measurement is also compensated to account for the mismatch of the DUT.

How to turn OFF match correction:

Click **Response**, then **Cal**, then **Manage Cals**, then **Correction Methods**.

Correction Methods dialog box help

By default, the Guided Power Cal applies match correction to the receiver measurements. However, you may want to turn OFF match correction in the following cases:

- When making non-traditional measurements, such as high-power or multiport configurations. Because of added components or reconfigurations, the mismatch measurement may not be valid.
- When you have a remote program that already accounts for the match effects of the sensor.

Clear the box to NOT apply match correction on all receivers used on this channel. The receivers are still corrected using standard receiver calibration. [Learn more](#).

Check the box to apply match correction on all receivers used on this channel.

Calibrate All Channels

"Cal All" allows you to calibrate multiple channels in a single calibration session. This not only reduces the number of connections that need to be made, but also the number of cal standard measurements that must be performed.

In this topic:

- [Features](#)
- [Limitations](#)
- [How to perform a Cal All Channels Calibration](#)
 - [Select Channels dialog](#)
 - [Measurement Class Cal Properties dialog](#)
 - [Calibration Attenuator Settings dialog](#)
 - [Select DUT Connectors and Cal Kits dialog](#)
 - [Power Cal Settings dialog](#)
 - [Cal Steps dialog](#)
 - [Finish](#)

Other Cal Topics

Features

Cal All offers a single, optimized calibration procedure for all channels (with some limitations, see below). The optimizations include:

- Minimizing the number of physical connection of standards.
- Minimizing the number of power meter calibration sweeps.
- User-settable power levels for S-Parameter as well as power calibration steps.
- Accounting for different switch and attenuator settings among different channels. This reduces the number of measurements required to characterize different switch/attenuator settings (channel setup differences).
- Cal All will produce the same number and format of Cal Sets (error terms) that would be realized had the calibrations been performed one at a time.

Limitations

- [VMC](#) channels are NOT supported.
- [SMC+ Phase](#) with phase enabled is supported using a known delay mixer or a phase reference cal set. S2P file characterized mixers are NOT supported.
- For non-IMD channels, the wideband IF path is used during Cal All. Therefore, non-IMD channels that use the narrowband IF path (for [Narrow band pulse](#) measurements for example) or have [manually-selected IF frequencies](#) will not be properly calibrated.
- [ECal Extrapolation](#) is NOT supported on Swept IMD and IMDx channels.
- Starting the PNA in [Multiport mode](#) is NOT supported.
- Cal All is performed at one IFBW.
- All channels that are calibrated are forced into [stepped sweep mode](#).
- All channels to be calibrated MUST have the same [cal reference plane](#). In other words, Cal All cannot compensate for any path changes that occur external to the PNA.

How to perform a Cal All Channels Calibration

Using front-panel HARDKEY [softkey] buttons

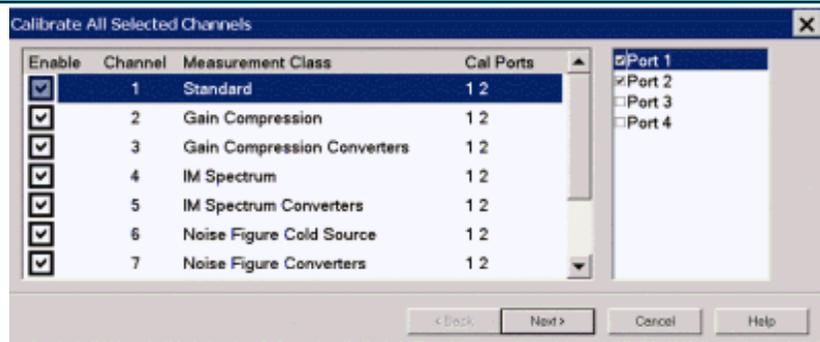

1. Press **CAL**
2. then **[Start Cal]**
3. then **[Cal All Channels]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Start Cal**
4. then **Cal All Channels**

Programming Commands

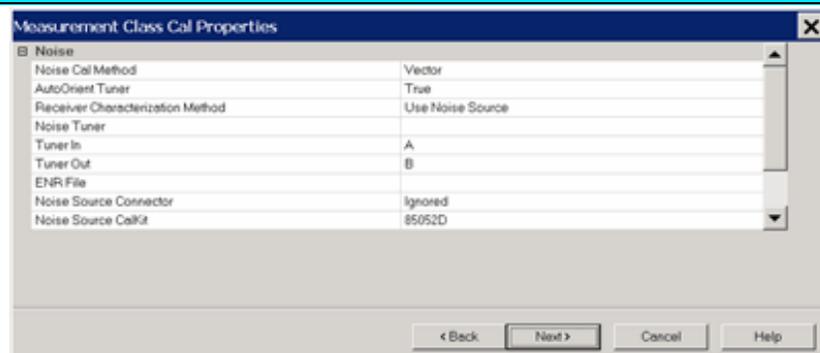

Selected Channels dialog box help

1. Check the channels to be calibrated.
2. Check the ports to be calibrated.
3. Click **Next>**

Note: To perform an LO power cal for a mixer channel, set the LO port to a PNA or external source in the [Mixer Setup dialog](#). Then select that port in this dialog.

Measurement Class Cal Properties dialog box help

Confirm or change the following unique cal properties for each channel to be calibrated. Click a link to learn about these properties.

The properties with **(NOT available in Cal All)** are NOT available in a Cal All calibration as they are in a stand-alone calibration.

The power cal is optional only if none of the selected channels require a power cal.

Calibration Attenuator Settings dialog box help

This dialog shows the Power, Attenuator, and IFBW settings for the Cal All calibration. The default values for the Cal All session are the preset values of a standard S-parameter channel. These values are not necessarily the same as those of the channels that are selected for calibration. When there are differences in measurement path (switch) settings between the Cal All channel and the selected channels, these differences are detected by Cal All and additional measurements are made for each path condition. These additional measurements allow Cal All to produce error terms appropriate for each of the selected channels. In general, the Cal All session should be performed at a power level that is high enough to prevent noise in the error terms. However, an increase in power could cause compression or damage to the PNA receivers. The following settings allow you to increase the power level ONLY during the Cal All session.

Power Limit (Disable)

Cal All shows you when power limits are enabled. This setting provides you a convenient way to TEMPORARILY disable these limits in order to take advantage of the power settings available in Cal All. If power limits are on, your DUT is probably a high-gain device and the attenuator settings in your channels are high resulting in lower power at the cal reference plane. This lower signal can result in noisier measurements during the acquisition of cal. This situation is precisely what Cal All is intended to improve. Cal All allows you to configure the calibration conditions for better signal-to-noise performance during the cal while leaving your DUT conditions alone. You can elect to clear the “Disable Power Limits during cal” checkbox when you prefer to calibrate at a higher power level than is allowed by your limit. The limit is restored after the Cal All session.

Source / Receiver Attenuator

By default, the Cal All calibration is performed with Source and Receiver attenuators set to 0. Change the Source or Receiver attenuator settings when external hardware (such as a booster amplifier) would cause the PNA receivers to be compressed or damaged.

You may also want to change the attenuator or path configuration settings to force the cal channel

to match settings of the selected channels. If all of the selected channels are set to identical hardware settings, it may be better to apply these settings to the cal channel. For example, if your channels all use a 5 or 10 dB attenuator step at port 1, you might elect to change the Cal All channel to use the same low attenuator settings. This will result in the cal measurements being made under the same path conditions as the channel and it will eliminate the need to mathematically compensate for the difference. However, if large attenuator values are used, the default Cal All settings will likely improve your results.

S-Parameter Cal Port Power

Set the power level at which the S-Parameter cal is performed.

Power Offsets

Power Offsets are channel-scoped. Consequently, offsets that you already set are NOT automatically copied to the Cal All session. This setting allows you to also apply a Power Offset during the Cal All session. [Learn about Power Offsets.](#)

IF Bandwidth

Set the IFBW used to perform the Cal All calibration. The default IFBW setting of 1 kHz is a good nominal setting for most measurements. Lowering the IFBW removes noise from the calibration measurement, but also causes slower sweeps.

Path Configuration

In addition to application-specific calibration requirements, Cal All performs an S-parameter calibration + power cal on behalf of all the selected channels. By default, this calibration is performed with standard channel default hardware paths:

- Bypass switches are set to “Thru”
- Noise switches are set to Normal.

Path configuration differences between your channel and the Cal All channel are mathematically removed.

The [Path Configuration dialog](#) allows you to change the path settings for this portion of Cal All calibration.

Select DUT Connectors and Cal Kits dialog box help

For each DUT port:

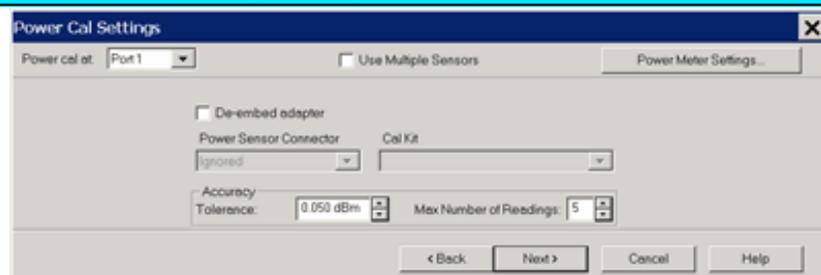

- Select the connector at the calibration reference plane (where the cal standards will be connected).
- Select the cal kit to be used.

Check **Modify Cal** to change the Thru method. An Unknown Thru cal is performed by default.

[Learn about THRU methods.](#)

[Learn more about this dialog.](#)

Power Cal Settings dialog box help

A guided power cal is performed on the source ports for the Cal All calibration.

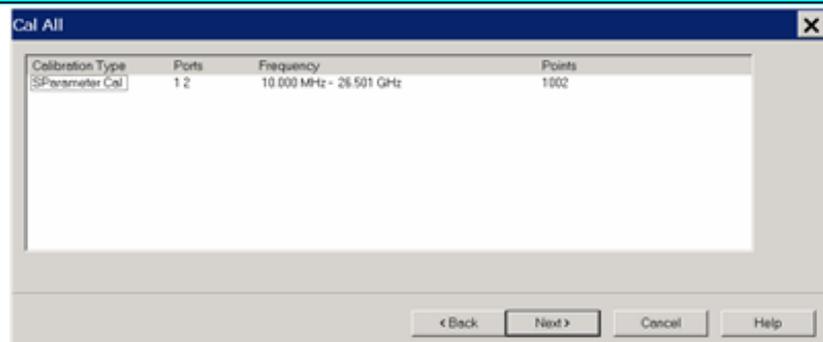

This dialog is displayed for each source port to receive a power cal.

To perform an LO power cal for a mixer channel, set the LO port to a PNA or external source in the [Mixer Setup dialog](#). Then select that port in the [Selected Channels dialog](#).

- To use the **same** power sensor for all power cals, do **NOT** check Use Multiple Sensors.
- To use **different** power sensors, check **Use Multiple Sensors**. The sensor must be configured as a PMAR device. [Learn how.](#)

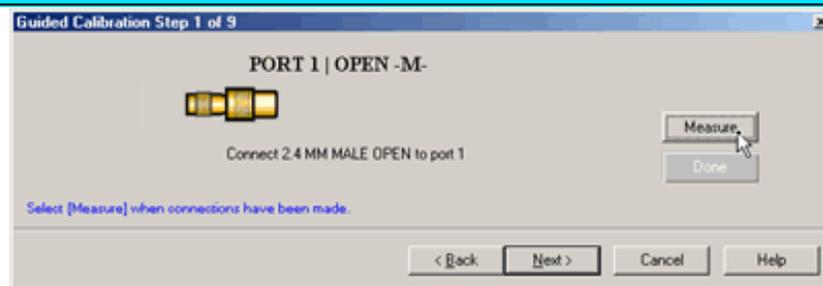

[Learn about this dialog box.](#)

Cal All Summary dialog box help

This page is a summary of the Cal All settings. Confirm the settings, then click **Next >** or **< Back** to change settings.

Cal Steps dialog box help

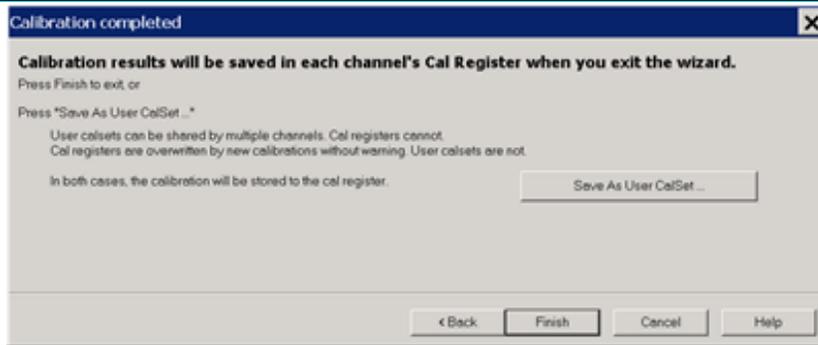

Follow the prompts to connect each standard. Then click **Measure**.

Click **Re-measure** if necessary.

Then click **Next >**

Finish Cal dialog box help

Click **Finish** to save the Cal All session results to Cal Registers.

Or click **Save As User CalSet**, then enter a prefix title. The Meas Class and channel number are appended to this prefix to save to a User Cal Set for each calibrated channel.

Using Calibration Sets

- [What are PNA Cal Sets](#)
- [Cal Registers and User Cal Sets](#)
- [How to Manage and Apply Cal Sets](#)
- [Examples of Cal Set Usage](#)
- [Archiving Cal Sets using .cal files](#)

See Also

Save and Recall: [Instrument States and Cal Set Data](#)

[See other Calibration Topics](#)

What are PNA Cal Sets

At the completion of a calibration, all calibration data is stored to a Cal Set. The Cal Set can be applied later to any channel that has the same stimulus settings as the Cal Set, thereby saving the time it takes to perform another calibration. The following data is saved to a Cal Set:

- Name
- Cal Set Description
- Cal Set Attributes - stimulus settings, cal type, port association
- Standards data
- Error term data
- GUID (**G**lobally **U**nique **I**dentifier)

Cal Registers and User Cal Sets

There are two types of Cal Sets:

- **Cal Registers** (channel specific)
- **User Cal Sets**

Calibration data is automatically saved to a Cal Register at the end of every calibration. You can also

choose to save the cal data to a User Cal Set.

Calibration Registers

New with PNA Release 5.0, Calibration Registers are designed to simplify calibrations for most users. When a calibration is complete, the data is automatically saved to the channel's Cal Register, overwriting (or [appended to](#)) the previous cal data stored in that register. This concept is similar to previous Agilent Vector Network Analyzers.

- Every channel has ONE dedicated Cal Register. They are named CHn_CALREG, where n is the channel number. The name cannot be changed.
- Cal Registers are more volatile because they are overwritten (or [appended](#)) each time a calibration is performed on that channel. The Cal data is always saved, but only temporarily.
- Cal Registers can be applied to other measurements, but ONLY on the same channel as the Cal Register.

User Cal Sets

At the end of a calibration, you can choose to also save cal data to an existing or new User Cal Set.

- User Cal Sets can be applied to any number of channels simultaneously.
- User Cal Sets are named by you for easy identification.
- You can have an unlimited number of User Cal Sets.
- At any time, you can copy Cal Register data to create a User Cal Set. See [Cal Set Properties](#).

Note: You can [set a Preference](#) to revert the pre-5.0 behavior - Cal data was automatically saved to a User Cal Set instead of a Cal Register.

Appending Data in a Cal Set

At the end of a calibration, data is saved to the channel's Cal Register and, if you choose, to a User Cal Set. When you choose to save to an existing User Cal Set, the PNA attempts to append the new error terms to the existing User Cal Set. The existing Cal Set data is completely overwritten UNLESS the new data can coexist with the existing data according to the following two rules:

- The stimulus settings of the new data must exactly match the existing data.
- The new cal must involve different ports from the existing cal.

For example:

Case 1 - An existing Cal Set contains a full 2-port cal between ports 1 and 2. Using the same stimulus settings, you perform a 1-port cal on port 3. At the end of the cal, you click [Save As User Cal Set](#) and

select the existing full 2-port User Cal Set.

Result: The 1-port cal is appended to the 2-port User Cal Set. There is NO overlap between them.

Case 2 - Same situation as Case 1, except the 1-port cal is performed on port 1.

Result: The Cal Set will contain a 1 port cal on port1 and a 1 port cal on port 2. The overlapping tracking terms are removed rendering the original full 2 port cal invalid.

How to Manage and Apply Cal Sets and Cal Types

The PNA attempts to apply a Cal Set, and turn error correction ON, for ALL of the measurements on the active channel. This may not always be possible. For example, suppose a channel contains both S11 (reflection) and S21 (transmission) measurements. If a Cal Set that contains only an S11 **Cal Type** is applied to that channel, the Cal Set does not contain the error terms to correct the S21 measurement. Error correction is turned ON for the S11 measurement and NOT turned on for the S21 measurement.

There are two ways to apply an existing Cal Set (Cal Register or User Cal Set) to a measurement:

1. Recalling an Instrument State with Cal data ([.cst file](#)) - A .cst file contains an Instrument State with all measurement attributes AND a 'pointer' to the Cal Set that was used to calibrate the measurement. Before saving a .cst file, be sure that a User Cal Set (NOT a Cal Register) is being used for the measurement. Because Cal Registers are automatically overwritten when a new calibration is performed, it is likely that the Cal Register data will change before the .cst file is recalled.
2. Create a new measurement and select a Cal Set to apply to the active channel.

Note: NEVER copy or modify Cal Sets from Windows Explorer or other applications. Cal Sets should only be accessed through the PNA Application.

How to select and apply a Cal Set to the active channel

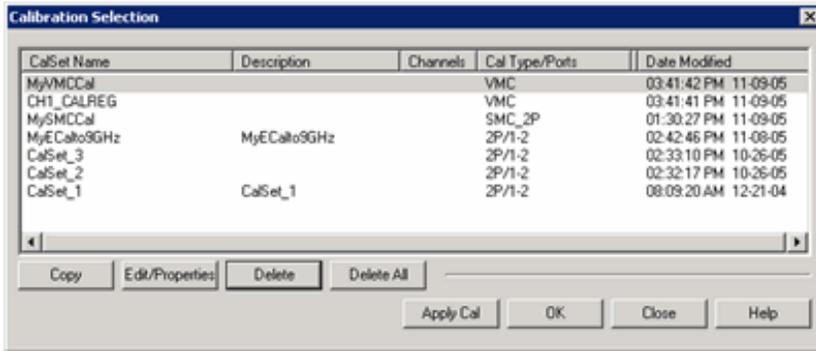

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then **[Manage Cals]**
3. then **[Cal Set]**

Calibration Selection dialog box help

This dialog box allows you to manage and apply Cal Sets.

Although the number of Cal Sets you can have is limited only by the amount of PNA memory, it is considered unusual to have more than about 10 existing Cal Sets, or one current Cal Set for every unique channel setup. Old Cal Sets (with 'stale' data) should be deleted or overwritten.

The active channel's Cal Register always appears, even if empty. Cal Registers that belong to other channels appear in the list of Cal Sets only if the channel exists, and only if they contain data.

- Learn about [Cal Registers](#).
- Learn how to [View the Error Terms of a Cal Set](#).

To apply a Cal Set to the active channel, click a row to select that Cal Set, then click Apply Cal.

Note: A Cal Set must have been generated from the same [measurement class](#) as the active channel in order for it to Applied.

Columns click a heading to sort by that column

Cal Set Name Name to identify the Cal Set.

Description User-settable text to further identify the Cal Set.

Channels Channel numbers that are currently using this Cal Set. A blank entry means it is not currently in use.

CalType / Ports Type of Cal contained in the Cal Set. [Learn about applying appropriate Cal Types](#).

Cal Type Abbreviations:

1P, 2P, 3P, 4P... - Full n-Port calibration

+ - Indicates a Power Correction is included in the Cal Set

R - Response (instead of ports, shows the measurement type that it corrects.)

ER/x-y [Enhanced Response](#), where **x** is the receive port; **y** is the source port.

VMC [Vector Mixer Cal](#)

SMC [Scalar Mixer Cal](#)

Modified Date and time the Cal Set was last modified.

Buttons

Copy Invokes the [Save as User Cal Set](#) dialog box. Type a name for the copy of the selected Cal Set data.

Show / Edit Properties Invokes the Cal Set Properties dialog box. This allows you to view all of the Cal Set properties and create a **duplicate** User Cal Set from an existing User Cal Set or Cal Register.

Delete Permanently deletes the Cal Set after you choose OK to a warning prompt.

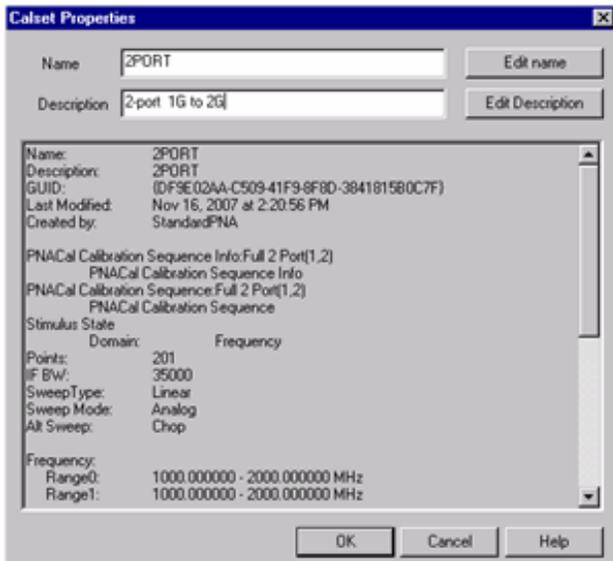

Delete All Permanently deletes ALL listed Cal Sets and Cal Registers after you choose OK to a warning prompt.

Apply Cal Applies the selected Cal Set to the active channel. If the stimulus settings of the Cal Set and channel are different, [a choice must be made](#).

Unselect Available ONLY if the selected Cal Set is being used by the active channel. Click to 'Un-apply' the Cal Set, then click **Close** to exit with the Cal Set un-applied.

OK Always APPLIES THE SELECTED CAL SET to the active channel, then closes the dialog box.

Close Exit the dialog box. Performs no further action.

Cal Set Properties dialog box help

Allows you to view all of the Cal Set properties and create a **duplicate** User Cal Set from an existing User Cal Set or Cal Register.

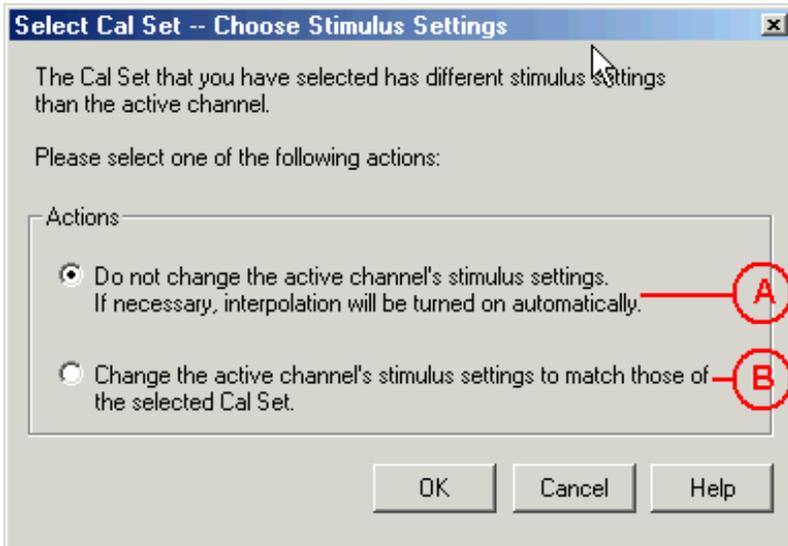

Name Edit name of the User Cal Set. You can NOT change the name of a Cal Register.

Description Descriptive text to further identify the Cal Set.

Cal Set Properties Lists descriptive information and stimulus conditions of the Cal Set.

Learn how to [View the Error Terms of a Cal Set.](#)

Stimulus Setting Different between Cal Set and Measurement

Select Cal Set -- Choose Stimulus Settings dialog box help

The Cal Set contains the channel stimulus settings that were in place when the Cal Set was saved. This dialog appears when the Cal Set channel settings are different than those of the channel to which the Cal Set is being applied. Choose between the following options.. (See above image).

- A. Keep the Active Channel Stimulus settings. Interpolate if possible.
 - If the Cal Set frequency range is greater the active channel, then Interpolation will be turned ON. Learn more about [Interpolation Accuracy](#)
 - If the Cal Set frequency range is less than the active channel, then this option is not available.
- B. Keep the Cal Set Stimulus settings. The Active Channel stimulus setting are changed.

OK Make the change.

Cancel Cal Set will NOT be applied.

Examples of Cal Set Usage

The following examples show how Cal Sets increase flexibility and speed in making analyzer measurements.

- Using one User Cal Set with many Channels
- [Using one Measurement with many Cal Sets](#)

Using one User Cal Set with many Channels

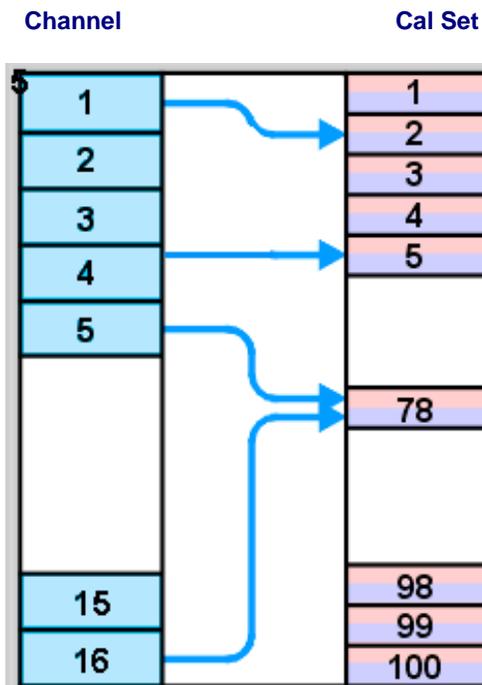

It is possible to do one calibration, then apply it to several channels.

An example:

During a manufacturing process, you may have many calibrated channels. You may wish to continuously cycle through the measurements and examine them individually. Occasionally, you may wish to refresh the calibration without having to recreate all the measurement state files.

Here is how: Examine the stimulus settings for each channel. Then make the User Cal Set stimulus range a super-set of the whole group. Each channel can then use the same User Cal Set. Some calibrations will be interpolated. **Note:** Make sure that [interpolation](#) is turned on.

Notice in the following image, Cal Set 78 is used on more than one channel, in this case Channel 5 and 16 .

Using one Measurement with many Cal Sets

The drawback with having one very large User Cal Set associated with many instrument states could be a loss of accuracy due to interpolation. In such cases, consider using one User Cal Set for each stimulus setting.. The stimulus conditions can then be changed for a channel by applying different User Cal Sets. Other settings (window setups, measurement definitions, scaling, limits, markers) will not change. This may result in faster state changes

than if you saved and recalled *.cst files for each set of stimulus conditions.

Example #1: An amplifier needs to be measured at several input power levels. Calibrate at several power levels and save each calibration in a separate User Cal Set. Then, apply the User Cal Sets to the single measurement consecutively.

Example #2: Making an S21 Measurement, you need to measure both wide span and narrow span characteristics of the device. One Cal Set covers the wide span setup; another the narrow span setup.

Archiving Cal Sets using .cal or .csa files

Because User Cal Sets can easily be deleted, provide extra backup by also saving your calibration as a .cal or .csa file ([see saving a .cal file](#)).

Example:

One person performs a calibration, names and saves it as a User Cal Set. This Cal Set is available for any other person to use. A second user could accidentally delete or modify the User Cal Set requiring the originator to repeat the calibration.

Security can be provided for calibration data by saving the Cal Set to a **.cal** file or **.csa** file. At a later time, the file could be recalled and the original calibration restored.

Error Correction and Interpolation

Error Correction and Interpolation settings work together to provide you with the highest level of calibration accuracy possible.

- [How to set Error Correction](#)
- [Error Correction](#)
- [Viewing Correction Levels](#)
- [How to set Interpolation](#)
- [Interpolation Accuracy](#)

See other Calibration Topics

How to set Error Correction

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then [**Correction ON/off**]

Using a mouse with PNA Menus

1. Click **Cal**
2. then **Correction ON/off**

[Programming Commands](#)

Error Correction

The Error Correction ON setting means that the calibration error terms are applied to the measurement. Error Correction is automatically turned ON when a calibration is performed or if a Cal Set is applied to a measurement. The PNA attempts to turn error correction ON for ALL of the measurements on the active channel. This may not always be possible when applying Cal Sets. For more information, see [Applying Cal Sets](#).

When full 2-port error correction is ON, both forward and reverse sweeps are required to gather all 12 error terms, even if only one reflection measurement is displayed. This may result in a higher measurement speed than expected. [Learn more](#).

You can always turn Error Correction OFF for the active measurement by clicking Correction OFF. The PNA will turn Error Correction OFF automatically when making stimulus changes [under some conditions](#). To turn correction back ON, click **Correction ON**. Then:

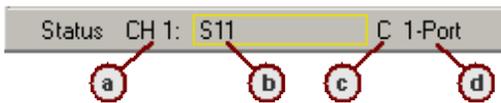

- If Interpolation can NOT be performed, a dialog box will ask if you would like to [change the stimulus settings](#) to those of the applied calibration. Click OK or Cancel.
- If Interpolation can be performed, the stimulus setting will change and correction turned ON.

Viewing Correction Level

The correction level provides information about the accuracy of the active measurement. Correction level notation is displayed on the status bar for different calibration types like response, full 2-port, TRL, or power calibration.

To View Correction Levels:

In the **View** menu, click **Status Bar**. The status bar appears and displays the following items:

- Active Channel
- Measurement parameter
- Correction Level (see description below)
- Calibration type

	Correction Level	Accuracy
C	Full	Highest
C*	Interpolated	Uncertain
CΔ	Changed	Uncertain
No Cor	No Correction	Lowest

C Full Correction

Full Correction level is displayed immediately after a calibration is performed or when a valid Cal Set is applied. If you require optimum accuracy, avoid adjusting analyzer settings after calibration so your measurement remains at this level.

C* Interpolated Correction

"C star" appears in the status bar when a measurement is being interpolated. See Interpolation (above) and [Interpolation Accuracy](#).

CΔ Changed Settings

"C-delta" appears in the status bar when one or more of the following stimulus settings change. The resulting measurement accuracy depends on which parameter has changed and how much it has changed. For optimum accuracy, recalibrate using the new settings.

- [Sweep time](#)
- [IF Bandwidth](#)
- [Port power](#)
- [Stepped sweep enabled/disabled](#)

No Corr No Correction

The following will cause the PNA to turn Error Correction OFF for the channel:

- Decrease the start frequency
- Increase the stop frequency
- Change start frequency, stop frequency, or number of points with Interpolation OFF.
- [Change sweep type](#)

How to set Interpolation

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[More]**
3. then **[Interplotion ON/off]**

Using a mouse with PNA Menus

1. Click **Cal**
2. then **More**
3. then **Interplotion ON/off**

◀ Programming Commands ▶

Interpolation

Calibration interpolation adjusts calibration error terms to match changes to the following settings that you make AFTER a calibration is performed or a [Cal Set applied](#).

The Interpolation **ON** setting means that interpolation is **enabled** for the active measurement. This does not necessarily mean that the measurement is interpolated. When enabled (ON), if interpolation becomes necessary because you change any of the following stimulus settings, **then** interpolation will

be applied. When stimulus settings change while interpolation is OFF, interpolation is NOT applied but instead, error correction is turned OFF.

Interpolation occurs (if enabled) when you change any of the following settings:

- Start frequency increased
- Stop frequency decreased
- Number of points

Note: Decreasing the start frequency, or increasing the stop frequency will always turn correction **OFF**. (Exception: [Power Calibration](#) DOES extrapolate to the start and stop frequencies.)

Interpolation Accuracy

When a measurement is interpolated, the accuracy of the measurements cannot be predicted. It may be affected significantly or not at all. Identifying measurement errors in these cases must be determined on a case-by-case basis. In general, the magnitude and phase stimulus from the PNA and the response from the DUT need to be smooth and continuous for measurement interpolation to give accurate results.

Significant measurement inaccuracy **WILL** occur when the phase shift response between measurement points increases changes more than 180 degrees. The PNA will incorrectly interpolate the new phase data. For more information, see [phase accuracy](#).

In general, the chances of significant inaccuracy increases when interpolating measurements under the following conditions:

- when frequency span between measurement points becomes much greater.
- when measurement frequencies are above 10 GHz where phase changes happen more rapidly.
- when interpolating across frequency band crossings. [Learn more about band crossings](#).

Note: When the interpolation algorithm encounters an abrupt or large change in the response magnitude or phase, such as can occur at band crossings, large interpolation errors can be included in the displayed data. These errors can be seen as steps or spikes. If this occurs, consider turning off interpolation, changing the measurement parameters, or creating [sweep segments](#) that skip over the band crossings.

Using ECal

This topic discusses all aspects of performing an ECal:

- [ECal Overview](#)
- [Connect ECal Module to the PNA](#)
- [How to Perform a Calibration Using ECal](#)

See Also:

[ECal User-Characterization](#)

[Perform a 4-Port Cal with ONE 2-Port ECal Module](#)

[Restore ECal Module Memory](#)

[See other Calibration Topics](#)

ECal Overview

ECal is a complete solid-state calibration solution. Every ECal module contains electronic standards that are automatically switched into position during a PNA measurement calibration. These electronic standards have been measured at the factory and the data stored within the memory of the ECal module. The PNA uses this stored data, along with the PNA-measured data, to calculate the error terms for a measurement calibration.

ECal modules are available in 2-port and 4-port models and a variety of connector types, covering many frequency ranges. See [Analyzer Accessories](#) for more about available ECal modules and ordering information.

You can perform the following calibrations with ECal:

- 1-Port Reflection calibration
- Full 2-Port calibration
- Full 3-Port calibration
- Full 4-Port calibration

Verify the validity of a mechanical or ECal calibration with [ECal confidence check](#).

Care and Handling of ECal Modules

You can improve accuracy, repeatability, and avoid costly repair of equipment in the following ways.

- Practice proper connector care. See [Connector Care](#).
- Protect equipment against ESD damage. Read [Electrostatic Discharge Protection](#).

Power Level into an ECal module

- NEVER exceed the following Damage levels to the ECal module.
- For highest accuracy, do not exceed the following ECal Compression levels when calibrating:

Model	Compression level	Damage level
N469x series	-5 dBm	+10 dBm
N4432A series	-7 dBm	+20 dBm
N4433A series		
N4431x series	+7 dBm	+20 dBm
8509x series	+9 dBm	+20 dBm

When using the PNA-X, the power level can be increased after calibration with minimal impact on measurement accuracy.

Connect ECal Module to the PNA

ECal modules are controlled and powered through a USB connection to the PNA. When you connect the module, the PNA automatically recognizes the type of module, frequency range, and connector type.

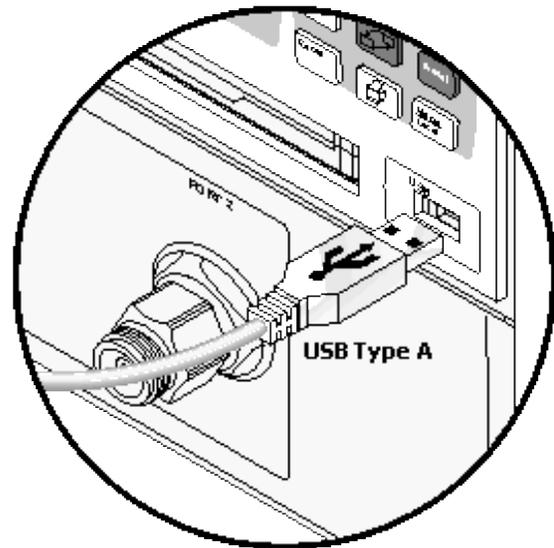

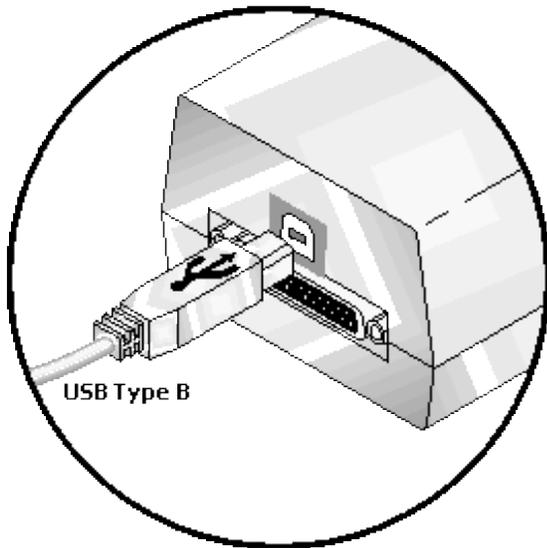

[See Important First-time USB connection note.](#)

ECal modules connect to the USB port on the front or rear panel of the PNA.

1. Wear a grounded wrist strap when making connections.
2. Connect the USB cable **Type B** connector to the ECal module and the USB cable **Type A** connector to the front or rear panel USB connector of the analyzer, as shown in the following graphics.

ECal Module USB Port

Analyzer Front Panel USB Port

Notes:

- Unused ECal modules that have completed a calibration may remain connected to the USB port.
- You can connect and disconnect the ECal module while the analyzer is operating. However, DO NOT connect or disconnect the module while data transfer is in progress. This can result in damage or at least corrupted data.

How to Perform a Calibration Using ECal

Select an ECal module that has connectors of the same type and gender as the DUT. If such an ECal module is not available, a module with connectors different from the DUT can be used by using [Advanced Settings](#) or [User Characterization](#). See Also: [Perform a 4-Port Cal with ONE 2-Port ECal Module](#)

Connect the ECal module ports to the PNA ports. During the calibration process the PNA can either automatically detect how the ECal module is connected, or the orientation can be performed manually.

1. Connect the ECal module USB cable to the analyzer USB. See [Connect ECal Module USB to PNA USB](#).
2. Allow the module to warm up until it indicates **READY**.
3. Enter the analyzer settings. See [Set Up Measurements](#).
4. Do one of the following to start the [Calibration Wizard](#)

**Using front-panel
HARDKEY [softkey] buttons**

Using a mouse with PNA Menus

1. Press **CAL**
2. then [**Start Cal**]
3. then [**Cal Wizard**]

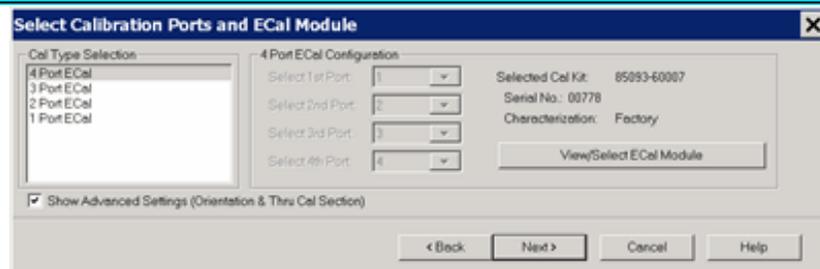

1. Click **Response**
2. then **Cal**
3. then **Cal Wizard**

Programming Commands

5. In the [Calibration Wizard Begin](#) dialog box, click **Use Electronic Cal (ECal)**.

Note: To calibrate with more than one ECal module, select [SmartCal](#), then choose the ECal modules as your Cal Kits.

Select Calibration Ports and ECal Module dialog box help

Allows you to select calibration type and settings.

Cal Type Selection / Configuration Select the number of ports to calibrate. Then select the port number configuration.

4 Port ECal Available only if using a 4-port PNA. No additional configuration necessary.

3 Port ECal Available only if using a 4-port or 3-port PNA.

2 Port ECal

1 Port ECal- (Reflection) Advanced Settings are not available.

View/Select ECal Module Click to [Select the ECal module](#) if more than one ECal module is connected to the PNA. Also, [Select the User Characterization](#) within the module. Learn more about [User Characterization](#).

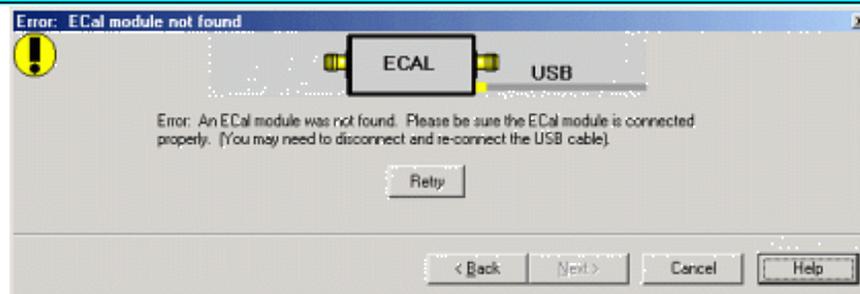

Show Advanced Settings Check to display the [Advanced Settings](#) when **Next** is clicked.

Back Return to [Cal Wizard Begin](#) dialog. If checked, you can clear the [Save Preferences](#) checkbox to see the Begin page when the Cal Wizard begins.

Note: The PNA no longer allows ECal isolation to be performed. The inherent isolation of the PNA is better than that attained with correction using an ECal module.

Terminate any unused ECal ports with a 50 ohm load.

ECal module not found dialog box help

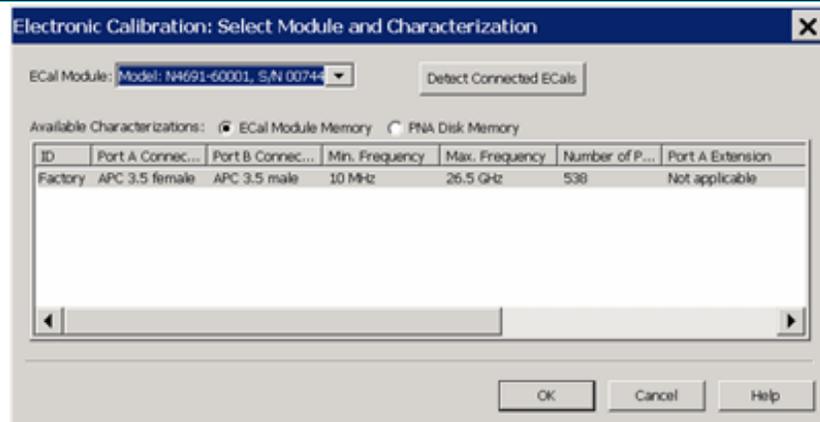

When this dialog appears, the ECal module is not connected or has not been recognized by the network analyzer.

Retry Check the USB connections and click to continue.

Notes:

- If your ECal module is not detected, try to unplug, then reconnect the USB connector to the PNA.
- When the ECal module is connected to the network analyzer for the first time, it may take approximately 30 seconds for the analyzer to recognize the module and make it available for calibration.
- For best accuracy, allow the ECal module to warm-up until it indicates READY.
- Agilent 8509x and N4431 ECal modules, when first connected, draw significantly more current than other modules. This could cause the USB to stop working in certain situations. [See USB limitations.](#)
- See [Connect ECal Module USB to PNA USB.](#)

Select Module and Characterization dialog box help

ECal Module Select one of the ECal modules that are connected to the PNA.

Detect Connected ECals Click to rescan the USB for ECal modules.

Available Characterizations

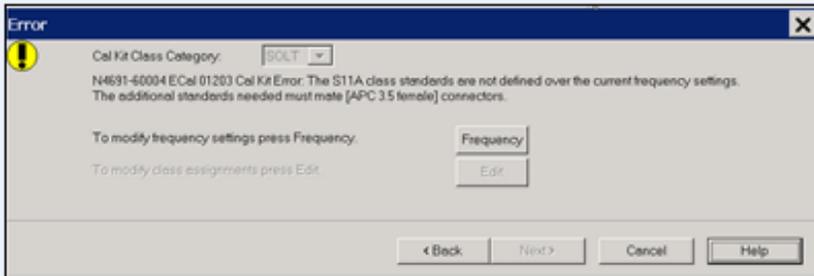

ECal Module Memory - Displays the factory and [user characterizations](#) that are stored in the ECal module.

PNA Disk Memory - Displays the user characterizations that are stored in PNA Disk Memory.

[Learn more User Characterizations in PNA Disk Memory.](#)

Select either the characterization data to use for the calibration. Once selected, that characterization becomes the default selection until the PNA is turned OFF and restarted. When restarted, **Factory** again becomes the default selection.

Error: Frequency Range dialog box help

When this dialog appears, the current cal standards (or ECal module) does not cover the current frequency range of the measurement. Do one of the following to correct the problem:

Cal Kit Class Category Not available with ECal modules.

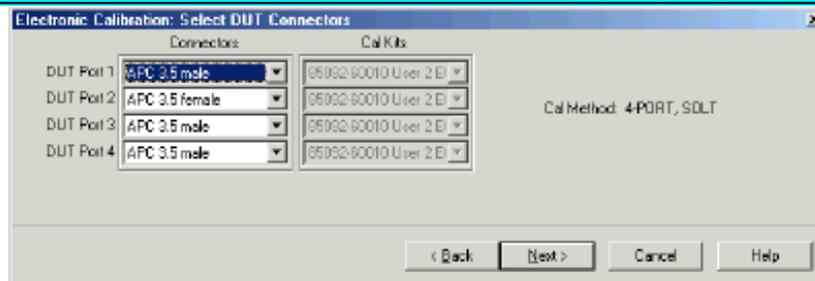

Frequency Change the frequency range of the active channel.

Edit Not available with ECal modules.

Back Select a different characterization that covers the required frequency range.

Cancel Re-characterize the module with an increased frequency range.

Select DUT Connectors and Cal Kits dialog box help

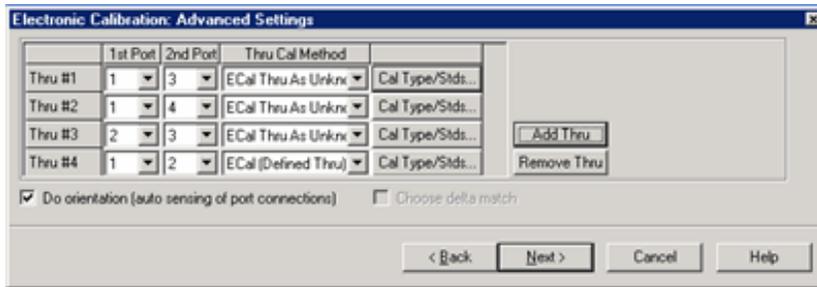

If the ECal module or selected User Characterization has more than one connector type, then the following dialog box is presented which allows you to describe the DUT connector type. Otherwise, click next to proceed to [Advanced Settings](#) (if checked) or [ECal Steps](#).

Connectors

The available connectors are listed for each DUT port.

Advanced Settings dialog box help

Thru #n

Lists the proposed Thru connections to be made during the calibration process. You can change these Thru connections to better suit your test setup.

- The proposed Thru connections are listed automatically.
- Additional Thru connections can be selected for higher accuracy. [Learn more](#).
- For Balanced measurements, [learn which Thru paths to select](#).

Add Thru

Click to add a Thru connection. [Learn more](#)

Remove Thru

Select a Thru by clicking the "Thru #N" field or the "1st Port / 2nd Port" field. Then click "Remove Thru". This selection is NOT available if the selected Thru is required for the calibration.

1st Port / 2nd Port

Click to change the two ports to be included in the Thru connection. The order of the port numbers (1st or 2nd) is not critical.

Thru Cal Method

Lists the available Thru Cal methods for the specified port pairs.

[Learn about ECal Thru Methods](#)

Cal Type/ Std

Click to invoke the [View / Modify Properties of Cal dialog box](#)

Do orientation

When this box is checked (the default setting) the PNA automatically senses the model and

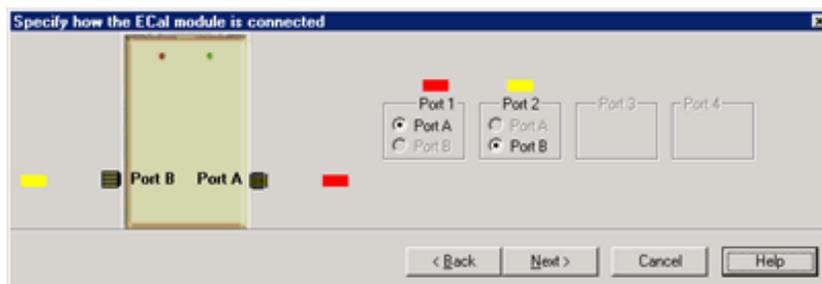

direction in which an ECal module port is connected to the PNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range.

Choose delta match

Available only when a Delta Match Cal is required.

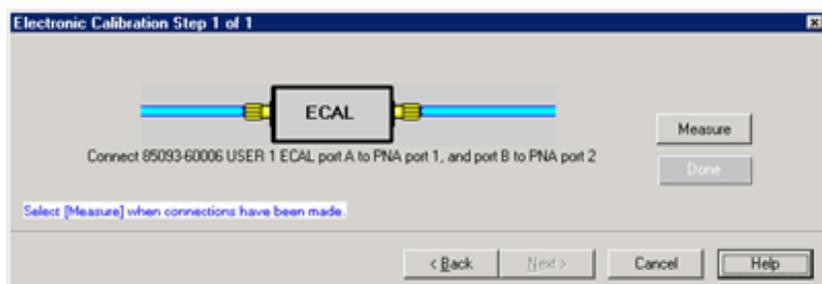

- Check, then click **Next** to invoke the [Select Cal Set for Delta Match](#) dialog box.
- Clear - The Cal Wizard uses the [Global Delta Match Cal](#) if available.

Specify how the ECal module is connected dialog box help

This dialog box appears when the **Do orientation** checkbox in the previous dialog box is cleared.

Click the ECal Port that is connected to each PNA port.

ECal User Characterization

- [Overview](#)
- [How to Perform a User Characterization](#)
- [Manage Disk Memory](#)
- [Restore ECal Module Memory](#)

See Also

[Using ECal](#)

[Perform a 4-Port Cal with a 2-Port ECal Module](#)

Other Calibration Topics

Overview

A user-characterized ECal module allows you to add adapters to the ECal module, re-measure the standards in the ECal module, INCLUDING the adapters, then add that data to ECal memory or save it to the PNA hard drive. This extends the reference plane from the module test ports to the adapters.

Why perform a User Characterization?

- If you need to use adapters with your ECal module, you could characterize your ECal module with the adapters attached and perform subsequent ECals in a single step.
- If you have a 4-port ECal module, you could configure the module with adapters of different connector types, then perform a User Characterization of the module. When you need to test a DUT with a pair of the connector types on your module, calibrate the PNA with a 1-step ECal using the same two connectors on the User-characterized module.
- If you test devices in a fixture, you could embed the characterization of the fixture in the characterization of the module. To do this, during the mechanical calibration portion of the User Characterization, calibrate at the reference plane of the device as you would normally calibrate. Then remove the fixturing to be embedded and insert the ECal module to be characterized. When measuring the ECal module, the PNA removes the effects of the fixturing and stores the measurement results in the user characterized ECal module. Subsequent calibrations with that user-characterized module will also remove the fixture effects.

Notes:

- Both 2-port and 4-port ECal modules support User Characterization.

- User Characterization does not delete the factory characterization data. The factory data is saved in the ECal module in addition to the User Characterization data.
- The ECal Data Wipe Utility is the only way that data can be deleted from the module. Learn more at <http://na.tm.agilent.com/pna/apps/applications.htm>.
- Beginning with A.06.03, a User Characterization can be performed beyond the frequency range of the ECal module. Although this practice is allowed, calibration accuracy with the extended User Characterization is likely to be degraded. To determine the level of degradation, compare measurements of a variety of devices using a PNA with a mechanical cal kit calibration versus an ECal extended User Characterization calibration.
- Beginning with A.08.33, you can save up to 12 User Characterizations in a single ECal module. Previous releases allowed up to 5. There are memory limitations. The PNA will determine if the contents of a User Characterization will fit inside the module before it is performed.
- Saving a new User Characterization with PNA releases **before** A.08.33 will erase any User Characterizations greater than 5. This is because the PNA completely rewrites ALL ECal User Characterizations when saving a new one in order to free storage space in the ECal module.
- Beginning with A.08.33, a User Characterization can be performed remotely. [See programming commands.](#)

User Characterizations can be saved to the **PNA Disk Memory** beginning with A.09.00. [Learn how.](#) Previously, User Characterizations could be saved only to the ECal module memory.

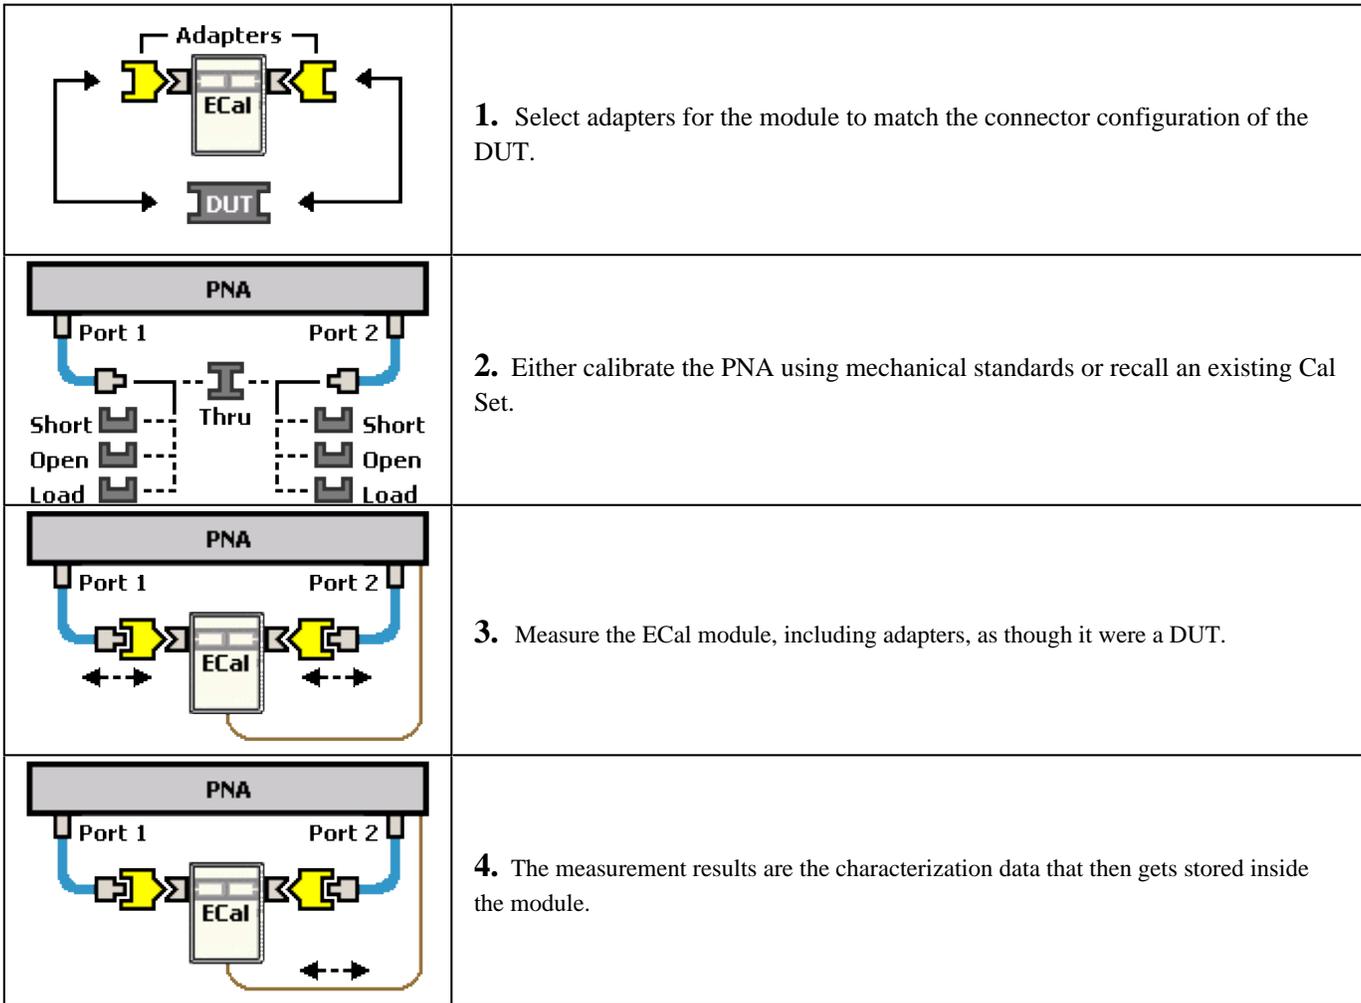

This feature provides the following benefits:

- A User Characterization using connectors that are NOT included in the [supported connector table](#) can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed by firmware using a description of any length for the User Characterization.
- There is NO limit to the number of data points allowed in a User Characterization stored to disk memory. When stored in the ECal module, the number of data points is limited by the PNA firmware.
- The number of User Characterizations that can be stored to disk memory is limited only by available disk space.
- User Characterizations stored to disk memory can be freely shared between PNAs that have PNA Rev. 9.00 or later.

[Learn how to Manage User Characterization in Disk Memory.](#)

How to Perform a User Characterization

SUMMARY (A [detailed procedure](#) follows.)

Note

A 2-port PNA can be used to perform a User Characterization on a 4-port ECal module.

However, a 4-port ECal module has SIX different port pairs. The PNA must be recalibrated for each port pair that uses unique connector types or gender.

- If all 4 ECal module ports have the same connector type and gender, then only one PNA calibration is required to measure all six port pairs.
- If all 4 ECal module ports have different connector types or gender, then 6 calibrations are required.

When more than one PNA calibration is required during a User Characterization, then ALL calibrations must be performed using the standard Cal Wizard, saved to Cal Sets, and then [recalled from Cal Sets](#) DURING the User Characterization.

Detailed steps to Perform a User Characterization

1. Connect the ECal module to the network analyzer with the USB cable. See [Connect ECal Module USB to PNA USB](#).
2. Allow the module to warm up until it indicates **READY**.
3. **Preset** the analyzer.
4. [Set up the measurement](#). For best accuracy, the **IF bandwidth** should be set to **1 kHz** or less.
5. Start and complete the **Characterize ECal Module** Wizard:

Using front-panel HARDKEY [softkey] buttons

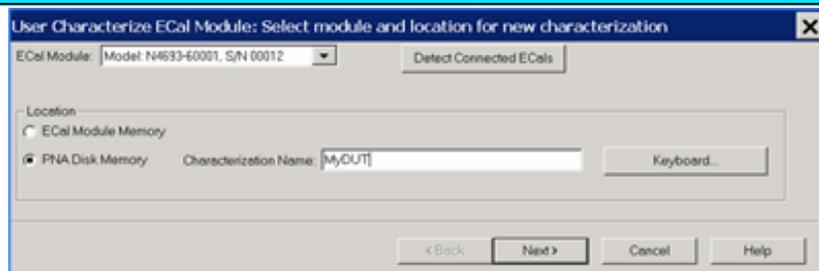

1. Press **CAL**
2. then **[More]**
3. then **[ECal]**
4. then **[Characterize ECal Module]**

Using a mouse with PNA Menus

1. Click **Response**
2. the **Cal**
3. then **More**
4. then **ECal**
5. then **Characterize ECal Module**

Programming Commands

Select Module and Location dialog box help

ECal Module Select one of the ECal modules that are connected to the PNA.

Detect Connected ECals Click to rescan the USB for ECal modules.

Select Connectors for the Characterization dialog box help

Connector Notes

When performing an ECal User Characterization, do NOT use a [custom connector name](#) that you added to this list. If you need to use a custom-defined connector type, select "Type B", or one of the "Type A" variations from the list of connectors for each port.

A User Characterization using connectors that are NOT included in the [supported connector table](#) can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed. [Learn more about storing to PNA Disk Memory.](#)

Select the adapters for the ECal module test ports. Select **No adapter** if no adapter is used on a port.

PORT A Lists the connector types available for Port A.

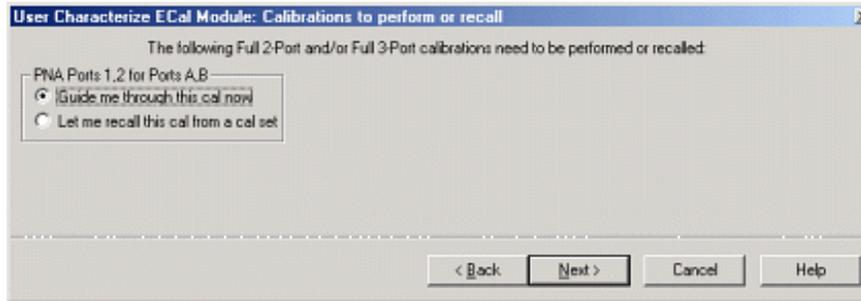

PORT B Lists the connector types available for Port B.

PORT C Lists the connector types available for Port C (available with a 4-port ECal module).

PORT D Lists the connector types available for Port D (available with a 4-port ECal module).

Next Click to continue to the [Calibrations to perform or recall](#) dialog box.

Calibrations to perform or recall dialog box help

The PNA must be calibrated before measuring the ECal module and necessary adapters. This dialog box displays the number and types of mechanical calibrations required for the characterization.

Guide me through this cal now Click to perform a Guided calibration. A calibration kit is required for each connector type.

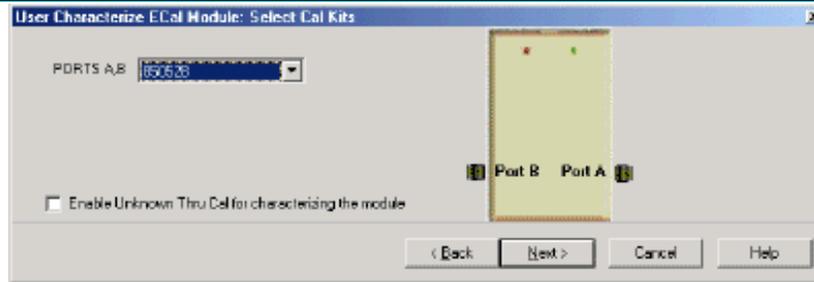

Note: Some PNA-L models cannot perform TRL calibration during the calibration portion of a User Characterization. However, this type of Cal can be performed using the Cal Wizard, saved to a Cal Set, then recalled at this point in the User Characterization.

If more than one calibration is required, this selection is not available. [See Note.](#)

Let me recall this cal from a cal set Click to select an existing Cal Set. You cannot select a Cal Set that is currently in use. Learn more about [Using Cal Sets.](#)

Next Click to continue to either the [Select Cal Kits](#) or the [Select Cal Set](#) dialog box.

Select Cal Kits dialog box help

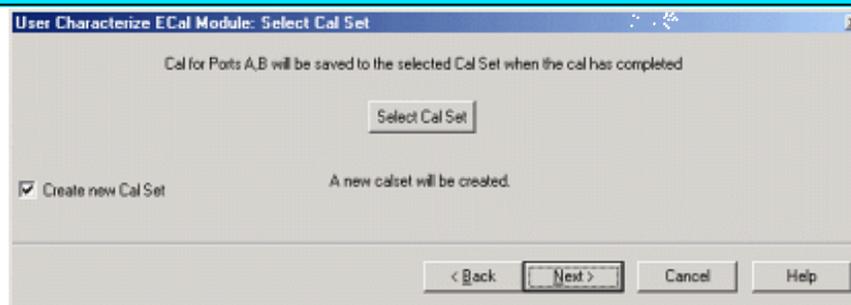

Provides a list of calibration kits to perform the calibration. Select the Cal Kit you will use for each port.

Enable Unknown Thru for characterizing the module Check to enable. This reduces the number of steps required to characterize the THRU standard. This setting is available only on PNA models with [one reference receiver per test port](#).

Next Click to continue to the [Select Cal Set](#) dialog box.

Select Cal Set dialog box help

The calibration that you perform will be written to a Cal Set. This dialog box allows you to select a Cal Set to overwrite, or to write to a new Cal Set. The current choice is visible below the **Select Cal Set** button.

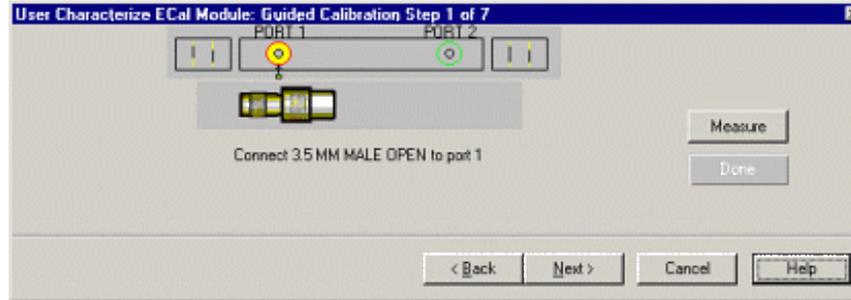

Select Cal Set Click to open the **Select A Cal Set** dialog box.

Create new Cal Set Check to create a new Cal Set to store the calibration. Clear to select and overwrite a stored Cal Set.

Next Click to continue to the [Guided Calibration Steps](#) dialog box.

Note: Remember the Cal Set name for future reference.

Guided Calibration Steps dialog box help

Instructs you to connect each calibration standard to the measurement port.

Measure Click to measure the standard.

Back Click to repeat one or more calibration steps.

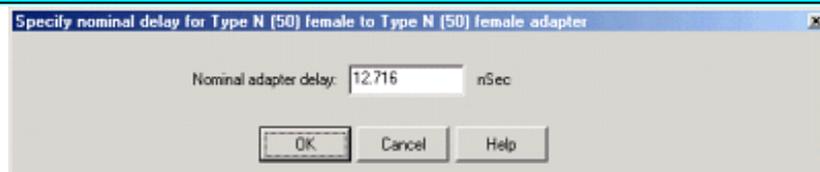

Done Click **after** a standard is re-measured and all measurements for the calibration are complete.

Next Click to continue to the next calibration step. (Does **not** measure the standard.)

Cancel Exits Calibration Wizard.

The **Specify nominal delay** or **Guided Calibration completed** dialog box appears when the steps are completed.

Specify nominal delay dialog box help

This dialog **ONLY** appears when [Adapter Removal](#) or [Unknown Thru](#) calibrations are performed.

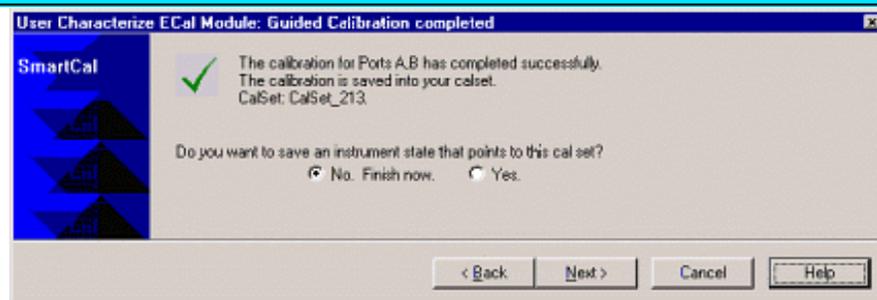

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

Nominal adapter delay To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here.

Nominal phase offset (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

Guided Calibration completed dialog box help

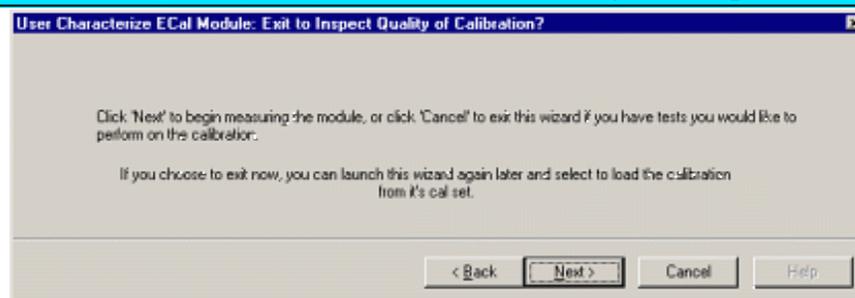

Allows you to finish the calibration and continue to the next characterization steps.

No. Finish now Select to save Cal Set data.

Yes Allows selection of Save options.

Next Click to continue to the [Exit to Inspect Quality of Calibration](#) dialog box.

Exit to Inspect Quality of Calibration dialog box help

Allows you to exit User Characterization to [validate the calibration](#) before proceeding with the characterization.

Back Allows you to repeat calibration.

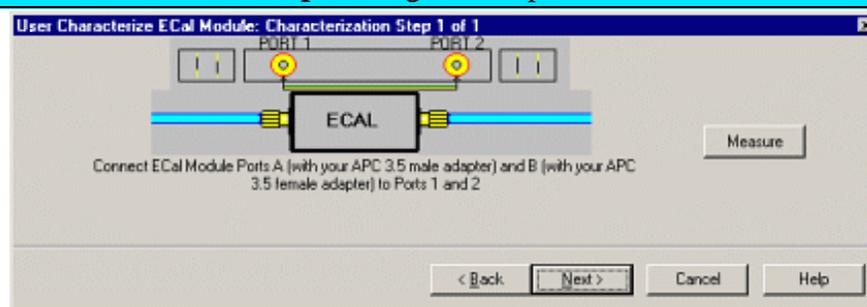

Next Click to continue to the [Characterization Steps](#) dialog box.

Cancel Exits the Calibration.

To return to the current step:

1. Start User Characterization.
2. In the **Select user number for new characterization** dialog box, click **Next**.
3. In the **Select Connectors for Characterization** dialog box, click **Next**. (Previous entry is stored in memory.)
4. In the **Calibrations to perform or recall** dialog box, recall the Cal Set that you just performed.

Characterization Steps dialog box help

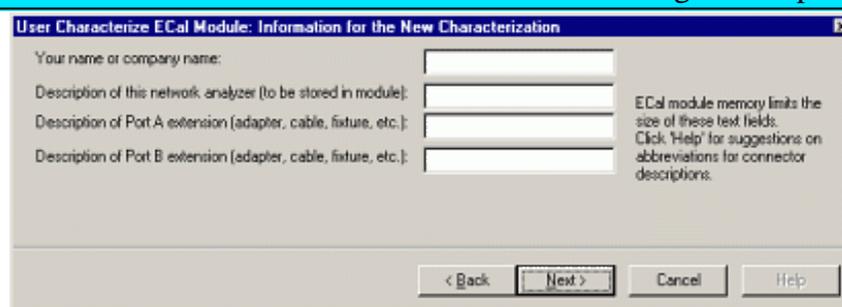

Describes the instructions for each measurement required for characterization.

Measure Measures the ECal module.

Next Click to continue to the [Information for the New Characterization](#) dialog box when measurements are complete.

Information for the New Characterization dialog box help

Allows you to describe the properties of the User Characterization.

Suggestions for connector abbreviations

To minimize the number of characters, we suggest using the following 3-character codes to describe the connectors listed.

A User Characterization using connectors that are NOT included on this list can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed. [Learn more about storing to PNA Disk Memory.](#)

Connector Type	3-Character Code
1.0 mm female	10F
1.0 mm male	10M
1.85 mm female	18F
1.85 mm male	18M
2.4 mm female	24F
2.4 mm male	24M
2.92 mm female	29F
2.92 mm male	29M
3.5 mm female	35F
3.5 mm male	35M
7-16 female	16F
7-16 male	16M
Type F female	F7F
Type F male	F7M
N50 female	N5F
N50 male	N5M
N75 female	N7F
N75 male	N7M
APC 7	7MM
K-band waveguide	KBW
P-band waveguide	PBW
Q-band waveguide	QBW
R-band waveguide	RBW
U-band waveguide	UBW
V-band waveguide	VBW
W-band waveguide	WBW
X-band waveguide	XBW

Next Click to continue to the [Write Characterized Data to the ECal module](#) dialog box.

Write Characterized Data dialog box help

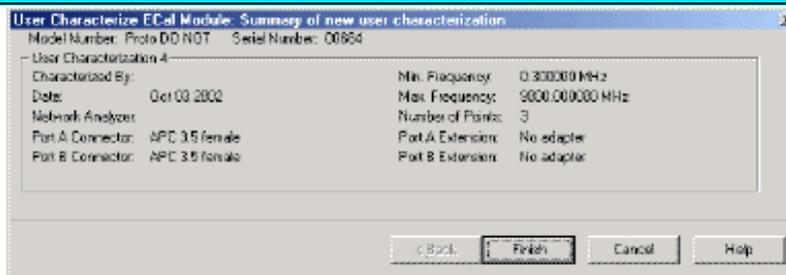

The PNA writes User Characterization and factory characterization data to either the PNA disk memory or the ECal module memory.

Write Click to write data.

The [Summary of new User Characterization](#) dialog box opens after data is saved to module.

- Existing data will be overwritten if you selected a User Characterization number that already has data. [Learn more](#)
- For more information, see [Restore ECal module memory](#).
- The ECal Data Wipe Utility is the only way that data can be deleted from the module. Learn more at <http://na.tm.agilent.com/pna/apps/applications.htm>.

Summary of new User Characterization dialog box help

Verify the status of the ECal User Characterization.

- ECal module model number

- summary from User Characterization

Cancel Click to exit (characterization complete).

Finish Click to exit (characterization complete).

Manage ECal User Characterizations in Disk Memory

Normally, User Characterizations that are stored in PNA disk memory can be used indefinitely without needing them to be managed. However, this dialog allows you to backup the characterizations in case they are accidentally erased, or to save them to a file that can be moved to another PNA.

How to Manage ECal User Characterizations in Disk Memory

Using front-panel HARDKEY [softkey] buttons

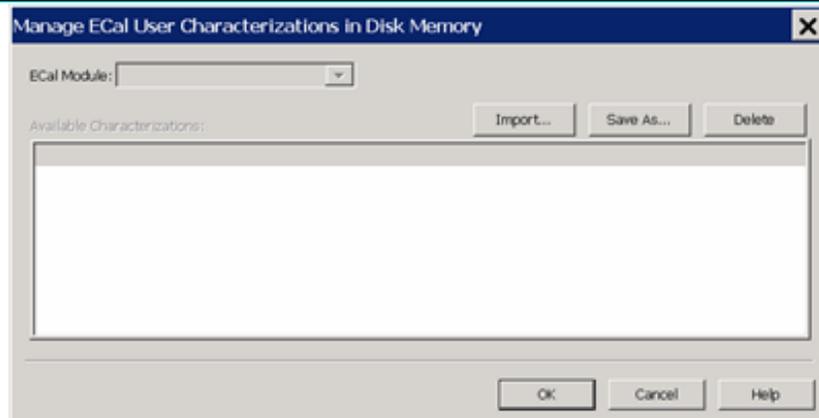

1. Press **CAL**
2. then **[More]**
3. then **[ECal]**
4. then **[Manage ECal Disk Memory]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **More**
4. then **ECal**
5. then **Manage ECal Disk Memory**

◀ Programming Commands ▶

Manage ECal User Characterizations in Disk Memory dialog box help

This dialog allows you to do either of the following:

- Save an existing User Characterization in disk memory to an *.euc file.
- Load a previously saved *.euc file for use on the PNA with the specified ECal module.

[Learn more about User Characterizations stored to Disk Memory.](#)

ECal Module Select an ECal Module from the list for which User Characterizations are currently stored in PNA disk memory.

Save As Saves a User Characterization that is currently in PNA disk memory to a *.euc file. This file can be used as a backup in case the archive file is accidentally deleted, or allows you to move the file to another PNA to be used with the selected ECal Module.

Import Loads a previously saved *.euc file for use on the PNA with the specified ECal module.

Delete Removes a User Characterization from PNA disk memory.

Restore ECal Module Memory

When user-characterized data is written to the ECal module, the entire contents of ECal memory is also written to the PNA hard drive, including the factory ECal data. In the unlikely event that your ECal module memory is lost, you can restore all ECal data to ECal memory.

Caution: If a new factory cal was performed **after** the ECal memory was written to the PNA, the new factory cal data will also be overwritten.

Note: An ECal Data Wipe Utility destroys all user data per US DoD 5220.22-M. Learn more at <http://na.tm.agilent.com/pna/apps/applications.htm>

How to Restore ECal Module Memory

Using front-panel HARDKEY [softkey] buttons

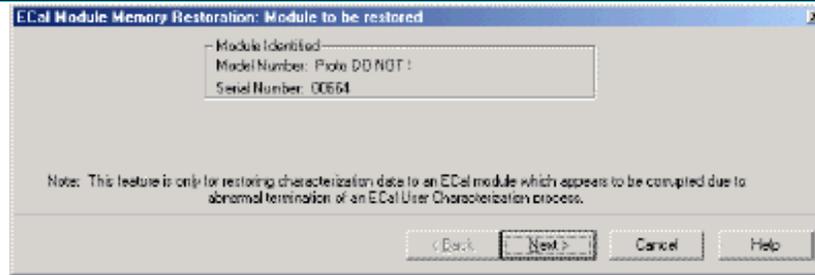

1. Press **SYSTEM**
2. then **[Service]**
3. then **[Utilities]**
4. then **[Restore...]**

Using a mouse with PNA Menus

1. Click **Utility**
2. then **System**
3. then **Service**
4. then **Utilities**
5. then **Restore...**

No Programming commands are available for this feature.

Module to be restored dialog box help

Verify the serial number of the module to be restored. If two modules are connected to the PNA , choose the one to have data restored.

Next Click to write data to the module.

Perform a 4-Port Cal with One 2-Port ECal Module

You can perform a 4-port calibration with a 2-Port ECal Module. When all four DUT connectors are the same type and gender, the calibration can occur with only four connections, the same number of connections you would make with a 4-port ECal module.

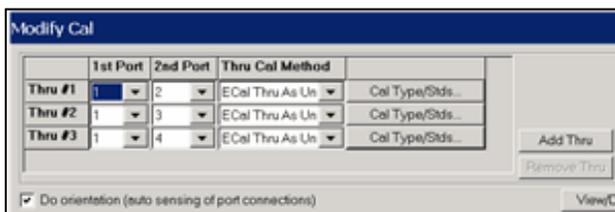

- The ECal module must span the frequency range of the measurement.
- The ECal module must have connectors that match the DUT connectors. Because we are using a 2-port ECal module, this means that the DUT must have only TWO unique connector types and gender. When the DUT has more than two connector types/genders, you can select a different cal kit for each port using SmartCal.

Procedure

1. Connect the 2-port ECal module to a PNA USB port.
2. Press **Cal**, then **Start Cal**, then **Cal Wizard**
3. Select either **SmartCal** or **Use Electronic Calibration** then click **Next**.
4. Select **4 Port Cal**, then click **Next** to see the following dialog:

5. Select the DUT Connectors for each port. In this example, all four DUT connectors are Type N, female.
6. Select the attached ECal module. We are using a **85092-60007 ECal** module.
7. Select **Modify Cal (Show Advanced Settings for ECal)** then click **Next** to see the following dialog:

8. For the fewest number of physical connections, select the default port assignments.
 - The **1st Port** selection for each port pair is 1.

- For single-ended (standard) measurements, THREE is the minimum number of Thru connections. For Balanced measurements, FOUR Thru connections should be made. [Learn more.](#)
 - For higher accuracy, select **Add Thru**. The Cal Wizard will add another port pair which results in more physical connections.
9. Select **ECal Thru as Unknown**. This is the most accurate and easiest Thru Cal Method. [Learn more.](#)
 10. You may need to clear **Do Orientation** when calibrating at low power levels. [Learn more.](#) This will add additional connection steps.
 11. Follow the prompts to complete the calibration:
 1. Connect ECal to ports 1 and 2. Click **Measure**.
 2. Connect ECal to ports 1 and 3. Click **Measure**.
 3. Connect ECal to ports 1 and 4. Click **Measure**.
 12. At the **Specify Delay** dialogs, click **OK**. This is the measured delay for each of the Thru connections in the ECal module. [Learn more.](#)
 13. Click either **Save As User Cal Set**, or **Finish**.

2-Aug-2011 New topic

TRL Calibration

TRL (Thru, Reflect, Line) represents a **family** of calibration techniques that measure two transmission standards and one reflection standard to determine the 2-port 12-term error coefficients. For example, **TRM** (Thru, Reflect, Match), **LRL** (Line, Reflect, Line), **LRM** (Line, Reflect, Match) are all included in this family.

The traditional SOLT calibration measures one transmission standard (T) and three reflection standards (SOL) to determine the same error coefficients.

- [Why Perform a TRL Cal?](#)
- [The TRL Calibration Process](#)
- [TRL Cal Kits](#)
- [Cal Standards Used in TRL](#)
- [TRL on 4-port PNA-L and ALL Models with an External Test Set](#)

See other Calibration Topics

Why Perform a TRL Cal?

TRL calibration is extremely accurate, in most cases more accurate than an SOLT cal. However, very few calibration kits contain TRL standards. TRL Cal is most often performed when you require a high level of accuracy and do not have calibration standards in the same connector type as your DUT. This is usually the case when using test fixtures, or making on-wafer measurements with probes. Therefore, in some cases you must construct and characterize standards in the same media type as your DUT configuration. It is easier to manufacture and characterize three TRL standards than the four SOLT standards.

Another advantage of TRL calibration is that the TRL standards need not be defined as completely and accurately as the SOLT standards. While SOLT standards are completely characterized and stored as the standard definition, TRL standards are modeled, and not completely characterized. However, TRL cal accuracy is directly proportional to the quality and repeatability of the TRL standards. Physical discontinuities, such as bends in the transmission lines and beads in coaxial structures, will degrade the TRL calibration. The connectors must be clean and allow repeatable connections.

To learn more about Cal Standard requirements, see [Cal Standards Used in TRL](#).

The TRL Cal Process

Although TRL can be performed using the Cal Wizard Unguided Cal selection, the following process uses the easier [SmartCal](#) selection. Both selections require that you already have TRL calibration standards defined and included in a PNA cal kit.

1. Preset the PNA
2. Set up a measurement and the desired stimulus settings.
3. Click **Calibration / Calibration Wizard**
4. Click **SmartCal (Guided Cal)**.
5. [Select the DUT connectors and Cal Kit](#) for each port. The LOWEST port number of each [port pair](#) MUST include TRL standards. TRL appears as the Cal Method.
6. Check **Modify Cal, Next**, then **View/Modify** to change [default TRL options](#) if necessary.
7. Follow the prompts to complete the calibration.
8. [Check the accuracy](#) of the calibration

TRL Cal Kits

Agilent Technologies offers two cal kits that include the required standards to perform a TRL calibration: 85050C (APC 7mm) and 85052C (3.5mm). Both kits include the traditional Short, Open, and Load standards. (The Thru standard, not actually supplied, assumes a [zero-length Thru](#)). In addition, the kits include an airline which is used as the LINE standard. To use the airline, the kits include an airline body, center conductor, and insertion / extraction tools. The APC 7 kit includes an adapter to connect the airline to the APC connector.

Cal Standards Used in TRL

These standards must be defined in your TRL cal kit:

THRU

Note: All [THRU calibration methods](#) are supported in a TRL Cal **EXCEPT** Unknown Thru.

- The THRU standard can be either a zero-length or non-zero length. However, a zero-length THRU is more accurate because it has zero loss and no reflections, by definition.
- The THRU standard cannot be the same electrical length as the LINE standard.
- If the insertion phase and electrical length are well-defined, the THRU standard may be used to [set the reference plane](#).
- Characteristic impedance of the THRU and LINE standards defines the reference impedance of the

calibration.

- If a THRU standard with the correct connectors is NOT available, an adapter removal cal can be performed.

REFLECT

- The REFLECT standard can be anything with a high reflection, as long as it is the same when connected to both PNA ports.
- The actual magnitude of the reflection need not be known.
- The phase of the reflection standard must be known within 1/4 wavelength.
- If the magnitude and phase of the reflection standard are well-defined, the standard may be used to [set the reference plane](#).

LINE

The LINE and THRU standards establish the reference impedance for the measurement after the calibration is completed. TRL calibration is limited by the following restrictions of the LINE standard:

- Must be of the same impedance and propagation constant as the THRU standard.
- The electrical length need only be specified within 1/4 wavelength.
- Cannot be the same length as the THRU standard.
- A TRL cal with broad frequency coverage requires multiple LINE standards. For example, a span from 2 GHz to 26 GHz requires two line standards.
- Must be an appropriate electrical length for the frequency range: at each frequency, the phase difference between the THRU and the LINE should be greater than 20 degrees and less than 160 degrees. This means in practice that a single LINE standard is only usable over an 8:1 frequency range (Frequency Span / Start Frequency). Therefore, for broad frequency coverage, multiple lines are required.
- At low frequencies, the LINE standard can become too long for practical use. The optimal length of the LINE standard is 1/4 wavelength at the geometric mean of the frequency span (square root of $f_1 \times f_2$).

Note: The TRL LINE standard must have a delay that is greater than 0 (zero) ps. Otherwise, calibration correction calculations will contain unpredictable results.

MATCH

If the LINE standard of appropriate length or loss cannot be fabricated, a MATCH standard may be used instead of the LINE.

- The MATCH standard is a low-reflection termination connected to both Port 1 and Port 2.
- The MATCH standard may be defined as an infinite length transmission line OR as a 1-port low reflect

termination, such as a load.

- When defined as an infinite length transmission line, both test ports must be terminated by a MATCH standard at the same time. When defined as a 1-port load standard, the loads are measured separately. The loads are assumed to have the same characteristics.
- The impedance of the MATCH standard becomes the reference impedance for the measurement. For best results, use the same load on both ports. The load may be defined using the data-based definition, the arbitrary impedance definition, or the fixed load definition.

TRL on a 4-port PNA-L and ALL PNA Models with an External Test Set

Beginning with the PNA code revision 5.25, TRL CAN be performed on a 4-port PNA-L and ALL PNA Models with an [External Test Set](#) enabled. Previously, a TRL calibration required a PNA with a reference receiver for each test port. With the new TRL method, a Delta Match Calibration is first performed and applied.

Note: See [Delta Match Calibration](#) to learn which models require this.

The accuracy of this TRL cal greatly depends on the accuracy of the Delta Match Calibration. With an accurate Delta Match Calibration, the difference in accuracy between a traditional TRL cal and this TRL cal is negligible.

How to Perform a TRL Cal in these cases

1. Click **Calibration, Cal Wizard**.
2. Select a TRL cal kit for the ports to be calibrated.
3. During the calibration, the Cal Wizard prompts you for a [valid Delta Match Cal](#).

CalPod (Opt 301 or 302)

CalPod is a system that simplifies the process of recalibrating the PNA without requiring the removal of the DUT or the physical connection of standards. This allows recalibration from a remote location such as when the DUT is in a temperature chamber.

In this topic:

- [Overview](#)
- [How to start the CalPod dialog](#)
- [CalPod dialog](#)
- [CalPod Setup dialog](#)
- [CalPod Operational Check](#)

[CalPod as ECal](#)

Other Calibration topics

Process Overview

Note: The following overview assumes the CalPod system has been installed and configured. See the **CalPod User's Guide** for installation instructions at: <http://cp.literature.agilent.com/litweb/pdf/85523-90001.pdf>

The following process assumes a 2-port DUT connected to the PNA ports 1 and 2 through CalPod modules as follows:

The Blue boxes represent CalPod modules with internal Thru, Short, Open, and Load states.

1. After configuring and assigning CalPod modules to PNA ports 1 and 2, connect the CalPod modules to the PNA, directly or using short cables. [Learn how to configure CalPod.](#)
2. Setup measurements on a channel. An IFBW of 1 kHz or lower with eight averages is recommended. CalPod does not support measurements below 100 MHz.
3. Perform a full 2-port calibration for the channel with the CalPod outputs as the reference plane.
4. Click **Initialize Channel** to automatically perform the following steps:
 - a. The OPEN, SHORT, AND LOAD states of both Calpod modules are switched in and S11/S22 are measured.
 - b. The resulting measurements are stored in the channel's Cal Set as additional standard measurements. These measurements are used to characterize the Calpod states - they are NOT used at this time to change the error correction.

Notes:

- Because the OPEN, SHORT, AND LOAD states in the CalPods are measured, it is not important what is connected to the CalPod when Initialize is pressed. Therefore, for highest accuracy, click Initialize IMMEDIATELY and ONLY ONCE after performing the calibration - before causing ANY cable movement.
- If an adapter is required to connect the DUT to a CalPod, use a high-quality adapter. Any temperature drift due to the adapter is NOT recorrected.
- Always connect the DUT as close as possible to the CalPod modules.

5. Connect the DUT to the CalPod outputs.

6. Click **Recorrect Channel** or **Recorrect All Channels** whenever necessary. Any of the following actions will cause the current calibration to become invalid and require recorection:
 - a. Moving the CalPod modules to the ends of long cables.
 - b. Changing the cables.
 - c. Extreme temperature variations.
 - d. Measurement drift over long time periods.

7. The following steps occur automatically during recorection for the active channel:
 - a. The OPEN, SHORT, AND LOAD states of both CalPod modules are switched in and S11/S22 are measured.
 - b. Additional (de-embedded) error terms are computed to compensate for changed conditions from the Initialize measurements.
 - c. Another Cal Set is created using the original name with the CalPod number appended. The modified error terms are saved to that Cal Set and applied to the channel. The measurements are now fully corrected.

How to start the CalPod dialog

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then **[More]**
3. then **[CalPod]**
4. then **[CalPod...]**

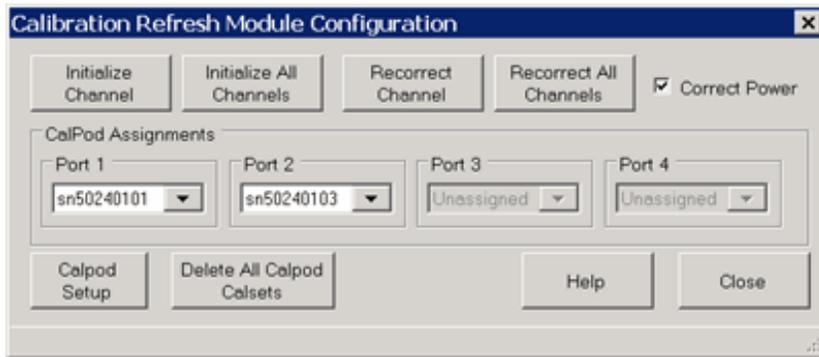

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **CalPod**
4. then **CalPod**

Programming Commands

CalPod dialog box help

[Learn all about the CalPod process.\(Scroll up\)](#)

Initialize Channel Calibrated measurements of the CalPod states are performed as initial reference data points for the active channel.

Initialize All Channels Calibrated measurements of the CalPod states are performed as initial reference data points for all current channels. This command is not recommended, it is generally preferable to initialize each channel immediately following calibration.

Recorrect Channel Recorrects the active channel Cal Set to match the initial reference.

Recorrect All Channels Recorrects the Cal Sets on ALL channels that were initialized.

Correct Power

This checkbox causes power to be recorrected **ONLY** when source power correction data is stored as error terms in the CalSet. This occurs only when a [Guided Power Cal](#) is performed and when an app channel is calibrated such as a FCA, GCA, IMD, and Noise Figure channel. This checkbox has **NO** effect when a S-parameter Cal or a standard [Source Power Cal](#) has been performed, because source power correction data is not stored in the CalSet.

When any of the above power calcs have been performed, and when this box is checked, the power output at the PNA port is adjusted to compensate for any change in path loss when Recorrect is performed. For example, if the path loss between the PNA port and the CalPod was increased by two dB following initialization, then the PNA output power will be increased by two dB upon recorection. Do this when you add a significant amount of loss in the calibration path, or when the power level at the DUT is important.

When a significant amount of loss is introduced in the calibration path, it may not be possible to increase the source power enough to overcome the loss. In this case, an **Unleveled source** message may appear on the PNA screen.

When the checkbox is cleared, the source power level is not corrected.

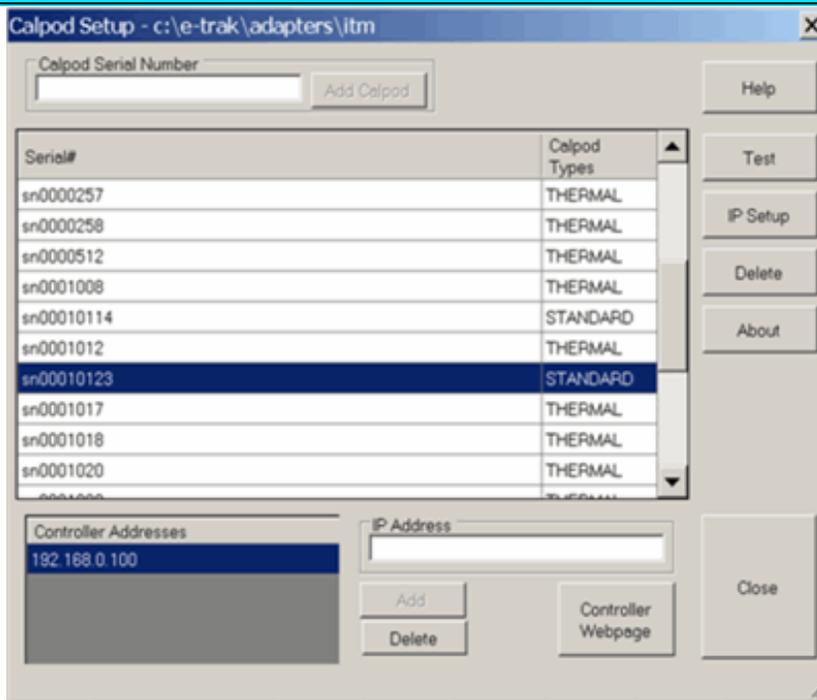

CalPod Assignments

For each PNA port, select a CalPod module.

CalPod Setup Starts the [CalPod Setup](#) dialog

Delete All CalPod Cal Sets Deletes all recorection Cal Sets and reinstates the Initialization Cal Set.

CalPod Setup dialog box help

To start this dialog, click **CalPod Setup** in the [CalPod](#) dialog box.

CalPod Serial Number Type the CalPod module (without 'sn'), then click **Add CalPod**. The new module is added to the list of available CalPod modules. (The list of available CalPod modules is limited to four entries when option 301 is the only PNA CalPod option.)

Serial # and CalPod Types

Shows the list of available CalPod modules. A CalPod module type may be STANDARD or THERMAL. A CalPod module will be listed as a STANDARD type unless two conditions are met: the PNA has option 302 and the thermal characterization data has previously been loaded into the PNA from a USB flash drive.

Buttons

Test Click to test the connection between the controller and the selected CalPod module. The

message box displays the connection status and temperature for both Ambient and Thermal modules. Only the Thermal module will apply test temperature for recorection.

Delete Removes the selected STANDARD CalPod module from the list.

To delete a THERMAL CalPod from the list:

1. Navigate to the c:/e-trak/adapters/itm directory.
2. Delete the .xml file associated with the CalPod serial number.
3. Exit all CalPod dialog boxes and restart the CalPod dialog.
4. The CalPod may now be removed using the **Delete** button.

About Shows the CalPod software version information.

For more CalPod Setup information, see the CalPod web site: <http://na.tm.agilent.com/pna/calpod>. Click **CalPod Controller Configuration**.

CalPod Operator's Check

This program is provided as a convenience to help determine the operational status of each 855xxA Series CalPod and its associated CalPod Controller. While this check is not intended to be a complete test, it does check each unit enough to provide greater than 95% confidence that the CalPod is functioning properly.

- When the max frequency of the CalPod is higher than the max frequency of the PNA, the full frequency range of the CalPod is not tested.
- Up to four CalPod modules may be checked at once. All four devices must be of the same frequency range.
- The software revision for the Operator's Check code is displayed in the upper left-hand corner of the window

Before running Op Check

The CalPod system must be installed and configured on the PNA. The PNA must have Option 301 or 302 installed.

See the **CalPod User's Guide** for instructions at: <http://cp.literature.agilent.com/litweb/pdf/85523-90001.pdf>

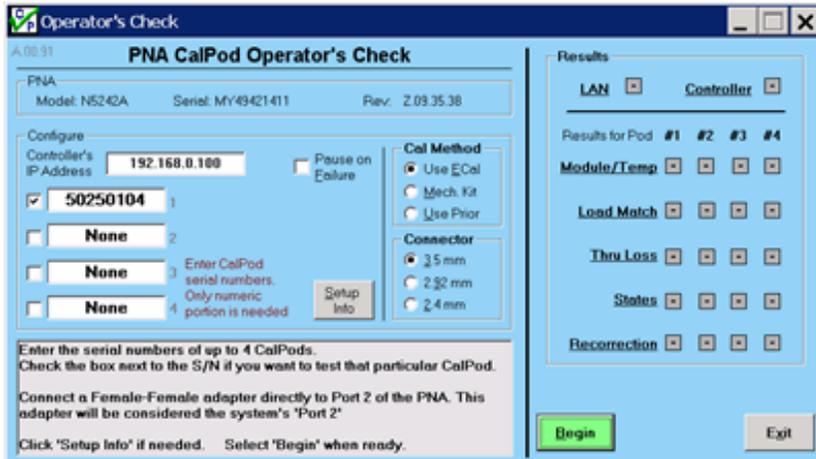

Required equipment:

- An appropriate ECal or mechanical Cal Kit.

- A high-quality cable.
- A female-female adapter of the calibration connector type.
- A fixed attenuator up to 10 dB (3 dB preferred) or other frequency insensitive device with similar loss.

How to perform CalPod Operators Check

Click **Utilities**, then **System**, then **Service**, then **CalPod**, then **OpCheck**.

Click **Setup Info** to learn more about this dialog.

Also, click **Cal Method** or **Connector** for additional explanation for these areas.

Configure

1. Enter information in the “Configure” area.
2. Each time a 2-port cal is performed, the results are saved in a file. The “Use Prior” selection uses the saved calibration.
3. When the calibration connector type does not mate with the CalPod connectors, perform the calibration and then use adapters to connect to the CalPod module.
4. Click **Begin** to start the Op Check.
5. Follow the prompts in the gray box.

Op Check Results

- The Results area shows Op Check progress.
- Click a test label for test information.
- When the check has finished, the results are saved to a text file. The default path and filename is:

C:/Program Files/Agilent/Network Analyzer/Service/calpodopchklog.txt. To save multiple results, rename the file or save it to a different location.

- For assistance in troubleshooting CalPod Operator's Check failures or for additional information, see the appropriate FAQ at the CalPod web site: <http://na.tm.agilent.com/pna/calpod>
-

CalPod as ECal (Option 304)

A [CalPod module](#) can be used as 1-port ECal module to calibrate channels for all measurement classes. In addition, the CalPod module can be left in place during measurements in order to refresh calibrations.

In this topic:

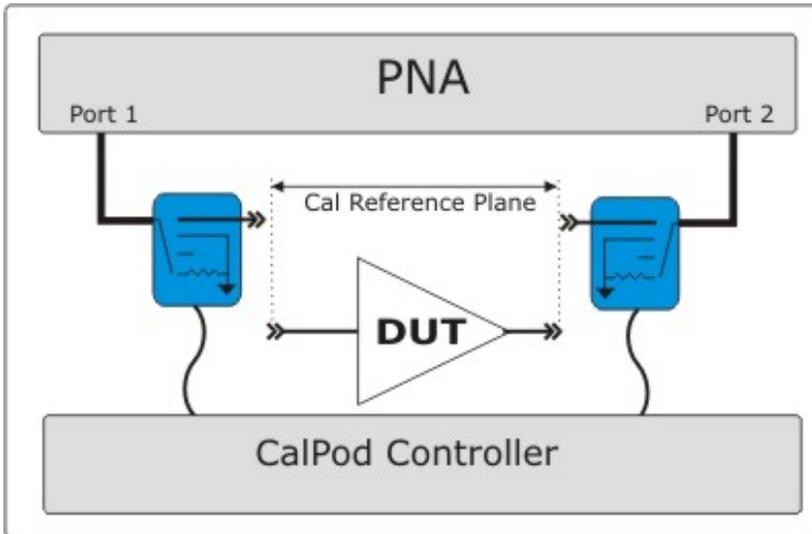

- [Overview](#)
- Characterizing the CalPod module
 - [Summary](#)
 - [Detailed Steps](#)
- [Calibrating with CalPod](#)

More Calibration topics

Overview

To use a CalPod module as a calibration device:

1. The CalPod module must be configured using the CalPod software. [Learn how](#).
2. Unlike an ECal module, a CalPod module has no internal memory and therefore, no internal characterization data. Before a CalPod can be used as an ECal module, its internal standards must first be characterized using the ECal User Characterization wizard. In addition, the characterization data can ONLY be stored in PNA disk memory.
3. After these steps have been performed, connect the CalPod modules to the controller to perform a PNA calibration. The CalPod modules will appear in Cal Wizard dialogs just like an ECal module.

This image shows TWO CalPod modules after both have been characterized. A PNA calibration, and subsequent 'refresh' calibrations can occur without making additional connections.

Characterizing the CalPod module - Summary

When performing a User Characterization for a CalPod module, you can establish the Calibration reference plane at the input connector, or at the output connector, depending on how you plan to use CalPod.

1. Initially calibrate the PNA.
2. After the calibration, the internal CalPod OPEN, SHORT, and LOAD standards are measured.
3. The measurements are saved to PNA disk memory. They are used when performing calibrations using the CalPod module.

Detailed steps to Perform a User Characterization

Note: If you have more than one CalPod module, each module must be characterized separately.

1. Perform a one-time CalPod configuration. [Learn how.](#)
2. Connect the CalPod module to the CalPod controller.
3. **Preset** the analyzer.
4. [Set up the measurement.](#) For best accuracy, the **IF bandwidth** should be set to **1 kHz** or less.
5. Start the User Characterization Wizard as follows:

**Using front-panel
HARDKEY [softkey] buttons**

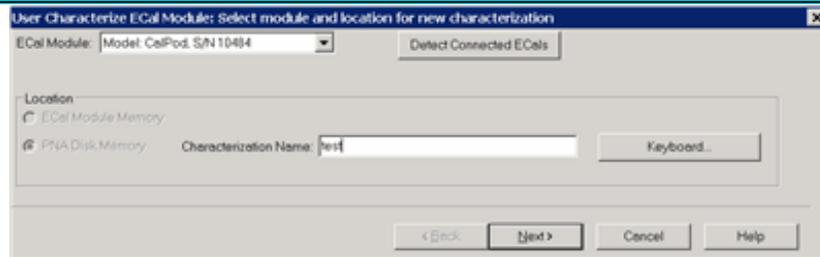

Using a mouse with PNA Menus

1. Press **CAL**
2. then **[More]**
3. then **[ECal]**
4. then **[Characterize ECal Module]**

1. Click **Response**
2. the **Cal**
3. then **More**

Select Module and Location dialog box help

ECal Module Select a CalPod from list of connected modules and registered CalPods.

Detect Connected ECals Click to rescan CalPod/ECal modules.

Location

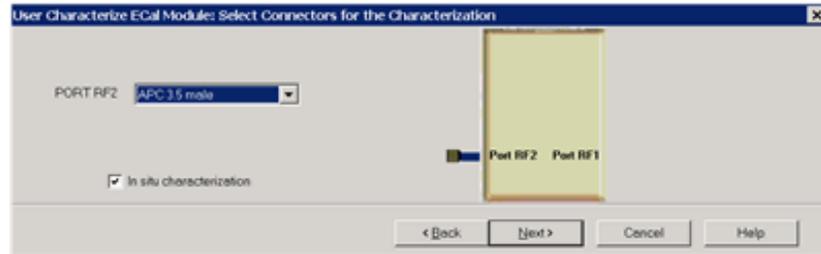

- **ECal Module Memory** NOT available for CalPod modules.
- **PNA Disk Memory** Enter a Characterization Name. This name appears when selecting a User Characterization to be used with subsequent calibrations.
 - [Learn how to manage characterizations that are stored to PNA disk memory.](#)
 - [See the benefits of storing the User Characterization to PNA Disk Memory.](#)

Keyboard Launches a keypad that can be used to type a characterization name from the PNA front panel.

Next Click to continue to the [Select Connectors for the Characterization](#) dialog box.

[See note regarding extended frequency use.](#)

Select Connectors for the Characterization dialog box help

In situ characterization

When Checked:

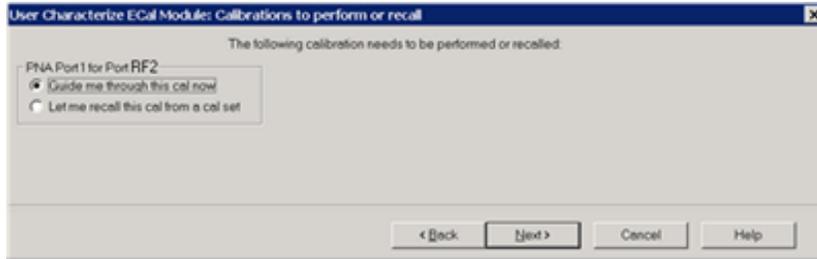

- This initial calibration, and all DUT measurements are performed WITH the CalPod module THRU path in place (In Situ).
- Select the RF2 (output) connector type and Cal Kit.
- The Cal Kit standards are connected to the RF2 Output connector, making it the reference plane. This calibration removes everything in front of the output connector from subsequent measurements.
- The User Char description will show "In Situ".

When Cleared:

- This initial calibration, and all DUT measurements are performed WITHOUT the CalPod module in place. This is similar to an ECal calibration.
- Select the RF1 (input) connector type and Cal Kit. The Cal Kit standards are connected at this location, making it the reference plane.

Next Click to continue to the [Calibrations to perform or recall](#) dialog box.

Calibrations to perform or recall dialog box help

Perform or load a 1-port cal.

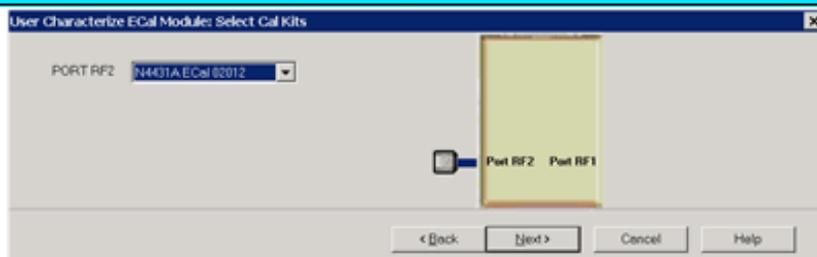

Guide me through this cal now Click to perform a Guided calibration. A calibration kit is required for each connector type.

Note: Some PNA-L models cannot perform TRL calibration during the calibration portion of a User Characterization. However, this type of Cal can be performed using the Cal Wizard, saved to a Cal Set, then recalled at this point in the User Characterization.

Let me recall this cal from a cal set Click to select an existing Cal Set. You cannot select a Cal Set that is currently in use. Learn more about [Using Cal Sets](#).

Next Click to continue to either the [Select Cal Kits](#) (Perform Cal) or [Select Cal Set](#) (Recall Calset).

Select Cal Kits dialog box help

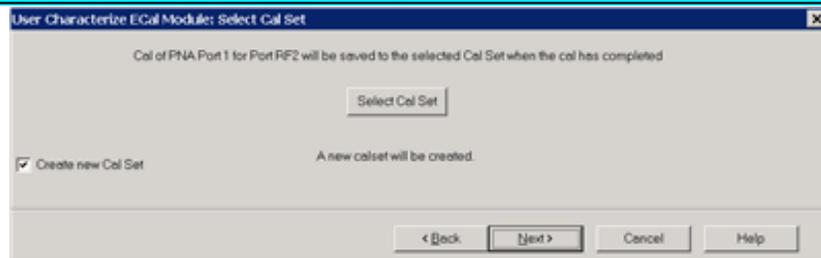

When 'In situ' is selected, a cal kit is selected for port "RF2", as this will be the calibration reference plane (where standards are connected).

Provides a list of calibration kits to perform the calibration. Select the Cal Kit you will use for the port.

Next Click to continue to the [Select Cal Set](#) dialog box.

Select Cal Set dialog box help

The calibration that you perform will be written to a Cal Set. This dialog box allows you to select a Cal Set to overwrite, or to write to a new Cal Set. The current choice is visible below the **Select Cal Set** button.

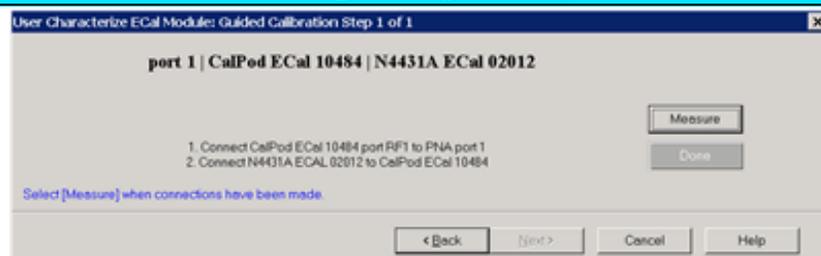

Select Cal Set Click to open the **Select A Cal Set** dialog box.

Create new Cal Set Check to create a new Cal Set to store the calibration. Clear to select and overwrite a stored Cal Set.

Next Click to continue to the [Guided Calibration Steps](#) dialog box.

Note: Remember the Cal Set name for future reference.

Guided Calibration Steps dialog box help

The first Measure page.

Connect each calibration standard to the location in the prompt.

Measure Click to measure the standard.

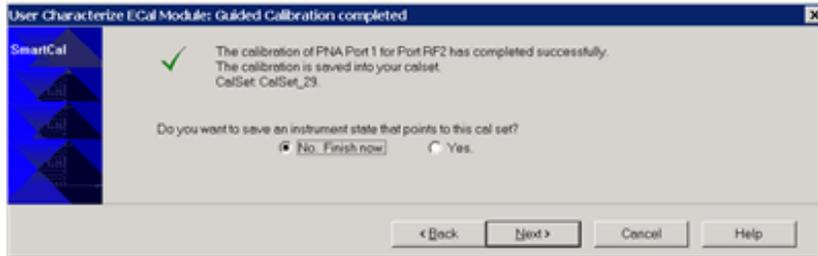

Back Click to repeat one or more calibration steps.

Done Click **after** a standard is re-measured and all measurements for the calibration are complete.

Next Click to continue to the next calibration step. (Does **not** measure the standard.)

Cancel Exits Calibration Wizard.

Guided Calibration completed dialog box help

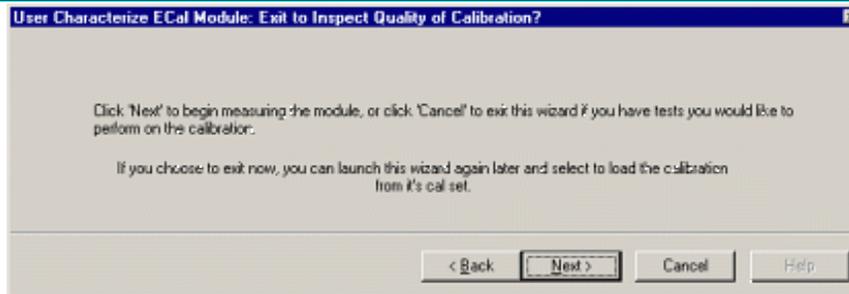

Allows you to finish the calibration and continue to the next characterization steps.

No. Finish now Select to save Cal Set data.

Yes Allows selection of Save options.

Next Click to continue to the [Exit to Inspect Quality of Calibration](#) dialog box.

Exit to Inspect Quality of Calibration dialog box help

Allows you to exit User Characterization to [validate the calibration](#) before proceeding with the characterization.

Back Allows you to repeat calibration.

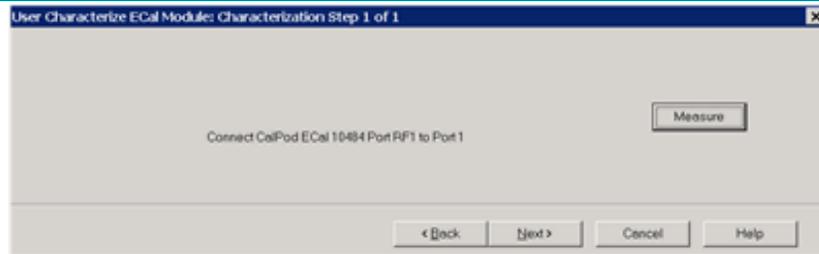

Next Click to continue to the [Characterization Steps](#) dialog box.

Cancel Exits the Calibration.

To return to the current step:

1. Start User Characterization.
2. In the **Select Connectors for Characterization** dialog box, click **Next**. (Previous entry is stored in memory.)
3. In the **Calibrations to perform or recall** dialog box, recall the Cal Set that you just performed.

Characterization Steps dialog box help

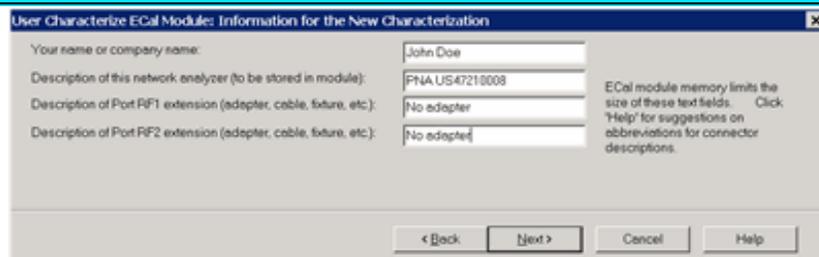

After the initial PNA calibration, the CalPod internal states are measured.

Connect the CalPod if not already connected.

Measure Measures the CalPod module.

Next Click to continue to the [Information for the New Characterization](#) dialog box when measurements are complete.

Information for the New Characterization dialog box help

Enter descriptive information that will be stored in the characterization file. This description will be viewable in the several PNA dialogs when the CalPod is selected.

Next Click to continue to the [Write Characterized Data](#) dialog box.

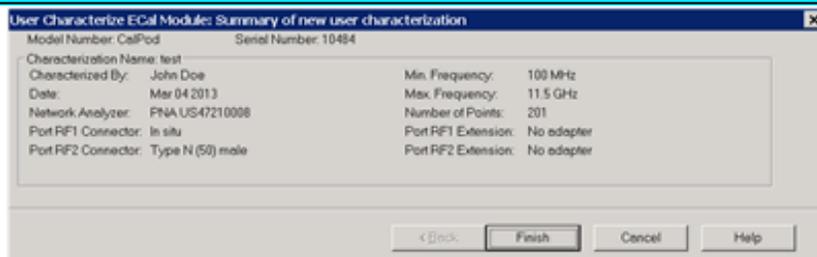

Write Characterized Data dialog box help

The PNA writes User Characterization data to the PNA disk memory.

Write Click to write data.

Summary of new User Characterization dialog box help

Summary page of characterization wizard after characterization is complete.

Cancel Click to exit (characterization complete).

Finish Click to exit (characterization complete).

Calibrating with CalPod

The CalPod module is now characterized and ready to be used in a PNA calibration.

When CalPod modules are selected for ALL ports of an N-port cal, Unknown Thru is the only selectable Thru method for all paths. [Learn more about Unknown Thru.](#)

The above image is the **Connectors and Cal Kits** page as seen during a SmartCal on a standard channel. A similar version of this page is shown in the Calibration Wizard for all Application channels (FCA, GCA, NFA and so forth).

12-Feb-2013 New topic

Calibration Preferences Wizard

Two Cal Preferences are set from this Wizard:

1. [Whether or not to show the first 'Method' Page of the Cal Wizard](#)
2. [Select and order the Cal Types that are available during a SmartCal with Mechanical Standards](#)

To change either of these choices, you must select **Yes, Enable the calibration preferences** at the first Wizard page.

How to change Cal Preferences

Programming commands are NOT available for the preference settings discussed in this topic, although there are other [Cal Preferences](#) that can be set remotely.

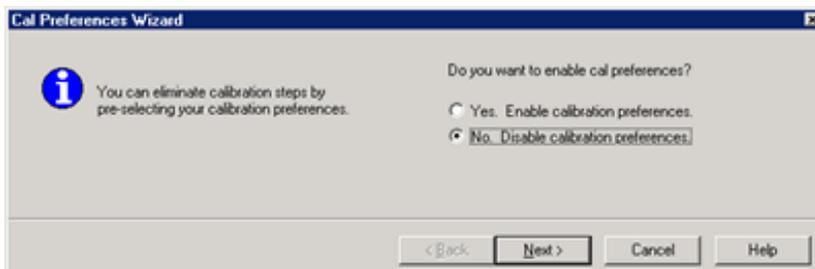

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[Start Cal]**
3. then **[Preferences]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Start Cal**
4. then **Preferences**

◀ **Programming Commands** ▶

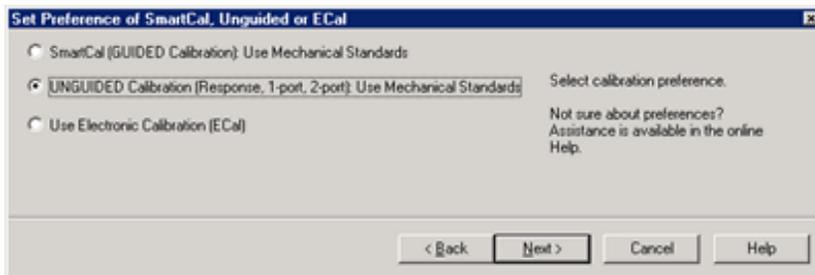

Cal Preferences Wizard dialog box help

Use this dialog to change either of the following preferences:

- Show or Hide the first page of the Cal Wizard
- Select order of calibrations that are offered.

To change either of these choices, you must select **Yes, Enable the calibration preferences**.

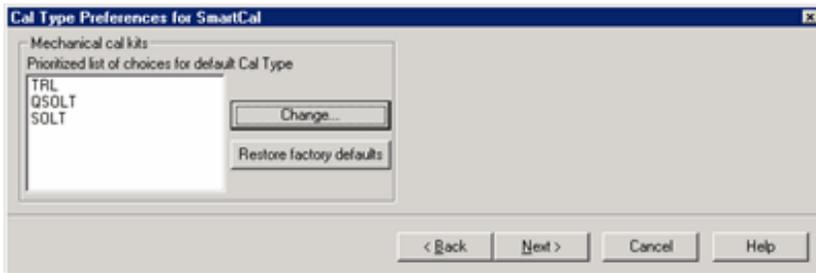

Cal Preferences of... dialog box help

Use this dialog to change which Cal method to perform.

After making this selection, the first page of the Cal Wizard will not be shown on subsequent calibrations.

To change **ONLY** the order of Cal Types that are offered, and none of these preferences, you must do the following:

1. Select one of these choices and click **Next**.
2. Select and order the Cal Types, then click **Next**
3. Click **Finish**
4. Click **Cal**, then **Cal Wizard**.
5. On the first Cal Wizard page that shows, click **Back**, then clear the **Preferences** checkbox.

Cal Type Preferences dialog box help

This dialog is used to set which Cal Types are available, and the order in which they are selected as the default choice, during a SmartCal with Mechanical Standards. This setting is also used to set the default Cal Type for Guided calibrations using SCPI or COM.

The specified Cal Type order should allow you to make fewer changes to the Cal Type during a SmartCal with Mechanical Standards.

For example, in the above image, the first Cal Type on the list is TRL. When doing a SmartCal with Mechanical Standards:

- If a TRL Cal Kit is available for the specified DUT connectors, then TRL becomes the default Cal Type.
- If a TRL Cal Kit is NOT available, then the second Cal Type on the list (SOLT) is evaluated for compatibility with the available Cal Kits, and so forth with the Cal Types that remain on the list.
- If TRL is removed from the list, that Cal Type is NOT available for selection during a SmartCal with Mechanical Standards.

[Learn more about Cal Types.](#)

[See where you choose Cal Type during a SmartCal](#)

Prioritized list of choices for default Cal Type Shows the current list of Cal Types and the order in which they will be selected for Mechanical calibrations.

Change Click to invoke the [Modify list of default Cal Types](#) dialog.

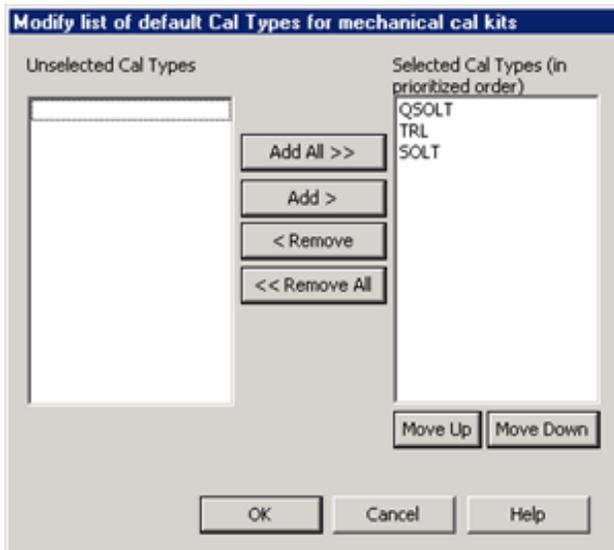

Restore factory defaults Returns the list to the original selections and order. The factory defaults are in order of accuracy from highest (TRL) to lowest (QSOLT).

Cancel Closes the dialog without making changes.

Notes:

- Your Cal Type settings are saved only until the PNA application is closed. When re-opened, the factory default settings are restored.

[Learn more about QSOLT Calibration](#)

Modify list of default Cal Types dialog box help

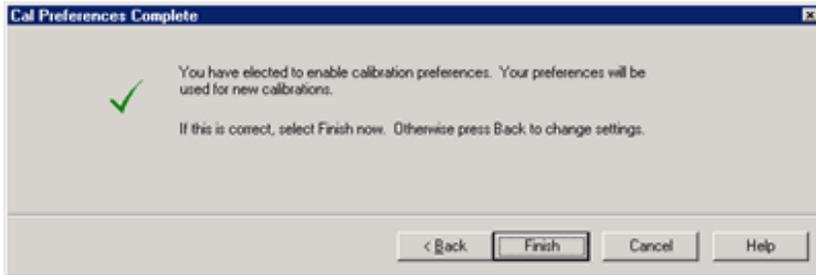

Use this dialog to Add, Remove, and re-order the available Cal Types. There must be at least ONE selected Cal Type to perform a SmartCal with Mechanical Standards.

Unselected Cal Types Cal Types in this list will not be presented as a choice during a Calibration.

Selected Cal Types Cal Types in this list will be presented, in order, as the default choice during a Calibration. Click a Cal Type to select it, then click the following buttons to perform that operation.

Add / Remove buttons Click to Add and Remove the selected Cal Types from the Selected Cal Types list.

Move Up / Down Click to re-order the Selected Cal Types list.

Cal Preferences Complete dialog box help

Either Enable or Disable Cal Preferences.

See how to [select ONLY Cal Type Preferences](#) and continue to show the first Cal Wizard page.

- [Saving a Source Power Calibration](#)
- [Reducing Time to Complete a Source Power Calibration](#)
- [Receiver Power Calibration](#)
- [Saving Receiver Cals](#)

Other Source Power Cal choices

- **Guided Power Cal** can be performed during an S-parameter Guided Calibration. [Learn more.](#)
- **Receiver Leveling** can be used to provide 'real-time' source power cal. [Learn more.](#)
- **See Also:** [Configure an Power Meter As a Receiver \(PMAR\)](#)

[See other Calibration Topics](#)

Source Power Calibration Overview

Perform Source Power Calibration when you need accurate power levels at some point in the

measurement path between the PNA test ports. For example, you need to characterize the gain of an amplifier across a frequency range at a specified input power. You would perform a source power cal at the input of the amplifier to ensure the **exact** power level into the amplifier across the frequency range.

Using a Source Power Cal, you can expect the power at the point of calibration to be within the range of the uncertainty of the power meter and sensor that is used.

Source Power Calibration...

- Is independent of measurement type. It corrects the PNA source regardless of which receivers are being used in a measurement. Therefore, it can be used with both [ratio or non-ratio measurements](#).
- Applies ONLY to those measurements on the selected channel that use the test port that was [specified as the Source](#) for the calibration. For example, if you specify Channel 1 and Port 1 as the source to be calibrated, only those measurements on channel 1 that use port 1 as the source will be corrected.
- Can be used in conjunction with other measurement calibrations, such as a full 2-port calibration. For highest accuracy, perform the measurement calibration AFTER the source calibration.
- Can be used with [Power Sweep](#) type. Source Power Cal will correct the power at all power levels across the power sweep.
- Can be used with [Port Power Uncoupled](#).
- Forces [sweep mode to Stepped](#) on measurements with source power correction turned ON.
- Beginning with PNA Rev. 7.50, an external source can be calibrated using Source Power Cal.

Overview of How it works:

[See Important First-time USB connection note.](#)

[Click to see the detailed procedure](#)

1. Specify the measurement settings (frequency range, IFBW and so forth).
2. Start Source Power Calibration.

Note: When using an Agilent 848X power sensor (sensors that do NOT have built-in calibration factors), enter the Cal Factors using the [Power Sensor Settings](#) dialog, because the PNA instructs the power meter to NOT use the Cal Factor tables internal to the power meter.

3. Connect a power meter sensor to the point at which you want a known power level. This may be at the input or output of your device, or some other point between the test ports.
4. The PNA source is stepped through the specified frequency range, and power is measured with the power meter. At each data point, the source power is adjusted until the measured power is within your specified accuracy level.

5. When complete, the power meter is preset. The source power calibration can be [saved as part of the instrument state](#).
6. The power meter is removed and the measurement path reconnected.
7. The calibration is automatically applied to the channel. All measurements on that channel using that source port benefit from the source power cal.
8. Perform an S-parameter calibration AFTER a Source Power Cal. The S-parameter cal is performed using the corrected stimulus power levels for the relevant ports.

Verify the source power calibration using the following procedure.

1. Connect the power meter as it was during the source power calibration.
2. Set the PNA to [Point Trigger](#) mode.
3. Trigger the PNA across the trace. Read about the behavior of the [sweep indicator](#).
4. At each data point, the power meter should read the corrected power level within the specified tolerance.

Supported Power Meters and Sensors

[See Agilent's Power Meters and Sensors Webpage.](#)

USB Power Sensors

- U848x Series USB Thermocouple Power Sensors (A.09.90.08 and later).
 - These include the following models: U8481A, U8485A, U8487A, U8488A
 - External Calibration (connecting the sensor to the 1 mW ref port) is NOT supported.
- U2020 X-Series USB Peak and Average Power Sensors.
 - The PNA does NOT support peak mode in these sensors, but measures average power.
- U2000 Series USB power sensors.

USB Notes:

- From a standard power cal (this topic), only one USB power sensor can be used to cover the entire frequency span. To use multiple power sensors, perform a Guided Power Cal. [Learn how.](#)
- To select a USB power sensor for a standard power cal:

1. Connect the sensor directly to one of the PNA USB ports.
2. From the [Source Power Cal](#) dialog, click **Power Meter Config**.
3. On the [Power Meter Settings](#) dialog, select **USB**.

- [See Important First-time USB connection note](#).
- See note about [Zeroing USB Power Sensors](#).
- See also: [Power Meters as Receivers](#) (PMAR)

Power Meters

- P Series power meters (N1911A and N1912A) and all supported sensors.
- EPM Series power meters (N1913A and N1914A) and all supported sensors.
- EPM-P Series power meters (E4416A and E4417A) and all supported sensors.
- E Series power meters (E4418 and E4419) and all supported sensors.
- HP 437B / 438A power meters.

Power Meter Notes:

- N1911A, 12A, 13A, and 14A power meters have a **device-side USB connector**  and are controlled by the PNA exactly like a USB sensor. See [USB Power Sensors](#) (above). Although these meters may also have a front-panel USB port, USB power sensors must be connected directly to one of the PNA USB ports.
- Source Power Calibration operates slowly with the Agilent E930x and E932x power sensors.
- Some Agilent power meters have a mode that emulates the command set of the 437B or 438A power meter. The PNA does NOT support this emulation mode.
- The [82357A USB/GPIB Interface](#) can be used to control power meters.
- [Create a Custom Power Meter Driver](#) for use with other power meters.

Non-Agilent Power Sensors

- Rohde and Schwarz NRP-Z power sensors (limited support). [Learn how to install the drivers](#).

How to perform Source Power Calibration

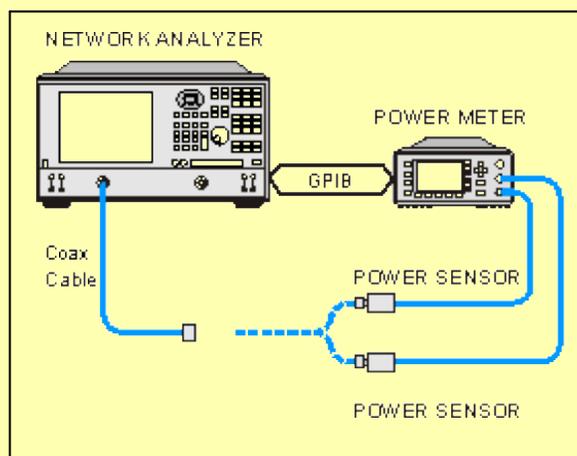

Note: Beginning with PNA firmware rev A.09.30, an Guided Power Cal can be performed during

an S-parameter Guided Calibration. [Learn more.](#)

1. Setup your measurement (sweep type, frequency range, IFBW, and so forth). By default, a Source Power Cal is performed on the source port of the active measurement.
2. Connect coax cable, GPIB cable, and power sensors to the PNA as shown in graphic below.

This image does NOT apply to USB power sensors, which are connected directly to a PNA USB port.

[See Important First-time USB connection note.](#)

3. Apply power to the power meter and allow 30 minutes warm-up time before beginning calibration.
4. Select **Source Power Cal** as follows:

**Using front-panel
HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[Power Cal]**
3. then **[Source Cal]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Power Cal**
4. then **Source Cal**

Programming Commands

5. Complete the Source Power Cal dialog box (below), including [Options](#), [Loss Compensation](#) and [Power Sensor Settings](#), as needed.

Note: When using an Agilent 848X power sensor (sensors that do NOT have built-in calibration factors), enter the Cal Factors using the [Power Sensor Settings](#) dialog, because the PNA instructs the power meter to NOT use the Cal Factor tables internal to the power meter.

6. When complete, click **Take a Cal Sweep** in the Source Power Cal dialog box.
7. Follow the prompts to connect the sensors as required.
8. At this time you can change the Source Port setting and perform a Source Power Cal on a different port.
9. When calibration is finished, click **OK**. Correction is then applied and turned ON for the relevant ports on the active channel.
10. Remove sensor.
11. **SrcPwrCal** is displayed in the status bar when Source Power Correction is applied to the Active Measurement.
12. Perform a S-parameter calibration, which would use the corrected stimulus power levels for the relevant ports.

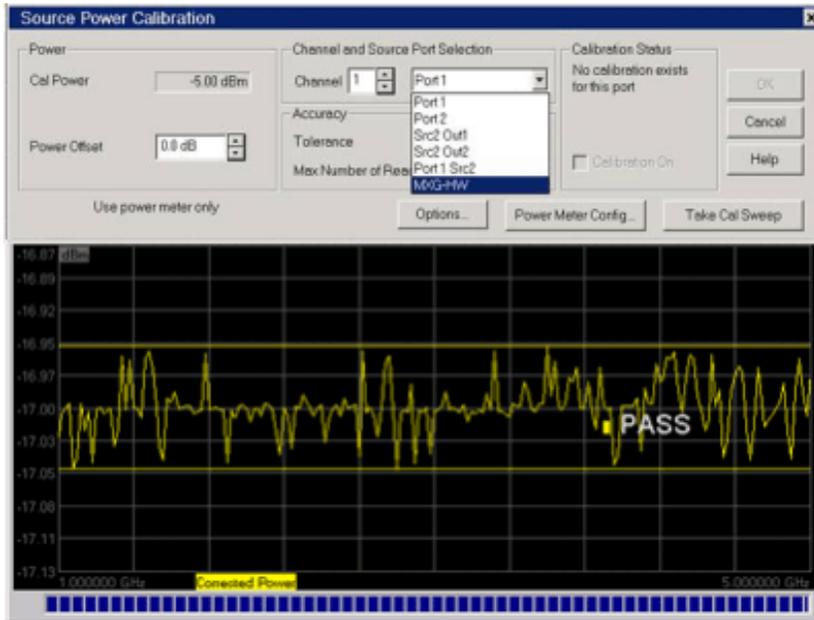

To turn Source Power Correction OFF:

- On the **Calibration** menu, point to **Power Calibration**, then click **Source Power Correction on/OFF**.
- ONLY correction for the source port of the ACTIVE MEASUREMENT is turned OFF (regardless of [port power coupling setting](#).)

Interpolation or Extrapolation

If the original stimulus settings are changed, Interpolation or EXTRAPOLATION is applied and **SrcPwrCal*** is displayed in the status bar. This is different from [measurement calibration interpolation](#). For example, if the frequency span is increased, the PNA will extrapolate new correction values rather than turn correction off. This is to protect your test device from being overpowered by the source. If the original settings are restored, then source power calibration returns to full correction.

Source Power Cal dialog box help

Note: Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

Power

Cal Power The calculated power (in dBm) at the calibration point. This value is the specified PNA source power plus the Power Offset value.

Power Offset Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement. These components will remain during a measurement. For example, specify 10 dB to account for a 10 dB amplifier in the path to your DUT. Following the calibration, the PNA power readouts are adjusted to this value.

To account for components that will be removed when the calibration is complete, use the [Loss Compensation table](#).

Channel and Port Selection

Channel Specifies the channel on which to perform the calibration. This setting defaults to the active channel.

Source Port Specifies the source port to be corrected. This setting defaults to the source port for the active measurement.

Beginning with PNA Rev. 7.22, external sources can be calibrated using this dialog. [Learn more](#).

Accuracy

At each data point, power is measured using the [specified Power Meter Settling Tolerance](#), then

adjusted until the reading is within this Accuracy **Tolerance** or the **Max Number of Readings** has been met. The **last** power reading is plotted on the screen against the Tolerance limit lines.

Tolerance Sets the maximum desired deviation from the specified **Cal Power** level in 0.005 dB increments from 0 to 5 dB.

Max Number of Readings Sets the maximum number of readings to take at each data point for iterating the source power. Enter a value between 1 and 1000.

Calibration Status

Allows you to turn Source Power Cal ON | OFF and view Cal data for each port, regardless of the active measurement. This feature allows the [Internal Second Source](#) to be calibrated and turned ON | OFF, even when being used as an incidental source in a measurement, such as an LO.

Calibration ON Check to turn Source Power Calibration ON for the specified source port.

The displayed text indicates when [interpolation](#) is applied for the calibration.

Buttons

Options Invokes the [Source Power Cal Options](#) dialog. Label to the left of the button displays the current 'Options' setting.

Power Meter Config Invokes the [Power Meter Settings](#) dialog box

Take Cal Sweep Begins source power calibration measurement.

OK Applies calibration. This button is disabled until the Take Cal Sweep has been pressed.

Cancel If a sweep is in progress, cancels the sweep. Press again to close the dialog.

Attention please: the power meter is operating in 200 r/s mode.

During a measurement, some Agilent power meters may display this message on the screen: It means that the meter is operating in 200 readings/sec which is the fastest speed setting for this meter. This is normal operation.

Pass / Fail Limits

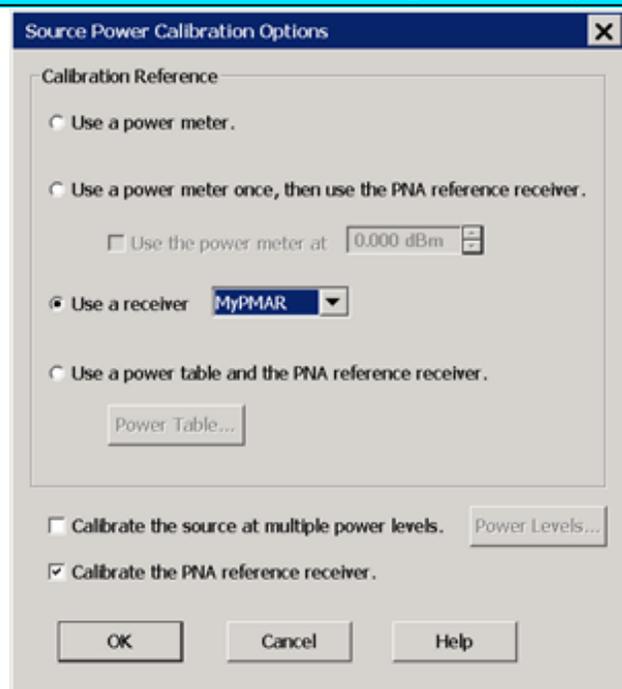

Limit lines are drawn on the Source Power Cal measurement graticule area. These lines are at the Cal Power +/- the current setting of Accuracy Tolerance. A FAIL during the Source Power Cal sweep means that the PNA was unable to measure power to within the Accuracy Tolerance. Tight tolerances are more difficult to achieve at lower Cal Power levels. When a FAIL indication appears,

increase the Max Number of Readings. If this does not cause a PASS condition, then decrease the Accuracy Tolerance value.

See Also

- Learn more about [Source Power Cal](#)
- Learn about [External Testsets](#) and Source Power Cal.

Source Power Calibration Options dialog box help

Provides options for measurement of the source power.

Note: At low power levels (less than -30 dBm) most power meters are not as accurate as a PNA receiver.

Calibration Reference Choose power meter/PNA receiver to use to measure power.

- **Use a power meter.** Traditional source power calibration using only a power meter to measure the source power at each data point. Most accurate (at higher power levels) and slowest method.

Note: Because the following two settings use PNA receivers to make power measurements, they do NOT work correctly when a [Frequency Offset](#) value is being used.

- **Use a power meter once, then use the PNA reference receiver.** When checked, the first reading at each data point uses a power meter to calibrate the reference receiver. Subsequent readings, if necessary to meet your accuracy requirement, are measured using the reference receiver. This technique is much faster than using the power meter, and more accurate when measuring low power levels.

Note: Do NOT use this setting if there is a component before the power sensor that exhibits non-linear behavior, such as a power amplifier in compression. Use a power meter and [Calibrate the source at multiple power levels](#).

- **Use a receiver.** Select a PNA Receiver or a PMAR (Power Meter as Receiver).

PNA receiver - For highest accuracy, first calibrate the receiver by performing a source power cal using a power meter, then a [receiver cal](#). That receiver can then be used to quickly calibrate other PNA source ports, or used on another channel with different stimulus settings. This would be useful, for example, if the power level of the measurement was below the sensitivity of the power sensor. Calibrate the PNA receiver using a source power cal that is within the sensitivity of the sensor. Then, use the calibrated receiver to perform a second source power cal at the reduced power level.

- The PNA receiver is specified using either standard receiver notation or [logical receiver notation](#).
- It is best to use the reference receiver for the source port to be calibrated. For example, if calibrating source port 2, specify "R2" or "a2" which is the same port 2 reference receiver using [logical receiver notation](#).
- To ensure an accurate source power cal, the frequency range over which the receiver was calibrated must be the same or larger than the "receiver only" source power calibration.
- All accuracy and settling tolerance and number of reading settings apply just as they do with a power meter reading.

PMAR Device - The power meter/sensor must first be configured. [Learn how to Configure a PMAR device](#).

- **Use a power table and the PNA reference receiver** Used to provide power leveling with mmWave test set and modules. [Learn more](#).

Calibrate the source at multiple power levels Used primarily with [mmWave measurements](#).

This feature can also be used with standard PNA measurements when a component is used in the source path such as a booster amp which does NOT have linear gain or loss over frequency. If this is not true for your setup but want to improve your source power accuracy, consider using the [Receiver Leveling](#) feature.

When checked, source power is measured using the specified 'Cal Reference' device (power

meter/sensor or PNA receiver) and iterated on a sweep-to-sweep basis to construct a 2-dimensional power table: Power IN, Power OUT, over all frequencies.

- Click **Power Levels** to launch the [Source Cal Power Levels dialog box](#) to set the power levels at which source power is to be measured.
- The source power cal is saved, but the power table is NOT accessible.

Calibrate the PNA reference receiver Check to calibrate the appropriate reference receiver to the power level that is measured at the calibration plane. Do this to make very accurate measurements using the calibrated reference receiver. This cal is done in addition to the standard source power cal using the any of the methods listed above. At the end of the source power cal measurement sweep, you can optionally save the reference receiver cal to a Cal Set to be recalled at a later time. The Cal is saved when the **OK** button is clicked to close the Source Power Cal dialog.

Source Cal Power Levels dialog box help

This dialog appears when you click **Power Levels** on the [Source Power Cal Options dialog](#).

Specify the power levels at which the Source Power will be calibrated. These values should be set to a few dB more or less than the measurement power levels.

Max Power - The highest power level at which to calibrate. This value should be a few dB **higher** than the highest power level of your measurement.

Min Power - The lowest power level at which to calibrate. This value should be a few dB **lower** than the lowest power level of your measurement.

Power Step - Calibrate at every incremental power level, between the Max and Min Power settings.

Power Meter Settings dialog box help

The screenshot shows the 'Power Meter Settings' dialog box. It features a title bar with a close button. The 'Interface' section includes radio buttons for 'GPIB', 'USB', 'LAN', and 'Any'. The 'GPIB' option is selected, and its 'Address' is set to 13. The 'USB' option has a dropdown menu. The 'LAN' option has a text field for 'Hostname or IP Address'. The 'Any' option has a text field for 'VISA resource string/alias'. A 'Sensors' button is located below the interface options. The 'Settling' section contains a 'Tolerance' field set to 0.050 dBm and a 'Max Number of Readings' field set to 3. The 'Sensor Loss Compensation' section has a checkbox for 'Use Loss Table' which is unchecked, and an 'Edit Table' button. At the bottom of the dialog are 'OK', 'Cancel', and 'Help' buttons.

This dialog appears when you click the **Power Meter Config** button on many dialog boxes.

Communication

- **GPIB / Address** Select GPIB power meter. Then select the address for the power meter. Default is 13. The PNA will search VISA interfaces that are configured in the Agilent IO Libraries on the PNA. **Note:** Use this selection when using a [82357A USB/GPIB Interface](#),
- **USB** PNA scans for USB power sensors or [N191x device-side USB power meters](#). Select a power sensor from the list. Only ONE USB power sensor can be configured to cover the entire frequency range of the calibration. To use multiple power sensors, perform a [Guided Power Cal](#).
- **LAN** Specify the Hostname or IP address of the Power Meter.
- **Any** For future use.

Sensors Invokes the [power sensor settings](#) dialog box.

Settling

These Settling settings do not apply when a PNA receiver is the power measurement device. Each power meter reading is "settled" when either:

- two consecutive meter readings are within this **Tolerance** value or

- when the **Max Number of Readings** has been met.

The readings that were taken are averaged together to become the "settled" reading. The settled reading is then compared to the [Accuracy Tolerance requirements](#) (tolerance and max readings) specified on the Source Power Cal dialog box.

Tolerance When consecutive power meter readings are within this value of each other, then the reading is considered settled.

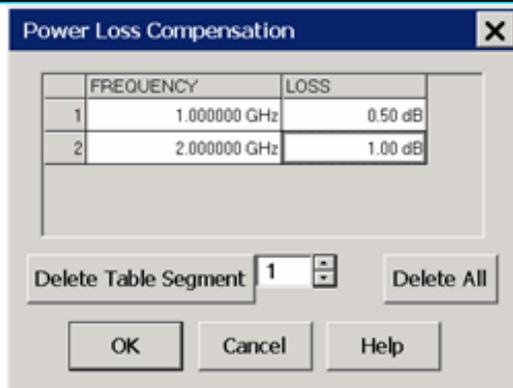

Max Number of Readings Sets the maximum number of readings the power meter will take to achieve settling.

Sensor Loss Compensation

Use Loss Table Select this checkbox to apply loss data to Source Power calibration correction (such as for an adapter on the power sensor).

Edit Table Invokes the [Power Loss Compensation](#) dialog box.

Power Loss Compensation dialog box help

To Add a Row to the table, click on a row in the table and press the down arrow on either the PNA front panel or keyboard.

To Edit a value, double-click in the cell to be edited.

Compensates for losses that occur when using an adapter or coupler to connect the power sensor to the measurement port. These components will be removed when the calibration is complete. To account for components that will remain during the measurement, use the [Power Offset setting](#).

The Frequency / Loss pairs define the amount of loss for the entire frequency range. For example, using the entries in the above dialog image:

- 0.5 dB is used to compensate power sensor measurements up to 1 GHz.
- Each data point between 1 GHz to 2 GHz is linearly interpolated between 0.5 dB and 1 dB.
- 1 dB is used above 2 GHz.
- A single frequency/loss segment is applied to the entire frequency range.

Beginning with A.09.80, enter up to **9999** segments to achieve greater accuracy. Previously the limit was 100.

These values can be loaded from an S2P file using the [Characterize Adaptor Macro](#).

Note: Large segment counts with one or more power sensors can result in long load and close times for the PNA Application.

Frequency Enter a frequency in Hz.

Loss Enter a loss as a POSITIVE value in dB. To compensate for gain, use NEGATIVE values.

Delete Table Segment Deletes row indicated in the field.

Delete All Deletes all data in the table.

The Power Loss Compensation table survives PNA Preset and Power OFF. To NOT use Loss compensation, clear the Use Loss table checkbox on the [Power Meter Settings](#) dialog.

Maximum Frequency

Internal Zero External Zero

This dialog appears when you click the **Sensors** button on the [Power Meter Settings dialog](#).

Note: Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

Sensor A (B) Displays one of the following messages depending on type of sensor.

- **Not connected** The PNA is not detecting a power sensor.
- **Cal factors are contained within this sensor** This message is displayed when the Internal Reference Cal Factor and Cal Factor data are contained in the sensor and automatically accessed.
- **Sensor Data** Allows the following entries for power sensor data:
 - **Reference Cal Factor** Specifies the sensor's Reference Cal Factor.
 - **Cal Factor Table** Specifies the frequency and corresponding Cal Factor for the sensor.
 - **Delete Cal Factor** Deletes the indicated row in the table.
 - **Delete All** Deletes all data in the table.
 - **To Add a Row** to the table, click on a row in the table and press the down arrow on either the PNA front panel or keyboard. A row is added to the bottom of the table. The table is automatically sorted by frequency when OK is pressed.

Load Cal Factors Click to load cal factors from a *.csv file that you create from the cal factors that appear on the sensor. The first line of the file **MUST** have the reference Cal Factor (typically 100), followed by Freq / Cal Factor pairs as show in the following image:

	1	2
1	100	
2	50	113.3
3	51	108.9
4	52	109.1
5	53	106.5

Save Cal Factors Click to save the cal factor table to a *.csv file.

Use this sensor only Check this box to use this sensor over the entire frequency span of the measurement, even if two sensors are connected to power meter.

Clear this box to allow entry of minimum and maximum frequencies for the sensor. Only ONE of the two sensors can have this box checked. You will be prompted to connect the appropriate sensor during the power calibration.

Minimum Frequency Specifies the minimum frequency range for the sensor when using dual sensors.

Maximum Frequency Specifies the maximum frequency range for the sensor when using dual sensors.

Zero and Calibrate the Power Sensor

For highest accuracy, Zero AND Calibrate the power sensor before measuring data. Follow prompts that may appear.

Zero - If the following settings are 'greyed', Internal or External zeroing is selected automatically based on the power meter/sensor model. Otherwise, select the appropriate type of zeroing to perform, then press **Zero**.

- **Internal Zero** - A switch inside the power sensor removes the sensor from the incident power.
- **External Zero** - Requires that you physically remove the sensor from incident power.

Note: For the U2000 Series USB power sensors

Calibration is NOT available. Select External Zero ONLY when the power to be measured is **below** the specified level. Otherwise, the U2000 series performs internal zeroing automatically when needed. See your power sensor documentation for more details.

- U200xA - below -30 dBm
- U200xH - below -20 dBm
- U200xB - below 0 dBm

If your U2000 power sensor 'hangs' when external zeroing, upgrade the power sensor firmware to Rev. A.01.02.00 or higher to fix this problem.

Note: For the U2020 X-Series USB power sensors

The U2020 X-Series support only internal zeroing. But like the U2000 series, they default to performing zeroing automatically when needed.

Calibrate - Available when the selected sensor has calibration capability. Calibration involves measuring an internal 1 mW source.

- Agilent P-Series sensors and U2020 X-Series USB sensors have an internal reference so you can calibrate them without connecting to a meter's reference port.
- Agilent U2000 USB power sensors do not require calibrating.
- For other sensors, refer to the documentation to determine if it has calibration capability.

Press **Calibrate**, then follow the prompts.

Copy a Source Power Calibration to other Channels

A macro application is now available that copies a Source Power Calibration to other channels. Once downloaded and installed on a PNA, the [macro](#) is automatically configured up. To learn more, click **Help** on the application main dialog. Get the application from <http://na.tm.agilent.com/pna/apps/applications.htm>.

Saving a Source Power Calibration

Because Source Power Cal calibrates source hardware, the calibration data is saved as part of the **Instrument State**, in either a .sta file or a .cst file. This correction is applied to all measurements on the channel that uses the calibrated source. See [Save Instrument State](#).

Reducing Time to Complete a Source Power Calibration

The time required to perform a Source Power Calibration depends on source power, number of points, and number of readings taken. You can reduce this measurement time with the following methods:

- **Reduce number of points before calibration.** You can reduce the number of points before the measurement, then return the number of points to its original value after calibration is complete and correction is ON. The analyzer will perform a linear interpolation, although with some loss in accuracy.
- **Use an Agilent E-Series sensor.** You can obtain 40+ readings per second over GPIB with this type of sensor on the PNA.
- **Increase power to the sensor.** Lower power may have longer settling time with some sensors.
- Check [Use Reference Receiver for Iteration](#).

Receiver Power Calibration

Note: Beginning with PNA firmware rev A.09.30, a Guided Power Cal can be performed during an S-parameter Guided Calibration. [Learn more](#).

Receiver power calibration mathematically removes frequency response errors in the specified PNA receiver, and adjusts readings to the same, or a value offset from, the source power calibration level. It is the same as doing a **Response Cal** or **Data / Memory, (Normalization)** but with the data shifted to the [Cal Power](#) value.

Use Receiver Power Calibration to make very accurate absolute power (amplitude) measurements.

Receiver Power Calibration:

- Is ONLY allowed when making absolute power ([unratioed](#)) measurements.
- Is most accurate when a source power calibration was performed first.
- Applies to all unratioed measurements in the active channel using that receiver.
- Can be saved in a Cal Set and later reapplied to a like measurement.

Interpolation

Like other calibration types, if the original stimulus settings are narrowed, interpolation is applied and **C* Rcvr Pwr** is displayed in the status bar. If the original stimulus settings are made wider, the PNA will turn Receiver Power Correction **OFF**.

If the original settings are restored, then receiver power calibration returns to full correction.

How to perform a Receiver Power Calibration

1. Perform a [Source Power Calibration](#).
2. Set the active measurement to unratioed. [Learn How](#).
3. Connect a THRU line from the source port to the receiver port.
 - When performing a receiver power cal on a reference receiver (source 1 and receiver R1), no connection is necessary as the receiver is internally connected to the source.
 - When the source port and receiver port are the same (receiver A, source port 1), then connect an open or short to get maximum power to the receiver. This practice is not recommended. It is best to use different ports for the source and receiver.
4. Ensure correction for Source Power Calibration is ON as indicated by **Src Pwr Cal** or **Src Pwr Cal*** in the status bar.
5. Start the [Calibration Wizard](#)

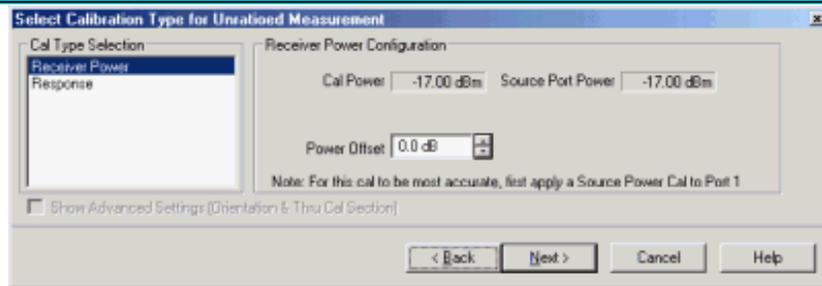

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[Power Cal]**
3. then **[Receiver Cal]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Power Cal**
4. then **Receiver Cal**

Select Calibration Type for Unratioed Measurement dialog box help

Cal Type Selection Select **Receiver Power**

Receiver Power Configuration

Cal Power Specifies the power level to be displayed on the measurement when complete. (Source Port Power + Power Offset).

Source Port Power Test port Power set for the measurement. [Learn how to change Test Port Power](#)

Power Offset Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement **AFTER** a source power cal has been performed. Following the calibration, the PNA power readouts are adjusted to the Cal Power value.

Next Click to continue the Calibration Wizard.

Notes:

- When Receiver Power Cal is finished, **'Response'** is displayed in the status bar and correction data is applied to subsequent sweeps. This is done because Receiver Power Cals are essentially Response Cals once they are stored and applied. See Saving a Receiver Power Cal below.
- To turn correction **OFF**, click **Calibration**, point to **Power Calibration**, then set **Receiver Power Correction** to **OFF**.

[Learn more about Receiver Power Cal \(scroll up\).](#)

Saving a Receiver Power Calibration

Beginning with PNA Revision 5.0, Receiver Power Cal is saved to a [Cal Register](#) and optionally to a [User Cal Set](#). It can be applied to measurements in the same way as other Cal Types. Previously, Receiver Power Cal data was saved as part of an Instrument State and was only applied to the

measurement on which it was performed.

[Learn more about Saving PNA files types.](#)

14 Sept-2006	MQ Added Receiver-only SPC.

Fixture Simulator

The following features allow you to mathematically add (embed) or remove (de-embed) circuits to, or from, your PNA measurements. The mathematical models are applied to specific ports for all measurements on the channel.

Notes

- Beginning with PNA Rev. A.09.20, the following features are available in [GCA](#), [GCX](#), [Swept IMD](#), [Swept IMDX](#), [Noise Figure](#), and [NFX](#) Apps:
 - [Port Extensions](#) (Not available in Swept IMD or IMDX)
 - [2 Port De-embedding](#)
 - [Port Matching](#)
 - [Port Z Conversion](#)
- All other Fixturing features are available ONLY in a [standard channel](#).
- When fixturing is enabled, all of the enabled fixturing features are applied when [snp files are saved](#).

See Also

- **Procedures:** [To Embed or De-embed?](#)
- [Characterize Adaptor Macro](#) can be used to create S2P files from Cal Sets.
- ["De-embedding and Embedding S-Parameter Networks Using a Vector Network Analyzer" App note](#), for more conceptual information on Fixture Simulation.
- [See an example](#) of how these functions can be used to de-embed unwanted effects of a test fixture, and then mathematically embed the DUT in the circuit in which it is used.

Order of Fixture Operations

First, the following **Single-ended** measurement functions are processed in this order:

1. [Port Extensions](#)
2. [2-Port De-embedding](#)
3. [Port Matching Circuit Embedding](#)

4. [Port Z \(Impedance\) Conversion](#)
5. [4-Port Network \(single-ended\) Embed/De-embed](#)

Then, **Balanced** measurement functions are processed in this order:

6. [Balanced Conversion](#)
7. [Differential](#) / [Common Mode](#) Port Z Conversion
8. [Differential Matching Circuit Embedding](#)

- [Source power compensation](#) is then optionally applied to compensate for the aggregate loss through all enabled fixturing operations.

Notes

- The fixturing operations are applied to the measurement results.
- The order of operations **1 through 4** can be changed using the SCPI command: [CALC:FSIM:SEND:OORD](#). Learn how to send this command from the [GPIB Command Processor Console](#).
- The order of the operations **5 through 8** can NOT be changed.
- In the [PNA data processing chain](#), the Fixture Simulator functions occur at the same time as the **Apply Error Terms** block.

How to select Fixturing Simulator

About Fixturing ON/off

BOTH of the following must occur to turn a fixturing selection **ON**.

EITHER ONE will turn a fixturing selection **OFF**.

1. Check **Fixturing ON/off**
Port Extensions is NOT affected by Fixturing ON/off.
2. Check **Enable** on the individual fixturing selection dialog box.

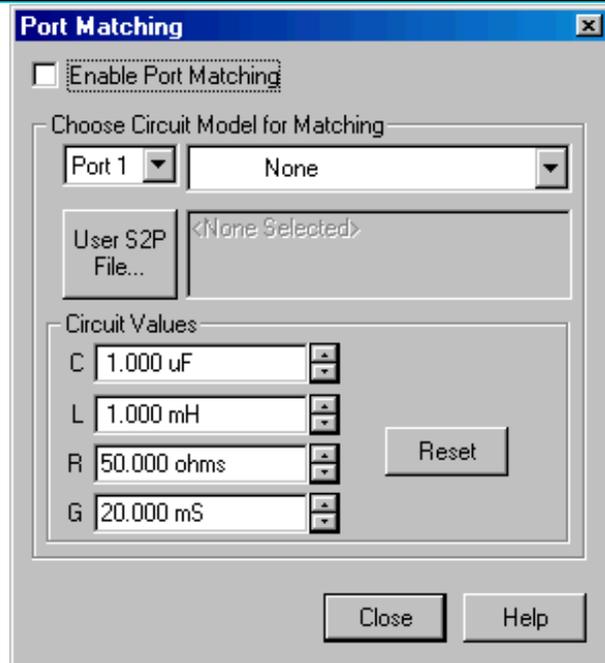

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[More]**
3. then **[Fixtures]**

Using a mouse with PNA Menus

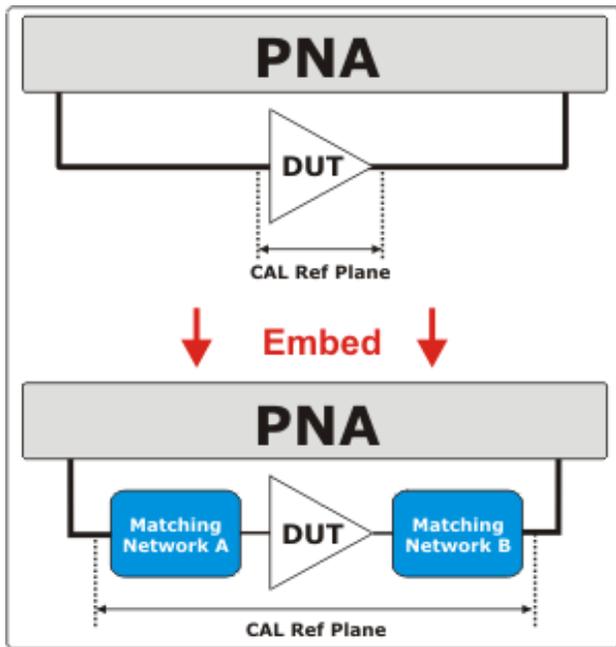

1. Click **Cal**
2. then **More**
3. then **Fixtures**

Port Matching dialog box help

Note: Beginning with PNA Rev. A.09.20, this feature is available to the following [measurement classes](#): [GCA](#), [Swept IMD](#), [Swept IMDx](#), [Noise Figure](#), [NFX](#), and standard (S-Parameter) channels.

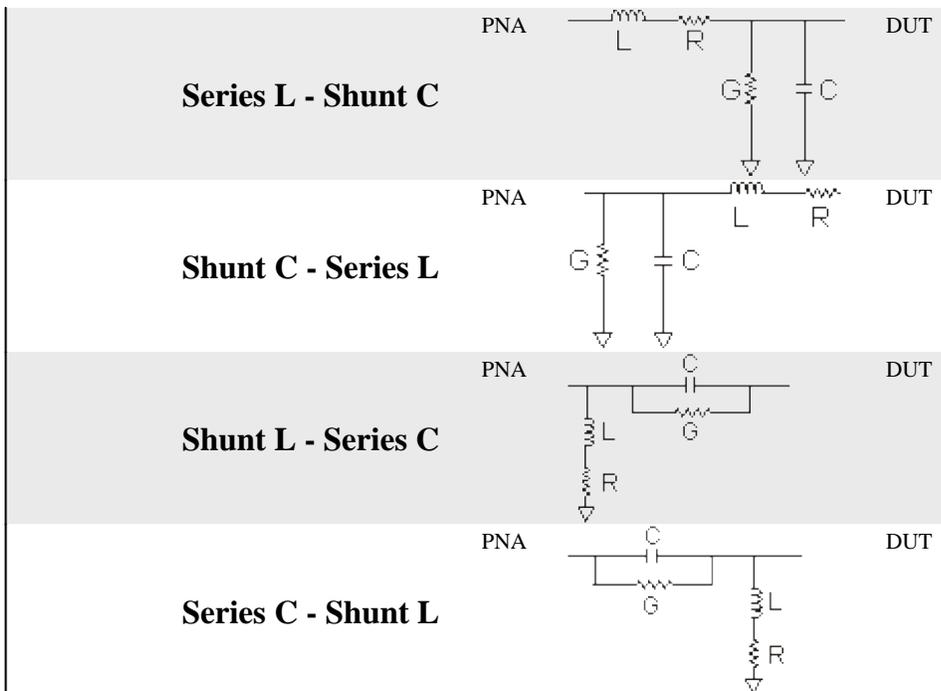

This function specifies a circuit to embed (add) to the measurement results. [See Order of Fixture Operations](#).

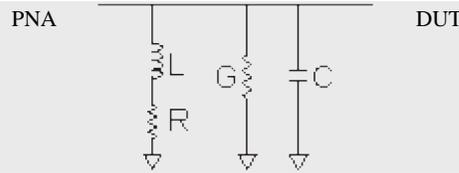

Enable Port Matching Check to apply the settings to the measurement results. Must also enable [Fixturing ON/off](#).

Port - Select Port in which to apply simulation.

Circuit Model for Matching - Choose one of the following that best emulates your fixture at the selected PNA port:

Shunt L - Shunt C

User Defined (S2P File) Load a file that is specified with **User S2P File** button.

None Use no circuit model.

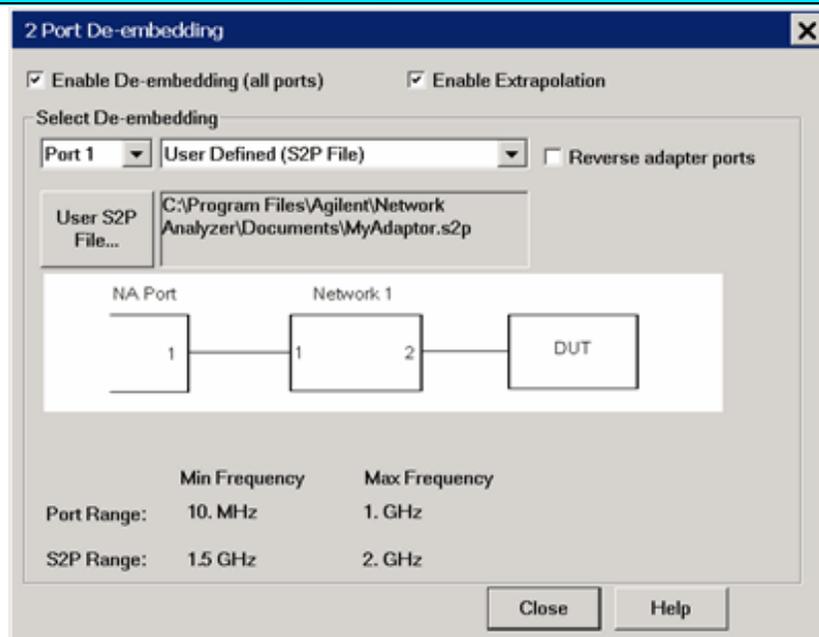

User S2P File Click to specify an S2P file of the circuit model to embed at the selected port. If the normalized impedance value in a recalled User .S2P file is different from the port reference impedance setting of the PNA, the PNA setting is used. [Characterize Adaptor Macro](#) can be used to create S2P files from Cal Sets.

Circuit Values

Capacitance (C), Inductance(L), Resistance(R), Conductance(G) Values for the specific components of the circuit type that models your fixture.

Reset Restores the default values.

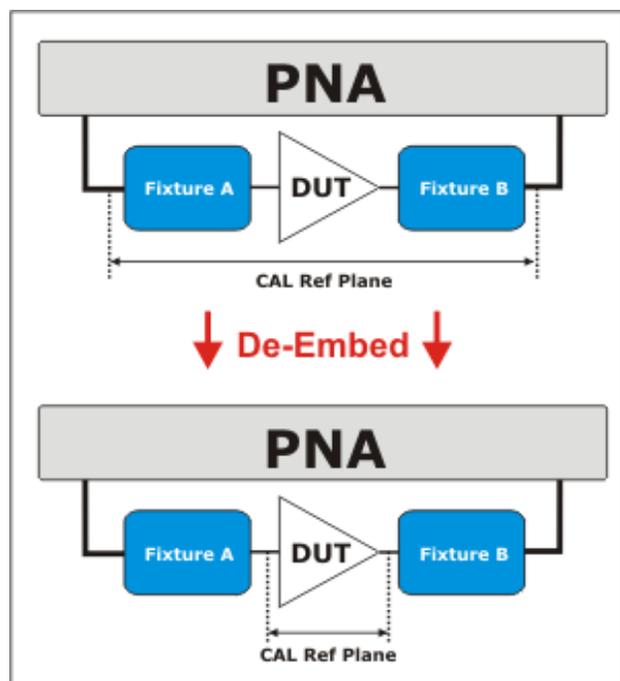

2 Port De-embedding dialog box help

Note: Beginning with PNA Rev. A.09.20, this feature is available to the following [measurement classes](#): [GCA](#), [Swept IMD](#), [Swept IMDx](#), [Noise Figure](#), [NFX](#), and standard (S-Parameter) channels.

De-Embed when you have performed a calibration and then added a fixture (an adapter, an attenuator, a longer cable, etc.) that connects between the Cal reference plane and your DUT. This function **removes** the effects of a component or test fixture from the measurement results.

Note: De-embedding a component with more than 20 dB of loss becomes impractical because of an inability to accurately measure the match of the DUT through such a device.

The de-embedding operation recalls an .s2p file (Touchstone format) which includes the electrical characteristics of a 2-port fixture or device. The file can be in any standard format (real-imaginary, magnitude-angle, dB-angle).

Enable De-embedding Check to apply the settings to the measurement results. Must also enable [Fixturing ON/off](#).

Enable Extrapolation Check to apply a simple extrapolation when the S2P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of both the channel and the S2P file are displayed at the bottom of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

This setting also causes [4-port Extrapolation](#) to be enabled and disabled.

Port The PNA port to which the recalled de-embedding file is applied.

From the drop-down menu, select **User Defined (S2P File)**.

Reverse Adaptor Ports Check to cause the Fixture/Adapter to be configured with Port 2 connected to the PNA and Port 1 to be connected to the DUT. The image in the dialog reflects that change.

User S2P File Click to specify an existing .S2P file. If the normalized impedance value in a recalled User .S2P file is different from the port reference impedance setting of the PNA, the PNA setting is used. [Characterize Adaptor Macro](#) can be used to create S2P files from Cal Sets.

Port Z (Impedance) Conversion dialog box help

Note: Beginning with PNA Rev. A.09.20, this feature is available to the following [measurement classes](#): [GCA](#), [Swept IMD](#), [Swept IMDx](#), [Noise Figure](#), [NFX](#), and standard (S-Parameter) channels.

This function corrects the measurement and displays the results as if the measurement had been made into the specified impedance value. However, the physical port termination is still approximately 50 ohms.

The specified impedance value is applied to all of the measurements on **ONLY** the active channel.

[See Order of Fixture Operations.](#)

Enable Port Z Conversion Check to apply the settings to the measurement results. Must also enable [Fixturing ON/off](#).

R Real part of the impedance value.

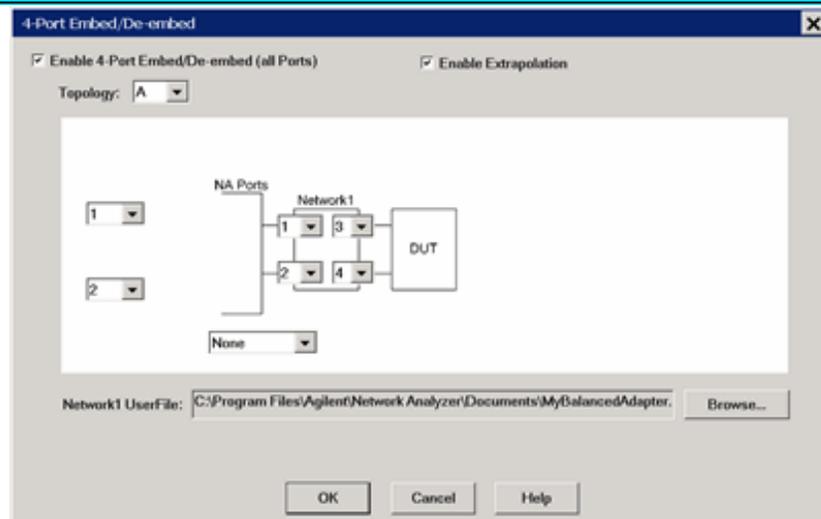

jX Imaginary part of the impedance value.

Close Applies the entries and closes the dialog box

Note: Port Z (Impedance) conversion uses values in the following prioritized order:

1. [Balanced \(Differential or Common Mode\)](#) - if enabled, these values are always used.
2. [Single Port Impedance](#) - if enabled, this value is used if Balanced is not enabled.
3. [System Impedance](#) - if neither balanced or single port is enabled, this value is used.

4-Port Embed/De-embed dialog box help

This function specifies a single-ended 4-port circuit (*.S4P file) to embed (add) or de-embed (remove) from the measurement results. Computation takes place BEFORE Balanced conversion. [See Order of Fixture Operations.](#)

There is a single normalized impedance value for each port in the *.S4P file. This impedance value must match the impedance of the previous Port Z setting, or the PNA port impedance.

The PNA will interpolate if the number of data points that are read is different from the current PNA setting.

Enable 4-Port Embed/De-embed Check to apply the settings to the measurement results. Must also enable [Fixturing ON/off](#).

Enable Extrapolation Check to apply a simple extrapolation when the S4P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of both the channel and the S4P file are displayed at the bottom of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

This setting also causes [2-port Extrapolation](#) to be enabled and disabled.

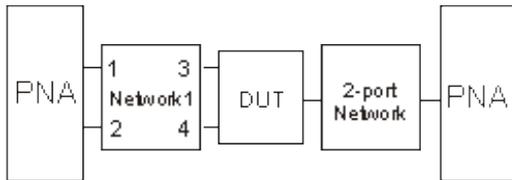

Topology

Select a DUT topology. Refer to the images on the 4-port embed/De-embed dialog box.

- **A** - 2 PNA/DUT Ports
- **B** - 3 PNA/DUT Ports
- **C** - 4 PNA/DUT Ports

Note: Not all possible DUT topologies are addressed with this dialog box.

To embed or de-embed other topologies, use this dialog in conjunction with the [2-port embed/de-embed dialog](#). For example, if you have a 3-port Bal-SE DUT and have networks to de-embed as shown here:

1. In this dialog specify **Topology B**.
2. De-embed the 4-port Network1 on the Balanced input.
3. Use the [2-port dialog](#) to de-embed the 2-port network on the Single-ended output.

NA Ports - Select the PNA Port that is connected to each circuit port.

Network Ports Select the network ports that represent the configuration of the S4P file. By default, ports 1 and 2 are connected to the PNA and ports 3 and 4 are connected to the DUT.

None, Embed, De-embed For Network1 and Network2, select:

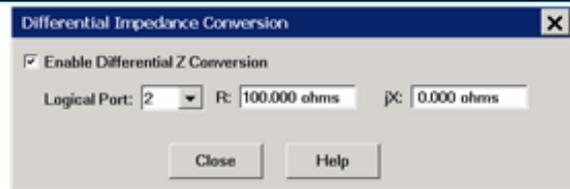

- **None** - The same as disabling.
- **Embed** - Add the specified network circuit to the measurement results. [See 2-port Embed image](#).
- **De-embed** - Remove the specified network circuit from the measurement results. [See 2-port De-embed image](#).

Browse For both Network1 and Network2, navigate to find the .*S4P file to embed or de-embed.

OK Applies the changes and closes the dialog box.

Cancel Does NOT apply the changes and closes the dialog box.

Differential Impedance Conversion dialog box help

This function sets the Differential impedance value for each balanced port.

The default value for **R**: is the SUM of the impedance values for both ports that make the logical port. If [Port Z Conversion](#) is not enabled, then [System Z0](#) values for both ports are summed.

[See Order of Fixture Operations.](#)

Enable Differential Z Conversion Check to apply the settings to the measurement results. Must also enable [Fixturing ON/off](#).

Logical Port Select the logical (balanced) port to receive impedance value. To see logical port numbers, see the [measurement topology](#).

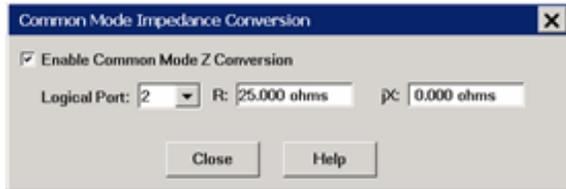

R Real part of the impedance value.

jX Imaginary part of the impedance value.

Close Closes the dialog box.

[See note about Port Impedance priority.](#)

Common Mode Impedance Conversion dialog box help

This function sets Common Mode Impedance value for each balanced port.

The default value for **R**: is calculated as follows.

$$(Z1 * Z2) / (Z1 + Z2)$$

Where ports 1 and 2 comprise the logical port:

Z1 = the Port Impedance values for port 1

Z2 = the Port Impedance values for port 2

If [Port Z Conversion](#) is not enabled, then [System Z0](#) values for port 1 and 2 are used in the calculation.

[See Order of Fixture Operations.](#)

Enable Common Mode Z Conversion Check to apply the settings to the measurement results. Must also enable [Fixturing ON/off](#).

Logical Port Select the logical (balanced) port to receive impedance value. To see logical port numbers, see the [measurement topology](#).

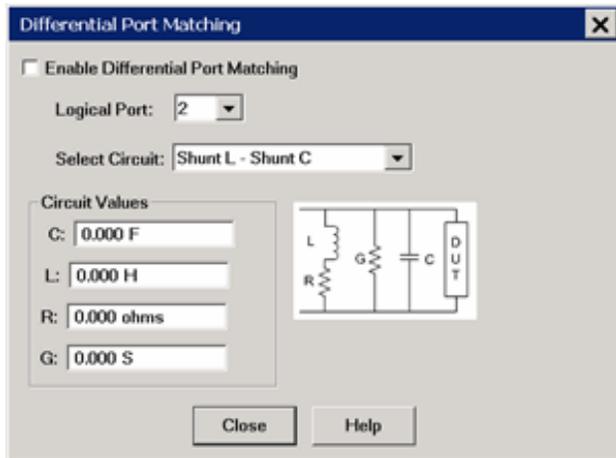

R Real part of the impedance value.

jX Imaginary part of the impedance value.

Close Closes the dialog box.

[See note about Port Impedance priority.](#)

Differential Port Matching dialog box help

This function allows the embedding of a differential matching circuit at a balanced port.

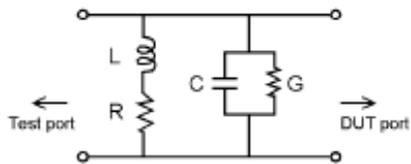

[See Order of Fixture Operations.](#)

Enable Differential Port Matching Check to embed the selected matching circuit to the measurement results. Must also enable [Fixturing ON/off](#).

Logical Port Choose [Logical DUT port](#) to receive the selected matching circuit. To see logical port numbers, see the [measurement topology](#).

Select Circuit Select a matching circuit. Choose from:

- **Shunt L - Shunt C** Predefined circuit.

Circuit Values Choose from:

- **C** Capacitance value
- **G** Conductance value
- **L** Inductance value
- **R** Resistance value
- **User defined** Select an *.S2P file that represents the matching circuit. Then click **Browse** to navigate to the *.S2P file.

Note: For the *.S2P file:

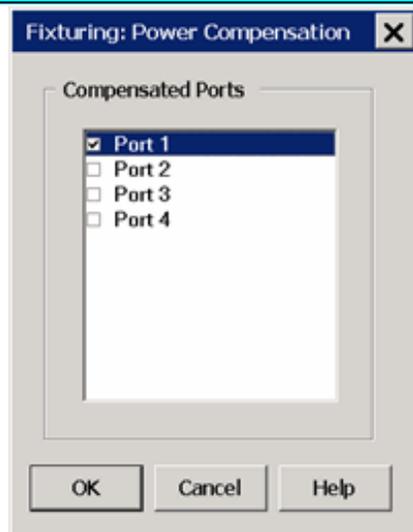

Port 1 of the circuit is assumed to be connected to the PNA

Port 2 of the circuit is assumed to be connected to the DUT.

- **None** No embedded circuit on selected port.

Close Closes the dialog box.

Power Compensation dialog help

This function adjusts the source power at the specified port to compensate for the combined amount of gain or loss through ALL enabled fixturing operations. Use this function to set the power level at the DUT input.

For example:

- Your DUT requires a fixture on the input port which is connected to PNA port 1.
- The fixture description (such as an S2P file at the [2-port De-embed function](#)) indicates the fixture has approximately 2 dB of loss across the frequency span.
- You set source power to 0 dBm. But you want 0 dBm at the DUT input (the fixture output).
- Check Power Compensation on Port 1 and enable [Fixturing](#).
- Power Compensation causes the source power to be increased by approximately 2 dB so that the power at the fixture output plane will remain at 0 dBm.

Power Compensation affects all measurements in the channel.

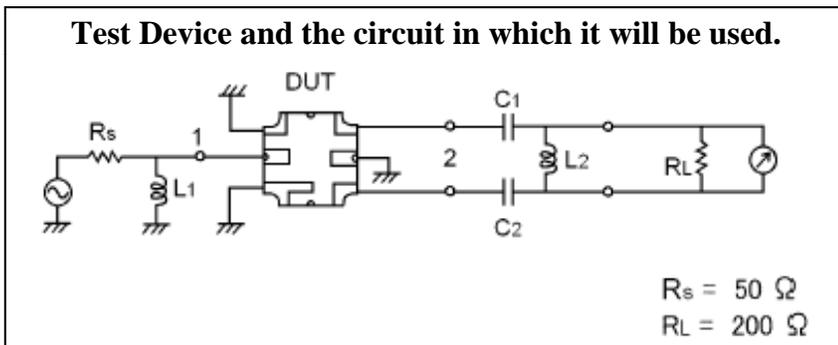

Enable [Fixturing](#) to use Power Compensation.

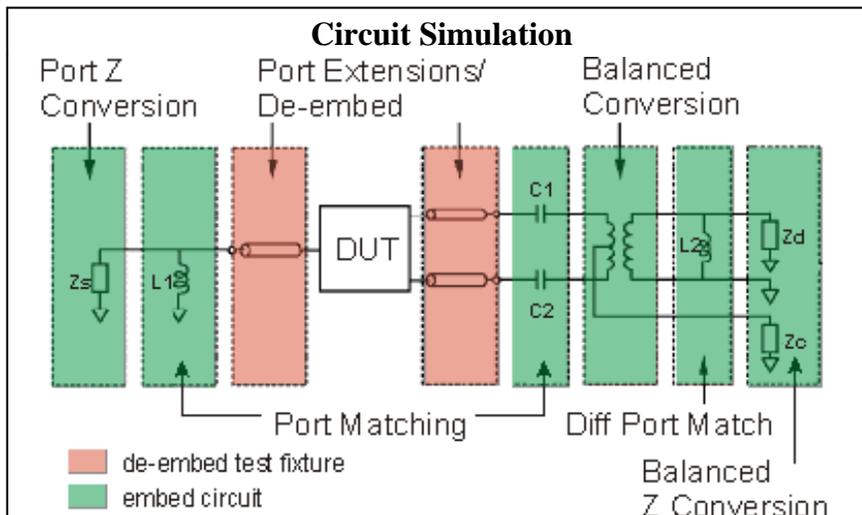

Note: Use caution when applying power compensation. Always test your setup without a DUT in a place. If you are using S2P files, [Recall](#) your S2P file into the PNA so you can verify that the device your S2P file describes is what you intended it to be. It is too easy to misalign data in S2P files if they are constructed by hand.

Fixture Simulator Example

The following example shows a DUT and the matching circuit with which the DUT will be used in its intended application. When the DUT is tested in a high-volume manufacturing environment, multiple test fixtures are often required. The most accurate way to test the DUT and ensure measurement consistency between the different test fixtures is to use a simple, repeatable, test fixture without the actual matching elements.

To get the desired performance data, the parasitic effects of the fixture must first be removed (de-embedded) from the measured data. Then a perfect "virtual" matching circuit must be simulated and added mathematically (embedded) to the corrected, measured data. The result is an accurate display of the DUT as though it was actually tested with a physical matching circuit, but without the uncertainties of using real components.

This diagram does NOT refer to the order in which operations are performed.

[See Order of Fixture Operations.](#)

1. [Create a balanced measurement](#) using single-ended to balanced (SE-Bal) [topology](#). Include all relevant measurement settings (IFBW, number of points, and so forth). Once the measurement is created and calibrated, the measurement parameter can be easily changed. For example, Sdd22 to Sds21.
2. Calibrate the measurement at the point where the simple test fixture is connected to the PNA. Use accurate calibration standards and definitions.
3. Remove the effects of the three uncalibrated transmission lines of the simple test fixture. This can be done in several different methods. The easiest is to use manual or automatic [Port Extensions](#) to move the calibration reference plane to the DUT. This removes the electrical length and loss of the fixture's transmission lines, but does not account for fixture mismatch. Another method is to de-embed previously-created *.S2p files of the 3 transmission lines. The files can be created using external ADS modeling software. Another alternative is to create the *.S2P files by independently measuring all 3 ports of the test fixture and [saving the results of each to an S2P file](#).
4. With the test fixture connected to the PNA and a DUT inserted, the measurement results now appear as though calibration was performed at the connections to the DUT, and the device was measured in a 50-ohm single-ended test environment. The following steps will cause the results to reflect the performance of the device as though the device is embedded in the circuit in which it will be used.
5. Port 1 of the device is a single-ended port and sees a source impedance the same as the PNA system impedance, so no change is required. However, if R_s were a value other than 50 ohms, [Port 1 Impedance Conversion](#) would be used to simulate the different impedance.
6. [Port Matching](#) is used to simulate L1 inductance. Select any of the Shunt L circuits to embed (add) to the measurement results. Enter the value of L and R. The C and G values can be entered as 0 (zero).
7. [Port Matching](#) is used to simulate C1 and C2 capacitance. For both port 2 and port 3, select any of the **Series C** circuits to embed (add) to the measurement results. Enter the value of C and G. The L and R values can be entered as 0 (zero).

8. [Balanced Conversion](#) mathematically simulates the measurement in balanced mode.
 9. [Differential Port Matching](#) is used to simulate L2 inductance. Select Shunt L- Shunt C and enter the inductance / resistance value. The C and G values can be entered as 0 (zero).
 10. Finally, [Differential Z Conversion](#) is used to simulate a circuit termination of 200 ohms. If you are making Common Mode measurements, specify [Common Mode Z Conversion](#).
-

Port Extensions

Port extensions allow you to electrically move the measurement reference plane after you have performed a calibration.

Note: Beginning with PNA Rev. A.09.20, this feature is available to [GCA](#), and standard (S-Parameter) channels.

- [Why and How to use Port Extensions](#)
- [Manual Port Extensions Procedure](#)
- [Port Extensions dialog and Toolbar](#)
- [Step Size dialog](#)
- [Automatic Port Extension dialog](#)

See Also

[PNA Data Flow Map](#)

[Fixture Compensation features](#)

[Phase Accuracy](#)

[Comparing the PNA Delay Functions](#)

Other Calibration Topics

Why use Port Extensions

1. You are unable to perform a calibration directly at your device because it is in a test fixture. Perform a calibration at a convenient place, then use port extensions to compensate for the time delay (phase shift), and optionally the loss, caused by the fixture.
2. You have already performed a calibration, and then decide that you need to add a length of transmission line in the measurement configuration. Use port extensions to "tell" the analyzer you have added the length to a specific port.

Important Note: Port Extensions and PNA Data Flow

See [PNA Data Flow diagram](#)

Normally, Port Extensions are applied to individual S-parameters in the **Phase Correction** process and only applies to displayed S-parameters.

However, when [Fixturing](#) is ON or when making a [Balanced Measurement](#), Port Extension compensation is applied in the **Apply Error Terms** process which affects ALL S-parameters, whether displayed or not. This allows all underlying S-parameters to have proper extensions applied.

Therefore, when using Port Extensions with features that require more than a single S-parameter (such as k-factor in equation editor), do one of the following:

- Enable [Fixturing](#) - Individual Fixturing features are NOT required to be enabled.
- Use [8510 Mode Data Processing](#).

When Port Extension compensation is applied in the **Apply Error Terms** process, after a [Data-to-Memory](#) operation has been performed, further changes to Port Extensions settings will NOT be applied to the Memory trace.

How to use Port Extensions

- If you know the **electrical length** of the fixture or additional transmission line, enter the value directly to the **Time** setting.
- If you know the **physical length** of the fixture or additional transmission line, enter the value directly to the **Distance** setting.
- If you do **NOT** know either the electrical or physical length of the fixture or additional transmission line, you must be able to connect an OPEN or SHORT to the new reference plane - in place of the DUT. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane.
- Port Extensions can then be added manually (as follows), or by using [Automatic Port Extensions](#).

Manual Port Extensions Procedure

1. Select a calibrated S11 measurement.
2. Select Phase format.
3. With an OPEN or SHORT at the calibration reference plane, verify that the phase across the frequency span

is at or near zero.

4. Connect the fixture or added transmission line and attach an OPEN or SHORT in place of the DUT. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane. On the Port Extension toolbar or dialog, increase either **Time** or **Distance** until the phase response is flat across the frequency span of interest.
5. If you know the loss of the additional transmission line, enter the [Loss Compensation](#) values using either one or two data points.

Note: Most OPEN and SHORT standards have delay. Therefore, adjusting delay with this method results in a delay equal to two times the delay of the OPEN or SHORT.

How to access Port Extensions settings

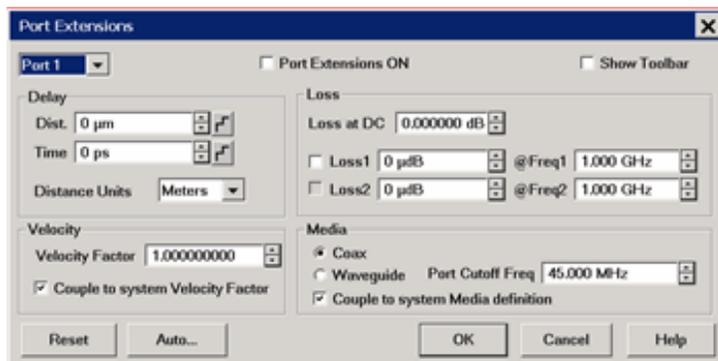

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then [Port Extensions]

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Port Extension**

Programming Commands

Port Extensions dialog and Toolbar help

Note: Beginning with PNA Rev. A.09.20, this feature is available to the following [measurement classes](#): [GCA](#), [Noise Fixture](#), [NFX](#), and standard (S-Parameter) channels.

Port extensions settings affect all measurements on the active channel that are associated with a particular port.

[Learn Why and How to use Port Extensions](#) (scroll up).

Port Extension Turns ON and OFF port extensions on all ports.

Port Select a PNA port for delay and loss values. Port Extensions settings affect ALL measurements on the active channel that are associated with a particular port.

Show Toolbar Check to show the Port Extensions toolbar. The toolbar allows you to make adjustments to the port extensions while showing more of the PNA screen. Beginning with PNA rev A.08.50, this is the only way to show or hide the toolbar.

Delay settings

Enter delay in either Distance or Time by entering a value or clicking the up/down arrows. Click  to start the [Step Size](#) dialog.

Time The amount of port extension delay in time. Enter a positive value.

Distance The amount of port extension delay in physical length. Enter a positive value.

Distance Units (Dialog ONLY) Select from Meters, Inches, or Feet. The Step Size setting will not change automatically. [Learn more.](#)

Loss Compensation

The following settings allow the entire frequency span to be corrected for loss.

Loss at DC Offsets the entire frequency span by this value. Loss1 or Use1 must also be checked. To compensate for loss at DC, enter a positive value which causes the trace to shift in the positive (up) direction.

Loss @Frequency Check the box, and enter values for Loss and Frequency

When **Loss1** or **Loss1/Loss2** are used, a curved-fit algorithm is used as follows:

Loss1 ONLY:

$$\text{Loss}(f) = \text{Loss1} * (f/\text{Freq1}) ^ 0.5$$

Loss1 and Loss2:

Set the lower frequency to Loss1, and the higher frequency to Loss2.

$$\text{Loss}(f) = \text{Loss1} * (f/\text{Freq1}) ^ n$$

Where:

$$n = \log_{10} [\text{abs}(\text{Loss1}/\text{Loss2})] / \log_{10} (\text{Freq1}/\text{Freq2})$$

Note: abs = absolute value

Velocity

Velocity Factor For each port, sets the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum.

Couple to system Velocity Factor When unchecked, the Velocity Factor is set for only the specified port and only for Port Extensions. When checked, sets the Velocity Factor for all ports. In addition, changing this value also changes this setting for the [Electrical Delay](#) and [Time Domain Distance Marker](#) features.

Media

For each port, select the media of the added transmission line or fixturing.

Coax Select when the fixture or added transmission line is coax. Also specify the velocity factor of the coax.

Waveguide / Cutoff Frequency Select when the fixture or added transmission line is waveguide. Also enter cutoff (minimum) frequency of the waveguide.

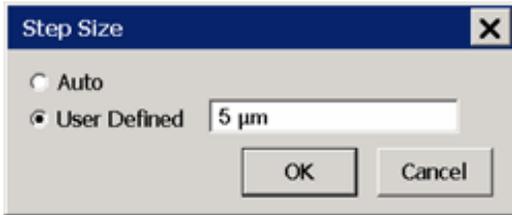

Note: when using a Waveguide cal Kit, set [System Z0](#) to 1 ohm before calibrating.

Couple to system Media Definition. When unchecked, the Waveguide Cutoff Frequency is set for only the specified port and only for Port Extensions. When checked, sets the Waveguide Cutoff Frequency for all ports. In addition, changing this value also changes this setting for the [Electrical Delay](#) feature.

Reset All port extensions settings are changed to preset values. The Port Extension ON / OFF state is NOT affected.

Auto Ext. Starts the [Automatic Port Extensions](#) dialog box

Note: Individual receiver port extensions (A,B, and so forth) can no longer be set. (Sept. 2004)

Step Size dialog box help

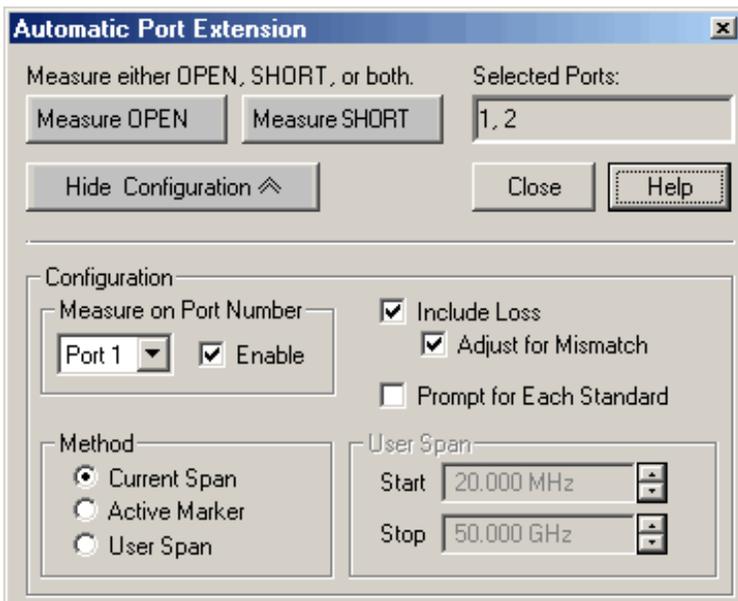

Changes the step size that occurs when the Time or Dist up/down arrows are pressed on the Port Extension toolbar. The Units for step size are changed on the Port Extension dialog.

Auto Step Size is set to the default value.

User Defined Enter a step size value, then click OK.

This value remains the same when the units are changed. For example if a step size of 12 is entered on this dialog, then you change the units from Inches to Feet, the step size of 12 inches becomes 12 feet, not 1 feet. Therefore, change the units first, then set the step size.

Learn about [Port Extensions](#) (scroll up)

Automatic Port Extension dialog box help

Automatic Port Extension AUTOMATICALLY performs the same operation as [Manual Port Extension](#). By connecting a SHORT or OPEN, the reference plane is automatically moved to the point at which the standard is connected. In addition, Automatic Port Extension will optionally measure and compensate for the loss of the additional transmission line.

Auto Port Extension is NOT available when:

- Sweep type is set to power sweep
- Frequency Offset is ON
- Media is set to Waveguide

Note: Turn OFF [Equations](#) that may exist on the active trace when using Automatic Port Extensions.

Auto Port Extensions Procedure

1. Connect the added transmission line or fixture. Attach an OPEN or SHORT to all affected ports at the new reference plane. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane.
2. On the Port Extension toolbar, click **Auto Port Ext.** Click **Show Configuration** to make additional settings.
3. Click **Measure** to perform the port extension calculations. The resulting delay and loss settings are entered into the port extension toolbar. These settings are saved with Instrument Save or you can manually record the values and enter them again when required.

Settings

Measure either OPEN, SHORT, or both Press a button to make the measurement of the reflection standard.

Measure either OPEN or SHORT depending on which is most convenient. An ideal OPEN and SHORT, with zero loss and delay, is assumed. Therefore, accuracy is most affected by the quality of the standard. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane. When measuring both OPEN and SHORT standards, the average of the two is used and will slightly improve accuracy.

Selected Ports Indicates the ports that currently have automatic port extension enabled. By default, ALL PNA ports are enabled. To disable a port, see **Measure on Port Number** below.

Note: Port Extensions settings affect ALL measurements on the active channel that are associated with a particular port.

Show/Hide Configuration Press to either show or hide the following configuration settings in the dialog box.

Measure on Port Number

Select port number to enable or disable automatic port extension.

Enable Check to enable the specified port. All enabled ports will have their reference plane automatically adjusted after performing Automatic Port Extension.

Include Loss Check to automatically measure the loss in the additional transmission line and apply compensation. To calculate loss compensation, frequencies at 1/4 and 3/4 through the frequency range are usually used as Freq1 and Freq2 values. [Learn more about Loss Compensation.](#)

Adjust for Mismatch Only available when **Include Loss** is checked. During the measurement of the OPEN or SHORT standard, mismatch could cause ripple in the magnitude (loss) response. The [Loss compensation curved-fit algorithm](#) allows half of the ripple to be positive and half negative. When measuring low-loss devices, it is possible that some magnitude responses could become slightly positive, indicating gain rather than loss.

Check - Offsets the trace to cause all of the data points to be at or below zero.

Clear - Most accurate application of the curve-fit calculation, but allows positive responses.

Prompt for Each Standard Check to invoke a prompt when the Measure OPEN or SHORT button is pressed. The prompt will indicate which standard to connect to which port.

Method

Select the span of data points which will be used to determine correction values for phase and loss (optional). If a portion of the current frequency span does not have flat or linear response, you can eliminate this portion from the calculations by using a reduced User Span.

To calculate loss compensation, Current Span and User Span methods usually use frequencies at 1/4 and 3/4 through the frequency range as Freq1 and Freq2 values. See [Loss Compensation](#) to learn more about how loss is calculated.

Current Span Use the entire frequency span to determine phase and loss values.

Active Marker Use only the frequency at the active marker, and one data point higher in frequency, to calculate phase and loss values. If a marker is not present, one will be created in the center of the frequency span.

User Span Use the following User Span settings to determine phase and loss values.

User Span

Start Enter start frequency of the user span.

Stop Enter stop frequency of the user span.

Characterize Adaptor Macro

This external [Macro](#) application creates an S2P file that models a device such as an adaptor, the input OR output side of a test fixture, or an on-wafer probe head. This is done by calculating the four S-parameters of the device from two 1-port calibrations. Such S2P files can be used for embedding or de-embedding the device from S-parameter measurements and FCA calibrations.

This application, along with the FCA [Embed/De-embed feature](#), can be especially useful when performing FCA calibrations.

- An SMC calibration requires a [power meter measurement](#) at the port 1 reference plane. This could be very difficult in on-wafer applications where the measurement reference plane is at the tip of a probe. This macro, in conjunction with the FCA Embed/De-embed feature, enables you to model the probe and connect the power sensor at the coax connector where the probe connects.
- Likewise, a VMC calibration requires that a [calibration mixer](#) be used for the Thru standard. Again, this can be very difficult in on-wafer applications where the measurement reference plane is at the tip of a probe. This macro, in conjunction with the FCA Embed/De-embed feature, enables you to model the probe and connect the calibration mixer at the coax connectors where the probe connects.

New: Characterize Adaptor Macro - Version A.02.22

- Saves Forward (measurements) Only
- This macro update requires PNA firmware version A.09.50 or higher

For S-Parameter measurements:

- [To Embed or De-embed](#)
- [Procedures](#)

How to start the Characterize Adaptor Macro

Using front-panel HARDKEY [softkey] buttons

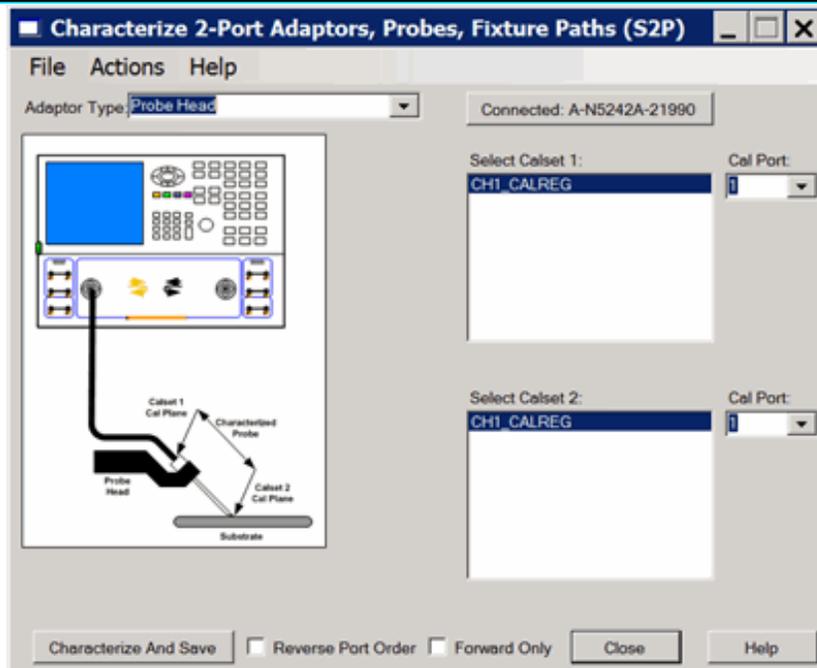

1. Press **MACRO**
2. then [**AdaptorChar**]

Using a mouse with PNA Menus

1. Click **Utility**
2. then **Macro**
3. then **AdaptorChar**

Programming Commands

Characterize 2-Port Adaptors, Probes, Fixture Paths (S2P) dialog box help

Important Notes

- The device to be characterized (probe, adaptor...) MUST be reciprocal ($S_{21} = S_{12}$).
- Two 1-port cals must be performed and saved to Cal Sets BEFORE using the Characterize Adaptor application.
- The frequencies and number of points of the two Cal Sets MUST be identical.
- **CRITICAL:** The calculations that are performed to create the S2P file require that **Calset 1** ALWAYS be from the side closest to the PNA and **Calset 2** ALWAYS be from the other side of the device. If your application that uses the resulting S2P file requires that the ports be reversed, check **Reverse Port Order**. Or learn how to [reverse the port order on an existing S2P file](#).
- The majority of this topic describes the characterization of a 2-port device from two 1-port cal sets. However, you can also use the cal sets from two 2-port calibrations, or one 2-port and two 1-port calibrations. See procedures for both.

[Learn more about the Characterize Adaptor Macro.\(scroll up\)](#)

Connected <PNA host name> The two 1-port Cal Sets can reside in another PNA. Click to connect to another PNA that is DCOM configured. [Learn how to configure DCOM](#).

Adaptor Type Select the type of device to be characterized.

Note: The image that appears in the macro does not influence the calculations. It only appears to help you visualize the measurement reference plane of the Cal Sets.

Select Calset 1 and Calset-2 Select a 1-port Cal Set from each list. Although all Cal sets are listed, only the Cal Sets that have error terms to satisfy a 1-port calibration may be used.

Cal Port Select the port within the selected Cal Set which represents the modeled device. The Cal Ports must be the same for both selected Cal Sets.

Characterize and Save Calculates four S-parameters, then invokes the [Save As dialog](#) with [S2P file type](#). This button is not available until valid Cal Sets and Cal Ports are selected.

Reverse Port Order By default, the calculations that are performed to create the S2P file require that **Calset 1** ALWAYS be from the side closest to the PNA and **Calset 2** ALWAYS be from the other side of the device. Check **Reverse Port Order** to cause the ports to be reversed in the resulting S2P file.

Forward Only The resulting S2P file will contain only S11 and S21 (forward measurements). This is useful for Enhanced Response calibration / de-embedding.

Reverse S2P

Click **Actions**, then **Reverse S2P File**

This action causes ports to be reversed on an existing S2P file. For example:

- The data for S11 becomes the data for S22 and vice versa.
- The data for S21 becomes the data for S12 and vice versa.

The resulting file is written in the standard [PNA S2P file format](#).

1. Navigate to the S2P file to be reversed.
2. Navigate to where the new reversed S2P file will be saved. By default, the file is saved to the same folder as: [old filename]_Reversed.s2p.
3. Click **OK**.

Write to Power Loss Table

Click **Actions**, then **Write to PNA Pwr Loss Table**.

Power Loss Table Setup dialog box help

Loads the S2P Frequency / Loss pairs into the PNA [Power Loss Compensation table](#) to compensate for losses that occur when using the device to connect a power sensor to the measurement port during a Source Power Cal.

Note: PNA firmware revisions prior to A.08.33.07 ONLY support up to 100 segments in the power loss table. Therefore, to save data to the power loss table in one of the earlier firmware revs, then the Cal Sets that created the S2P file must contain 100 data points or less. Revision A.08.33.07 and above allows any number of segments.

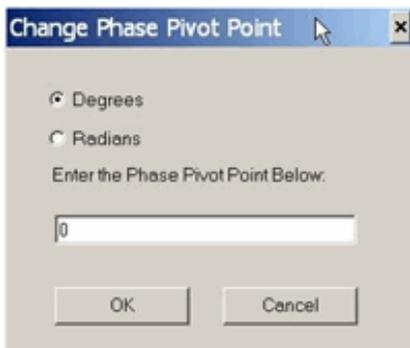

Use Selected Calsets Computes the transmission loss of the fixture based on the selected Cal Sets. This choice is NOT available until two valid Cal Sets are selected.

Use S2P File Uses the S21 data in an existing S2P file to build the PNA's power loss table. Select, then click ... then navigate to the S2P file, then click **OK**.

Note: In the PNA Power Loss Compensation table, loss is expressed as a positive number. The macro assumes that any negative S21 value in the S2P file is a loss and therefore multiplies the S21 values in the file by -1 to express that value as a positive number. This ensures proper handling of the offset during a source power cal.

Change Phase Pivot Point

Click **File**, then **Set Phase Pivot Point**.

Change Phase Pivot Point dialog box help

Before the A.01.50 revision (see Help, About) the Characterize Adaptor macro projected the phase of S21 at DC to cross the X-axis between 0° and -180°, based on the delay of the adapter. For most adapters the value is 0°.

However, when characterizing electrically long cables, cables with significant mismatch, or high noise in the measurements, it is possible that the projection of phase goes above 0°. This results in a 180° phase difference between the results computed by the macro versus the results you might get by measuring the same adapter with a 2-port calibration.

This revision allows you to adjust the center of the 180° phase pivot window . The default value 0° yields a window between +90° to -90° which should be adequate for the majority of adapters.

Enter the value in degrees or radians. This value remains while the application is running.

Restarting the application will result in the Phase Pivot Point to revert back to 0° , the default value.

To Embed or De-embed S-Parameter Measurements

- For FCA measurements, see [FCA Embed or De-embed](#).
- In this section, the term “adapter ” can mean any type of 2-port device and its associated S2P file.

To make an accurate measurement, the setup configuration during the DUT measurement **MUST** exactly match the setup configuration during Calibration. In other words, if you calibrate with an adapter, you must also measure the DUT with the adapter.

However, the PNA provides some flexibility by allowing you to ‘**Virtually**’ add (embed) or remove (de-embed) an adapter from the measurement. Knowing how to do this can be confusing.

- To perform a calibration **WITHOUT** the adapter, but make DUT measurements **WITH** the adapter, then **De-embed** (remove) the adapter from the DUT measurement.
- To perform a calibration **WITH** the adapter, but make DUT measurements **WITHOUT** the adapter then **Embed** (add) the adapter during the DUT measurement.

Procedures

- [Create an S2P file using Characterize Adaptor Macro](#)
- [De-embed the S2P file from DUT measurement](#)
- [Embed the S2P file in DUT measurement](#)

- [De-Embedding a Fixture that has a THRU Standard](#)
- [De-Embedding a Fixture with No THRU Standard](#)

Create an S2P file using the Characterize Adaptor Macro

1. Configure your PNA measurement (frequency span, power level, IF bandwidth, and number of points).
2. Perform a 1-port SmartCal at the reference plane. Save the cal to a User Cal Set using a descriptive name (for example, **Ref Plane**).
3. Connect the adapter to be characterized at the reference plane.
4. Perform another 1-port SmartCal at the end of the adapter. Save it to a User Cal Set using a different descriptive name (for example, **Adapt End**).
5. [Start the Characterize Adaptor Macro](#).
6. In the **Select Calset1** field of the dialog box, select the Cal Set for the reference plane (from step 2 above).
7. In the **Select Calset2** field of the dialog box, select the Cal Set for the end of the adapter (from step 4 above).
8. Click **Characterize and Save**. In the resulting dialog box, enter the .S2P file name and location.
9. Click **Close**.

De-embed the adapter (S2P file) from subsequent S-parameter measurements

See [Fixture De-embedding](#)

Note: Subsequent measurements must have the same or smaller frequency range (within the Start / Stop frequencies) as that of the S2P file.

1. Perform a 2 port SOLT calibration **without** the adapter/fixture.
2. Select 2-port De-embedding: click **Response**, then **Cal**, then **More**, point to **Fixtures**, then click **2 port De-embedding**.
3. Select the Port to add the adapter to, then select **User Defined (S2P file)**.
4. Click **Use S2P file** and select the S2P file created using the Characterize Adaptor macro.
5. Check **Enable De-embedding**, then click **Close**.
6. Enable Fixturing: click **Response**, then **Cal**, then **More**, point to **Fixtures**, then click **Fixturing on/OFF**.
7. **Sim** appears in the Status Bar to indicate that Fixture Simulation is ON.

Embed the adapter (S2P file) into subsequent S-parameter measurements

The adapter (S2P file) can also be a matching network. [Learn more.](#)

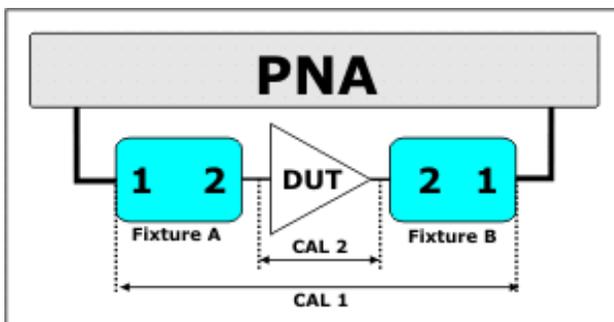

1. Perform a 2 port SOLT calibration **including** the adapter. Note the port number on which the adapter is calibrated.
2. Select Port Matching: click **Response**, then **Cal**, then **More**, point to **Fixtures**, then click **Port Matching**
3. Under Choose Circuit Model for Matching, select the Port that the adapter was on during calibration, then select **User Defined (S2P file)**.
4. Press **Use S2P File** and navigate to the S2P file created using the Characterize Adaptor macro.
5. Check **Enable Port Matching**, then click **Close**.
6. Enable Fixturing: click **Response**, then **Cal**, then **More**, point to **Fixtures**, then **Fixturing on/OFF**.
7. **Sim** appears in the Status Bar to indicate that Fixture Simulation is ON.

De-Embedding a Fixture that has a THRU Standard

A test fixture is generally regarded as a single 'bed' in which a DUT is placed. However, for modeling purposes such as this, it is separated into two circuits: Fixture A on the input of the DUT, and Fixture B on the output.

Use this procedure to perform calibrations **WITHOUT** the test fixture while making measurements **WITH** the test fixture. A calibration is performed once **WITH** the test fixture, and then again as it wears with use and electrical performance changes. The fixture is de-embedded from subsequent measurements to match the regular calibrations that are performed without the fixture.

If you have a THRU standard for your test fixture, you can perform a full 2-port calibration in the fixture, and from that create the required S2P files for de-embedding.

1. Perform a full 2-port **CAL 1** at the connections of the PNA to the fixture as shown above. Save to **MyCalSet1**.
2. Perform a full 2-port **CAL 2** where the DUT is inserted (reference plane). Save to **MyCalSet2**.

Follow the [Create an S2P file](#) procedure, beginning with step 6, using the following selections:

1. Create #1 S2P file:
 1. For CalSet1, choose **MyCalSet1** and select **CalPort=1**
 2. For CalSet2, choose **MyCalSet2** and select **CalPort=1**
 3. Save to **FixtureA.s2p**
2. Create #2 S2P file:
 1. For CalSet1, choose **MyCalSet1** and select **CalPort=2**
 2. For CalSet2, choose **MyCalSet2** and select **CalPort=2**
 3. Save to **FixtureB.s2p**

Follow steps in [To De-embed the adapter...](#)

Perform these steps TWICE; once for each of the following S2P files:

1. For PNA Port 1, select **FixtureA.s2p**
2. For PNA Port 2, select **FixtureB.s2p**

De-Embedding a Fixture with No THRU Standard

This procedure is a slight modification of the above. Cal 2 is performed from two 1-port calcs when a THRU standard for the fixture is not readily available.

1. Perform a full 2-port **CAL 1** at the connections of the PNA to the fixture as shown above. Save to **MyCalSet1**.
2. **CAL 2** is performed using two 1 port calcs
 - **Cal2A** at the Fixture A / DUT plane. Save to **MyCalSet2A**
 - **Cal2B** at the Fixture B / DUT plane. Save to **MyCalSet2B**

Follow steps in [Create an S2P file...Step 6](#) above, except:

1. Create #1 S2P file:
 1. For CalSet1, choose **MyCalSet1** and select **CalPort=1**
 2. For CalSet2, choose **MyCalSet2A** and select **CalPort=1**

3. Save to **FixtureA.s2p**
2. Create #2 S2P file:
 1. For CalSet1, choose **MyCalSet1** and select **CalPort=2**
 2. For CalSet2, choose **MyCalSet2B** and select **CalPort=2**
 3. Save to **FixtureB.s2p**

Follow steps in [To De-embed the adapter](#) above, except:

1. For PNA Port 1, select **FixtureA.s2p**
 2. For PNA Port 2, select **FixtureB.s2p**
-

Swap Adapters Calibration Method

Although Swap Adapters calibration (also known as Swap Equal Adapters and Equal Length Adapters) method is NOT included in the PNA firmware, you can still perform this calibration.

Before we introduced the of the [Unknown Thru](#) method, the Swap Adapters method was often used as a quick alternative to the more tedious [adapter removal](#) method. In that case, you would be trading measurement accuracy for convenience. You might still want to perform Swap Adapters if you do NOT have calibration standards with the same connector type as your DUT. A procedure for this is shown below.

For any other reason, the Swap Adapters method is NOT recommended because the [Unknown Thru](#) method is more convenient AND more accurate.

There are many variations on the Swap Adapters calibration depending on the number of ports to be calibrated and whether the DUT is [insertable or non-insertable](#). However, the concepts are the same: you perform connect and measure the reflection standards (OPEN, SHORT, and LOAD) with one adapter in place, then swap for a different adapter for the Thru measurement. The adapters must have the same delay, loss, and impedance. The better the adapters match, the better measurement results. Measure the adapters with a calibrated PNA to be sure.

Procedure

The following is an example procedure showing how to perform a Swap Adapters 2-port calibration for a non-insertable DUT. The DUT has 2.92 mm connectors. You do NOT have 2.92 mm calibration standards, but you DO have 2.4 mm standards and adapters that have the same electrical properties as the 2.92 mm adapters.

Adapters A1 and A2 = test port to 2.4 mm adapters

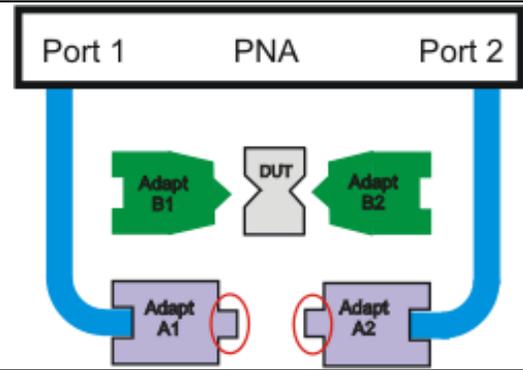

Adapters B1 and B2 = test port to 2.92 mm adapters

1. Start the Cal Wizard and select Guided (Smart) Cal. **Note:** The PNA will NOT prompt you to connect the adapters by name or when to swap the adapters.

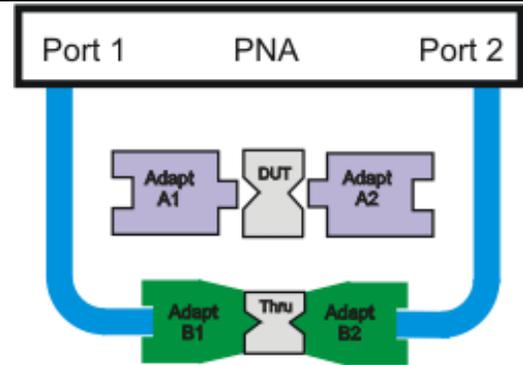

2. Specify the connector type and gender and Cal Kit of the adapter that you will be using (2.4 mm) - NOT the connector type of the DUT (2.92 mm). By specifying the connector gender, you are also specifying the Thru method (flush thru for insertable and Unknown Thru for non-insertable.) For example, when both DUT ports have female connectors, we will perform an Unknown Thru cal.

3. When prompted for reflection standards on port 1, connect the Open, Short, and Load standards to Adapter A1.

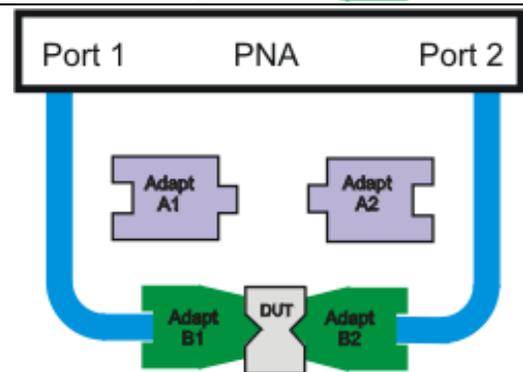

4. When prompted for reflection standards on port 2, connect the Open, Short, and Load standards to Adapter A2.

5. When prompted for a Thru connection, swap Adapter A1 and A2 for B1 and B2. Connect the Thru device. This could be any device that meets the requirements of the [Unknown Thru standard](#). In the case of a non-insertable DUT, connect B1 and B2.

6. Make DUT measurements with Adapters B1 and B2 in place.

Delta Match Calibration

A [TRL Cal](#), [QSOLT](#), or [Unknown Thru](#) Cal requires simultaneous, valid measurements of the reference receivers for the test ports being calibrated. This is not possible for both the **2-port AND 4-port** versions of the **N5231A, N5232A, and N5239A** PNA-L models.

This is also NOT possible with older N5230C 4-port models, nor for certain port pairs when an [external test set](#) is connected to ANY PNA model. With external test sets, some pairs of ports share the same receiver. In general these are the port pairs where one port is directly above the other. Therefore, TRL, QSOLT, and Unknown Thru are NOT possible in the context of a 2-port cal for any of those port pairs.

A Delta Match Calibration can be thought of as a software method used to overcome this hardware limitation. The Delta Match Calibration characterizes the [source match](#) and [load match](#) of the PNA test ports, and then calculates the differences, or "delta", of the two match terms. The delta term is combined with directivity and reflection tracking to compute a switch correction term. The switch correction error terms for each port are then used during subsequent TRL, QSOLT, or Unknown Thru calibrations.

There are several ways to acquire the Delta Match Calibration:

1. **From an existing User Cal Set** that meets the following Delta Match criteria: (Not allowed for use with [external test sets](#).)
 - Must have been performed using ECal or as a guided mechanical Cal (not Unguided).
 - Must have the same start frequency, stop frequency, and number of points as the channel being calibrated.
 - Must calibrate the ports that require the delta match terms.
2. **From a [Global Delta Match Calibration](#).**
3. **From a 'Self Delta Match'** when other portions of the calibration fully characterize all ports using SOLT with [Defined Thru](#) or [Flush Thru](#). For example, when calibrating all four ports of a PNA-L, perform a SOLT between ports 1 and 2, and also between ports 3 and 4, then Unknown Thru could be used between any combination of the remaining ports. This is allowed with an [external test set](#).

Which to use? A Self Delta Match Cal will always be used when possible. Otherwise, the Cal Wizard will use a GDM Cal when available unless you select [Choose Delta Match](#).

Global Delta Match (GDM) Cal

A GDM Cal is an "all-inclusive" calibration that can be applied whenever the delta match terms are

required.

Factory GDM Cal

Beginning with A.09.80, a factory-performed GDM calibration is installed on 2-port PNA-L models. This GDM Cal is identical to one that you would perform, except that it is likely to be more accurate than a GDM Cal that would be performed by most PNA-L customers. The factory GDM is used when a Self Delta Match Cal is not possible, just like a user-performed GDM.

- If you choose to perform a GDM Cal, it will overwrite the Factory GDM Cal.
- A backup copy of the factory GDM Cal is saved on the PNA-L at D:\calfiles\ Global Delta Match Calset.pcs.
- To restore the original file, copy it to the original location at: c:\users\public\network analyzer\UserCalSets\Global Delta Match Calset.pcs.
- If the original file is deleted, it will be restored automatically from the backup location.

User GDM Cal

When a GDM Cal is required, and your PNA-L model does NOT have a factory GDM, it must be performed at least once in order to use TRL, Unknown Thru, or QSOLT calibrations

- To attain the highest accuracy, the following settings are automatically used to perform a GDM Cal. When applied, it will likely be [interpolated](#).
 - Performed over the entire frequency range of the PNA.
 - Uses very dense data points, particularly at low frequencies.
 - Uses 100 Hz IF Bandwidth.
- The measurement conditions (cabling or adapters) of the subsequent calibration do NOT have to match the conditions under which the GDM Cal was performed. Because the GDM Cal characterizes the switch correction at each PNA port, those terms are NOT affected by differences in cabling or adapters.
- For highest accuracy when using an ECal module to perform the GDM Cal, the test ports of the ECal module should permit an [insertable connection](#) (for example 3.5mm male on one port and 3.5 mm female on the other). The frequency range of the ECal module must cover the entire frequency range. When using mechanical standards, the GDM Cal will force an insertable connection.
- Upon completion, the GDM Cal is stored as a special type of Cal Set and should be used ONLY as a Delta Match Cal. It provides Delta Match error terms, but does NOT provide all of the standard error correction terms.
- Experience has shown that a GDM Cal may require updating only once every year depending on environmental conditions and how heavily the instrument is used.

How to perform a GDM Cal

Note: 2-port PNA-L models have a Factory GDM Cal, which means it is NOT necessary to perform a GDM Cal. If you perform a GDM, the Factory GDM will be overwritten.

These selections will only be available if the PNA hardware requires a Delta Match Calibration.

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[Start Cal]**
3. then **[Global Delta Match]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Start Cal**
4. then **Global Delta Match**

Programming Commands

Delta Match Calibration. Select DUT Connectors and Cal Kit dialog box help

- Only one Cal Kit is specified and necessary to perform a Delta Match Cal. However, ALL of the PNA test ports are calibrated in a Delta Match Cal.
- You must configure ALL test ports to terminate in the specified connector / gender using the necessary adapters. The errors from adapters are removed during calibration, but when using mechanical standards, the GDM Cal will force an insertable connection.
- For highest accuracy when using an ECal module to perform the GDM Cal, the test ports of the ECal module should permit an [insertable connection](#) (for example 3.5mm male on one port and 3.5 mm female on the other). The frequency range of the ECal module must cover the entire frequency range. When using mechanical standards, the GDM Cal will force an insertable connection. **If you select an ECal module that does NOT cover the entire frequency range of the PNA** your selection will change to a different Cal Kit.

Guided Calibration Steps dialog box help

Follow the prompts to connect standards to the calibration plane.

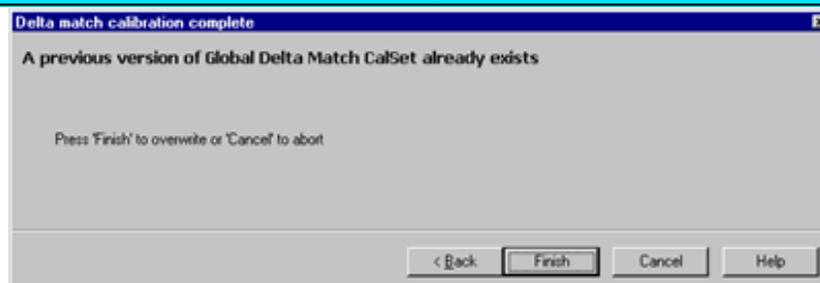

Then click **Measure**.

When all standards have been measured, click **Done** to complete the measurement steps.

THRU Connections

- ONLY 2 Thru connections are required for a 4-port Cal. This is less than the minimum number of Thrus of a standard 4-port Cal.
- GDM Cal is always performed using a **Flush Thru**, a **Known Thru**, or an **insertable ECal module**. You can NOT use an Unknown Thru in the calibration process. For highest accuracy, perform GDM Cal using an insertable ECal module and select Flush-thru as the Calibration Thru method. [Learn about Calibration Thru methods.](#)

Delta Match Calibration Complete dialog box help

Click **Finish** to store the GDM Calibration as a special type of Cal Set.

By default, it will be used when a Delta Match Calibration is required.

It can ONLY be used as a Delta Match Cal. It does NOT provide all of the standard error correction terms.

Calibration Overview

The following is discussed in this topic:

- [What Is Measurement Calibration?](#)
- [Why Is Calibration Necessary?](#)
- [Conditions Where Calibration Is Suggested](#)
- [What Is ECal?](#)

See other Calibration Topics

What Is Measurement Calibration?

Calibration removes one or more of the systematic errors using an equation called an error model. Measurement of high quality standards (for example, a short, open, load, and thru) allows the analyzer to solve for the error terms in the error model. See [Measurement Errors](#).

You can choose from different calibration types, depending on the measurement you are making and the level of accuracy you need for the measurement. See [Select a Calibration Type](#).

The accuracy of the calibrated measurements is dependent on the quality of the standards in the calibration kit and how accurately the standards are modeled (defined) in the calibration kit definition file. The calibration-kit definition file is stored in the analyzer. In order to make accurate measurements, the calibration-kit definition must match the actual calibration kit used. To learn more, see [Accurate Calibrations](#).

Calibration Wizard provides the different calibration methods used in the PNA. See [Calibration Wizard](#).

There are quick checks you can do to ensure your measurement calibration is accurate. To learn more see [Validity of a Measurement Calibration](#)

If you make your own custom-built calibration standards (for example, during in-fixture measurements), then you must characterize the calibration standards and enter the definitions into a user modified calibration-kit file. For more information on modifying calibration kit files, see [Calibration Standards](#).

Note: [Instrument Calibration](#) is ensuring the analyzer hardware is performing as specified. This is not the same as measurement calibration.

Why Is Calibration Necessary?

It is impossible to make perfect hardware that would not need any form of **error correction**. Even making the hardware good enough to eliminate the need for error correction for most devices would be extremely expensive.

The accuracy of network analysis is greatly influenced by factors external to the network analyzer. Components of the measurement setup, such as interconnecting cables and adapters, introduce variations in magnitude and **phase** that can mask the actual response of the device under test.

The best balance is to make the hardware as good as practically possible, balancing performance and cost. Calibration is then a very useful tool to improve measurement accuracy.

Conditions Where Calibration Is Suggested

Generally, you should calibrate for making a measurement under the following circumstances:

- You want the best accuracy possible.
- You are adapting to a different connector type or impedance.
- You are connecting a cable between the test device and an analyzer test port.
- You are measuring across a wide frequency span or an electrically long device.
- You are connecting an attenuator or other such device on the input or output of the test device.

If your test setup meets any of the conditions above, the following system characteristics may be affected:

- Amplitude at device input
- Frequency response accuracy
- Directivity
- Crosstalk (isolation)
- Source match
- Load match

What Is ECal

ECal is a complete solid-state calibration solution. It makes one port (Reflection), full two and three-port calibrations fast and easy. See [Using ECal](#).

- It is less prone to operator error.

- The various standards (located inside the calibration module) never wear out because they are switched with PIN-diode or FET switches.
- The calibration modules are characterized using a TRL-calibrated network analyzer.
- ECal is not as accurate as a good TRL calibration.

For information about ordering ECal modules, see [Analyzer Accessories](#) or contact your [Agilent Support Representative](#)

Measurement Errors

You can improve accuracy by knowing how errors occur and how to correct for them. This topic discusses the sources of measurement error and how to monitor error terms.

- [Drift Errors](#)
- [Random Errors](#)
- [Systematic Errors](#)
 - [3-Port Error Terms](#)
 - [4-Port Error Terms](#)
- [Monitoring Error Terms](#)

[See other Calibration Topics](#)

Drift Errors

Drift errors are due to the instrument or test-system performance changing after a calibration has been done.

Drift errors are primarily caused by thermal expansion characteristics of interconnecting cables within the test set and conversion stability of the microwave frequency converter and can be removed by re-calibrating.

The time frame over which a calibration remains accurate is dependent on the rate of drift that the test system undergoes in your test environment.

Providing a stable ambient temperature usually minimizes drift. For more information, see [Measurement Stability](#).

Random Errors

Random errors are not predictable and cannot be removed through error correction. However, there are things that can be done to minimize their impact on measurement accuracy. The following explains the three main sources of random errors.

Instrument Noise Errors

Noise is unwanted electrical disturbances generated in the components of the analyzer.

These disturbances include:

- Low level noise due to the broadband noise floor of the receiver.
- High level noise or jitter of the trace data due to the noise floor and the phase noise of the LO source inside the test set.

You can reduce noise errors by doing one or more of the following:

- Increase the [source power](#) to the device being measured - ONLY reduces low-level noise.
- [Narrow the IF bandwidth](#).
- Apply several measurement [sweep averages](#).

Switch Repeatability Errors

Mechanical RF switches are used in the analyzer to switch the source attenuator settings.

Sometimes when mechanical RF switches are activated, the contacts close differently from when they were previously activated. When this occurs, it can adversely affect the accuracy of a measurement.

You can reduce the effects of switch repeatability errors by avoiding switching attenuator settings during a critical measurement.

Connector Repeatability Errors

Connector wear causes changes in electrical performance. You can reduce connector repeatability errors by practicing good connector care methods. See [Connector Care](#).

Systematic Errors

Systematic errors are caused by imperfections in the analyzer and test setup.

- They are repeatable (and therefore predictable), and are assumed to be time invariant.
- They can be characterized during the calibration process and mathematically reduced during measurements.
- They are never completely removed. There are always some residual errors due to limitations in the calibration process. The residual (after measurement calibration) systematic errors result from:
 - imperfections in the calibration standards
 - connector interface
 - interconnecting cables

- instrumentation

Reflection measurements generate the following three systematic errors:

- [Directivity](#)
- [Source Match](#)
- [Frequency Response Reflection Tracking](#)

Transmission measurements generate the following three systematic errors:

- [Isolation](#)
- [Load Match](#)
- [Frequency Response Transmission Tracking](#)

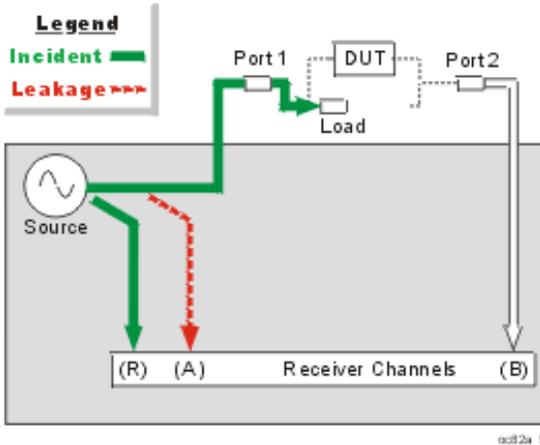

Notes about the following Systematic Error descriptions:

- The figures for the following six systematic errors show the relevant hardware configured for a forward measurement. For reverse measurements, internal switching in the analyzer makes Port 2 the source and Port 1 the receiver. 'A' becomes the transmitted receiver, 'B' becomes the reflected receiver, and 'R2' becomes the reference receiver. These six systematic errors, times two directions, results in 12 systematic errors for a two port device.
- For simplicity, it may be stated that ONE standard is used to determine each systematic error. In reality, ALL standards are used to determine ALL of the systematic errors.
- The following describes an SOLT calibration. This does not apply to TRL, or other types of calibration.

Directivity Error

All network analyzers make reflection measurements using directional couplers or bridges.

With an ideal coupler, only the reflected signal from the DUT appears at the 'A' receiver. In reality, a small amount of incident signal leaks through the forward path of the coupler and into the 'A' receiver. This leakage path, and any other path that allows energy to arrive at the 'A' receiver without reflecting off the DUT, contributes to directivity error.

How the Analyzer Measures and Reduces Directivity Error.

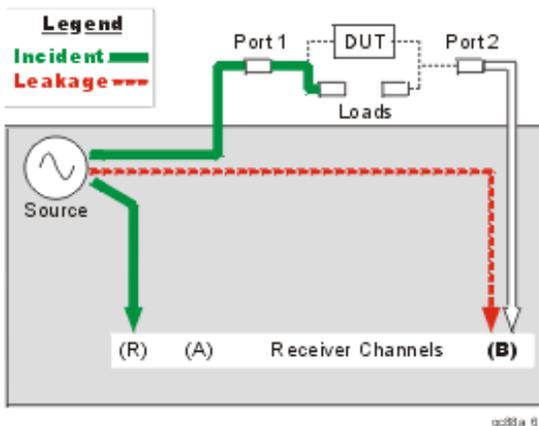

1. During calibration, a load standard is connected to Port 1. We assume no reflections from the **load**.
2. The signal measured at the 'A' receiver results from the incident signal leakage through the coupler and other paths.
3. Directivity error is mathematically removed from subsequent reflection measurements.

Isolation Error

Ideally, only signal transmitted through the DUT is measured at the 'B' receiver.

In reality, a small amount of signal leaks into the 'B' receiver through various paths in the analyzer.

The signal leakage, also known as crosstalk, is isolation error which can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Isolation Error

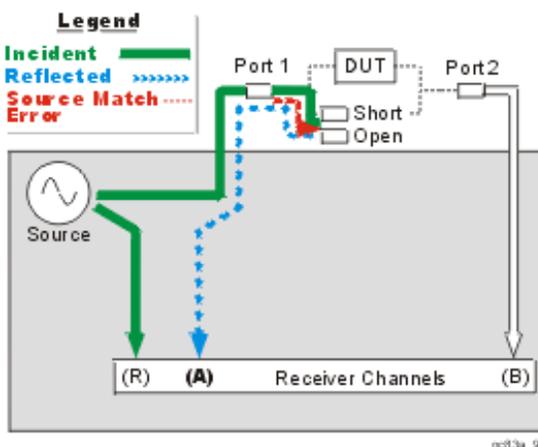

1. During calibration, load standards are connected to both Port 1 and Port 2.
2. The signal measured at the 'B' receiver is leakage through various paths in the analyzer.
3. This isolation error is mathematically removed from subsequent transmission measurements.

Source Match Error

Ideally in reflection measurements, all of the signal that is reflected off of the DUT is measured at the 'A' receiver.

In reality, some of the signal reflects off the DUT, and multiple internal reflections occur between the analyzer and the DUT. These reflections combine with the incident signal and are measured at the 'A' receiver, but not at the 'R' receiver.

This measurement error is called source match error which can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Source Match Error

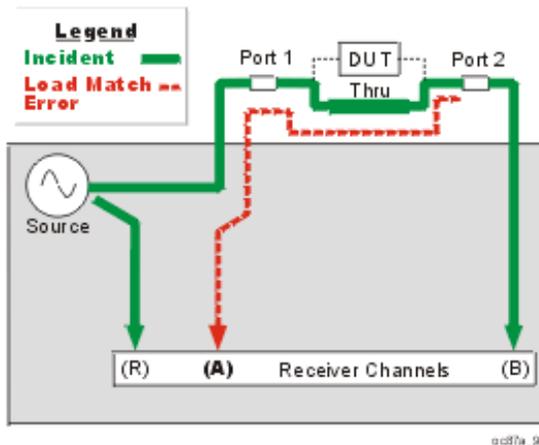

1. During calibration, all reflection standards are connected to Port 1. Known reflections from the standards are measured at the 'A' receiver.
2. Complex math is used to calculate source match error.
3. Source match error is mathematically removed from subsequent reflection and transmission measurements.

Load Match Error

Ideally in transmission measurements, an incident signal is transmitted through the DUT and is measured at the 'B' receiver.

In reality, some of the signal is reflected off of Port 2 and other components and is not measured at the 'B' receiver.

This measurement error is called load match error which can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Load Match Error

1. The Port 1 and Port 2 test connectors are mated together for a perfect zero-length thru connection. If this is not possible, a [characterized thru adapter](#) is inserted. This allows a known amount of incident signal at Port 2.
2. The signal measured at the 'A' receiver is reflection signal off of Port 2
3. The resulting load match error is mathematically removed from subsequent transmission and reflection measurements.

Frequency Response Reflection Tracking Error

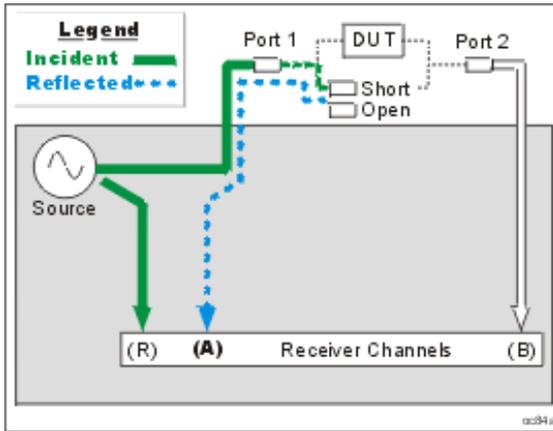

Reflection measurements are made by comparing signal at the 'A' receiver to signal at the 'R1' receiver. This is called a ratio measurement or "A over R1" (A/R1).

For ideal reflection measurements, the frequency response of the 'A' and 'R1' receivers would be identical.

In reality, they are not, causing a frequency response reflection tracking error. This is the vector sum of all test variations in which magnitude and phase change as a function of frequency. This includes variations contributed by:

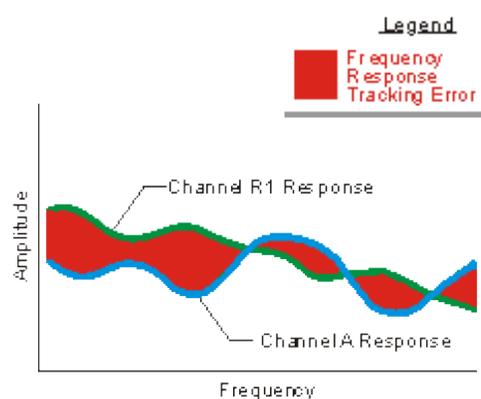

- signal-separation devices
- test cables
- adapters
- variations between the reference and test signal paths

Frequency response reflection tracking error can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Frequency Response Reflection Tracking Error.

1. During calibration, all reflection standards are used to determine reflection tracking.
2. The average 'A' receiver response is compared with the 'R1' receiver response.
3. Complex math is used to calculate Frequency Response Reflection Tracking Error (see the following diagram). This frequency response reflection tracking error is mathematically removed from subsequent DUT measurements.

Note: In reflection response calibrations, only a single calibration standard is measured (open or short) and thus only its contribution to the **error correction** is used.

Frequency Response Transmission Tracking Error

Transmission measurements are made by comparing signal at the 'B' receiver to signal at the 'R1' receiver. This is called a ratio measurement or "B over R1" (B/R1).

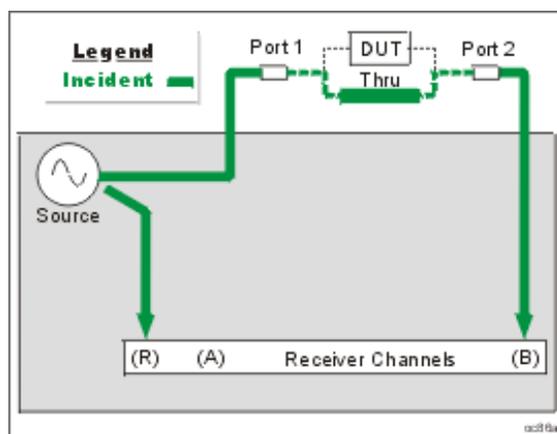

For ideal transmission measurements, the frequency response of the 'B' and 'R1' receivers would be identical.

In reality, they are not, causing a frequency response transmission tracking error. This is the vector sum

of all test variations in which magnitude and phase change as a function of frequency. This includes variations contributed by:

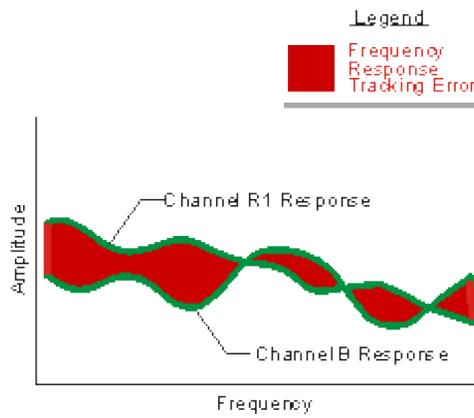

- signal-separation devices
- test cables
- adapters
- variations between the reference and test signal paths

Frequency response transmission tracking error can be characterized and reduced by the analyzer.

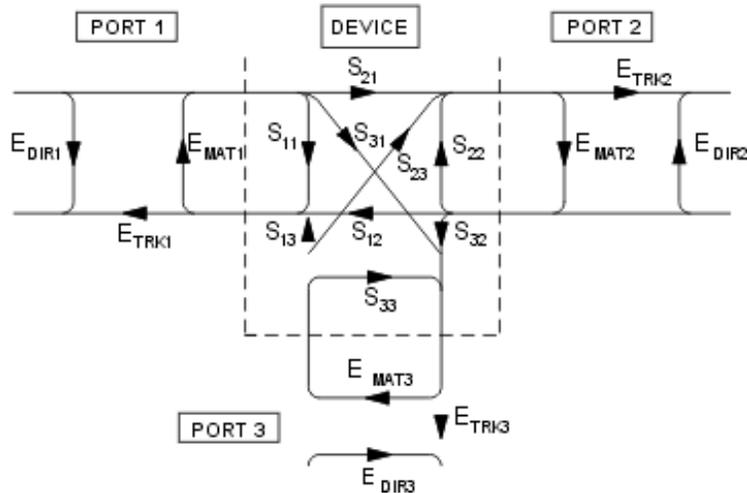

How the Analyzer Measures and Reduces Frequency Response Transmission Tracking Error.

1. During calibration, the Port 1 and Port 2 test connectors are mated together for a perfect zero-length thru connection. If this is not possible, a [characterized thru adapter](#) is inserted. This allows a known amount of incident signal to reach Port 2.
2. Measurements are made at the 'B' and 'R1' receivers.
3. Complex math is used to calculate Frequency Response Transmission Tracking Error (see the following diagram). This frequency response transmission tracking error is mathematically removed from subsequent DUT measurements.

3-Port Error Terms

The following flow diagram displays the 3-port error term model:

where:

E = error term

DIR = Directivity

MAT = Forward Source Match and Reverse Load Match

TRK = Forward Reflection Tracking and Reverse Transmission Tracking

4-Port error terms

A full 4-port calibration requires the following terms:

[Learn about the port numbering convention](#) for error terms.

		Source Port			
		1	2	3	4
R e c e i v e	1	DIR 1,1 RTRK 1,1 SRM 1,1	LDM 1,2 TTRK 1,2 XTLK 1,2	LDM 1,3 TTRK 1,3 XTLK 1,3	LDM 1,4 TTRK 1,4 XTLK 1,4
	2	LDM 2,1 TTRK 2,1 XTLK 2,1	DIR 2,2 RTRK 2,2 SRM 2,2	LDM 2,3 TTRK 2,3 XTLK 2,3	LDM 2,4 TTRK 2,4 XTLK 2,4
	3	LDM 3,1 TTRK 3,1 XTLK 3,1	LDM 3,2 TTRK 3,2 XTLK 3,2	DIR 3,3 RTRK 3,3 SRM 3,3	LDM 3,4 TTRK 3,4 XTLK 3,4
	4	LDM 4,1 TTRK 4,1 XTLK 4,1	LDM 4,2 TTRK 4,2 XTLK 4,2	LDM 4,3 TTRK 4,3 XTLK 4,3	DIR 4,4 RTRK 4,4 SRM 4,4

Reflection terms

- DIR: Directivity

- RTRK: Reflection Tracking
- SRM: Source Match

Transmission terms

- LDM: Load Match
- TTRK: Transmission Tracking
- XTLK: Cross Talk

How can we measure only 3 THRU connections?

On a 4-port PNA, a full 4-port cal can be performed while measuring only 3 THRU connections. Measuring more than 3 THRU connections will give higher accuracy.

By measuring all of the reflection terms, and 3 transmission THRU connections, there is adequate information available to calculate the remaining transmission terms. The following is a high level explanation of the concept. The actual calculations are much more complex.

To simplify, let's substitute letters (A,B,C,D) for port numbers from the diagram above so that they can be combined without confusion. Also for simplicity, let's assume that the source match and directivity errors are zero.

	A	B	C	D
A	AA	AB	AC	AD
B	BA	BB	BC	BD
C	CA	CB	CC	CD
D	DA	DB	DC	DD

- The reflection errors are all measured (AA, BB, CC, DD).
- Lets assume we measure a THRU between ports AB, AC, AD. The reverse direction for these THRU's are also measured at the same time (BA, CA, DA).
- The terms left to calculate are BC, CB, BD, DB, CD, DC.

The following shows how the BC term is calculated from BA and AC:

$$\frac{BA * AC}{AA} = \frac{B * \cancel{AA} * C}{\cancel{AA}} = BC$$

Similarly:

- CB is calculated from CA and AB
- BD is calculated from BA and AD
- DB is calculated from AB and DA
- CD is calculated from CA and AD
- DC is calculated from DA and AC

Monitoring Error Terms using Cal Set Viewer

You can use **Cal Set Viewer** to monitor the measured data and the calculated error term. This will help to determine the health of your PNA and the accuracy of your measurements.

By printing or saving the error terms, you can periodically compare current error terms with previously recorded error terms that have been generated by the same PNA, measurement setup, and calibration kit. If previously generated values are not available, refer to Typical Error Term Data in Appendix A, "Error Terms", of the Service Guide.

Note: The service guide for your PNA is available at <http://www.agilent.com/find/pna>
It is also on the CDROM that was shipped with your PNA.

- A stable system should generate repeatable error terms over about six months.
- A sudden shift in error terms over the same frequency range, power, and receiver settings, may indicate the need for troubleshooting system components. For information on troubleshooting error terms, see Appendix A , "Error Terms", of the Service Guide.
- A subtle, long-term shift in error terms often reflects drift or connector and cable wear. The cure is often as simple as cleaning and gauging connectors or inspecting cables.

Viewing Cal Set Data

- Existing measurement traces are unaffected by the Cal Set Viewer.
- The Cal Set data trace is presented in the highest unused channel number (usually 32) in the active window.
- The Cal Set data trace is labeled as S11 in the status bar regardless of the type of error term or standard.
- Only one Cal Set error term or standard data can be viewed at a time. However, a data trace can be stored into memory and then compared to other data traces.

How to access Cal Set Viewer

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[Manage Cals]**
3. then **[Cal Set Viewer]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Manage Cals**
4. then **Cal Set Viewer**

Programming Commands

How to use Cal Set Viewer

1. Use the down arrow to select a Cal Set. Then click either:
 - **Error Terms** - calculated data.
 - **Standards** - the raw measurement data of the Standard. **ONLY** available with Unguided Cal (not ECal or Guided Cal).
2. Use the down arrow to select an error term or standard to view.
3. Select the **Enable** check box to view the data on the PNA screen.

Port numbering convention for error terms is the same as for S-Parameters:

E Term (Receiver, Source) with the following exceptions:

- Load Match (2,1) - The match of port 2 which is measured by making an S11 measurement.
 - Load Match (1,2) - The match of port 1 which is measured by making an S22 measurement.
 - Transmission Tracking (2,1) - The port 2 receiver relative to the port 1 reference. (source=port 1).
 - Transmission Tracking (1,2) - The port 1 receiver relative to the port 2 reference. (source=port 2).
 - And so forth for multipoint calibrations.
-

Accurate Measurement Calibrations

Calibration accuracy is affected by the type of calibration, quality of the calibration standards, and the care with which the calibration is performed. This section provides additional information about how to make accurate calibrations.

- [Measurement Reference Plane](#)
- [Effects of Using Wrong Calibration Standards](#)
- [Data-based versus Polynomial Calibration Kits](#)
- [Accuracy Level of Interpolated Measurement](#)
- [Effects of Power Level](#)
- [Using Port Extensions](#)
- [Isolation Portion of 2-Port Calibration](#)
- [Choosing a Thru Method](#)

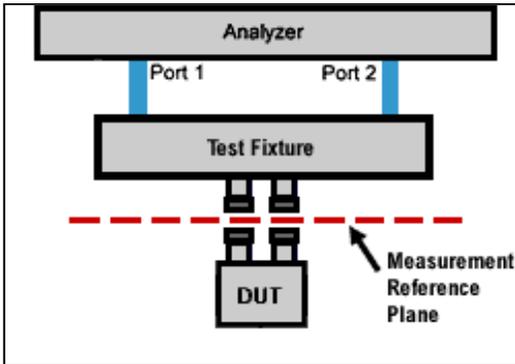

Learn how to [determine the validity of your calibration](#).

[See other Calibration Topics](#)

Measurement Reference Plane

Most measurement setups will NOT allow you to connect a device under test (DUT) directly to the PNA front panel test ports. More likely, you would connect your device to test fixtures, adapters, or cables that are connected to the PNA.

A calibration takes place at the points where calibration standards are connected during the calibration process. This is called the measurement reference plane (see graphic). For the highest measurement accuracy, make the calibration reference plane the place where your DUT is connected. When this occurs, the errors associated with the test setup (cables, test fixtures, and adapters used between the analyzer ports and the reference plane) are measured and removed in the calibration process.

Effects of Using Wrong Calibration Standards

Normally, a calibration is performed using a calibration kit that contains standards with connectors of the same type and sex as your DUT.

However, your calibration kit may not always have the same connector type and gender as your device. For example, suppose your device has 3.5mm connectors, but you have a Type-N calibration kit. If you use an adapter to connect the Type-N standards to the 3.5mm test port, then the adapter becomes part of the calibration and NOT part of the test setup. This will result in significant errors in your reflection measurements.

Data-based versus Polynomial Calibration Kits

The [Select DUT Connectors and Cal Kits](#) dialog box offers a data-based model and a polynomial model for the newest high-frequency cal kits. See PNA Accessories. The data-based models provide higher accuracy for describing calibration standards than the polynomial models. It is RECOMMENDED that the data-based model be used if the most accurate results are desired.

	Data-Based Model	Polynomial Model
How accurate is the model?	Provides highest calibration accuracy. Eliminates the errors that can be the result of polynomial model approximations.	Provides high calibration accuracy.
How does the model define calibration standards?	Uses S-Parameter measurements.	Uses traditional four-term polynomial calibration standard modeling parameters.
How do I manually edit the definitions of the calibration standards when using the model?	Use the Advanced Modify Cal Kit function.	Use the Advanced Modify Cal Kit function.

How do I use the Calibration Wizard with the model?	Use only the SmartCal (Guided) Calibration method.	Use the SmartCal (Guided) or the Unguided Mechanical Calibration methods.
--	--	---

Learn about the [“Expanded Math”](#) feature.

Effects of Power Level

To attain the most accurate error correction, do NOT change the power level after a calibration is performed. However, when changing power within the same attenuator range at which the measurement calibration was performed, S-parameter measurements can be made with only a small degradation of accuracy. If a different attenuator range is selected, the accuracy of error correction is further degraded.

To check the accuracy of a calibration, see [Validity of a Calibration](#).

Using Port Extensions

Use the port extensions feature after calibration to compensate for phase shift of an extended measurement reference plane due to additions such as cables, adapters, or fixtures.

Port extensions is the simplest method to compensate for phase shift, mismatch, and loss of the path between the calibration reference plane and the DUT.

Learn how to apply [port extensions](#).

Learn about [characterizing a test fixture](#).

Isolation Portion of 2-Port Calibration

The isolation portion of a calibration corrects for crosstalk, the signal leakage between test ports when no device is present. When performing an UNGUIDED 2-port calibration, you have the option of omitting the isolation portion of the calibration.

Note: Isolation can be performed on a Smart (Guided) Calibration ONLY remotely using SCPI or COM.

The uncorrected isolation between the test ports of the PNA is exceptional (typically >100dB). Therefore, you should only perform the Isolation portion of a 2-port calibration when you require isolation that is better than 100dB. Perform an isolation calibration when you are testing a device with high insertion loss, such as some filter stopbands or a switch in the open position.

The isolation calibration can add noise to the error model when the measurement is very close to the noise floor of the analyzer. To improve measurement accuracy, set a narrow IF Bandwidth.

How to perform an isolation calibration

Isolation is measured when the Load standards are connected to the PNA test ports. For best accuracy, connect Load standards to BOTH test ports each time you are prompted to connect a load standard. If two Loads are not available, connect the untested PNA port to any device that will present a good match.

Choosing a Thru Method

When calibrating for a non-insertable device, you must choose a method to calibrate for the THRU error terms. This can have a significant effect on measurement accuracy. Learn more about [choosing a thru method](#).

Last Modified:

18-Feb-2011 Removed popups and added remotely to Isolation note.

Calibration Thru Methods

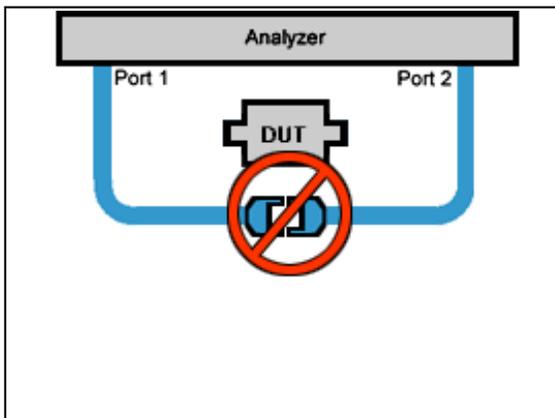

- [What is a Non-Insertable Device](#)
- [Choosing a Thru Method](#)
- [Flush Thru](#)
- [Adapter Removal](#)
- [Swap Adapters](#) (separate topic)
- [Defined Thru](#)
- [Unknown Thru](#)
- [ECal Thru Method Choices](#)

Other Cal Topics

What is a Non-Insertable Device

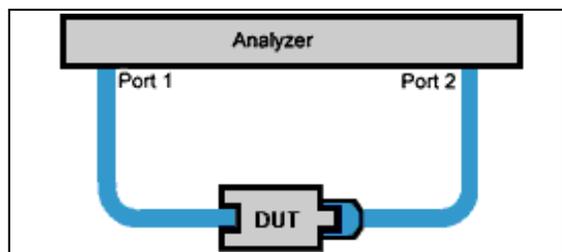

To understand the Thru method choices, you must first understand what is meant by "Non-Insertable device". These definitions also apply to ECal modules. Substitute "ECal module" for "device". Then see [ECal Thru Method Choices](#).

A **non-insertable device** is one whose connectors could NOT mate together. They either do not have the same type of connector or they have the same gender. This also means that the test port cables would not mate together, as in the following diagram.

An **insertable** device is one whose connectors could mate together. They have the same type of

connector and opposite, or no, gender. This also means that the test port cables would mate together, as in the following diagram.

Choosing a Thru Method of Calibration

The Thru method is selected from the Cal Wizard. Select the **Modify** checkbox in the [Select DUT Connectors and Cal Kits](#) dialog box.

Notes:

For ECal, the following choices have different meanings. See [THRU methods for ECal](#).

For 4-port calibration, see [How can we measure only 3 THRU connections?](#)

Choice for Insertable Devices: FLUSH Thru (also known as Zero-length Thru)

When calibrating for an insertable device, the test ports at your measurement reference plane connect directly together. This is called a zero-length THRU, or Flush THRU meaning that the THRU standard has zero-length: no delay, no loss, no capacitance, and no inductance. Your calibration kit may not have a physical THRU standard because it is assumed you have an insertable device and will be using a zero-length THRU.

Choices for Non-Insertable Devices

The following methods calibrate for a non-insertable device:

- [Adapter Removal](#) Accurate, but least convenient.
- [Defined Thru](#)
- [Unknown Thru Cal](#) Preferred method.

Adapter Removal Calibration

This method is potentially very accurate. However, it requires many connections which increases the chances of inaccurate data.

Two full 2-port calibrations are performed: one with the adapter connected at port 1, and the other with the adapter connected to port 2. The result of the two calibrations is a single full 2-port calibration that includes accurate characterization and removal of the mismatch caused by the adapter.

Performing an Adapter Removal Cal requires:

- a THRU adapter with connectors that match those on the DUT.
- calibration standards for both DUT connectors.

To select Adapter Removal during a SmartCal, select the **Modify** checkbox in the [Select DUT Connectors and Cal Kits](#) dialog box. The Cal Wizard will guide you through the steps.

Learn how to perform an [Adapter Removal Cal using ECal](#).

Defined Thru (also known as **Known Thru**, **Cal Kit Thru**, **ECal Thru**, **Characterized Thru**)

Defined Thru uses the THRU definition that is stored in the Cal Kit file or ECal module. The THRU standard may have worn over time, making it not as accurate as when it was new. Defined Thru is usually more accurate than Adapter Removal, but not as accurate as [Unknown Thru](#) method.

Notes

- If performing an ECal, this is the THRU standard in the ECal Module.
- If Defined Thru appears as a potential THRU method in the [SmartCal Wizard](#), this means that there is a defined THRU standard in the selected Cal Kit. This could be a [Zero-length Thru](#). The SmartCal Wizard will prompt you to connect the required standard when appropriate.

To define a THRU standard in a Cal Kit (not ECal module):

1. From the PNA Menu, click Calibration, [Advanced Modify Cal Kits](#).
2. Select the Cal Kit
3. Click Edit Kit
4. Click Add
5. Select THRU
6. Complete the dialog box.

The next time you perform a Guided Cal, this Defined THRU standard will be available if the DUT connector types match the THRU standard.

Unknown Thru Cal

Unknown Thru Cal is the **preferred** THRU method of calibrating the PNA to measure a non-insertable device.

The Unknown Thru calibration is also known as **Short-Open-Load-Reciprocal Thru** (SOLR) calibration.

- Very easy to perform.
- Better accuracy than [Defined Thru](#) and usually better than [Adapter Removal](#).
- Does not rely on existing standard definitions that may no longer be accurate.
- Causes minimal cable movement if the THRU standard has the same footprint as the DUT. In fact, the DUT can often BE the THRU standard.
- NOT recommended when there is 40 dB or more of combined loss in the Unknown Thru and calibration path. This would NOT allow enough signal to accurately measure at the receiver.

About the Unknown Thru Process

SmartCal guides you through the process. Although the following process describes ports 1 and 2, Unknown Thru can be performed on any two ports when using a multiport PNA.

1. Perform 1-port cal on port 1.
2. Perform 1-port cal on port 2.
3. Connect Unknown Thru between ports 1 and 2.
4. Measure Unknown Thru.
5. [Confirm Estimated Delay](#). This estimate may be wrong if there are too few frequency points over the given frequency span. You can measure the delay value independently and enter that value in the dialog box.

The Unknown Thru Standard

- Can have up to 40 dB of combined loss in the Unknown Thru and calibration path.
- Must be reciprocal: $S_{21}=S_{12}$.
- Must know the phase response to within 1/4 wavelength (see step 5 above).
- Can be the DUT if it meets these conditions.

Unknown Thru Limitations

- Unknown Thru is NOT supported during a TRL calibration.

- Beginning with PNA code release 5.25, Unknown Thru CAN be performed using a 4-port PNA-L that does NOT have a [reference receiver for each test port](#). However, a [Delta Match Calibration](#) is usually required before the Unknown Thru is measured.
- Unknown Thru is NOT supported on E8801A, E8802A, and E8803A.

ECal Thru Method Choices

When the ECal module connectors exactly match the DUT connectors, choose from the following THRU methods:

ECal Thru as Unknown Thru [Learn more about Unknown Thru.](#)

- Measures the THRU state of the ECal module as an Unknown Thru.
- The default method when the ECal module connectors match the DUT.
- Very accurate and easy.
- May require a [Delta Match Cal.](#)

Flush Thru (zero-length Thru) [Learn more about Flush Thru](#)

- Requires an insertable ECal module / DUT.
- Remove the ECal module and connect the two reference planes directly together for a zero-length thru.
- Accurate, but not as easy as 'ECal Thru as Unknown Thru'.

ECal (Defined Thru)

- Measures the THRU state of the ECal module.
- Very easy, but not as accurate as 'ECal Thru as Unknown Thru'

Unknown Thru

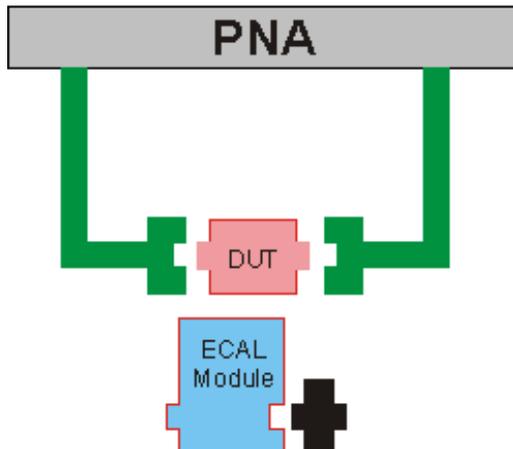

- Remove the ECal module.
- Then connect a Thru adapter to be measured as Unknown Thru.
- May require a [Delta Match Cal.](#)

When the ECal module connectors do NOT exactly match the DUT connectors, choose from the following two methods:

Adapter Removal

- Can be used with ECal when your DUT is [NON-insertable](#). However, the ECal module MUST be insertable, and the adapter connectors must exactly match the connectors of the DUT as in the following diagram.

Note: With PNA release 4.8, adapter removal now performs 2-port measurements on both sides of the adapter. It previously performed 2-port measurements on one side and 1-port measurements on the other. This improves the accuracy of the adapter removal calibration.

ECal User Characterization

In cases when adapter removal cannot be performed, ECal [User Characterization](#) is ALWAYS possible if you have the right adapters. A User Characterization is performed once and stored in the ECal module. However, accuracy is compromised every time you remove, then reconnect, the adapter with the ECal module.

Validity of a Calibration

This section helps you determine if your calibration is valid and how the analyzer displays correction level information for your measurement.

- [Frequency Response of Calibration Standards](#)
- [Validating a Calibration](#)
- [Quick Check](#)
- [ECal Confidence Check](#)
- [Verification Kit](#)

See other Calibration Topics

Frequency Response of Calibration Standards

In order for the response of a calibration standard to show as a dot on the [smith chart display format](#), it must have no phase delay with respect to frequency. The only standards that exhibit such "perfect" response are the following:

- 7-mm short (with no offset)
- Type-N male short (with no offset)

There are two reasons why other types of calibration standards show phase delay after calibration:

1. The reference plane of the standard is electrically offset from the mating plane of the test port. Such devices exhibit the properties of a small length of transmission line, including a certain amount of phase shift.
2. The standard is an open termination, which by definition exhibits a certain amount of fringe capacitance and therefore phase shift. Open terminations which are offset from the mating plane will exhibit a phase shift due to the offset in addition to the phase shift caused by the fringe capacitance.

The most important point to remember is that all standards are measured in order to remove [systematic errors](#) from subsequent device measurements. As a result, if calibration standards with delay and fringe capacitance are measured as a device after a calibration, they will NOT appear to be "perfect". This is an indication that your analyzer **is calibrated accurately and working properly**.

Validating a Calibration

At the completion of a calibration or selection of a stored Cal Set, validation can accomplish the following:

Improve Measurement Accuracy – Once a measurement calibration has been performed, its performance should be checked before making device measurements. There are several sources of error that can invalidate a calibration: bad cables, dirty or worn calibration standards that no longer behave like the modeled standards, and operator error.

Verify Accuracy of Interpolation – You should validate the calibration if you are testing a device and the measurements are uncertain because of interpolation. For more information see [Interpolation Accuracy](#).

Verify Accuracy of Cal Standards – To check accuracy, a device with a known magnitude and phase response should be measured.

Quick Check

For this test, all you need are a few calibration standards. The device used should not be one of the calibration standards; a measurement of one of these standards is merely a measure of repeatability.

The following reflection and transmission Quick Check tests can be applied to all test ports.

To verify reflection measurements, perform the following steps:

1. Connect either an OPEN or SHORT standard to port 1. The magnitude of S11 should be close to 0 dB (within a few tenths of a dB).
2. Connect a load calibration standard to port 1. The magnitude of S11 should be less than the specified calibrated directivity of the analyzer (typically less than -30 dB).

To verify transmission measurements:

1. Connect a THRU cable (or known device representative of your measurement) from port 1 to port 2. Verify the loss characteristics are equivalent to the known performance of the cable or device.
2. To verify S21 isolation, connect two loads: one on port 1 and one on port 2. Measure the magnitude of S21 and verify that it is less than the specified isolation (typically less than -80 dB).

Note: To get a more accurate range of expected values for these measurements, consult the analyzer's specifications.

ECal Confidence Check

ECal Confidence Check is a method to check the accuracy of a calibration performed with mechanical standards or an ECal module. The confidence check allows you to measure an impedance state in the ECal module (called the confidence state), and compare it with factory measured data stored in the module.

In order for this test to be valid, the test ports of the ECal module must connect directly to the calibration reference plane (without adapters).

Note: In the **N469x** series of 2-port ECal modules, from the module minimum frequency up to approximately 2 GHz, the confidence state has a very high amount of transmission loss. In this frequency range, calibrated measurements of transmission S-parameters for the confidence state may vary much more than expected from the Agilent-characterized data in the measurement memory trace. When comparing the measurement trace and memory trace you, ignore the data for frequencies up to 2 GHz.

How to Perform ECal Confidence Check:

1. Connect ECal module to the analyzer with the USB cable. See [Connect ECal Module to the PNA](#). **Note:** Terminate any unused ECAL ports with a 50 ohm load.
2. Allow the module to warm up for 15 minutes or until the module indicates **READY**.
3. Do one of the following to start ECal Confidence Check

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[More]**
3. then **[ECal]**
4. then **[Confidence Check]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **More**
4. then **ECal**
5. then **Confidence Check**

Programming Commands

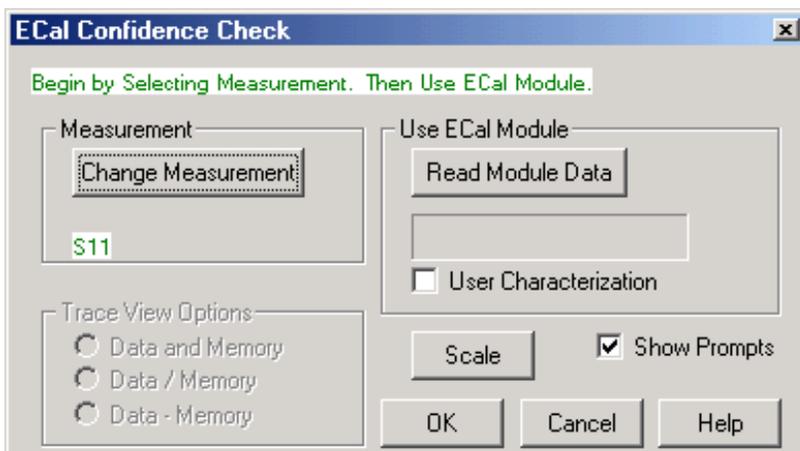

On the following [ECal Confidence Check dialog box](#):

4. Click **Read Module Data**. The following occurs:
 - ECal module is set to "confidence state".
 - PNA reads and displays stored data.
 - PNA measures and displays "confidence state".

5. To view a different parameter, select **Change Measurement** and select the check box for the desired parameter. The default is the active channel parameter.
6. Select the viewing option in the Trace View Options block.
7. Compare the stored and measured data for each measurement parameter.

Notes:

- After exiting ECal Confidence Check, the ECal module remains in the same impedance state and the factory (or user-characterized) data is still stored in the memory trace. Therefore, you can save both the data and memory trace as a *.csv files and import them to a spreadsheet. [Learn how.](#)
- If the two traces show excessive difference, there may be a loose or dirty connection at the test ports or damage to the test cables. Carefully inspect the cables and connections. Then clean and gage each connector, and re-calibrate if needed.
- The User Characterization setting selects the user-characterization data instead of the factory characterization data (available when a User-Characterization is stored in the ECal module).

ECal Confidence Check dialog box help

Compares the accuracy of corrected (calibrated) data with stored data in the ECal module. For the check to be valid, the module test ports must connect directly to the calibration reference plane (without an adapter). [Learn more about ECal Confidence Check.](#)

Measurement

Change Measurement Opens the Measure dialog box.

Use ECal Module

Read Module Data

- Copies stored data from the ECal module to Memory.
- Changes state of ECal module to confidence state.
- Measures and displays confidence state and Memory trace.

User Characterization Selects the user-characterization data (stored in the module) instead of the factory characterization data (available when a User-Characterization is stored in the ECal module).

Scale Opens the Scale dialog box.

Show Prompts Check to show a reminder for the connection (default).

Trace View Options

Data and Memory Trace Displays current measurement data and Memory trace.

Data / Memory Performs an operation where the current measurement data is divided by the data in memory.

Data + Memory Performs an operation where the current measurement data is added to the data in memory.

Verification Kit

Measuring known devices, other than calibration standards, is a straightforward way of verifying that the network analyzer system is operating properly. Verification kits use accurately known verification standards with well-defined magnitude and phase response. These kits include precision airlines, mismatch airlines, and precision fixed attenuators. Traceable measurement data is shipped with each kit on disk and verification kits may be re-certified by Agilent.

See [Analyzer Accessories](#) for a list of Agilent verification kits.

Calibration Standards

This following section explains the general principles and terms regarding calibration kit files. To learn **how** to modify calibration kit files, See [Modify Calibration Kits](#).

- [About Calibration Kits](#)
- [Calibration Standards](#)
- [Standard Type](#)
- [Standard Definitions](#)
- [Class Assignments](#)

See other Calibration Topics

About Calibration Kits

A calibration kit is a set of physical devices called standards. Each standard has a precisely known or predictable magnitude and phase response as a function of frequency.

In order to calibrate the analyzer using the standards in a calibration kit, the response of each standard must be mathematically defined and then organized into standard classes that correspond to the error models used by the analyzer.

To be able to use a particular calibration kit, the known characteristics from each standard in the kit must be stored into analyzer memory. This is done for you with the PNA. All Agilent Cal Kits containing standard definitions are stored in the PNA. For a list of Agilent calibration kits, see [Analyzer Accessories](#).

Calibration Standards

Calibration standards provide the reference for error-corrected measurements in the network analyzer. Each standard has a precisely known definition that includes electrical delay, impedance, and loss. The analyzer stores these definitions and uses them to calculate error correction terms.

During measurement calibration, the analyzer measures standards and mathematically compares the results with "ideal models" of those standards. The differences are separated into error terms that are later removed from device measurements during error correction. [See Systematic Errors](#).

Standard Type

A standard type is one of four basic types that define the form or structure of the model to be used with that standard. The following are the four basic standard types:

Standard	Terminal Impedance
SHORT	zero ohms
OPEN	infinite ohms
LOAD	system impedance, Z_0
THRU/LINE	no terminal impedance

Learn about other Calibration Standards:

- [Data-Based Standard](#)
- [Sliding Load](#)
- [Offset Load](#)
- [Arbitrary Impedance Load](#)

Standard Definitions

Standard definitions describe the electrical characteristics of the standards and the frequencies they will be used. Standard definitions can be viewed from the [Advanced Modify Cal Kit](#) menu selection.

Standard definitions include:

- **Minimum Frequency** Specifies the minimum frequency the standard is used for calibration.
- **Maximum Frequency** Specifies the maximum frequency the standard is used for calibration.
- **Z_0** Specifies the characteristic impedance of the standard (not the system characteristic impedance or the terminal impedance of the standard).
- **Delay** Specifies a uniform length of transmission line between the standard being defined and the actual calibration plane.
- **Type** Specifies type of standard (SHORT, OPEN, THRU/LINE, LOAD, ARBITRARY).
- **Loss** Specifies energy loss, due to skin effect, along a one-way length of coaxial cable.

Loss model equation:

- The value of loss is entered as ohms/second at 1 GHz.
- To compute the loss of the standard, measure the delay in seconds and the loss in dB at 1 GHz. Then use the following formula:

$$\text{Loss} \left(\frac{\Omega}{S} \right) = \frac{\text{loss (dB)} \times Z_0(\Omega)}{4.3429(\text{dB}) \times \text{delay(s)}}$$

Capacitance model equation:

C0, C1, C2, C3. Specifies the fringing capacitance for the open standard.

- $C = (C0) + (C1 \times F) + (C2 \times F^2) + (C3 \times F^3)$
- (F is the measurement frequency).
- The terms in the equation are defined when specifying the open as follows:
 - C0 term is the constant term of the third-order polynomial and is expressed in Farads.
 - C1 term is expressed in F/Hz (Farads/Hz).
 - C2 term is expressed in F/Hz².
 - C3 term is expressed in F/Hz³.

Inductance model equation:

L0, L1, L2, L3. Specifies the residual inductance for the short standard.

- $L = (L0) + (L1 \times F) + (L2 \times F^2) + (L3 \times F^3)$
- (F is the measurement frequency).
- The terms in the equation are defined when specifying the short as follows:
 - L0 term is the constant term of the third-order polynomial and is expressed in Henries.
 - L1 term is expressed in H/Hz (Henries/Hz)
 - L2 term is expressed in H/Hz².
 - L3 term is expressed in H/Hz³.

Class Assignments

Once a standard is characterized, it must be assigned to a standard "class". A standard class is a group of standards that are organized according to the calibration of the PNA error model.

The number of classes needed for a particular calibration type is equal to the number of error terms being corrected.

A class often consists of a single standard, but may be composed of multiple standards. These may be

required for accuracy or to cover a wide frequency range.

Example: A response calibration requires only one class, and the standards for that class may include an OPEN, or SHORT, or THRU. A 1-port calibration requires three classes. A 2-port calibration requires 10 classes, not including two for isolation.

The number of standards assigned to a given class may vary from one to seven for unguided calibrations. Guided calibrations allow as many standards as needed.

Calibration Classes are assigned in the Advanced Modify Cal Kit menu, [SOLT](#) or [TRL](#) tab.

The different classes used in the PNA:

S11A, S11B, S11C (S22A, S22B, S22C and so forth)

These are the three classes for port 1-reflection calibrations (three classes also for S22 and S33). They are used in the one-port calibrations and the full two-port calibration. They are required in removing the directivity, source match, and reflection tracking errors. Typically, these classes might consist of an open, a short and a load standard for each port.

Transmission and Match (forward and reverse)

These classes are used to perform a full two-port calibration. The transmission class relates primarily to the transmission tracking, while the match class refers to load match. For both of these classes, the typical standard is a thru or delay.

Isolation

The isolation classes are used to perform a full two-port and the TRL two-port calibrations. The isolation classes apply to the forward and reverse crosstalk terms in the PNA error model.

TRL THRU

These are used to perform a TRL two-port calibration. The TRL thru class should contain a thru standard or a short line. If it contains a non-zero length thru standard, then the calibration type is called LRL or LRM.

TRL REFLECT

This class is used to perform a TRL two-port calibration. The TRL reflect class should contain a standard with a high reflection coefficient, typically an open or short. The actual reflection coefficient need not be known, but its phase angle should be specified approximately correctly (± 90 deg). The exact same reflection standard must be used on both ports in the TRL calibration process.

TRL LINE or MATCH

These are used to perform a TRL two-port calibration. The TRL line or match class should contain line

standards, load standards, or both. If a line standard is used, its phase shift must differ from that of the TRL THRU standard by 20° to 160° . This limits the useable frequency range to about 8 to 1. Two or more line standards of different lengths may be specified to get broader frequency coverage. It is also common to include a load standard for covering low frequencies, where the line's length would be impractically long. When a load is used, the calibration type is called TRM or LRM.

Note: For more information, read [Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers \(Application Note 1287-11\)](#)

Modify Calibration Kits

Beginning with A.10.00, VNA CalKit Editor, a standalone application, has been integrated into the PNA Firmware.

The following topics discuss Modifying Calibration Kits:

Using VNA CalKit Editor

- [Connectors Tab](#)
- [Standards Tab](#)
- [SOLT Tab](#)
- [TRL Tab](#)

Concepts

- [Why Modify a Cal Kit](#)
- [VNA Cal Kit File Types](#)
- [About PNA Cal Kits and Firmware Upgrades](#)

Procedures

- [How to Create a New Cal Kit from an Existing Cal Kit](#)
- [Creating Custom Calibration Kits using a New Connector Family](#)

Note: Although the User Interface is changed, the existing remote commands can still be used to modify Cal Kits.

How to Modify Cal Kits

The series of dialog boxes that follow allow you to modify the standard definitions or class assignments of calibration kit files.

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[More]**
3. then **[Cal Kit]**

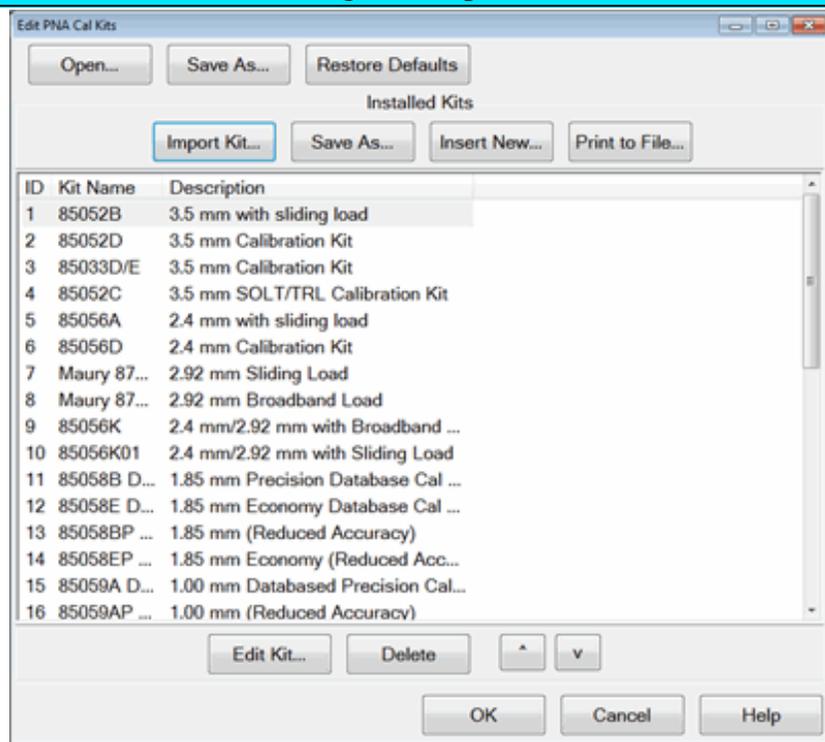

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **More**
4. then **Cal Kit**

Programming Commands

Edit PNA Cal Kits

Edit PNA Cal Kits dialog box help

Provides access to all Agilent cal kits and allows modification of their standard definitions.

PNA Cal Kits and Firmware Upgrades

- The default "factory" cal kits are overwritten when new firmware is installed. Your custom cal kits (files with custom filenames) are NOT overwritten. However, the custom cal kits must be imported (click **Import Kit**) into the new firmware. [Learn how to import cal kits.](#)
- All PNA cal kits can only be imported by the current firmware revision and later. They can NOT be imported by PAST firmware revisions. Once a Cal Kit has been imported by a later firmware revision, it cannot be imported by the previous version of firmware from which it originated.
- When a firmware upgrade takes place, ALL cal kits, both factory and custom, that are present on the PNA are saved to a single *.wks file using a unique filename. These files are NOT Excel spreadsheet files. They are opened using the **Open** button (see below). They can be used as archives of cal kits from previous firmware versions.

Open Opens an archive of cal kits from past firmware upgrades and 'Save As' operations.

Save As Saves ALL cal kits in the PNA to a *.wks file.

Restore Defaults Re-installs the default factory contents of all Agilent cal kits from the PNA hard drive. The factory Agilent cal kits are stored on the PNA hard drive at c:\users\public\network analyzer\PnaCalKits\factory.

Installed Kits

Import Kit Invokes the [Import Kit](#) dialog box.

Save As Saves the selected calibration kit and definitions (using **.ckt** file type).

Insert New Invokes a blank [Edit Kit dialog box](#) to create new calibration kit definitions.

Print to File Prints the contents of the selected cal kit to a .prn file.

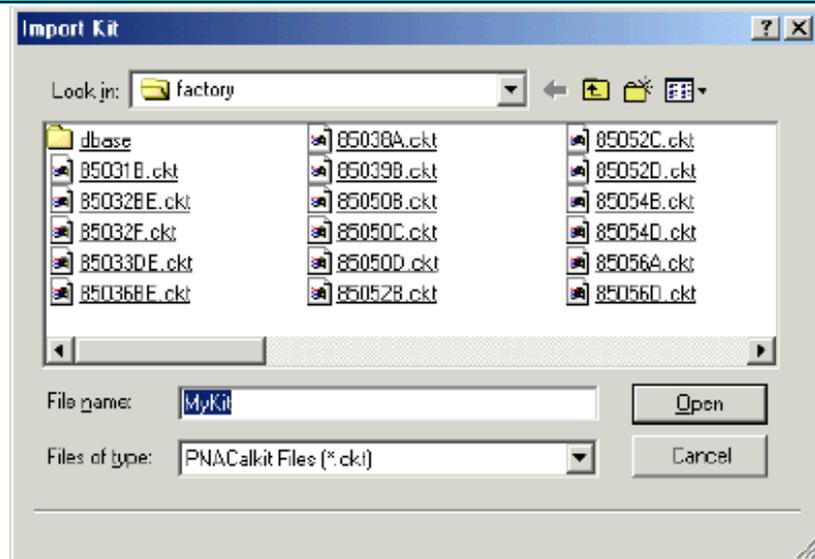

Edit Kit... Invokes the [Connectors tab](#) of the Edit Kit dialog box to modify selected calibration kit definitions.

Delete Deletes selected calibration kit file.

^ Selects previous / next calibration kit in list.

For more information see [Creating Custom Calibration Kits using a New Connector Family.](#)

Import Kit dialog box help

Note: There is no limit to the number of cal kits that can be imported. However, during an [Unguided cal](#), you can access ONLY mechanical cal kits #1 through 95.

Imports calibration kit definitions from hard disk or other drive that are saved in the various formats. The following four cal kit types can be imported.

Files of type Select the file type of your Cal Kit. Learn more about [VNA Cal Kit File Types](#)

File name Navigate and select your cal kit file.

Open Imports the selected file. The kit is added at the end of the list of cal kits.

Note: [See PNA Cal Kits and Firmware Upgrades](#)

Importing Kits other than current PNA Series Kits

Cal kit files from Agilent "legacy" network analyzers (listed above) may not contain information that the PNA requires. Therefore, the PNA may modify the cal kit name and description, the cal standards, and the cal class assignments in a best effort manner. You may need to correct these modifications after importing your legacy cal kit to meet your specific requirements.

- "Legacy" cal kit files are based on the analyzer test port gender while PNA cal kits are based on the Device Under Test (DUT) connector gender. Therefore, when the kit is imported, the standard label and description are reversed and are noted as F- (female) and M- (male) .
- When a Coaxial standard is detected in the kit file, a pair of male/female connectors is typically created.
- Waveguide standards that are created as connector have no gender.

Last modified:

25-Nov-2013	Updated for Win7 locations
25-Jun-2013	Integrated CalKit Editor (10.0)

Why Modify a Cal Kit

For most applications, the default calibration kit models provide sufficient accuracy for your calibration. However, several situations may exist that would require you to create a custom calibration kit:

- Using a connector interface different from those used in the predefined calibration kit models.
 - Using standards (or combinations of standards) that are different from the predefined calibration kits. For example, using three offset SHORTs instead of an OPEN, SHORT, and LOAD to perform a 1-port calibration.
 - Improving the accuracy of the models for predefined kits. When the model describes the actual performance of the standard, the calibration is more accurate. For example: A 7 mm LOAD is determined to be 50.4 instead of 50.0 .
 - Modifying the THRU definition when performing a calibration for a non-insertable device.
 - Performing a TRL calibration.
-

2-Apr-2013 New file

Creating a New Connector Family

To create a custom calibration kit that uses a new connector type, you must first define the connector family. The connector family is the name of the connector-type of the calibration kit, such as:

- APC7
- 2.4 mm
- Type-N (50)

Although more than one connector family is allowed, it is best to limit each calibration kit to only one connector family.

If you are using a connector family that has male and female connectors, include definitions of both genders. If you are using a family with no gender, such as APC7, only one connector definition is required.

Use the following steps to create a custom calibration kit:

1. In the [Connectors Tab](#), click **Add** to name the new connector family.
2. Enter the Kit Description for the custom cal kit.
3. Click **Add** in the Connectors section of the dialog box.
4. Enter a Connector Family name.
5. Enter a Description of the connector.
6. Select the Gender of one of the connectors.
7. Enter the minimum and maximum Frequency Range.
8. Enter the Impedance.
9. Click the down-arrow to select the Media.
10. Enter the cut-off frequency
11. Click **Apply**.
12. Click **OK**.
13. If you need to add another connector gender, in the [Connectors Tab](#), click **Add** in the Connectors section again for the next connector gender.
14. If you are adding another connector gender, repeat step 3.

Note: If you have male and female versions of the connector family, you probably do NOT also have a NO GENDER version.

Enter Standards

Now that the connector family is added to the custom cal kit, you are ready to add new calibration standards.

1. In the [Standards Tab](#), under the list of standards, click **Add**.
2. Select the type of standard (OPEN, SHORT, LOAD, or THRU), then click **OK**.
3. Complete the information in the dialog box for the standard you selected. Note that for banded standards, the start and stop frequency may be different than the frequency range of the specified connector. Edit the start and stop frequencies as needed. Click **OK** when all the settings are correct.
4. Repeat steps 2 - 3, as necessary, to add all standards and definitions to the new custom cal kit.
5. Assign each of the standards to a calibration class. This is done through the [TRL Tab](#) or [SOLT Tab](#)
6. Save the Cal Kit.

How to Create a New Cal Kit from an Existing Cal Kit

You can create a new custom Cal Kit using an existing Cal Kit as a starting point.

Here is how:

1. From the [Edit Cal Kits](#) dialog, load the Cal Kit you want to use as a starting point.
2. Immediately click **Save As** and change the file name. Select either ***.xkt** or ***.ckt** file type. [Learn more about these file types.](#)
3. Make modifications to your new custom Cal Kit as required.
4. Routinely save your work by clicking **Save**.

2-Apr-2013 New file

VNA Cal Kit File Types

The VNA Cal Kit editor can open the following types of Cal Kit files:

VNA Families	File Type
Current PNA Series Cal Kits	*.xkt (default with A.10.00 and above) *.ckt
Old PNA Series Cal Kit (before A.07.50)	*.ck1
8510 Cal Kit	.CK_*
8753, 8752, 8719, 8720, or 8722 Cal Kit	*.ck
Current FieldFox Cal Kits	*.xkt
Previous FieldFox Cal Kits	*.xml

Note: Currently, the VNA Cal Kit editor can NOT open or save to ENA file type ***.ckx**

The current revision of Cal Kit files can be downloaded at <http://na.tm.agilent.com/pna/caldefs/stddefs.html>

File Save (As)

The VNA Cal Kit Editor saves Cal Kits in two formats:

- ***.xkt** - A custom format that is based on xml.
- ***.ckt** - PNA format - can be read by PNA Rev. A.07.50 and higher.

File Association

With the exception of *.xml, the above file types are automatically associated with the CalKit Editor if they are not already associated with a different program. That means, after running CalKit Editor, double-clicking any of the above file types (except *.xml) will open the file using CalKit Editor.

If you have already associated one of these file types with a different program and would like to change it to CalKit Editor, do the following:

1. Right-click the file, then click **Open With**
2. Browse to the CalKitEditor install folder.
 - For a 32-bit version of Windows: C:\Program Files\Agilent\VNA Cal Kit Editor

- For a 64-bit version of Windows: C:\Program Files (x86)\Agilent\VNA Cal Kit Editor

3. Check **Always use the selected program to open this kind of file.**
4. Select **CalKit Editor.**

About Opening Legacy VNA Kits

Cal kit files from Agilent "legacy" network analyzers (listed above) may not contain information that the VNA requires. When loaded into the VNA Cal Kit Editor, the cal kit name and description, the cal standards, and the cal class assignments will be modified in a best effort manner. You may need to correct these modifications after importing your legacy cal kit to meet your specific requirements.

- "Legacy" cal kit files are based on the analyzer test port sex. Modern VNA cal kits are based on the Device Under Test (DUT) connector sex. Therefore, when the kit is imported the standard's label and description are reversed and are noted as F- (female) and M- (male) .
- When a Coaxial standard is detected in the kit file, a pair of male/female connectors is typically created.
- Waveguide standards that are created as connector have no gender.

2-Apr-2013 New file

Connectors Tab

The screenshot shows a software interface for configuring connectors. At the top, there are tabs for 'Connectors', 'Standards', 'SOLT', and 'TRL'. The 'Connectors' tab is active. Below the tabs, there is a 'Connector Family' dropdown menu set to '3.5 mm', with 'Add' and 'Delete' buttons to its right. The 'Frequency Range' section has 'Min' and 'Max' input fields, both set to '0' and '999000' respectively, with 'MHz' units. The 'Gender' section has two radio buttons: 'Gendered' (selected) and 'Genderless'. The 'Impedance' section has a 'Z0' input field set to '50' with 'ohms' units. The 'Transmission Media' section has a 'Media' dropdown menu set to 'WAVEGUIDE', and 'Cutoff Frequency' and 'Height/Width Ratio' input fields, both set to '0' with 'MHz' units.

Cal Kit Name Allows you to change the Name of the selected calibration kit.

Cal Kit Description Allows you to change the description of the selected calibration kit.

Connector Family .Click the down arrow to select the connector family associated with the Cal Kit.

Add Starts the [Add Connector](#) dialog box which allows you to add new connector type to the calibration kit.

Delete Deletes - **WITHOUT WARNING** - the selected connector family.

Note: To modify a connector family or name, Add a new connector, then delete the old connector.

The following is the list of Factory-defined connector type strings:

	Type N (50) female	7-16 female	X-band waveguide
	Type N (50) male	7-16 male	P-band waveguide
APC 3.5 female	Type N (75) female	2.92 mm female	K-band waveguide
APC 3.5 male	Type N (75) male	2.92 mm male	Q-band waveguide
APC 2.4 female	Type F (75) female	1.85 mm female	R-band waveguide
APC 2.4 male	Type F (75) male	1.85 mm male	U-band waveguide
APC 7	Type A (50) female	1.0 mm female	V-band waveguide
	Type A (50) male	1.0 mm male	W-band waveguide
	Type B		

Frequency Range

Min Allows you to define the lowest frequency at which the standard is used for calibration.

Max Allows you to define the highest frequency at which the standard is used for calibration.

Gender

Gendered - The connector family contains both Male and Female connectors.

Genderless - The connector family does NOT contain Male and Female connectors. APC7 connectors are an example of this connector type.

Impedance

Specify the impedance of the standard.

Media

The medium (or 'geometry') of the connector (COAX or WAVEGUIDE).

Cutoff Frequency If Media is Waveguide, type the low-end cutoff frequency.

Height/Width Ratio Used to calculate waveguide loss. This value is usually on the data sheet for waveguide devices.

About Waveguide Cal Kits

If modifying or creating a waveguide cal kit, be sure to make the following settings. You can [create a](#)

[custom waveguide cal kit](#) using an existing factory waveguide Cal kit as a starting point. The factory cal kits already have these settings.

- Frequency Range: **Min. frequency = Cutoff frequency.**
- Gender: **No Gender**
- Impedance Z0: **1 ohm**
- Media: **Waveguide**

For waveguide, choose TRL (Thru-Reflect-Line) calibration type . These calibration types are more accurate and take fewer steps than SOLT.

Add Connector Family

Enter a name for the new connector family. Then click **OK**.

Available at the bottom of every tab

Save As - Allows you to save the cal kit to a new file name and type.

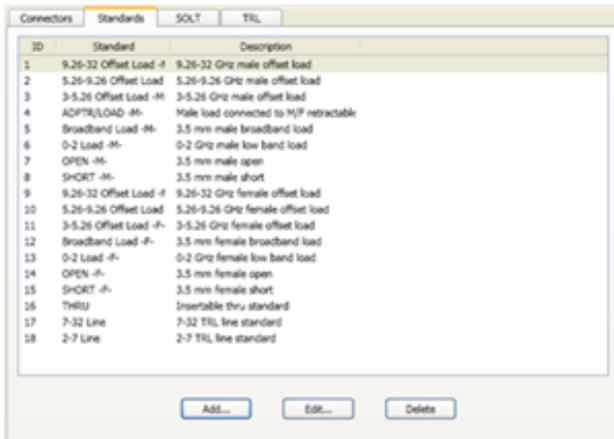

Save - Saves the cal kit to the same file name and type.

Close - Closes the cal kit editing session. The file is NOT saved automatically.

- [ISOLATION](#)

Standards dialog box help

The following fields apply to **ALL** standard types:

A screenshot of a dialog box with a light beige background and a dashed border. It contains three fields: 'Standard ID' with the value '19', 'Label' with the value 'OPEN -M- 2', and 'Description' with the value '3.5 mm male open 2'.

The other areas of the dialog change depending on the type of standard selected.

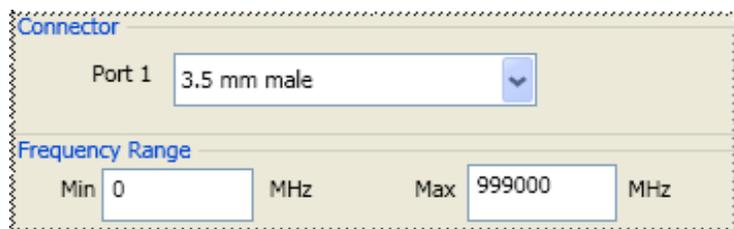

Identification

Standard ID Number in list of standards

Label Type of standard. This usually appears in prompts for standards.

Description Description of standard.

The following fields apply to ALL standard types EXCEPT the Isolation type:

A screenshot of a dialog box with a light beige background and a dashed border. It contains two sections: 'Connector' with a dropdown menu showing '3.5 mm male' and 'Port 1' next to it, and 'Frequency Range' with 'Min' set to '0' and 'Max' set to '999000', both followed by 'MHz' labels.

Connector

Indicates the type and gender (Male, Female, None) of the standard.

Thru and Isolation standards have two connectors.

Data-Based standards MAY have two connectors.

Frequency Range

Min Defines the lowest frequency at which the standard is used for calibration.

Max Defines the highest frequency at which the standard is used for calibration.

The Delay Characteristics fields apply to MOST standard types:

Delay Characteristics

Delay pSec Loss Gohms/s

Z0 ohms

Delay Characteristics

Delay Defines the one-way travel time from the calibration plane to the standard in seconds.

Z0 Defines the impedance of the standard.

Loss Defines energy loss in Gohms, due to skin effect, along a one-way length of coaxial cable.

Other fields are unique to standard type

Choose from:

- [OPEN](#)
- [SHORT](#)
- [LOAD](#)
- [THRU](#)
- [DATA-BASED](#)
- [ISOLATION](#)

Open Standard

C0, C1, C2, C3 Specifies the fringing capacitance.

Open Characteristics

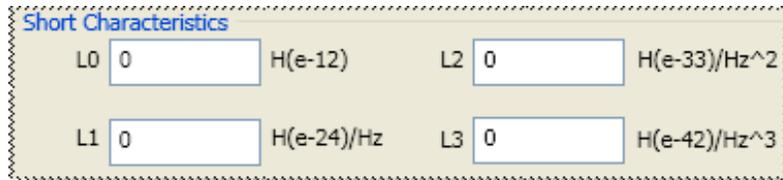

C0 F(e-15) C2 F(e-36)/Hz²

C1 F(e-27)/Hz C3 F(e-45)/Hz³

These are the unique fields of the dialog. [See the areas that are common to all standards.](#)

Short Standard

L0, L1, L2, L3 Specifies the residual inductance.

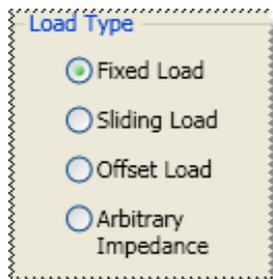

Short Characteristics

L0	<input type="text" value="0"/>	H(e-12)	L2	<input type="text" value="0"/>	H(e-33)/Hz^2
L1	<input type="text" value="0"/>	H(e-24)/Hz	L3	<input type="text" value="0"/>	H(e-42)/Hz^3

Load Standard

Choose from the following

Load Type

- Fixed Load
- Sliding Load
- Offset Load
- Arbitrary Impedance

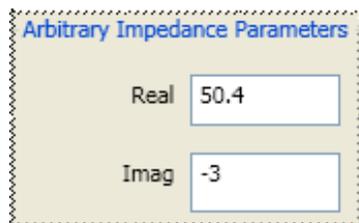

Fixed Load Specifies the load type as Fixed. The fixed load is assumed to be a perfect termination without reflection.

Sliding Load

A sliding load is defined by making multiple measurements of the device with the sliding load element positioned at various marked positions of a long transmission line. The transmission line is assumed to have zero reflections and the load element has a finite reflection that can be mathematically removed using a least squares circle fitting method.

A sliding load cal can be very accurate when performed perfectly. It can also be very inaccurate when not using proper technique. **For accurate results, closely follow the users manual instructions for the sliding load.**

Arbitrary Impedance

Arbitrary Impedance Parameters

Real	<input type="text" value="50.4"/>
Imag	<input type="text" value="-3"/>

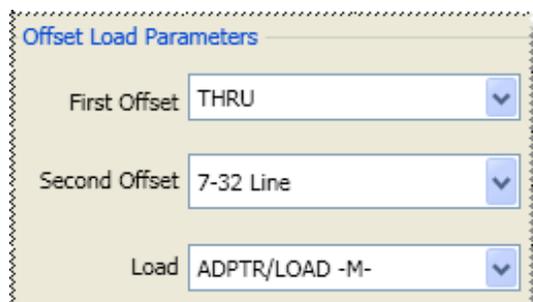

Specifies the load type that has an impedance value different from system Z0. An arbitrary impedance device is similar to a fixed load except that the load impedance is NOT perfect. Early

firmware releases of the PNA series used a fixed resistance value. A complex terminating impedance has been added to allow for more accurate modeling of circuit board or on-wafer devices.

The following Complex Impedance settings are available ONLY when Arbitrary Impedance is selected.

- **Real** The real portion of the impedance value.
- **Imaginary** The imaginary portion of the impedance value.

Offset Load

Offset Load Parameters

First Offset THRU

Second Offset 7-32 Line

Load ADPTR/LOAD -M-

In Jan 2006, Offset Load definitions were added to TRL and Waveguide Cal Kit files. Using an Offset Load standard results in a more accurate calibration than with a Broadband Load. Therefore, when performing a calibration using one of the modified Cal Kit definitions, you may be prompted to connect more standards than before this change. To revert to using the Broadband Load Standard without offset, do the following:

1. Click **Calibration**, then **Advanced Modify Cal Kit**
2. Select the kit, then click **Edit Kit**
3. Under Class Assignments, click **Edit**
4. Select Calibration Kit Class **S11C** (Loads)
5. Under Selected Standards, select **Broadband Load**, then click **Move Up** until the standard is at the top of the list. This will ensure that the Broadband Load is used first.

About Offset Load

An offset load is a compound standard consisting of a load element and two known offset elements (transmission lines) of different length. The shorter offset element can be a zero-length (Flush-thru) offset. The load element is defined as a 1-port reflection standard. An offset load standard is used when the response of the offset elements are more precisely known than the response of the load element. This is the case with waveguide. Measurement of an offset load standard consists of two

measurements, one with each of the two offset elements terminated by the load element. The frequency range of the offset load standard should be set so that there will be at least a 20 degree separation between the expected response of each measurement.

To specify more than two offset elements, define multiple offset load standards. In cases where more than two offsets are used, the frequency range may be extended as the internal algorithm at each frequency will search through all of the possible combinations of offsets to find the pair with the widest expected separation to use in determining the actual response of the load element.

The following Offset Load settings are available ONLY when Offset Load is selected.

- First Offset Standard
- Second Offset Standard
- Load Standard

Thru Standard

The screenshot shows a configuration dialog for a Thru Standard. It is divided into several sections:

- Connectors:** Port 1 is set to "3.5 mm female" and Port 2 is set to "3.5 mm male".
- Frequency Range:** Min is 0 MHz and Max is 38800 MHz.
- Delay Characteristics:** Delay is 0 pSec, Loss is 0 Gohms/s, and Z0 is 50 ohms.
- Virtual Device:** A checkbox labeled "Virtual Device" is checked.

Connectors - Defines connector type at both ends of the Thru standard.

Virtual Device

Most cal kits have only one Thru standard definition for SOLT calibrations. For these cases, use the default selections (checked for zero-length Thrus and cleared for non-zero-length Thrus).

This checkbox is used to make forward and reverse measurements of your Thru standard for the same pair of ports in two separate steps. This is NOT common for zero-length (Flush) Thru standards.

When **checked**, calibration prompts involving that Thru will **omit** the Description. For example “Connect port 1 to port 2”. This is the common prompt for Flush-Thru standards.

When **cleared**, calibration prompts for that Thru will **include** the Description. For example “Connect <standard description> between ports 1 and 2”.

To make forward and reverse measurements of your Thru standard for the same pair of ports as two separate steps, do the following:

1. Create separate definitions of the Thru standard(s) using the same settings, except for the Label and Description. **Clear** this checkbox for BOTH definitions.
2. For one Thru definition, in the label and description include the word 'FORWARD' to prompt the operator to use this standard for the forward measurement. Assign this standard to the SOLT “FWD TRANS” and “FWD MATCH” classes of the cal kit.
3. For the Thru definition, in the label and description include the word 'REVERSE' to prompt the operator to use this standard for the reverse measurement. Assign this standard to the SOLT “REV TRANS” and “REV MATCH” classes of the cal kit.
4. When you perform SOLT calibrations using this cal kit, the forward measurements of the Thru will be measured in one connection step, and the reverse measurements in another.

Data-Based Standard

Response Data Summary

Number of Response Data Variables = 4
index = 0: Number of Data Variable Values = 900
Data Variable Name = S11
index = 1: Number of Data Variable Values = 900
Data Variable Name = S21

Load Data File...

Accuracy Data Summary

Load Data File...

Virtual Device

Note: To learn how to modify data-based standard files, visit <http://na.tm.agilent.com/pna/dbcal.html>

Learn about the relative accuracy of [Databased versus Polynomial Cal Kits](#).

The modified file can then be uploaded into the VNA.

Upload Data From File

Click **Load Data File**, then navigate to the *.dat file which is provided with the data-based Cal Kit. Both Response data and Accuracy (Uncertainty) data is provided in a single *.dat file.

For Advanced Users

Response data can be loaded from a *.s2p or *.cti file.

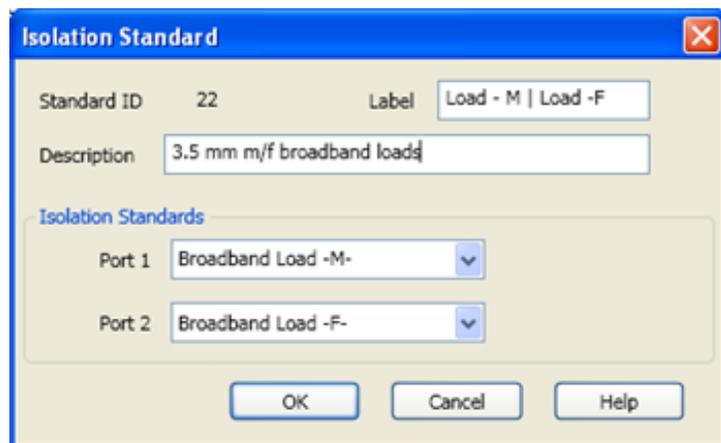

Accuracy data can be loaded from a *.cti file.

Virtual Device

This checkbox is displayed for a Data-Based cal standard when the standard has been defined to have 2 ports.

- When Cleared (default) calibration prompts for that standard will include it's Description. For example "Connect <standard description> between ports 1 and 2".
- When Checked, calibration prompts for that standard will NOT include its Description, so the prompt will be worded as if the data-based standard is a zero-length Thru connection. For example "Connect port 1 to port 2".

Isolation Standard

The screenshot shows a dialog box titled "Isolation Standard". It has a blue title bar with a close button. The main area is light beige. At the top, there are two fields: "Standard ID" with the value "22" and "Label" with the value "Load - M | Load -F". Below these is a "Description" field containing "3.5 mm m/f broadband loads". Underneath is a section titled "Isolation Standards" which contains two dropdown menus: "Port 1" with the selected value "Broadband Load -M-" and "Port 2" with the selected value "Broadband Load -F-". At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

The pair of loads are considered one standard.

Both loads are connected to the VNA and measured with the same prompt.

Available at the bottom of every tab

SOLT Tab

Note: This dialog looks similar to the dialog that appears after the [Cal Wizard View / Modify dialog](#). However, setting changes in that dialog affect **ONLY** the calibration that is in progress. These settings, accessed through [Modify Cal Kit](#), changes the cal kit for all future calibrations that use this cal kit.

Allows you to assign single or multiple standards to **SOLT** Calibration Classes.

Click the [TRL tab](#) to assign standards to TRL Calibration Classes.

1. For each Cal Kit Class, select **Available Standards** from the left list, then click **>>** to copy the standard to the Cal Kit.
2. Use **MOVE UP** and **MOVE DOWN** to change the **ORDER** of the standards. The order is used in guided calibrations to determine which standards in that class will be used in calibrations that involve the frequency ranges over which the standards are defined. Guided cals will include standards in the order in which they appear in this class list, and in the case where standards in the class list have frequency ranges that overlap, the order also determines which standard is used for frequencies in the overlap range. For example, let's assume that you define a broadband Short from Min Freq.= 0 Hz and Max Freq.= 999 GHz, and that standard is listed first in the SB or TRL REFLECT class. If you then list a frequency-banded Short with the same connector below the broadband short in those same classes, then guided calibrations would not use the frequency-banded Shorts because the broadband Shorts would always be given priority.

SOLT <cal class> Label

The cal standard category label that appears in the VNA's user interface during **unguided** SOLT calibrations.

Calibration Kit Classes

For each calibration class, select **Available Standards**, then click **>>** to move to the **Selected Standards** list.

- **SA** - OPEN Standards
- **SB** - SHORT Standards
- **SC** - LOAD Standards
- **FWD / REV Trans and Match** - THRU Standards. Most Cal Kits do NOT include a physical THRU standard, but assume that an Insertable Thru will be used.
- ISOLATION - Isolation standard. For PNA analyzers, ISOLATION calibration is not usually recommended. It could be beneficial in some situations where custom user-supplied test set hardware is being used.

Note: In older VNA models, the SA, SB, and SC classes were labeled S11A, S11B, S11C and S22A, S22B, S22C. Separate classes for ports 1 and 2 is now considered unnecessary, especially in the context of VNA models with more than 2 ports. When saving a cal kit in the PNA *.ckt format with this editor and viewing the kit in PNA firmware with the older user interface, the standard selections for those three classes are duplicated in both the S11 and S22 selections for those classes.

Link FWD TRANS, FWD MATCH, REV TRANS, and REV MATCH Check to automatically assign the standard definition for FWD TRANS to FWD MATCH, REV MATCH, and REV TRANS. Clear to separately assign FWD MATCH, REV MATCH and REV TRANS classes (SOLT calibrations only).

Expanded Calibration

The following two check boxes **apply ONLY during Guided Calibrations**. For Unguided Calibration, these check boxes are ignored, including the case where the multiple standards dialog box is presented.

Measure all mateable standards in class Check this box to attain the very highest accuracy possible. For example, if a cal kit contains several load standards, during the calibration process you will be prompted to measure each of the standards. This could require a significant amount of calibration time. When checked, the "Use expanded math when possible" box is also checked automatically.

Use expanded math when possible Some kits contain multiple calibration standards of the same type that together cover a very wide frequency range. (For example: multiple shorts, or a lowband load and a sliding load.) If a calibration requires more than one standard to cover the calibration frequency range, there can be regions of overlapping measurements. When this checkbox is selected, the VNA automatically computes the most accurate measurement in the overlap regions using a "weighted least squares fit" algorithm. This function improves accuracy without slowing the calibration speed.

- Manually select this checkbox only when using a cal kit that contains multiple standards of the

same type. (For example: multiple shorts, or a lowband load and a sliding load.)

- The checkbox is cleared by default when a polynomial model is selected from the cal kit menu.
- The checkbox is selected by default when the 85058B or 85058E data-based model is selected from the cal kit menu.

Available at the bottom of every tab

Save As - Allows you to save the cal kit to a new file name and type.

Save - Saves the cal kit to the same file name and type.

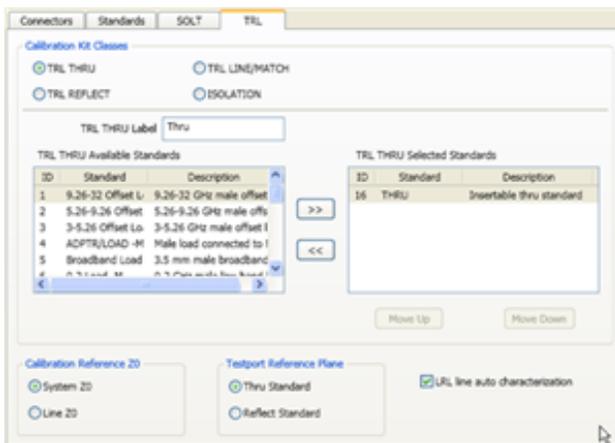

Close - Closes the cal kit editing session. The file is NOT saved automatically.

Last modified:

2-Apr-2013 New file

TRL Tab

On the image below, click a setting area to learn more.

Note: This dialog will look different if you clicked Help at the Cal Wizard View / Modify dialog. The functionality is the same.

Allows you to assign single or multiple standards to Calibration Classes.

1. For each Cal Kit Class, select **Available Standards** from the left list, then click >> to copy the standard to the Cal Kit.
2. Use **MOVE UP** and **MOVE DOWN** to change the **ORDER** of the standards. The order is used in guided calibrations to determine which standards in that class will be used in calibrations that involve the frequency ranges over which the standards are defined. Guided cals will include standards in the order in which they appear in this class list, and in the case where standards in the class list have frequency ranges that overlap, the order also determines which standard is used for frequencies in the overlap range. For example, let's assume that you define a broadband Short from Min Freq.= 0 Hz and Max Freq.= 999 GHz, and that standard is listed first in the SB or TRL REFLECT class. If you then list a frequency-banded Short with the same connector below the broadband short in those same classes, then guided calibrations would not use the frequency-banded Shorts because the broadband Shorts would always be given priority.

Note: The TRL LINE/MATCH class has a slight exception to these prioritization behaviors. In general, Line standards are given a higher priority than Match standards. So if a Line standard and a Match standard are defined to have the same frequency range and the Match standard is listed above the Line standard in the class order, a guided TRL cal will still prefer to use the Line standard rather than the Match standard.

TRL <cal class> Label

The cal standard category label that appears in the VNA's user interface during **unguided** TRL calibrations.

Cal Kit Classes

- For PNA analyzers, ISOLATION calibration is not usually recommended. It could be beneficial in some situations where custom user-supplied test set hardware is being used.

TRL THRU

Note: All **THRU calibration methods** are supported in a TRL Cal **EXCEPT** Unknown Thru.

- The THRU standard can be either a zero-length or non-zero length. However, a zero-length THRU is more accurate because it has zero loss and no reflections, by definition.
- The THRU standard cannot be the same electrical length as the LINE standard.
- If the insertion phase and electrical length are well-defined, the THRU standard may be used to set the reference plane.
- The THRU standard and LINE standard have the same characteristic impedance and are perfectly matched. They define the reference impedance of the calibration.
- If a THRU standard with the correct connectors is NOT available, an adapter removal cal can be performed.

TRL REFLECT

- The REFLECT standard can be anything with a high reflection, as long as it is the same when connected to one or more VNA ports.
- The REFLECT standard on each port is identical.
- The actual magnitude of the reflection need not be known.
- The phase of the reflection standard must be known within 1/4 wavelength.
- If the magnitude and phase of the reflection standard are well-defined, the standard may be used to set the reference plane.

TRL LINE

The LINE and THRU standards establish the reference impedance for the measurement after the calibration is completed. TRL calibration is limited by the following restrictions of the LINE standard:

- Must be of the same impedance and propagation constant as the THRU standard.
- The electrical length need only be specified within 1/4 wavelength.
- Cannot be the same length as the THRU standard.
- A TRL cal with broad frequency coverage requires multiple LINE standards. For example, a span from 2 GHz to 26 GHz requires two line standards.

- Must be an appropriate electrical length for the frequency range: at each frequency, the phase difference between the THRU and the LINE should be greater than 20 degrees and less than 160 degrees. This means in practice that a single LINE standard is only usable over an 8:1 frequency range (Frequency Span / Start Frequency). Therefore, for broad frequency coverage, multiple lines are required.
- At low frequencies, the LINE standard can become too long for practical use. The optimal length of the LINE standard is 1/4 wavelength at the geometric mean of the frequency span (square root of $f_1 \times f_2$).

Note: The TRL LINE standard must have a delay that is greater than 0 (zero) ps. Otherwise, calibration correction calculations will contain unpredictable results.

TRL MATCH

If the LINE standard of appropriate length or loss cannot be fabricated, a MATCH standard may be used instead of the LINE.

- The MATCH standard is a low-reflection termination connected to both Port 1 and Port 2.
- The MATCH standard may be defined as an infinite length transmission line OR as a 1-port low reflect termination, such as a load.
- When defined as an infinite length transmission line, both test ports must be terminated by a MATCH standard at the same time. When defined as a 1-port load standard, the loads are measured separately. The loads are assumed to have the same characteristics.
- The impedance of the MATCH standard becomes the reference impedance for the measurement. For best results, use the same load on both ports. The load may be defined using the data-based definition, the arbitrary impedance definition, or the fixed load definition.

Calibration Reference Z0 (TRL only)

System Z0 The system impedance is used as the reference impedance. Choose when the desired test port impedance differs from the impedance of the LINE standard. Also, choose when skin effect impedance correction is desired for coax lines.

Line Z0 The impedance of the line standard is used as the reference impedance, or center of the Smith Chart. Any reflection from the line standard is assumed to be part of the directivity error.

Testport Reference Plane (TRL only)

Thru Standard The THRU standard definition is used to establish the measurement reference plane. Select if the THRU standard is zero-length or very short.

Reflect Standard The REFLECT standard definition is used to establish the position of the measurement reference plane. Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined.

Also, select If a flush short is used for the REFLECT standard because a flush short provides a more accurate phase reference than a Thru standard.

LRL line auto characterization

Note: This setting ONLY applies if an LRL Cal Kit is being modified **AND** Testport Reference Plane is set to Thru Standard **AND** the TRL Thru class standard and the TRL Line/Match class standard both have the same values for Offset Z0 and Loss. Otherwise, this setting is ignored.

- Check the box to allow the VNA to automatically correct for line loss and dispersion characteristics.
- Clear the box if anomalies appear during a calibrated measurement which may indicate different loss and impedance values for the Line standards.

Markers

Markers provide a numerical readout of measured data, a search capability for specific values, and can change stimulus settings. There are 9 regular markers and one [Reference marker](#) (used with Delta markers) available per trace. This topic discusses all aspects of markers.

Note: Marker Readout can be turned ON / OFF and customized from the **View/Display** menu. [Learn more.](#)

- [Creating and Moving Markers](#)
- [Marker Dialog](#)
- [Searching with Markers](#)
- [Marker Functions](#) (Change Instrument Settings)
- [Marker Display](#)
- [Marker Table](#)

Other Analyze Data topics

How to Create Markers

Using front-panel HARDKEY [softkey] buttons

1. Press **MARKER**
2. then **[Marker n]**

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Marker**
3. select a marker number

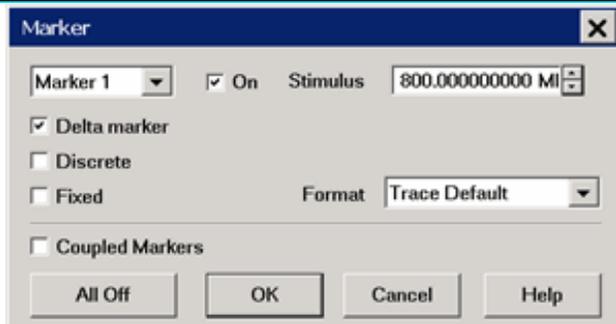

[Programming Commands](#)

Moving a Marker

To move a marker, make the marker active by selecting its number in any of the previous 3 methods. The **active marker** appears on the analyzer display as ∇ . All of the other markers are inactive and are represented on the analyzer display as Δ . Then change the stimulus value using any of the following methods:

- Type a value.
- Scroll to a stimulus value using the up / down arrows. The resolution can not be changed.
- Click the stimulus box, then use the front-panel knob.
- Click and Drag Markers using a finger (touchscreen) or by left-clicking and holding a marker symbol. Then drag the marker to any point on the trace. This feature is NOT allowed in Smith Chart or Polar [display formats](#) or with a [Fixed Marker type](#).

Marker dialog box help

Marker Specifies the current (active) marker number that you are defining.

On Check to display the marker and corresponding data on the screen.

Stimulus Specifies the X-axis value of the active marker. To change stimulus value, type a value, use the up and down arrows, click in the text box and use the front-panel knob, or drag the marker on the screen.

Delta Marker Check to make the active marker display data that is relative to the reference (R) marker. There is only one reference marker per trace. All nine other markers can be regular markers or delta markers. When a delta marker is created, if not already displayed, the reference marker is displayed automatically. A delta marker can be activated from the [Marker dialog box](#) or the [Marker Toolbar](#).

Discrete Marker Check to display values at only the discrete points where data is measured. Clear to display values that are interpolated from the data points. The interpolated marker will report y-axis data from ANY frequency value between the start and stop frequency.

Fixed Check to cause the marker to have a fixed X-axis and **Y-axis** position based on its placement on the trace when it was set to fixed. It does NOT move with trace data amplitude. It can be scrolled left and right on the X-axis by changing the marker stimulus value. Use this marker type to quickly monitor "before and after" changes to your test device. For example, you could use fixed markers to record the difference of test results before and after tuning a filter.

Clear the box to create a **Normal** marker, which has a fixed stimulus position (X-axis) and responds to changes in data amplitude (Y-axis). It can be scrolled left and right on the X-axis by changing the marker stimulus value. Use this marker type with one of the marker search types to locate the desired data.

Coupled Markers Check to couple markers by marker number, 1 to 1, 2 to 2 and so forth. The markers will remain coupled until this box is unchecked. [Learn more about coupled markers.](#)

(Marker) Format Displays the marker data in a format that you choose. The Trace Default setting has the same marker and grid formats. Choose from the following:

Log/Phase	Log Mag	Real
Linear/Phase	Linear Mag	Imaginary
Real/Imag	Phase	Kelvin
R+jX (complex impedance)	SWR	Fahrenheit
G+jB (complex admittance)	Delay	Celsius

All Off Switches OFF all markers on the active trace.

Searching with Markers

You can use markers to search and return data for the following trace criteria:

- [Max and Min](#): find the highest or lowest points on the trace
- [Peak](#), then move to other peaks (left, right, next highest)
- [Target Value](#): find a specific Y-axis value
- [Bandwidth](#) (Filters)
- [Compression Point](#) (Amplifiers)
- [About PSAT and PNOP Markers](#)
 - [Power Saturation](#) (Amplifiers)
 - [Power Normal Operating Point](#) (Amplifiers)
- [What is a Peak?](#)
- [Search Domain](#)
- [Search Within](#)

How to Search with Markers

Using front-panel HARDKEY [softkey] buttons

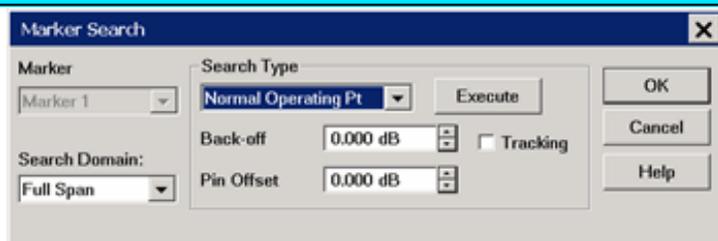

1. Press **SEARCH**

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Marker Search**

← Programming Commands →

Marker Search dialog box help

Marker Specifies the marker that you are defining. Not available for search types that deploy specific markers.

Search Domain Defines the area where the marker can move or search. For full span, the marker searches for specified values within the full measurement span. For user span, the marker searches for specified values within a measurement span that you define. [Learn more about Search Domain.](#)

Search Type

Note You must either press **Execute** or check **Tracking** to initiate all search types. If there is no valid data match for the search type, the marker will not move from its current position.

- **Execute** Click to cause the marker to search for the specified criteria.
- **Tracking** Check to cause the marker to search for the specified criteria with each new sweep. The searches begin with the first sweep after Tracking has been checked, based on the current search type and domain information. Therefore, make sure that the search criteria are in the desired state before using the data. You cannot manually change the stimulus setting for a marker if Tracking is selected for that marker.

Maximum Marker locates the maximum (highest) data value.

Minimum Marker locates the minimum (lowest) data value.

Next Peak Marker locates the peak with the next lower amplitude value relative to its starting position.

Peak Right The marker locates the **next valid peak to the right** of its starting position on the X-axis.

Peak Left The marker locates the **next valid peak to the left** of its starting position on the X-axis.

- **Threshold** - Minimum amplitude (dB). To be considered valid, the peak must be **above** the threshold level. The valley on either side can be below the threshold level.
- **Excursion** The vertical distance (dB) between the peak and the valleys on both sides. To be considered a peak, data values must "fall off" from the peak on both sides by the excursion value.

For more information, see [What is a Peak?](#)

Target Enter the Target value. The marker moves to the first occurrence of the Target value to the right of its current position. Subsequent presses of the Execute button cause the marker to move to the next value to the right that meets the Target value. When the marker reaches the upper end of the stimulus range, it will "wrap around" and continue the search from the lower end of the stimulus range (left side of the window).

- If **Discrete Marker** is OFF, the marker locates the interpolated data point that equals the target value.
- If **Discrete Marker** is ON and there are two data points on either side of the target value, the marker locates the data point closest to the Target value

Bandwidth Markers

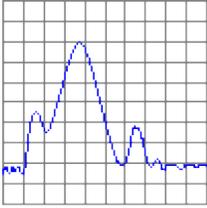

Four markers are automatically deployed to find the first negative or positive bandpass in the selected search domain.

To create Bandwidth markers:

1. Press **SEARCH**, then **[Bandwidth]**
 2. Specify the level in dB from the peak or valley where bandwidth is measured.
- Bandwidth Search can be used **ONLY** with [Log Mag display format](#).
 - To use Bandwidth Search on a peak or valley other than the maximum or minimum values, change the Search Domain.

Enter a **Negative** number to search for a **Peak** bandpass, such as a filter S21 response:

- Marker 1: Maximum value within the [Search Domain](#).
- Marker 2: Specified level DOWN the left of the peak.
- Marker 3: Specified level DOWN the right of the peak.
- Marker 4: Center frequency between markers 2 and 3.

Enter a **Positive** number to search for a **Valley** bandpass, such as a filter S11 response:

- Marker 1: Minimum value within the [Search Domain](#).
- Marker 2: Specified level UP the left of the valley.
- Marker 3: Specified level UP the right of the valley.
- Marker 4: Center frequency between markers 2 and 3.

The following four values are displayed for Bandwidth Search:

- **BW:** (Marker 3 x-axis value) - (Marker 2 x-axis value) = width of the filter.
- **Center:** Mathematical midpoint between markers 2 and 3.
- **Q:** Ratio of Center Frequency to Bandwidth (Center Frequency / Bandwidth).
- **Loss:** Y-axis value of Marker 4. This is the loss of the filter at its center frequency. The ideal filter has no loss (0 dB) in the passband.

Compression Markers

Uses the active marker to find the specified gain **Compression Level**. [Learn more about Gain Compression](#).

Note: Valid ONLY for S21 (Gain) measurements with a [Power Sweep](#).

To create Compression markers:

1. Press **SEARCH**, then **[Compression]**
2. Specify the compression level in dB,
3. Optionally press **Tracking** to search for the specified compression level with each sweep.

Linear gain is defined as the Y-axis value (gain) of the first data point of the [Search Domain](#) (Full Span by default).

Marker > N: X-axis value and Y-axis value

Comp Pin: Input power (marker X-axis value)

Comp Pout: Output power (Pin + gain)

Comp Level: Compression level found.

- When [Discrete](#) is OFF (default setting) the marker finds the exact specified compression, interpolated between the two closest data points and calculates the Comp Pin and Comp Pout value for that point.
- When Discrete is ON (not interpolated), the marker resides on the closest data point to the requested compression level.

Comp. Not Found: Displayed when the requested compression level is not found.

About PSAT and PNOP Markers

Compression measurements based on the Pout vs Pin curves are common in the satellite test industry. In the case of Travelling Wave Tube (TWT) amplifiers, PSAT markers identify the normal operating point near saturation, and the amplifiers are operated with the power slightly backed-off approximately 0.03 to 0.1 dB. For TWT amplifiers, the saturation curve always "folds over" and produces a maximum power out.

For Solid State Power Amplifiers (SSPA), the saturation is not as well defined. A common reference is the Normal Operating Point, which is a power backed-off by 8 to 10 dB from the maximum power. In this case, the normal operating point marker replaces the Psat with the PNOP values. Also, because the backoff is important, the backoff output and input powers are displayed (PBO Out), (PBO in) as well as gain at back off (PBO Gain).

Power Saturation (PSAT) Markers

Uses Markers 1, 2, and 3 to quickly identify output power saturation parameters of an amplifier.

Back-off is a point at which the output power is sufficiently lower than the saturated output power so that the device under test behaves in a more linear fashion.

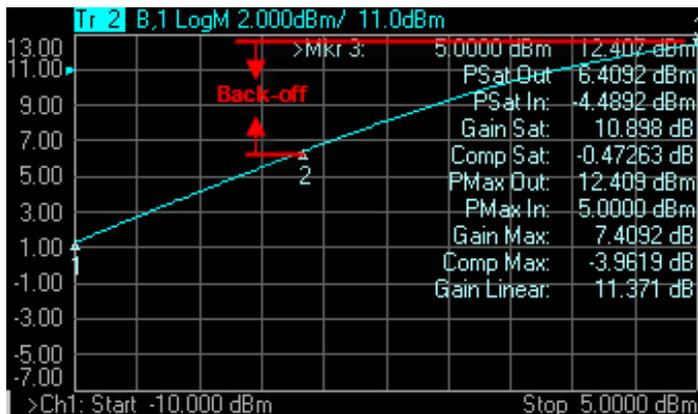

Note: Valid ONLY for Power IN vs Power OUT measurements. These markers can also be used on a CompOut trace with [Compression Analysis](#) mode in the Gain Compression Application.

To make a Power IN (X-axis) vs Power OUT (Y-axis) measurement:

1. [Preset](#)
2. Set [Sweep Type](#): Power Sweep
3. Set [Trace Meas](#) to "B" Receiver
4. Connect DUT input to port 1
5. Connect DUT output to port 2

To create PSAT markers:

1. Press **SEARCH**, then **[Search...]**
2. From Search Type, select **Power Saturation**
3. For **PMax Back-Off**, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
4. Press **Execute** or check **Tracking**. [Learn more](#).

This setting uses **three** markers to calculate and display 10 values.

The three markers:

- Marker 1: Linear gain; the first data point in the sweep.
- Marker 2: Specified output power **Back-off** from max power.
- Marker 3: Max Power output; usually the last data point.

The 10 displayed values:

Param	Description	Calculated from...
>Mkr 3	Marker 3 X-axis and Y-axis value	Marker 3 X-axis and Y-axis value
PSat Out	Output power at the saturation point.	Marker 2 Y-axis value
PSat In	Input power at the saturation point.	Marker 2 X-axis value
Gain Sat	Gain at the saturation point.	Psat Out - Psat In
Comp Sat	Compression at the saturation point.	Gain Sat - Gain Linear
PMax Out	Maximum output power.	Marker 3 Y-axis value
PMax In	Input power at the maximum output power.	Marker 3 X-axis value
Gain Max	Gain at the maximum output power.	PMax Out - PMax In
Comp Max	Compression at the maximum output power.	Gain Max - Gain Linear
Gain Linear	Linear gain at the first data point.	Marker 1 - Y-axis value MINUS X-axis value

- **Comp. Not Found** is displayed when the requested Back-off point is not found.
- When [Discrete](#) marker is NOT selected (the default setting), the three markers find an interpolated value between the two closest data points.
- When [Discrete](#) marker is selected (NOT interpolated), the three markers reside on the closest data points.

Programming Commands

Power Normal Operating Point Marker

Uses Markers 1, 2, 3, and 4 to quickly identify Normal Operating Point parameters of an amplifier.

Back-off is a point at which the output power is sufficiently lower than the saturated output power

so that the device under test behaves in a more linear fashion.

The power normal operating point is the output power where the input is offset from the back-off input power by the Pin Offset.

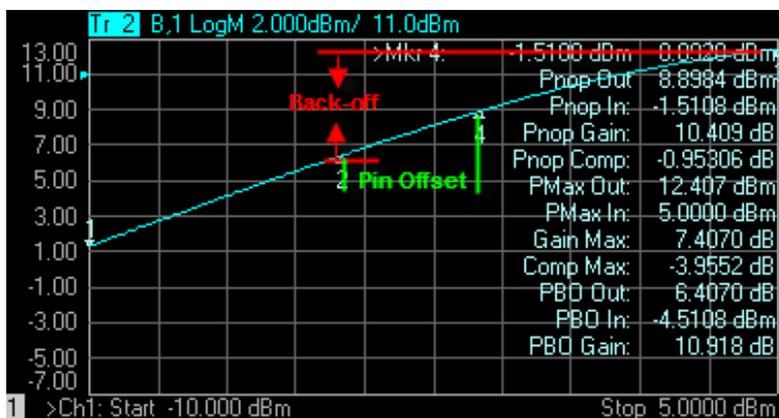

Note: Valid ONLY for Power IN vs Power OUT measurements.

These markers can also be used on a CompOut trace with [Compression Analysis](#) mode in the Gain Compression Application.

See [Power Saturation](#) to learn how to make a Power IN (X-axis) vs Power OUT (Y-axis) measurement.

To create PSAT markers:

1. Press **SEARCH**, then [**Search...**]
2. From Search Type, select **Normal Operating Pt**
3. For **Back-Off**, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
4. For **Pin Offset**, enter the X-axis (Power IN) difference between Back-off marker (2) and PNOP marker (4).
5. Press **Execute** or check **Tracking**. [Learn more](#).

This setting uses **four** markers to calculate and display 12 values.

The four markers:

- Marker 1: Linear gain; the first data point in the sweep.
- Marker 2: Max Output Power MINUS the specified Output (Y-axis) **Back-off** value in dB.
- Marker 3: Max Output Power; usually the last data point in the sweep.

- Marker 4: X-axis value of Back-off (Marker 2) plus the **Pin Offset** (X-axis) value in dB.

The 12 displayed values:

Param	Description	Calculated from...
>Mkr 4	Marker 4 - X-axis and Y-axis values	Marker 4 - X-axis and Y-axis values
Pnop Out	Output power at the power normal operating point.	Marker 4 Y-axis value
Pnop In	Input power at the power normal operating point.	Marker 4 X-axis value
Pnop Gain	Gain at the power normal operating point.	Pnop Out - Pnop In
Pnop Comp	Compression at the power normal operating point.	Pnop Gain - Linear Gain*
PMax Out	Maximum output power.	Marker 3 Y-axis value
PMax In	Input power at the maximum output power.	Marker 3 X-axis value
Gain Max	Gain at the maximum output power.	PMax Out - PMax In
Comp Max	Compression at the maximum output power.	Gain Max - Linear Gain*
PBO Out	Output power at the back-off point.	Marker 2 Y-axis
PBO In	Input power at the back-off point.	Marker 2 X-axis
PBO Gain	Gain at the back-off point.	PBO Out - PBO In

***Linear Gain (not shown):** Marker 1 - Y-axis value MINUS X-axis value

- **PNOP Not Found** is displayed when the requested back-off level is not found.
- When [Discrete](#) marker is NOT selected (the default setting), the four markers each find an interpolated value between the two closest data points.
- When [Discrete](#) marker is selected (NOT interpolated), the four markers each reside on the closest data point.

What Is a "Peak"?

You define what the analyzer considers a "peak" by selecting the following two peak criteria settings:

- **Threshold** - Minimum amplitude (dB). To be considered valid, the peak must be **above** the threshold level. The valley on either side can be below the threshold level.
- **Excursion** - The vertical distance (dB) between the peak and the valleys on both sides. To be considered a peak, data values must "fall off" from the peak on both sides by the excursion value.

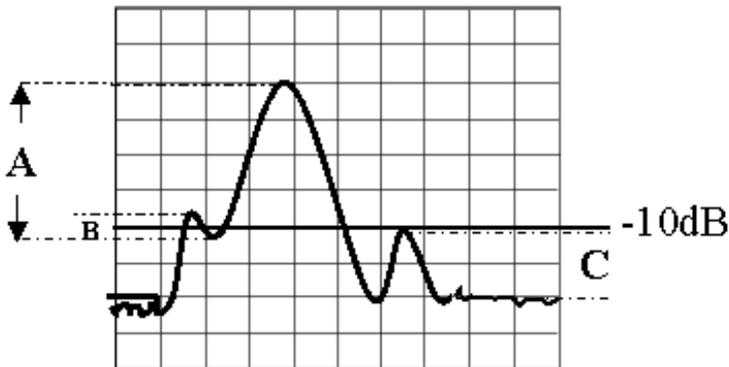

Example:

Threshold Setting: -10dB

Excursion Setting: 1dB

Scale = 1 dB / Division

Mouse over the graphic to find a valid peak.

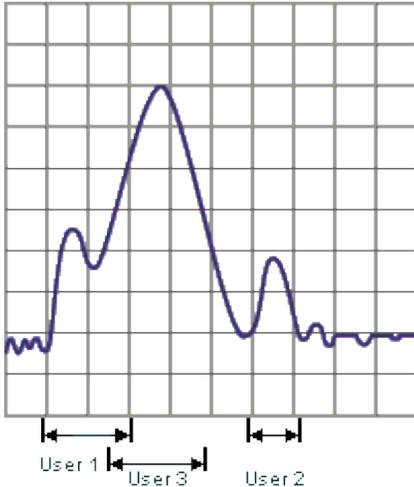

- **Peak A** = Valid Peak (Above Threshold and Excursion Settings)
- **Peak B** = Invalid Peak (Below Excursion Setting)
- **Peak C** = Invalid Peak (Below Threshold Setting)

Search Domain

Search domain settings restrict the stimulus values (X-axis for rectangular format) to a specified span. Set the Start and Stop stimulus settings of these **User** spans. If Start is greater than Stop, the marker will not move. [Learn how to set Search Domain.](#)

- The default domain of each new marker is "full span".
- There are 16 user-defined domains for every channel.
- The user-defined domains can overlap.
- More than one marker can use a defined domain.
- Search Domain settings are shared with [Trace Statistics User Ranges](#)

The graphic below shows examples of search domains.

Search Within

Using the [Zoom feature](#), you can search for the Maximum, Minimum, or a Target value within a 'zoomed' frequency range. The zoomed frequency range becomes the **User 16** Search Domain span.

A marker is created if not already present on the trace. If markers are already present on the trace, the lowest marker is moved to the found value.

1. Left-click the mouse or use a finger, then drag across a portion of a trace.
2. Release the mouse or lift the finger.
3. Select **Search Within**.
4. Then choose from the following:
 - **Max** - A marker moves to the HIGHEST value within the zoomed range.
 - **Min** - A marker moves to the LOWEST value within the zoomed range.
 - **Target** - A marker moves to the first value within the zoomed range that is currently set in the [Marker Search 'Target' setting](#). The same Discrete Marker rules apply as those for the standard Target Marker Search.

Marker Functions - Change Instrument Settings

The following settings change the relevant PNA settings to the position of the active maker.

How to change instrument settings using markers

Using front-panel HARDKEY [softkey] buttons

1. Press **MARKER**
2. then [**Marker Function**]

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Marker Function**

Programming Commands

Marker Function dialog box help

Note: Marker Functions do not work with channels that are in [CW](#) or [Segment Sweep](#) mode.

Marker =>Start Sets the start sweep setting to the value of the active marker.

Marker =>Stop Sets the stop sweep setting to the value of the active marker.

Marker =>Center Sets the center of the sweep to the value of the active marker.

Marker =>Ref Level Sets the screen [reference level](#) to the value of the active marker.

Marker =>Delay The phase slope at the **active marker** stimulus position is used to adjust the line length to the receiver input. This effectively flattens the phase trace around the active marker. Additional Electrical Delay adjustments are required on devices without constant group delay over the measured frequency span. You can use this to measure the electrical length or deviation from linear phase.

This feature adds phase delay to a variation in phase versus frequency; therefore, it is only applicable for ratioed measurements. See [Measurement Parameters](#).

Marker =>Span Sets the sweep span to the span that is defined by the [delta marker](#) and the marker that it references. Unavailable if there is no delta marker.

Marker =>CW Freq Sets the CW frequency to the frequency of the active marker. NOT available

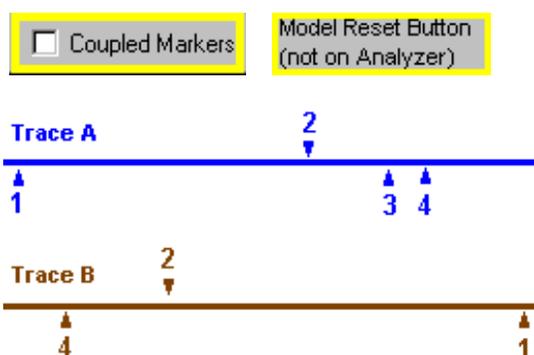

when the channel is in CW or Power Sweep. Use this function to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set [Sweep Type](#) to Power or CW.

Coupled Markers

The coupled markers feature causes markers on different traces to line up with the markers on the selected trace. Markers are coupled by marker number, 1 to 1, 2 to 2, 3 to 3, and so forth. If the x-axis domain is the same (such as frequency or time), coupling occurs across all channels, windows, and traces. Trace markers in a different x-axis domain will not be coupled. If a trace marker has no marker to couple with on the selected trace, the marker remains independent.

Coupled Markers Model

This model simulates the use of coupled markers in the PNA:

1. Click **Trace A** or **Trace B**
2. Click **Coupled Markers**
3. Notice the following:
 - Markers on the unselected trace move to the x-axis position of the selected trace.
 - If a marker number on the unselected trace has no corresponding marker on the selected trace, no movement occurs for that marker.
4. Click **Reset** to run the model again. There is no Reset for coupled markers on the PNA.

Marker Display

The marker display dialog allows you to change how markers and the associated readout is displayed on the PNA screen. Several marker display features also apply to [Statistics](#) display.

How to change marker display settings

Right-click on a marker readout, then click **Marker Display** or:

Using front-panel

HARDKEY [softkey] buttons

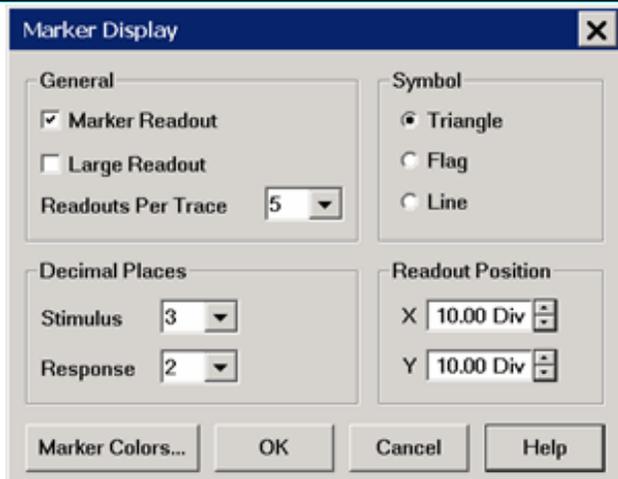

1. Press **MARKER**
2. then **[Properties]**
3. then **[Marker Display]**

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Marker**
3. then **Marker Display**

Programming Commands

Marker Display dialog box help

The following settings apply to readouts of ALL currently-displayed marker, bandwidth, and [trace statistics](#).

These settings revert to their defaults on Preset but ARE stored with [Instrument State](#) and [User Preset](#).

Marker Readout

Checked - Shows readout information.

Cleared - Shows NO readout information.

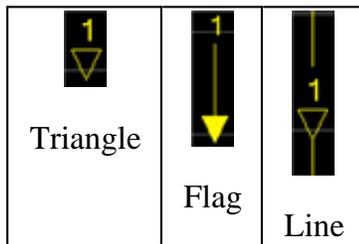

Large Readout

Checked - Shows the marker readout in large font size for easy reading. However, all readout lines may not be visible.

Cleared - Shows the marker readout in normal font size.

Readouts Per Trace Choose the quantity of marker readouts to show in the window for each trace. Choose to display up to 10 readouts per trace, up to 20 readouts per window. When more markers are present than the specified quantity of readouts, the marker numbers for which readouts are displayed can change depending on the marker number that is active. Readouts Per Trace can be set independently for each window.

Symbol - Choose from the following marker symbols.

Line symbols are NOT used on Smith or Polar [display formats](#).

Symbols can be set independently for each window.

Decimal Places Choose the marker readout resolution to display. These values also apply to the readouts that are displayed in the [marker table](#). Decimal Places can be set independently for each window.

Stimulus (X-axis) - Choose from **2** to **6** places after the decimal point. Default is 3.

Response (Y-axis) - choose from **1** to **4** places after the decimal point. Default is 2.

Readout Position Choose where to place the marker readouts. Marker readouts are right-justified on the specified X-axis and Y-axis position. The default position (10.0, 10.0) is the upper-right corner of the grid. Position (1.0,1.0) is the lower-left corner. Readout position can be set independently for each window.

Note: Readout Position can also be changed using a mouse by left-clicking on the top readout and dragging to the new position.

Marker Colors Starts the Display Colors dialog with only the marker colors available. [Learn more](#).

Marker Table

You can display a table that provides a summary of marker data for the active trace. The marker data is displayed in the specified format for each marker.

How to view the Marker Table

Using front-panel HARDKEY [softkey] buttons

1. Press **DISPLAY**
2. then **[More]**
3. then **[Tables]**
4. then **[Marker Table]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Display**
3. then **Tables**
4. then **Marker Table**

Using Math / Memory Operations

You can perform four types of math on the active trace versus a memory trace. In addition three statistics (Mean, Standard Deviation and Peak to Peak) can be calculated and displayed for the active data trace.

- [Trace Math](#)
- [Trace Statistics](#)

Note: Trace Math (described here) allows you to quickly apply one of four math operations using memory traces. [Equation Editor](#) allows you to build custom equations using several types of traces from the same, or different channels.

Other Analyze Data topics

Trace Math

To perform any of the math operations, you must first store a trace to memory. You can display the memory trace using the [View](#) options.

Trace math is performed on the complex data before it is formatted for display. See the [PNA data processing map](#).

Markers can be used while viewing a memory trace.

How to select Trace Math

Using front-panel HARDKEY [softkey] buttons

1. Press **MEMORY**

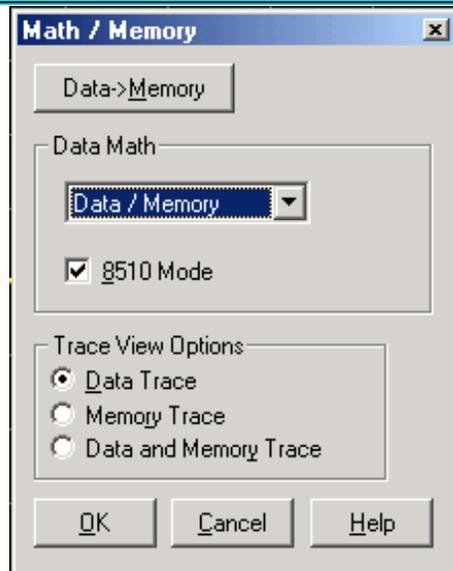

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Memory**
3. then **Memory**

Normalize, available only from the Memory menu, (not on the Math / Memory dialog), performs the same function as **Data=>Memory**, then **Data / Memory**.

[Programming Commands](#)

Math / Memory dialog box help

Normalize, available only from the Memory menu, (not on the Math / Memory dialog), performs the same function as **Data=>Memory**, then **Data / Memory**.

Data=>Memory Puts the active data trace into memory. You can store one memory trace for every displayed trace.

Note: Many PNA features are NOT allowed on Memory traces. For example, Memory traces can NOT be saved to any [file type](#) (PRN, SNP, CTI, CSV, MDF). However, you can restore a memory trace to a data trace using the **Memory-to-Data** utility at the <http://na.tm.agilent.com/pna/apps/applications.htm> website.

Data Math

All math operations are performed on linear (real and imaginary) data before being formatted. See the PNA Data flow (below).

Data (or OFF) Does no mathematical operation.

Data / Memory - Current measurement data is divided by the data in memory. Use for ratio comparison of two traces, such as measurements of gain or attenuation. [Learn more](#).

Data – Memory - Data in memory is subtracted from the current measurement data. For example, you can use this feature for storing a measured vector error, then subtracting this error from the DUT measurement. [Learn more](#).

Data + Memory - Current measurement data is added to the data in memory. [Learn more](#).

Data * Memory - Current measurement data is multiplied by the data in memory. [Learn more](#).

8510 Mode - [Learn more](#).

Trace View Options

Data Trace Displays ONLY the Data trace (with selected math operation applied).

Memory Trace Displays ONLY the trace that was put in memory.

Data and Memory Trace Displays BOTH the Data trace (with selected math operation applied), and the trace that was put in memory.

[Learn more about Trace Math](#) (scroll up)

(Data / Memory) and (Data - Memory)

(Data / Memory) and (Data - Memory) math operations are performed on linear data before it is formatted. Because data is often viewed in log format, it is not always clear which of the two math operations should be used. Remember: dividing linear data is the same as subtracting logarithmic data. The following illustrates, in general, when to use each operation.

Use **Data / Memory** for normalization purposes, such as when comparing S21 traces "before" and "after" a change is made or measurement of trace noise. In the following table, the Data/Mem values intuitively show the differences between traces. It is not obvious what Data-Mem is displaying.

S21 values to compare	Data/Mem	Data-Mem
0.5 dB and 0.6 dB	0.1 dB	-39 dB
0.5 dB and 0.7 dB	0.2 dB	-33 dB

Use **Data - Memory** to show the relative differences between two signals. Use for comparison of very small signals, such as the S11 match of two connectors.

In the following table, Data/Mem shows both pairs of connectors to have the same 2 dB difference. However, the second pair of connectors have much better S11 performance (-50 and -52) and the relative significance is shown in the Data-Mem values.

S11 values to compare	Data/Mem	Data-Mem
-10 dB and -12 dB	2 dB	-24 dB
-50 dB and -52 dB	2 dB	-64 dB

Data * Memory and Data + Memory

Use **Data * Memory** and **Data + Memory** to perform math on an active data trace using data from your own formulas or algorithms rather than data from a measurement. For example, if you want to

simulate the gain of a theoretical amplifier placed in series before the DUT, you could do the following:

1. Create an algorithm that would characterize the frequency response of the theoretical amplifier.
2. Enter complex data pairs that correspond to the number of data points for your data trace.
3. Load the data pairs into memory with SCPI or COM commands. The analyzer maps the complex pairs to correspond to the stimulus values at the actual measurement points.
4. Use the **data + memory** or **data * memory** function to add or multiply the frequency response data to the measured data from the active data trace.

Note: The data trace must be configured before you attempt to load the memory.

Trace Statistics

You can calculate and display statistics for the active data trace. These statistics are:

- Mean
- Standard deviation
- Peak-to-peak values

You can calculate statistics for the full stimulus span or for part of it by using User Ranges.

You can define up to 16 user ranges per channel. These user ranges are the same as the [Search Domain](#) specified for a marker search in that same channel. They use the same memory registers and thus share the same stimulus spans.

The user ranges for a channel can overlap each other.

A convenient use for trace statistics is to find the peak-to-peak value of passband ripple without searching separately for the minimum and maximum values.

The trace statistics are calculated based on the format used to display the data.

- [Rectangular data formats](#) are calculated from the scalar data represented in the display
- [Polar](#) or [Smith Chart](#) formats are calculated from the data as it would be displayed in [Log Mag](#) format

[See how to make Trace Statistics display settings.](#)

How to activate Trace Statistics

Using front-panel HARDKEY [softkey] buttons

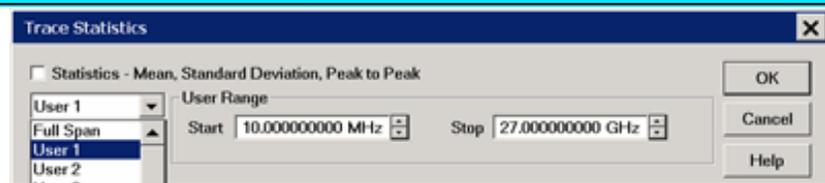

1. Press **ANALYSIS**
2. then **[Statistics]**
3. then **[Trace Statistics]**

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Analysis**
3. then **Trace Statistics**

Programming Commands

Trace Statistics dialog box help

[See how to make Trace Statistics display settings.](#)

Statistics Check to display mean, standard deviation, and peak to peak values for the active trace.

Span Specifies the span of the active trace where data is collected for a math operation. You can select Full Span, or define up to 16 user spans per channel with Start and Stop. You can also define the user spans from the Search Domain selector on the [Marker Search dialog box](#).

Start Defines the start of a user span.

Stop Defines the stop of a user span.

[Learn more about Trace Statistics](#) (scroll up)

8510 Mode

On the [Trace Math](#) dialog, check 8510 Mode to simulate the Agilent 8510 data processing chain as it pertains to Trace Math and Memory. This setting applies to all channels. When the box is checked or cleared, the PNA performs an [Instrument Preset](#) and retains its setting through subsequent Instrument Presets.

This setting can be saved as part of an [instrument state](#). However, when recalled, this setting is assumed only temporarily. When a subsequent PNA Preset is performed, the PNA reverts to the setting that was in effect before the state was recalled.

You can [set a preference](#) to always use 8510 mode.

A settings change in any of the operations that occur after the Memory operation on the above **PNA Data Flow** diagram changes both the Data trace and the Memory trace. For example, after storing a data trace to memory, when you change the format for the Data Trace, the format for the Memory Trace is also changed to the same setting.

Other 'Analyze Data' topics

Overview

Equation Editor allows you to enter an algebraic equation of standard mathematical operators and functions, referencing data that is available in the PNA. Once a valid equation is entered and enabled,

the display of the active trace is replaced with the results of the equation, and updated in real-time as new data is acquired. For equations that can be expressed with Equation Editor's supported functions, operators, and data, there is no need for off-line processing in a separate program.

For example, enter the equation $S_{21} / (1 - S_{11})$. The resulting trace is computed as each S_{21} data point divided by one minus the corresponding S_{11} data point. For a 201 point sweep setup, the computation is repeated 201 times, once for each point.

As another example, suppose you want the PNA to make a directivity measurement of your 3-port DUT. This is not a native PNA measurement, but can be achieved using the Equation Editor. The desired result is the sum and difference of LogMag formatted traces, expressed as: $S_{12} + S_{23} - S_{13}$.

Because Equation Editor operates on **unformatted complex data**, the required equation is:

```
DIR = S12 * S23 / S13
```

DIR becomes a display label to help you identify the computed data trace.

On the equation trace, set the format to LogMag.

How to start Equation Editor

Using front-panel HARDKEY [softkey] buttons

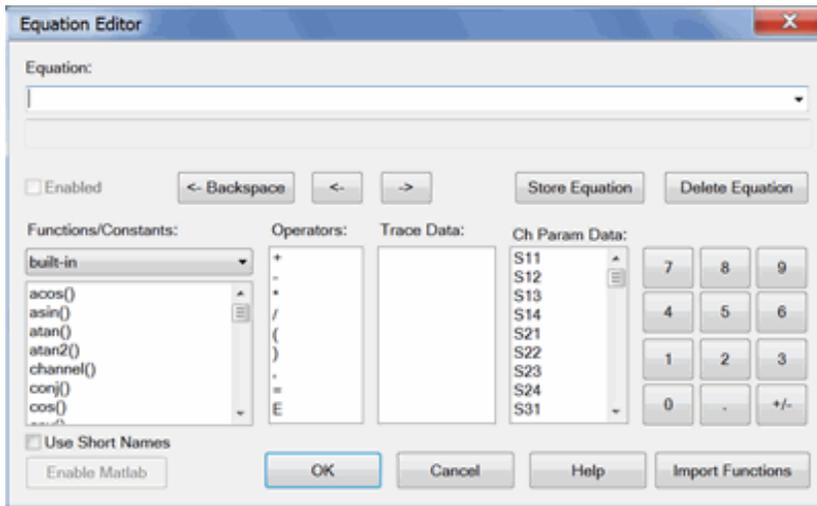

1. Press **ANALYSIS**
2. then **[Equation Editor]**

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Analysis**
3. then **Equation Editor**

<- Moves the cursor to the left without erasing characters.

-> Moves the cursor to the right without erasing characters.

Store Equation Press to save the current equation. To later recall the equation, click the down arrow to the right of the equation.

Delete Equation Removes the current equation from the drop-down list.

Functions/Constants: See [descriptions of Functions](#).

Select the "library" of functions to view. The "built-in" library appears by default which includes the standard functions of equation editor. Other functions that can appear here are functions that you have written and imported. [Learn more.](#)

Operators: See [descriptions of Operators](#).

Trace Data: Select from ALL of the currently **displayed** traces on ALL channels.

Ch Param Data: Select from **undisplayed** data that is available **ONLY** from the active channel (same channel as the equation trace). See [Data that is used in Equations](#).

Note: With an external test set enabled, only parameters involving ports 1 through 4 are listed. However, all available parameters can be typed directly into the **Equation** field.

Keypad: Provided to allow navigation of the entire dialog with a mouse.

Import Functions Click to launch the [Import Functions](#) Dialog box.

Use Short Names Some functions have shortened names that are entered automatically when checked. Both long and short names can be used interchangeably.

Enable Matlab Available when a full MATLAB version is installed by you on the PNA. [Learn more](#).

Using Equation Editor

1. Pick a trace in which to enter the equation

- Equation Editor works on the active trace.
- Either create a new trace, or click the [Trace Status](#) button on an existing trace to make the trace active.

2. Enter an equation

Start Equation Editor [See how](#).

- The equation text can be in the form of an expression $(S21)/(1-S11)$ or an equation $(DIR = S12 * S23 / S13)$. This topic refers to both types as equations.
- Either type, or double-click the Functions, Operators, and Data to build an equation.
- Functions and Constants ARE case-sensitive; Data names are NOT case sensitive.
- [Learn more about referring to data traces](#).

3. Check for a valid equation

When a valid equation is entered, the Enabled checkbox becomes available for checking. When the Enabled box is checked:

- The Equation Trace becomes computed data.
- The equation is visible on the [Trace Status](#) (up to about 10 characters).
- The equation is visible in the trace [Title](#) area (up to about 45 characters) when the Equation trace is active.
- The equation is visible in the [Status Bar](#) at the bottom of the display. This is updated only after the equation is entered and the [Trace Status](#) button is clicked.
- If an equation is NOT valid, and a trace from a different channel is used, make sure the number of data points is the same for both channels.

Learn more about the [Functions](#), [Operators](#), and [Data](#) that are used in Equation Editor.

Data that is used in Equation Editor

Definitions

- **Equation trace** A trace in which an equation resides.
- **Referred trace** A trace that is used as data in an equation.

Example: $eq=Tr2+S11$ is entered into **Tr1**.

Tr1 becomes an equation trace.

Tr2 and **S11** are both referred traces because they are used in the equation trace.

Notes

- Referred traces are processed one data point at a time. For example, the expression $S11/S21$ means that for each data point in S11 and S21, divide point N of S11 by point N of S21.
- Once an equation is enabled, the trace is no longer identified by its original measurement parameter. It becomes an equation trace.
- An equation trace can NOT refer to itself. For example, an equation in Tr1 cannot refer to trace Tr1.
- Referred traces can be selected from S-Parameters, Receiver data, and [Memory traces](#).
- [See note regarding External Test Sets.](#)
- See [Using Noise Power Traces in Equation Editor](#)

There are three ways to refer to traces:

The following distinction is important when discussing the three ways to refer to traces/data.

- **Trace** - a sequential collection of data points that are displayed on the PNA screen.

- **Data** - PNA measurements that are acquired but not displayed. When an equation trace refers to data that is not displayed, the PNA will automatically acquire the data.

1. Using **TrX** Trace notation (for example, Tr2).

When a trace is created, check "[Show Tr Annotation](#)" to see the **Tr** number of that trace.

- **Simple** - ALWAYS refers to displayed traces.
- Must be used for referring to traces in a different channel as the equation trace.
- All [trace settings](#) are preserved in the equation trace. If you do NOT want a trace setting to be used in the equation trace, you must disable it in the referred trace.
- If the referred trace is error corrected, then that data is corrected in the equation trace.
- Used to refer to a memory trace (it must already be stored in memory). Append .MEM to the **TrX** trace identifier. For example, **Tr2.mem** refers to the memory trace that is stored for Tr2.

2. Using **S-parameter** notation (for example, S11/S21)

- **Convenient** - ALWAYS refers to data that is NOT displayed.
- Refers to data that resides in the same channel as the equation.
- NOT the same as referring to a displayed S11 trace using **TrX** notation. [See Example](#).
 - The referred data includes NO [trace settings](#).
 - If the channel has error correction available, then it can be applied by turning error correction ON for the Equation trace.

3. Using **Receiver** notation (for example AB_2); NOT case sensitive.

At least one receiver is required, followed by an underscore and a number.

- The **letters** before the underscore refer to the receivers.
 - Letters alone refer to physical receivers.
 - Letters immediately followed by numbers refer to logical receivers. [Learn more](#).
 - If two receivers are referenced, they are ratioed.
- The **number** after the underscore refers to the source port for the measurement.

Examples

- AR1_2 = physical receiver A / physical receiver R1 with 2 as the source port.
- a3b4_1 = reference receiver for port 3 / test port receiver for port 4 with 1 as the source port.

[Learn more about ratioed and unratioed receiver measurements.](#)

Receiver notation is like S-parameter notation in that:

- Refers to data that is NOT displayed and resides in the same channel as the equation.
- The referred data includes NO trace settings.
- If the channel has error correction available for that receiver, then it can be applied by turning error correction ON for the Equation trace.

Referring to Traces in a different channel

When the equation trace refers to a trace on a different channel:

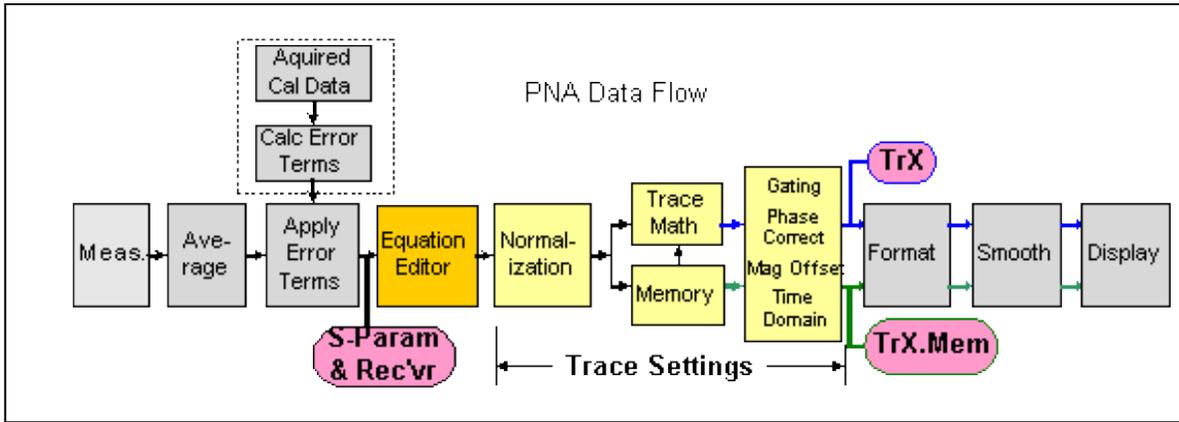

- The trace must already be displayed.
- Must refer to the trace using **TrX** notation.
- The Equation trace and the referred trace MUST have the same number of data points or the Enable checkbox will not be available.
- The Equation trace is updated when the last referred data in the same channel is acquired. Therefore, to prevent 'stale' data from being used, the Equation trace must be on a higher numbered channel than the referred trace. This is because the PNA acquires data in ascending channel number order - first channel 1, then channel 2, and so forth. If the Equation trace is on channel 1, and it refers to a trace on channel 2, the Equation trace will update after channel 1 is finished sweeping, using 'old' data for the channel 2 trace.

Port Extensions and Equation Editor

When using port extension with an equation, turn Fixturing ON to ensure that the underlying parameters have port extension properly applied. Learn more.

Trace Settings, Error Correction, and an Example

This discussion highlights the differences between using **S-parameter / Receiver** notation and **TrX** notation when referring to traces. The key to understanding the differences is realizing that **S-parameter / Receiver** notation ALWAYS refers to data that is NOT displayed.

- **Trace Settings** Normalization, Trace Math, Gating, Phase and Mag Offset, Electrical Delay, Time Domain.
- **Equation Editor** processing occurs on the **equation trace** immediately after error correction.
- **Referred Data/Trace** (used in the equation) is taken from the following locations:
 - When using **TrX** notation, data is taken immediately before formatting . These traces are always displayed and include **Trace Settings**.
 - When using **S-parameter / Receiver** notation, data is taken immediately after error correction. This data is NOT displayed and includes **NO** trace settings ([see example](#)).

See Equation Editor Notes at [GetData Method](#) or [GetDataByString Method](#).

Error-correction and Equation Editor

Using **TrX** notation:

- The Trace Settings and Error-correction on the referred trace are used in the Equation trace.
- If error correction is NOT ON, then the raw, uncorrected data is used in the equation trace.
- To see if error correction is ON, make the trace active, then see the [Correction level in the status bar](#).
- Turning error correction ON/OFF on the equation trace has no meaning. The referred data that is used in the equation is ALWAYS what determines its level of correction.

Using **S-parameter** and **Receiver** notation:

- Because the data is not displayed, **NO** trace settings are used in the Equation trace.
- Correction can be turned ON/OFF if corrected data is available for the referred data. Exception: When using S-parameter and Receiver notation to refer to a trace on a channel that has been calibrated with a [Response Cal](#) or Receiver Cal, correction can NOT be turned ON, even though the Status Bar indicates otherwise. For example: Tr1 is an S11 measurement with a Response Cal. Tr2 is an equation trace that refers to S11. The Tr2 equation trace is NOT corrected, even though the Status Bar may indicate that it is corrected. However, if Tr2 refers to Tr1 (not S11), the Tr2 equation trace is corrected.

Example

This example illustrates the differences when referring to a trace using **S-parameter** notation and **TrX** notation:

- **Tr1** is an S11 measurement with no equation, 2-port correction ON, and Time Domain transform ON.
- **Tr2** is an equation trace that refers to **Tr1**. Tr2 is corrected because Tr1 is corrected. Tr2 is transformed because Tr1 is transformed. If transform is turned ON for Tr2, the data will be transformed AGAIN, which results in "unusual" data.
- **Tr3** is an equation trace that refers to **S11**. This is NOT the same as referring to Tr1. The S11 trace that is referred to is a different instance of S11 that is NOT displayed, and has NO trace settings. Notice that Tr3 data is NOT transformed, although Tr1 is transformed. Correction for **Tr3** can be turned ON and OFF because a calibration was performed on the channel in which the S11 trace resides.
- **Note:** X- axis annotation of the Equation trace is completely independent of the data that is presented. ONLY the **data values** from a referred trace are used. For example, notice that the Equation trace **Tr2** has Frequency on the X-axis although the referred trace **Tr1** is presented in Time.

Functions and Constants used in Equation Editor

ALL trace data that is used in Equation Editor is unformatted, complex data.

When using a mouse with the PNA, hover over a function in the dialog to learn how it is used.

In the following table,

- Function(scalar x) means that an automatic conversion from a complex number to its scalar magnitude is performed before passing the value to the function.
- Function(complex x) means that the entire complex value is used.
- **a, b, c, d** are arguments that are used in the function.

Function/Constant	Description
acos(scalar a)	returns the arc cosine of a in radians
asin(scalar a)	returns the arc sine of a in radians
atan(scalar a)	returns the arc tangent of a in radians
atan2	returns the phase of complex a = (re,im) in radians has the following two argument sets: <ul style="list-style-type: none"> • atan2(complex a) - returns the phase in radians • atan2(scalar a, scalar b)
conj(complex a)	takes a and returns the complex conjugate
cos(complex a)	takes a in radians and returns the cosine
cpx(scalar a, scalar b)	returns a complex value (a+ib) from two scalar values
e	returns the constant $\approx 2.71828\dots$
exp(complex a)	returns the exponential of a
getNumPoints()	returns the number of points for the current sweep
im(complex a)	returns the imag part of a as the scalar part of the result (zeroes the imag part)
kfac(complex a, complex b, complex c, complex d)	k-factor: $k = (1 - a ^2 - d ^2 + a*d-b*c ^2) / (2 * b*c)$
when entered in EE: kfac(S11,S21,S12,S22)	returns a scalar result - the imaginary part of the complex result is always 0
ln(complex a)	returns the natural logarithm of a
log10(complex a)	returns the base 10 logarithm of a

mag(complex a)	returns $\sqrt{\mathbf{a.re}*\mathbf{a.re}+\mathbf{a.im}*\mathbf{a.im}}$
max(complex a, complex b, ...)	returns the complex value that has the largest magnitude of a list of values.
max_hold(complex a)	holds the current maximums of the sweep. Disable the equation to reset. See example
median(complex a, complex b,...)	returns the median of a list of complex values <ul style="list-style-type: none"> • The median is determined by sorting the values by magnitude, and returning the middle one. • If an even number of values is passed, then the smaller of the two middle values is returned.
min(complex a, complex b, ...)	returns the complex value that has the smallest magnitude of a list of values.
min_hold(complex a)	holds the current minimums of the sweep. Disable the equation to reset. See example
mrkx(a)	returns the x-axis value of the active marker on trace a.
mrky(a)	returns the y-axis value of the active marker on trace a.
mu1(complex a, complex b, complex c, complex d) when entered in EE: mu1(S11,S21,S12,S22)	$\mu1 = (1 - \mathbf{a} ^2) / (d - \text{conj}(\mathbf{a}) * (\mathbf{a}*d-\mathbf{b}*c) + \mathbf{b}*c)$
mu2(complex a, complex b, complex c, complex d) when entered in EE: mu1(S11,S21,S12,S22)	$\mu2 = (1 - \mathbf{d} ^2) / (a - \text{conj}(\mathbf{d}) * (\mathbf{a}*d-\mathbf{b}*c) + \mathbf{b}*c)$
for both mu1 and mu2 (Usually written with the Greek character μ)	<ul style="list-style-type: none"> • conj is the complex conjugate. For scalars \mathbf{a} and \mathbf{b}, $\text{conj}(\mathbf{a}+i\mathbf{b}) = (\mathbf{a}-i\mathbf{b})$ • returns a scalar result - the imaginary part of the complex result is always 0
phase(complex a)	returns $\text{atan2}(\mathbf{a})$ in degrees
PI	returns the numeric constant pi (3.141592), which is the ratio of the circumference of a circle to its diameter
pow(complex a,complex b)	returns \mathbf{a} to the power \mathbf{b}
re(complex a)	returns the scalar part of \mathbf{a} (zeroes the imag part)
sin(complex a)	takes \mathbf{a} in radians and returns the sine
sqrt(complex a)	returns the square root of \mathbf{a} , with phase angle in the half-open interval $(-\pi/2, \pi/2]$

tan(complex a)	takes a in radians and returns the tangent
traceDataArray(complex a)	returns the entire set of points from a sweep. Function is intended to be used as an argument in an custom function to allow access for data array processing.
xAxisArray()	returns the x-axis values for the entire sweep.
xAxisIndex()	returns the current index in the sweep.
xAxisValue()	returns the current value of the x-axis index.

Operators used in Equation Editor

Operator	Description
+	Addition
-	Subtraction
*	Multiplication
/	Division
(Open parenthesis
)	Close parenthesis
,	Comma - separator for arguments (as in S11, S22)
=	Equal (optional)
E	Exponent (as in 23.45E6)

Example Equations

The following examples may help you get started with Equation Editor.

Offset each data point in Tr2 from Tr1 by 2dB

Use the function: pow(complex **a**, complex **b**) -- returns **a** to the power **b**.

$$20\log(a) + 2 = 20\log(x)$$

$$\log(a) + 2/20 = \log(x) \text{ // divide all by 20.}$$

$$x = 10^{(\log(a) + 2/20)} \text{ // swap sides and take 10 to the power of both sides}$$

$$x = 10^{\log(a)} * 10^{(2/20)}$$

$$x = a * 10^{(2/20)}$$

The equation is entered into Tr2 as:

$$\text{Offset}=\text{Tr1}*\text{pow}(10, 2/20)$$

To offset by 5 dB

```
Offset=Tr1*pow(10, 5/20).
```

Balanced Match using a 2-port PNA

```
SDD11 = (S11-S21-S12+S22)/2
```

Conversion loss

```
B_1/pow(10, -15/20)
```

- B_1 is a receiver measurement;
- -15 is the input power in dBm

Third-order intercept point (IP3 or TOI)

```
TR1*sqrt(Tr1/Tr3)
```

- Tr1 = input signal power
- Tr3 = intermodulation power (both traces measured with single receivers)

Harmonics in dBc

```
B_1/Tr2
```

- B_1 is tuned to a harmonic frequency
- Tr2 = power at fundamental frequency, measured with B_1 receiver

PAE (Power Added Efficiency)

$P_{out} - P_{in} / P_{dc}$

Type the following equation into a new trace with an unratiod measurement, such as AI1. The data format is REAL:

```
PAE = 100 * (.001*pow(mag(Tr1),2) - (.001*pow(mag(Tr1),2)/pow(mag(Tr2),2)))/(Tr3*Tr4)
```

Where:

- Tr1 - a trace that measures unratiod B receiver.
- Tr2 - a corrected S21 trace (amplifier gain)
- Tr3 - a trace that measures [ADC voltage](#) (AI1) across a sensing resistor.

- Tr4 = an equation trace containing $I_{supp} = (Tr3 / \text{value of sensing resistor})$.

Data is displayed in Real format with units actually being watts.

1-port Insertion Loss

When it is not possible to connect both ends of a cable to the PNA, a 1-port insertion loss measurement can be made. However, the measured loss must be divided by 2 because the result includes the loss going down **and** coming back through the cable. This assumes that the device is terminated with a short or open to reflect all of the power. The 'divide by 2' operation (for dB) is performed as follows using Equation Editor:

- Tr1 - an S11 trace in log mag format.
- Tr2 - an equation trace containing `sqrt(Tr1)`

Max and Min Hold

These two functions allow you to capture and display either the Maximum or Minimum values for each data point over multiple sweeps.

Maxhold(S21) - displays the maximum value for each data point until reset. Reset by disabling, then enabling the equation. This example refers to an S21 trace that is not displayed.

Saving Equation Editor Data

Equation data can be saved to the PNA hard drive in the following formats:

- [Citifile \(.cti\)](#) - Equation data is saved and recalled. The file header indicates the "underlying" s-parameter trace type.
- [PRN](#) - read by Spreadsheet software. Can NOT be recalled by the PNA.
- [CSV](#) - read by Spreadsheet software. Can NOT be recalled by the PNA.
- [MDIF](#) - compatible with Agilent ADS (Advanced Design System). Can NOT be recalled by the PNA.
- [Print to File](#) (bmp, jpg, png) - saves image of PNA screen.

Equation data can NOT be saved in [.SnP file format](#). When attempting to save an Equation trace in .SnP format, the "underlying" S-parameter data is saved; not Equation data.

Last Modified:

12-Dec-2013	Added Matlab enable
26-Feb-2013	Several additions for A.09.90
6-Apr-2011	Replaced 1-port example with JV ex.
5-Nov-2010	Edited TR annotation
20-Sep-2010	Added file types to save data
2-Sep-10	Added link to NF
11-Jun-2009	Added link to GetData
3-Sep-2008	Removed legacy content
22-Aug-2008	Added xAxisArray() Maxhold() and Minhold() function
6-May-2008	Added Import functions
3-Jul-2007	Added PAE and other notes
18-Jun-2007	Added examples

Using Limit Lines

Limit lines allow you to compare measurement data to performance constraints that you define.

- [Overview](#)
- [Create and Edit Limit Lines](#)
- [Display and Test with Limit Lines](#)
- [Testing with Sufficient Data Points](#)

Other Analyze Data topics

Overview

Limit lines are visual representations on the PNA screen of the specified limits for a measurement. You can use limit lines to do the following:

- Give the operator **visual guides** when tuning devices.
- Provide **standard criteria** for meeting device specification.
- Show the **comparison** of data versus specifications.

Limit testing compares the measured data with defined limits, and provides optional **Pass or Fail** information for each measured data point.

You can have up to **100** discrete lines for each measurement trace allowing you to test all aspects of your DUT response.

Limit lines and limit testing are **NOT** available with **Smith Chart** or **Polar** display format. If limit lines are ON and you change to Smith Chart or Polar format, the analyzer will automatically disable the limit lines and limit testing.

Create and Edit Limit Lines

You can create limit lines for all measurement traces. The limit lines are the same color as the measurement trace.

Limit lines are made up of discrete lines with four coordinates:

- BEGIN and END stimulus - X-axis values.

- BEGIN and END response - Y-axis values.

How to create, edit, and test with Limit Lines

All limit line settings are made with the limit table. Use one of the following methods to show the limit table:

Using front-panel HARDKEY [softkey] buttons

1. Press **ANALYSIS**
2. then **[Limits]**
3. then **[Limit Test]**

Using a mouse with PNA Menus

1. Click **Marker/Analysis**
2. then **Analysis**
3. then **Limit Test**

Programming Commands

Limit Table

	TYPE	BEGIN STIMULUS	END STIMULUS	BEGIN RESPONSE	END RESPONSE
1	MIN	1.930000 GHz	1.990000 GHz	-5.000000 dB	-5.000000 dB
2	MAX	1.000000 GHz	1.500000 GHz	-60.000000 dB	-50.000000 dB
3	MAX	2.050000 GHz	3.000000 GHz	-50.000000 dB	-60.000000 dB
4	OFF	0.000000 GHz	0.000000 Hz	0.000000 dB	0.000000 dB

Note: To ADD a limit line to the table, change the last limit line to either MAX or MIN

1. In the **Type** area of the Limit Table, select **MIN** or **MAX** for Limit Line 1.
 - The MIN value will fail measurements BELOW this limit.
 - The MAX value will fail measurements ABOVE this limit.
2. Click **BEGIN STIMULUS** for Limit Segment 1. Enter the desired value.
3. Click **END STIMULUS** for Limit Segment 1. Enter the desired value.
4. Click **BEGIN RESPONSE** for Limit Segment 1. Enter the desired value.
5. Click **END RESPONSE** for Limit Segment 1. Enter the desired value.
6. Repeat Steps 1-5 for each desired limit line.

Displaying and Testing with Limit Lines

After creating limit lines, you can then choose to **display** or **hide** them for each trace. The specified limits remain valid even if limit lines are not displayed.

Limit testing cannot be performed on memory traces.

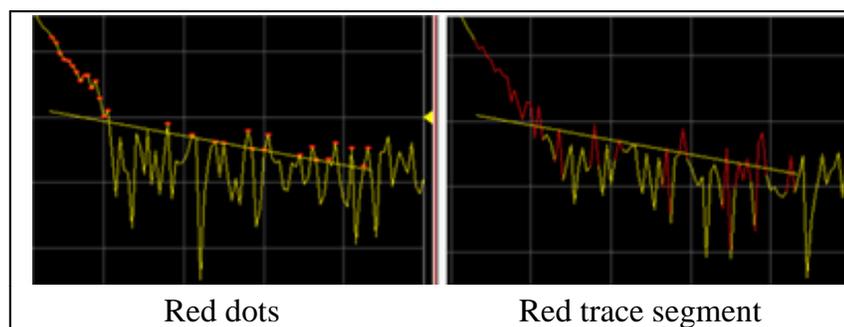

You can choose to provide a visual and / or audible PASS / FAIL indication.

With limit testing turned ON:

- Any portion of the measurement trace that **fails** is **displayed in red**.
- Any portion of the measurement trace that does **NOT fail** remains unchanged and silent.

Display failed trace points or trace segments

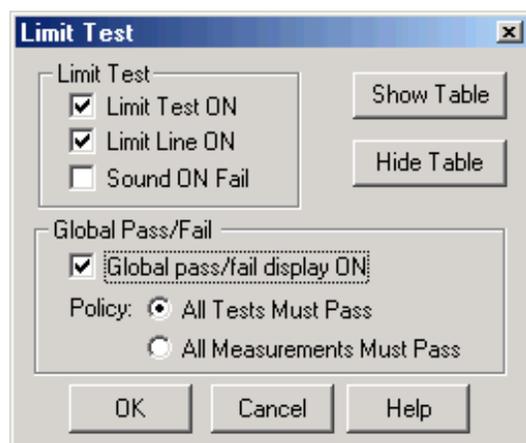

You can display the data points that fail limit line testing as red dots or as a red trace segment. The default behavior can be changed with a Preference setting. [Learn how.](#)

PASS is the default mode of Pass / Fail testing.

A data point will FAIL only if a measured point falls outside of the limits.

- If the limit line is set to OFF, the entire trace will PASS.
- If there is no measured data point at a limit line stimulus setting, that point will PASS.

Limit Test dialog box help

Show Table Shows the table that allows you to create and edit limits.

Hide Table Makes the limits table disappear from the screen.

Note: To ADD a limit line to the table, change the last limit line to either MAX or MIN

Limit Test

Limit Test ON Check the box to compare the data trace to the limits and display PASS or FAIL.

Limit Line ON Check the box to make the limits visible on the screen. (Testing still occurs if the limits are not visible.)

Sound ON Fail Check the box to make the PNA beep when a point on the data trace fails the limit test.

Global Pass/Fail

The Pass/Fail indicator provides an easy way to monitor the status of ALL measurements.

Global pass/fail display ON Check to display the Global Pass/Fail status.

Policy: Choose which of the following must occur for the Global Pass/Fail status to display PASS:

- All Tests (with **Limit Test ON**) Must Pass - This setting reads the results from the Limit Tests. If all tests (with **Limit Test ON**) PASS, then the Global Pass/Fail status will PASS.
- All Measurements Must Pass - This more critical setting shows FAIL unless all measured data points fall within established test limits **and** Limit Test is ON. **Note:** In this mode, if one measurement does NOT have **Limit Test ON**, Global Pass/Fail will show FAIL.

[Learn more about displaying and testing with Limits \(scroll up\)](#)

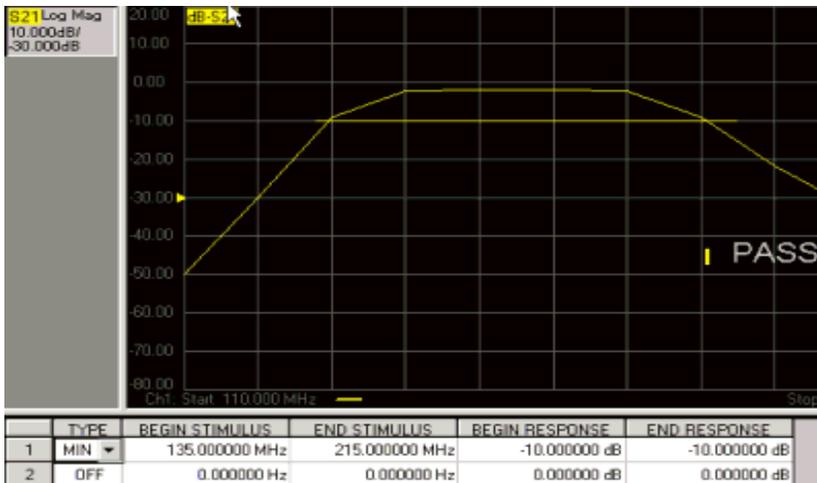

Testing with Sufficient Data Points

Limits are checked only at the actual measured data points. Therefore, It is possible for a device to be out of specification without a limit test failure indication if the data point density is insufficient.

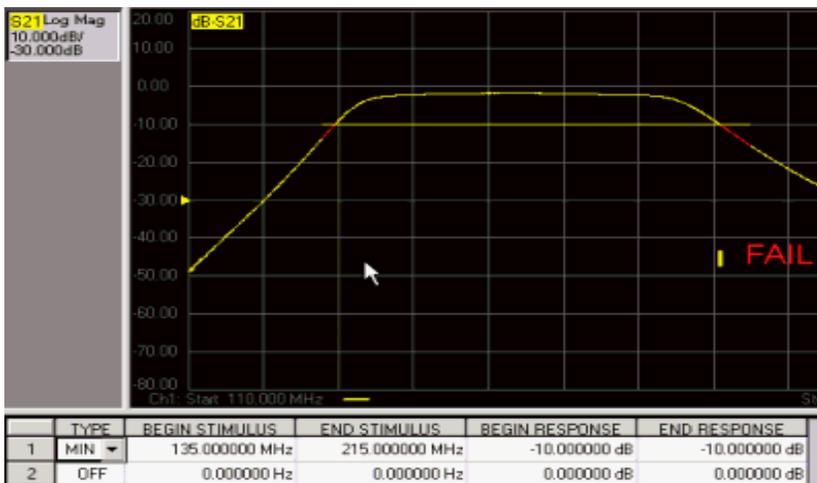

The following image is a data trace of an actual filter using 11 data points (approximately one every vertical graticule). The filter is being tested with a minimum limit line (any data point under the limit line fails).

Although the data trace is clearly below the limit line on both sides of the filter skirts, there is a PASS

indication because there is no data point being measured at these frequencies.

The following image shows the exact same conditions, except the number of data points is increased to 1601. The filter now fails the minimum limit test indicated by the red data trace.

Last Modified:

- 14-Mar-2013 Edited default fail type
- 11-Aug-2009 Added failed dots
- 3-Sep-2008 Removed legacy content
- 2-Feb-2007 MX Added UI

Save and Recall a File

The PNA allows you to save and recall files to and from an internal or external storage device in a variety of file formats.

- [How to Save PNA Instrument State](#)
- [How to Save PNA Measurement Data](#)
- [How to Recall a File](#)
- [About Instrument State and Calibration Data](#) (.csa, .cst, .sta, .cal)
- [About Measurement Data Files](#) (.prn, .snp, .cti, .csv, .mdf)
- [Managing Files without a Mouse](#)

Other Data Outputting topics

How to Save Instrument State and Calibration Files

Use one of the following methods:

Using front-panel HARDKEY [softkey] buttons

1. Press **SAVE**
2. then [**Save**], [**Save As**], or [**Auto Save**]

Using a mouse with PNA Menus

1. Click **File**
2. then **Save** or **Save As**

[Learn all about PNA Instrument State files.](#)

Save Immediately saves the PNA state and possibly calibration data to the filename and extension you used when you last performed a Save. This file will be overwritten the next time you click **Save**. To prevent this, use one of the following methods.

Save As Starts the [Save As](#) dialog box.

Auto Save NOT available from the PNA menu. Saves state and calibration data to the internal hard disk in the c:\users\public\network analyzer\documents folder. A filename is generated automatically using the syntax "**atxxx.csa**"; where xxx is a number that is incremented by one when a new file is Auto Saved.

Save (State and Calibration) As dialog box help

Save Allows you to navigate to the directory where you want to save the file.

File name Displays the filename that you either typed in or clicked on in the directory contents box.

Note: Filenames (not including the path name) MUST be limited to 64 characters.

Save as type

The following file types save **Instrument states and Calibration data**. You can save, and later recall, instrument settings and calibration data for **all channels** currently in use on the PNA. These file types are only recognized by Agilent PNA Series analyzers.

[Learn more about these file types.](#)

- ***.csa** - save Instrument state and actual Cal Set data (cal/state archive) **Default selection.**
- ***.cst** - save Instrument state and a link to the Cal Set data.
- ***.sta** - save Instrument state ONLY (**no** calibration data)
- ***.cal** - save actual Calibration data ONLY (**no** Instrument state)

Note: To save the PNA screen as .bmp, .jpg, or .png graphics file types, click **File / Print to File.**

[Learn more.](#)

Save Saves the file to the specified file name and directory.

How to Save Measurement Data

Use one of the following methods:

Using front-panel HARDKEY [softkey] buttons

1. Press **SAVE**
2. then **[Save Data As]**

Using a mouse with PNA Menus

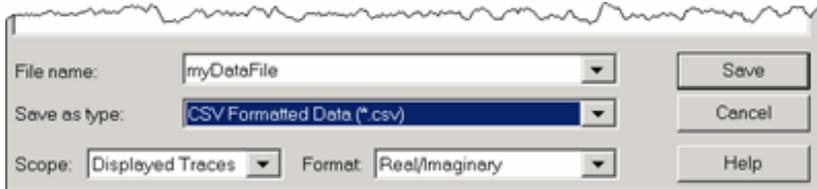

1. Click **File**
2. then **Save Data As**

Save Data As Saves the current trace(s) to the specified type of file.

Note: This dialog now contains the settings previously selected from the old [Define Data Save](#) dialog.

◀ Programming Commands ▶

Save Data As dialog box help

Note: Before saving measurement data, always [trigger a single](#) measurement, and then allow the PNA channel to go into Hold. This ensures that the entire measurement trace is saved.

Note: [Memory traces](#) can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF).

Save Allows you to navigate to the directory where you want to save the file.

File name Displays the filename that you either typed in or clicked on in the directory contents box.

Note: Filenames (not including the path name) MUST be limited to 64 characters.

Save as type Choose from: (click each to learn more about each file type): [*.prm](#), [*.SNP](#), [*.SNPX](#), [*.cti \(citifile\)](#), [*.csv](#), [*.mdf](#).

- FCA, GCA, Swept IMD, and Swept IMDx data can be saved to a special csv format. Learn how ([FCA](#), [GCA - Swept IMD](#))
- **Trace and Noise Parameters (*.snp)** - Save the noise figure parameters and S-parameters. [Learn more.](#)

- To save the PNA screen as .bmp, .jpg, or .png graphics file types, click **File / Print to File**. [Learn more.](#)

Data Scope

Determines what traces are saved to a file. Available ONLY with *.cti, *.csv, and *.mdf.

- **Auto**
 - When correction is OFF, saves the specified trace.
 - When correction is ON, saves all corrected parameters associated with the calibrated ports in the Cal Set.
 - For GCA and Swept IMD channels, saves the active trace only.
- **Single Trace** - Saves the active trace.
- **Displayed Traces** - Saves all displayed traces for all channels.

Format

Determines the format of the data. Available with (CTI Formatted, CSV, SNP, MDIF)

- **Auto** - Data is saved in LogMag or LinMag if one of these is the currently selected display format. If format is other than these, then data is saved in Real/Imag.
- **Displayed Format (CSV and MDIF only)** - Data is saved in the format of the displayed trace.
- **LogMag, LinMag, Real/Imag** - Select output format.
 - The imaginary portion for all **LogMag** and **LinMag** data is saved in degrees.
 - Real/ Imag data is never smoothed.

Note: .prn files can only save the active trace in the displayed format.

Save Saves the file to the specified file name and directory.

How to Recall (open) a file

Use one of the following methods:

Using front-panel HARDKEY [softkey] buttons

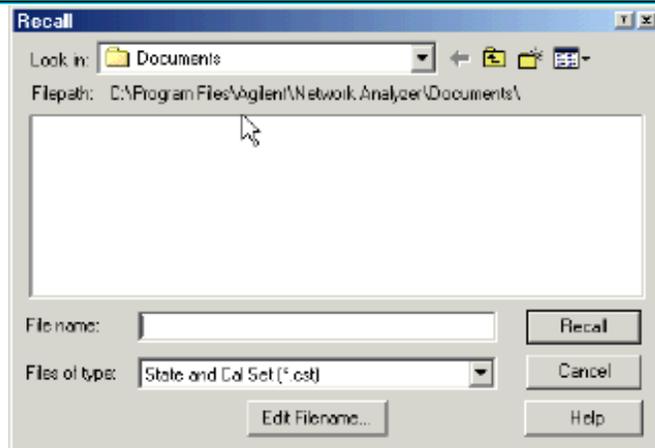

1. Press **RECALL**
2. then [**Recall**]
3. Select from a list of 12 files shown on softkeys. The list can be sorted by 'most recently used' or alphabetically depending on a preference. The preference setting appears at the bottom of the second page of softkeys listing files to be recalled, or on the [Preference dialog](#).
4. or press the Recall softkey to start the following dialog.

Using a mouse with PNA Menus

1. Click **File**
2. then **Recall**
3. Select from the top 6 'most recently used' list.
4. or click **Recall** to start the following dialog.

Programming Commands

Recall dialog box help

Look in Allows you to select the directory that contains the file that you want to recall.

Filename Displays the filename that you either typed in or clicked on in the directory contents box.

Files of type Allows you view and select files that are listed in categories of a file type. The following types of files can be recalled into the PNA: All [State files](#), Citi files, SNP files.

Recalling PNA State files

When an Instrument State file is recalled into the PNA, the current state of the instrument is overwritten with the recalled state. A *.cal file does not contain an instrument state, but only calibration data. [Learn more about Instrument States.](#)

See also [Power ON and OFF during Save / Recall, User Preset, and Preset.](#)

Recalling Data files into the PNA

Citi files and SNP files can be recalled and viewed in the PNA.

1. Click **File** then **Recall**.
2. Select **Citifile Data** or **Snp**.
3. Select the file to recall
4. Click **Recall**.

Note: Citi files that were saved in [CW Time sweep](#) can NOT be recalled into the PNA

Note: Filenames (not including the path name) that are longer than 64 characters will NOT be recalled.

Recalled data is ALWAYS displayed on the PNA using [LogMag format](#), regardless of how the file was stored.

The channel is placed in Trigger Hold. If triggering is resumed, the data will be overwritten.

SNP files are recalled as traces into a single window and channel, beginning at the [highest available channel number allowed on the PNA](#). For multi-port SNP files (greater than 4 ports), if the number of S parameters in the file is beyond the [maximum number of traces in a window](#), then new windows will be created.

Citi files are recalled into the same window and channel configuration as when they were saved. However, the new recalled channel numbers begin with the [highest channel number allowed on the PNA](#) and decrement for each additional channel.

For example, when a citi file is saved, two traces are in window 1, channel 1 and two additional traces are in window 2, channel 2. When recalled into a factory preset condition (1 trace in window 1, channel 1), the first two recalled traces appear in window 2, highest channel number, and the second two traces appear in window 3, (highest channel number -1). See also [Traces, Channels, and Windows on the PNA](#)

Recall Recalls the file displayed in the file name box.

Instrument State / Calibration Files

You can save, and later recall, instrument settings and calibration data **for all channels** currently in use on the PNA.

An **Instrument State** contains almost every PNA setting. The following PNA settings are NOT saved and recalled with Instrument State:

- [GPIB address](#)
- [RF power ON/OFF](#) (depends on current setting)
- [Test set I/O settings](#)

The following file types are used to save and recall instrument states and Cal Set information:

File Types		Information that is stored for each channel
.csa	.cst	<p>Instrument State Information</p> <p>Channels/Traces Averaging</p> <p>Windows Markers</p> <p>Triggering Math/memory</p> <p>Format Limits</p> <p>Scale More...</p> <p>Stimulus Information:</p> <p>Frequency range Alternate sweep</p> <p>Number of points Port powers</p> <p>IF bandwidth Source attenuators</p> <p>Sweep type Receiver attenuators</p> <p>Sweep mode Test Set port map</p>
		<p>Cal Set Information</p> <p>GUID (Globally Unique Identifier) provides link to Cal Set</p> <p>Name, Description, Modify date</p> <p>Stimulus Information:</p> <p>Frequency range Alternate sweep</p> <p>Number of points Port powers</p> <p>IF bandwidth Source attenuators</p> <p>Sweep type Receiver attenuators</p> <p>Sweep mode Test Set port map</p> <p>Error Terms: Directivity, Crosstalk, Source match, Load match, Reflection tracking, Transmission tracking</p>
	.sta	
		.cal

File Type Descriptions and Recall

The following describes each file type, and what occurs when the file type is recalled.

*.sta files

- Contain ONLY instrument state information - NOT Cal data.
- When recalled, they always replace the current instrument state immediately.

*.cst files

- Contain BOTH instrument state and a LINK to the Cal Sets. [Learn more about Cal Sets.](#)
- The **quickest and most flexible** method of saving and recalling a calibrated instrument state.
- Channels need not have cal data to save as .cst file.
- When recalled, the state information is loaded first. Then the PNA tries to [apply a Cal Set](#) as you would do manually. If the stimulus settings are different between the instrument state and the linked Cal Set, the usual choice is presented ([see Cal Sets](#)). If the linked Cal Set has been deleted, a message is displayed, but the state information remains in place.
- Because only a link to the Cal Set is saved, the Cal Set can be shared with other measurements.

Note: Before saving a .cst file, be sure that a User Cal Set (NOT a Cal Register) is being used for the calibration. Cal Registers are overwritten with new data whenever a calibration is performed, and may not be accurate cal data when the .cst file is recalled. [Learn more about Cal Sets.](#)

*.cal files

- Contain ONLY Cal Set information.
- When recalled, the Cal Set is NOT automatically applied. Apply the calibration data to a channel as you would [apply any Cal Set](#).
- [Learn about Recalling](#)

*.csa files

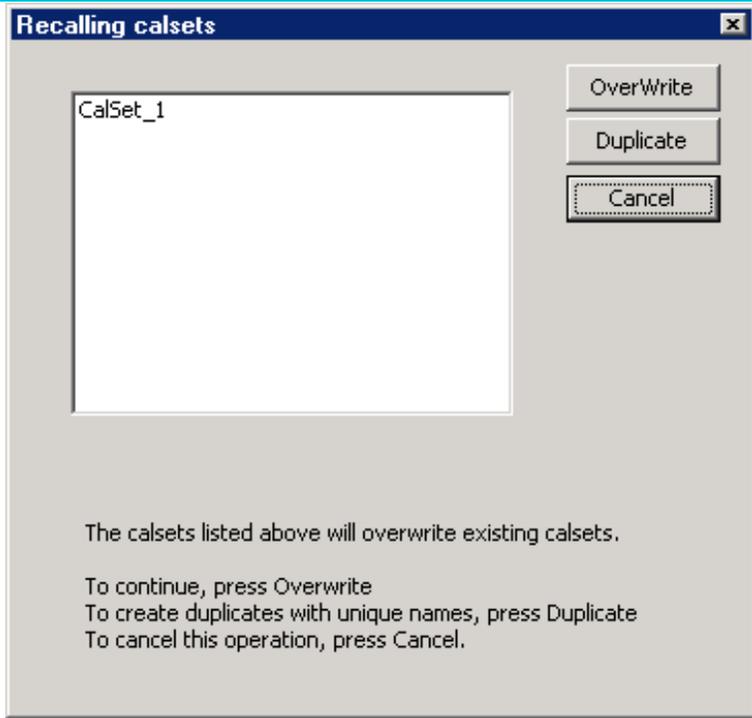

- Contain ALL instrument state and the actual Cal Set; not a link to the Cal Set.

- The **safest** method of saving and recalling a calibrated instrument state. However, the file size is larger than a *.cst file, and the save and recall times are longer. In addition, because the actual Cal Set is saved, it is very difficult to share the cal data with other measurements.
- Channels need not be calibrated to save as .cst file.
- The Cal Set that is saved could be a [Cal Register or a User Cal Set](#).
- [Learn about Recalling](#)

Note: *.pcs files are the internal file format the PNA uses for storing cal sets. These files should never be accessed or copied by the user.

Recalling Cal Sets

Recalling Cal Sets dialog box help

The calsets listed above will overwrite existing calsets.

To continue, press Overwrite
 To create duplicates with unique names, press Duplicate
 To cancel this operation, press Cancel.

Both **.cal** and **.csa** file types contain whole Cal Sets. When these file types are recalled, the PNA checks to see if the incoming Cal Set GUID matches an existing PNA Cal Set GUID. If it does, and if the rest of the Cal Set contents are different in any way, then both of these Cal Sets can NOT coexist in the PNA and you are offered the following choices.

Because all PNA channels are saved, there could be more than one Cal Set in either of these file types.

Overwrite The incoming Cal Set will replace the existing Cal Set.

Duplicate (Only available with .cal recalls.) Because the Cal Set is not automatically applied, you can choose to apply either the original or duplicate Cal Set. The original Cal Set remains in the .cal file.

Cancel Abandon the recall operation.

The PNA will offer a choice as described in each file type below. [Learn more about Cal Sets.](#)

Measurement Data Files

Measurement data is saved as ASCII file types for use in a spreadsheet or CAE programs.

Note: Before saving measurement data, always [trigger a single](#) measurement, and then allow the PNA channel to go into Hold. This ensures that the entire measurement trace is saved.

Note: [Memory traces](#) can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF).

The following file types can be saved by the PNA.

- [*.prn files](#)
- [*.SNP \(Touchstone\)](#)
- [*.cti \(Citifile\)](#)
- [*.csv](#)
- [*.mdf \(MDIF\)](#)

*.prn Files

Prn files have the following attributes:

- Comma-separated data which can be read into rows and columns by spreadsheet software, such as Microsoft Excel. To avoid the "delimiting" dialog boxes, change the filename extension from .prn to .csv. Then open directly into Microsoft Excel.
- Contain formatted and corrected stimulus and response data for the current active trace ONLY.
- Are Output only - they cannot be read by the PNA.
- Beginning with PNA Rev 6.2, [FCA](#) and [Cal Set Viewer](#) data can be saved to *.prn files

Example:

"S11 Log Mag"

"Frequency (Hz)",	"dB"
3.000000e+005 ,	-3.528682e+001 ,
4.529850e+007 ,	-2.817913e+001 ,
9.029700e+007 ,	-3.216808e+001 ,
1.352955e+008 ,	-3.101017e+001 ,

.SNP Format (*.s1p, *.s2p, *.s3p, *.s4p, and so forth)

- *.SNP file format, also known as Touchstone format, is specified by IBIS. [See the Touchstone specification.](#)
- *.SNP file format is used by CAE programs such as Agilent's Microwave Design System (MDS) and Advanced Design System (ADS).
- *.SNP data is saved using the **File**, [Save Data As](#) dialog.

Before saving measurement data, always [trigger a single](#) measurement, and then allow the PNA channel to go into Hold. This ensures that the entire measurement trace is saved.

*.SNP files and other PNA settings

- .SNP data can be [recalled](#) and viewed on the PNA, or read by the PNA [embed/de-embed](#) functions.
- To save SNP data with an [external test set](#) enabled, at the File, [Save As](#) dialog, select **SNP File(*.s*p)**, then complete the ["Choose Ports " dialog](#).
- When [Fixturing](#) is enabled, all of the enabled data transforms (De-embedding, Port Z Conversion, and so forth) are applied to saved SNP files.
- When [Smoothing](#) is applied to a trace, the smoothing is NOT saved when the format is Real, Imaginary (RI). Select a different format to save the smoothed data.
- Segmented FCA data is saved to *.S2PX files. Scroll down or [click here](#) to learn more.
- Learn about [FCA parameters that are saved to an S2P file](#).
- Noise Figure parameters and S-parameters can be saved to an *.s2p file. [Learn more](#).
- Balanced parameters can be saved to *.SNP files. See the ["Choose Ports " dialog](#).
- **IMPORTANT** - ALL valid data is saved using the same format and settings (trace math, offset, delay, and so forth) as the active measurement. This can cause the data that is saved for the non-active measurements to be dramatically different from the data that is displayed. For example, when saving an S2P file, if the active S11 measurement is set to Data/Mem (data divided by memory), then ALL 4 S-parameters are saved using Data/Mem. The memory trace that is used in the Data/Mem operation is the same as that used in the active (S11) measurement.

What is Saved

*.SNP data is generally used to gather all S-parameters for a fully corrected measurement. The PNA saves the data that is available on the channel of the active measurement.

File Type	# of Ports	# of S-parameters saved
*.s1p	1	1 S-parameter
*.s2p	2	4 S-parameters
*.s3p	3	9 S-parameters
*.s4p	4	16 S-parameters
...
*.SNP	N	N^2 S-parameters

- If correction for a **Full N-port cal** is applied, then valid data is returned for all corrected s-parameters. Response calcs will save uncorrected data.
- If requesting **less** data than is available, the [Choose ports for SNP data](#) dialog appears. Previous to PNA release 6.2, data was returned beginning with the first calibrated ports until your request is fulfilled.
- If correction is NOT applied, the PNA returns as much applicable raw data as possible using S-parameter measurements on the selected channel. Data that is not available is zero-filled. For example, if correction is NOT applied and the active measurement is S11, and an S21 measurement also exists on the channel, then data is returned for the S11 and S21 measurements. Data for S12 and S22 is not available and therefore returned as zeros in Real/Imaginary format. In Log Mag/Phase format, this appears as -200 dB and 45 degrees.

.SNP Data Output

.SNP files contain header information, stimulus data, a response data pair for EACH S-parameter measurement. The only difference between .s1p, s2p, and so forth, is the number of S-parameters that are saved.

The following is a sample of **Header information**:

```
!Agilent Technologies,E8362B,US42340026,Q.03.54
!Agilent E8362B: Q.03.54
!Date: Friday, April 25, 2003 13:46:41

.S2PX Data Output

*.S2PX files are used for Segmented Mixer Data. [Learn more.](#)

The following ADDITIONAL columns precede parameter data:

SegIndex,InputFreq,OutputFreq,LO1Freq,InputPower,LO1Power, <parameter data>

Choose ports for SNP File dialog box help

This dialog allows you to choose which S-parameter data to save when selecting File, [Save As](#), Trace SNP and any of the following conditions exist:

- you request less data than is available
- you want data for more than 4 ports
- a balanced measurement is active

Number of ports Select the number of ports for which data will be saved.

The following buttons appear when a [Balanced measurement](#) is displayed.

Normal Click to save normal (single-ended) port data.

Mixed Mode Click to save balanced (logical) port data. Choices are based on the [topology selection](#) for current active parameter:

- **SE-Bal**: Choose from S1, D2, C2 (Single-ended port 1, Differential port 2, Common port 2)
- **SE, SE, Bal**: Choose from S1, S2, D3, C3 (Single-ended port 1, Single-ended port 2, Differential port 3, Common port 3)
- **Bal-Bal**: Choose from D1, C1, D2, C2 (Differential port 1, Common port 1, Differential port 2, Common port 2)

For example, with SE-Bal topology, choose 2 ports, S1 for first, and D2 for second. The following 4 parameters are saved: Sss11, Ssd12, Sds21, Sdd22.

Arrow buttons Click to Add and Remove ports for the following columns:

Available Ports The PNA / External test set ports. There may NOT be valid data available for all of these ports. [Learn more.](#)

Chosen Ports When **OK** is clicked, SNP data is saved for these ports.

OK Becomes available when the number of **Chosen ports** = the **Number of ports** to save. Click to save to SNP file.

With **Number of ports** = 2, .s2p data is saved; with **Number of ports** = 3, .s3p data is saved, and so forth. [Learn more about SNP files](#)

.cti CitiFiles

Citifile format is compatible with the Agilent 8510 Network Analyzer and Agilent's Microwave Design System (MDS).

You can do the following using citifiles :

- save the active trace, or all traces.
- save formatted or unformatted citifile data

To save Formatted *.cti data

1. Click **File** then **Save Data As**
 2. Select **Citifile Formatted Data (*.cti)**
-

```

```

The above image is a Citifile opened in Notepad. There are two traces in separate channels - one is an FCA trace. Each trace has 3 data points. The save settings = **Displayed Traces Content**, and **Auto Format**.

Format is identified by DBANGLE (log mag), MAGANGLE (Lin Mag), or RI (real, imaginary - NOT shown)

On the [data access map](#), Formatted data is taken from location 2 or 4.

To save Unformatted *.cti data

1. Click **File**, then **Save Data As**
2. Select **Citifile Data Data (*.cti)**

On the [data access map](#), Unformatted data is taken from the block just before Format.

Citifiles can be recalled and viewed in the PNA. [Learn more.](#)

*.csv Files

Note: 2D Gain Compression data is saved as *.csv files using a different format than shown here. [Learn more.](#)

CSV files are read by spreadsheet programs such as Microsoft Excel.

To save *.csv files:

1. Click **File**, then **Save Data As**
2. Under **Save as type**, select **CSV Formatted Data**

*.csv files contain: header information and the following Comma-Separated Values.

- Stimulus data
- Data pairs for EACH S-parameter

```
!CSV A.01.01

Define Data Saves

Note: Although these settings are still supported, they are no longer necessary to save data files. The [Save Data As](#) dialog box contains these settings.

How to select Define Data Saves

Using front-panel HARDKEY [softkey] buttons	Using a mouse with PNA Menus
1. Press SYSTEM	1. Click Utility
2. then [Configure]	2. then System
3. then [More]	3. then Configure
4. then [Preferences]	4. then Preferences
5. then Data Saves	5. then Data Saves

Programming Commands

Define Data Saves dialog box help

Note: Although these settings are still supported, they are no longer necessary to save data files. The [Save Data As](#) dialog box contains these settings.

The following settings survive an Instrument Preset and PNA Shutdown.

CitiFile, CSV, and MDIF Contents

Determines what is saved to a .cti file.

Auto - Saves the active trace. Additional traces are saved if correction is ON. For Full 2-port calibration, 4 traces are saved; for Full 3-port calibration, 9 traces are saved, and so forth.

Single Trace - Saves the active trace.

Displayed Traces - Saves all displayed traces for all channels.

Citifile and CSV Format

Auto - Data is saved in LogMag or LinMag if one of these is the currently selected display format. If format is other than these, then data is saved in Real/Imag.

LogMag, LinMag, Real/Imag - Select output format.

- The imaginary portion for all LogMag and LinMag data is saved in degrees.
- Real/ Imag data is never smoothed.

SnP Format (.s1p, .s2p, .s3p)

[Learn more about SnP files.](#)

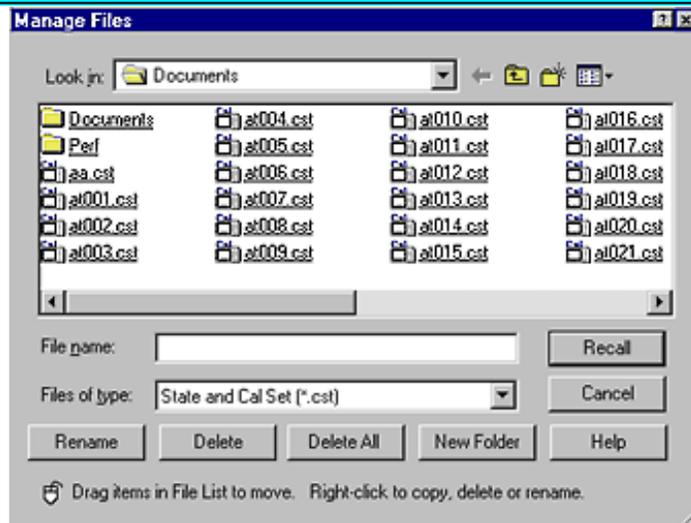

Auto - Data is saved in LogMag or LinMag if one of these is the currently selected format. If format is other than these, then data is saved in Real/Imag.

LogMag, LinMag, Real/Imag - Select output format. The imaginary portion for all LogMag and LinMag data is output is in degrees.

Manage Files without a Mouse

The Manage Files dialog box is designed to be used from the front panel. It performs the same function as Windows Explorer, but can be used without the use of a mouse or keyboard.

Manage Files dialog box help

Recall Opens a Network Analyzer file already stored in memory.

Rename Renames a file that is selected in the open folder.

Delete Removes a selected file from the open folder.

Delete All Removes all files of the file type selected that appear in the open folder.

New folder Create a new folder and give it a name.

29-Jun-2012 Added sNp data with response cal
29-Jun-2012 Added filename limitation
1-Jun-2011 Added S2PX
20-Sep-2010 Added memory trace notes
11-Nov-2009 Added snp fixturing note
3-Sep-2008 Removed legacy content
22-Aug-2008 Clarified invalid SNP data as -200 dB.
9-Jun-2008 Added no smoothing for real/imag cti files.
12-May-2008 Removed csv detail
17-Apr-2008 Added clarification and image to define data saves.
17-Oct-2007 Added note for MM
10/23/06 Added pcs note
9/18/06 MQ Added choose ports for snp
9/12/06 Added link to programming commands

Drive Mapping

Drive mapping allows you to share disk drives between the PNA and an external computer.

To prepare for Drive Mapping:

1. Both the PC and PNA must be connected to a shared computer network
2. You must know the full computer name of the Analyzer you are mapping **TO**. [Tell me how](#)

Note: This procedure requires a mouse and keyboard.

Map to a drive on the PNA from an External PC

1. On the analyzer desktop, click **Windows Explorer**. Right-click on the drive you want to share. Click **Sharing...**
2. In the dialog box, select **Shared this folder**. In the **Share Name** box, type in a share name for the drive. For example: **C\$**. Click **OK**.
3. On the external PC desktop, click **Windows Explorer**. From the **Tools** menu, click **Map Network Drive**.
4. If the current logon on your PC is different from the current logon on the analyzer, click **Connect using a different Logon** to connect to using the current analyzer logon, .This logon must be registered on the external PC. To see the current logon on either the PC or analyzer, hold **Ctrl - Alt**, and press **Delete**.
 - a. In the **Connect as** box, type the logon currently being used by the analyzer.
 - b. In the **Password** box, type the logon password that you use on the external computer. Click **OK**
5. In the **Folder** box, type *//computername ([prep1](#))/share name* (from step 2). (For example: *//SLT1234/C\$*)
6. Click **Finish**.

Last Modified:

25-Nov-2013 Modified for Win7

Print a Displayed Measurement

The analyzer allows you to print a displayed measurement to a printer or to a file. The printer can be either networked or local.

- [Connecting a Printer](#)
- [Printing](#)

Other Outputting Data topics

Connecting a Printer

You can connect a printer to one of the PNA USB ports or to the LAN connector.

To Add a Printer

Note: If you try to print from the PNA application and the **Add Printer Wizard** appears, click **Cancel** and add the printer using the following procedure.

1. From the PNA application, click **View** then click **Minimize Application**
2. On the Windows taskbar, click **Start**, point to **Settings**, then click **Printers**.
3. Double-click **Add Printer**.
4. Follow the instructions in the **Add Printer** Wizard.

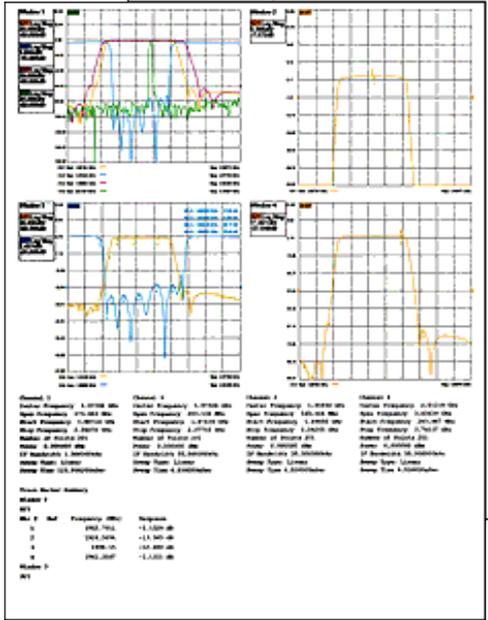

For more information, refer to Microsoft Windows Help or your printer documentation.

Printing

- [Print a Hardcopy](#)
- [Page Setup](#)
- [Print to File](#)

The measurement information on the screen can be printed to any local or networked printer that is connected to the PNA. The graphic below shows an example of how a screen-capture image appears when printed. The [Page Setup](#) settings allows you to customize the printed form of the measurement information.

Ch	Ref	Frequency (MHz)	Response
1	100%	1.000000	1.76e-06
2	100%	1.000000	1.84e-06
3	100%	1.000000	1.84e-06
4	100%	1.000000	1.84e-06
5	100%	1.000000	1.84e-06
6	100%	1.000000	1.84e-06
7	100%	1.000000	1.84e-06
8	100%	1.000000	1.84e-06
9	100%	1.000000	1.84e-06
10	100%	1.000000	1.84e-06

How to Print a Hardcopy

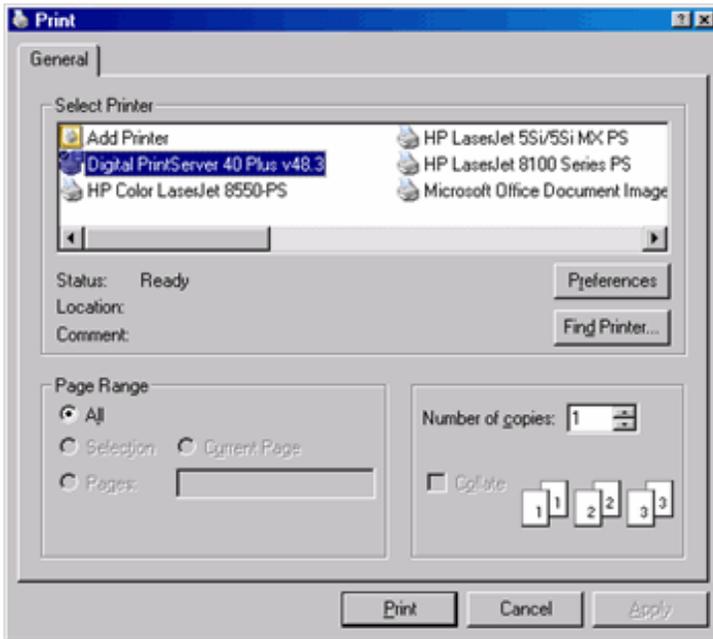

Using front-panel HARDKEY [softkey] buttons

1. Press **PRINT**
2. then **[Print]**

Using a mouse with PNA Menus

1. Click **File**
2. then **Print**
3. then **Print**

No programming commands are available for this feature.

Note: For information on the choices in the Print dialog box, see Windows Help.

Page Setup

The Page Setup dialog allows flexibility in the appearance that measurement data is printed. After setting up the page, click **File**, then **Print...** to obtain a hard-copy.

How to select Page Setup

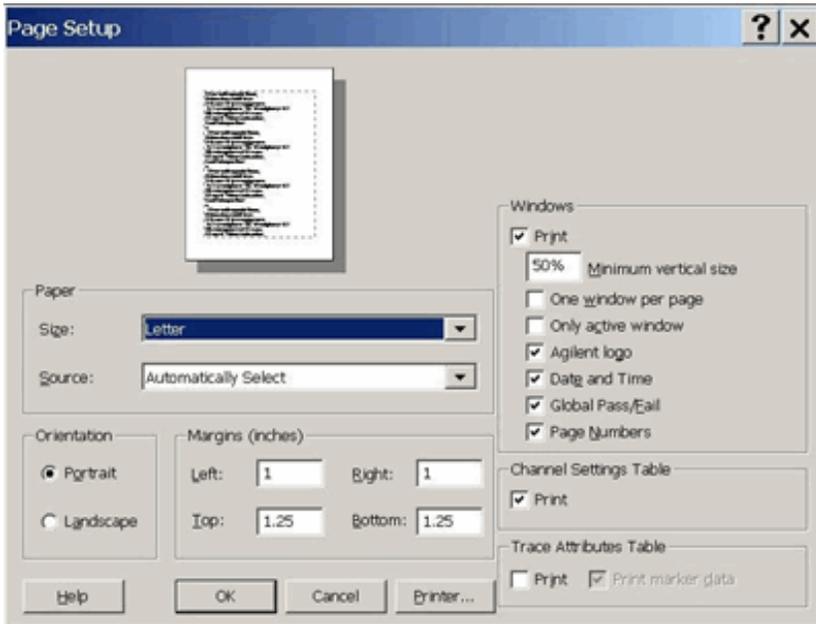

Using front-panel HARDKEY [softkey] buttons

1. Press **PRINT**
2. then **[Page Setup]**

Using a mouse with PNA Menus

1. Click **File**
2. then **Print**
3. then **Print Options**

◀ **Programming Commands** ▶

Page Setup dialog box help

Paper, Orientation, and Margins

These settings do NOT survive a PNA shutdown.

See Windows Help for information on these settings.

Windows

The following PNA-specific settings DO survive a PNA shutdown:

Minimum vertical size Adjust to change the amount of a page that the measurement window fills. The adjustment range is from 40 to 100%.

One window per page Check to print one window per page. Clear to print all selected windows without a forced page break.

Only active window Check to print only the active window. Clear to print all windows.

Agilent logo Check to print the Agilent logo to the header.

Data and Time Check to add the current date and time to the header.

Global Pass/Fail Check to add the Global Pass/Fail status to the header.

Page Numbers Check to add page numbers (1 of n) to the header.

Channel Settings Table

Print Check to print the channel settings table.

Segment data can no longer be printed.

Trace Attributes Table

Print Check to print the Trace Attributes Table. The Trace Attributes are measurement type, correction factors ON or OFF, smoothing, options, and marker details. The Trace Attributes are listed by Trace ID# for each window.

Each Trace ID# can have multiple entries depending on the number of markers associated with the trace. The marker details are marker number, position and response. If there are multiple markers on a trace, the trace attributes are only shown for the first marker. However, the trace attributes for the first marker apply to all other markers on that trace.

The options column can have one or more options. **D** for Delay, **M** for Marker, **G** for Gating. Multiple options selected would appear as follows: DMG.

Print marker data Check to print all marker data. The amount of data depends on how many markers are created.

Print to a File

The analyzer can save a screen-capture image in any of the following formats:

- **.png** (preferred format)
- **.bmp** (bitmap)
- **.jpg**

The analyzer automatically saves the file to the current path. If not previously defined, the analyzer automatically selects the default path c:\users\public\network analyzer\documents.

A .bmp file, like a .prn file, can be imported into software applications such as Microsoft Excel, Word, or Paint to display a screen-capture image.

[See Save and Recall files for more information.](#)

How to Print to a File

Using front-panel HARDKEY [softkey] buttons

1. Press **PRINT**
2. then **[Print to File]**

Using a mouse with PNA Menus

1. Click **File**
2. then **Print**
3. then **Print to File**

Programming Commands

Last modified:

7-Apr-2009 Added ECalModules/Module
13-Nov-2007 Replaced image with text

Added NFA, ENRFile, and GCA

Application Object

Description

The Application object is the highest object in the PNA [object model](#). This object presents methods and properties that affect the entire analyzer, rather than a specific channel or measurement. For example, the application object provides the GetIDString method. There's only one ID string for the instrument, unrelated to the channel or parameter being measured. Likewise, the TriggerSignal Property is global to the instrument. You can elect to use an internally generated (free run) trigger or a manual trigger. Either way, that type of trigger generation will be used on all measurements, on all channels. Therefore, it is under the Application object.

Accessing the Application object

This object is unique in that you must **create** this object rather than just get a handle to it.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
```

Replace <analyzerName> with the full computer name of your PNA. For example, "My PNA". See [Change Computer Name](#).

- [Superseded commands](#)

(**Bold** Methods or Properties provide access to a child object)

Methods	Interface	Description
	See History	
ActivateWindow	IApplication	Makes a window object the Active Window.
AllowAllEvents	IApplication	Monitors all events
AllowEventCategory	IApplication	Monitors an event category
AllowEventMessage	IApplication	Monitors an event

AllowEventSeverity	IApplication	Monitors an event severity level
BuildHybridKit	IApplication	Defines the user kit as port1kit + port2kit.
Channel	IApplication	Returns a handle to the channel object for the supplied channel number.
Configure	IApplication9	Restarts as an "N-port" PNA using the specified multiport test set.
CreateCustomMeasurementEx	IApplication3	Creates a new custom measurement with initialization.
CreateCustomMeasurement	IApplication	Superseded with CreateCustomMeasurementEx Method
CreateMeasurement	IApplication	Creates a new measurement.
CreateSParameter	IApplication	Creates a new S-Parameter measurement.
CreateSParameterEx	IApplication	Superseded with Create SParameter Method
DeleteShortcut	IApplication	Removes a macro (shortcut) from the list of macros
DisallowAllEvents	IApplication	Monitors NO events
DoPrint	IApplication	Prints the screen to the active Printer.
ExecuteShortcut	IApplication	Executes a macro (shortcut) stored in the analyzer.
GetAuxIO	IApplication	Returns a handle to the AuxIO interface
GetCalManager	IApplication	Returns a handle to the CalManager interface
GetExternalTestSetIO	IApplication	Returns a handle to the ExternalTestSet IO interface
GetIPConfigurationStruct	IApplication14	Returns an NA_IPConfiguration data structure which contains information about the current status of the PNA computer networking configuration.
GetMaterialHandlerIO	IApplication	Returns a handle to the MaterialHandlerIO interface
GetShortcut	IApplication	Returns the title and path of the specified macro (shortcut).
LANConfigurationInitialize	IApplication13	Resets the PNA LAN configuration.
LaunchCalWizard	IApplication	Launches the Cal Wizard
LaunchDialog	IApplication10	Launches the specified dialog box.
ManualTrigger	IApplication	Triggers the analyzer when TriggerSignal = naTriggerManual.
Preset	IApplication	Resets the analyzer to factory defined default settings.

PrintToFile	IApplication	Saves the screen data to bitmap (.bmp) file of the screen.
PutShortcut	IApplication	Puts a Macro (shortcut) file into the analyzer.
Quit	IApplication	Ends the Network Analyzer application.
Recall	IApplication	Recalls a measurement state, calibration state, or both from the hard drive into the analyzer.
RecallKits	IApplication	Recalls the calibration kits definitions that were stored with the SaveKits command.
Reset	IApplication	Removes all existing windows and measurements.
RestoreCalKitDefaults	IApplication	Restores the factory defaults for the specified kit.
RestoreCalKitDefaultsAll	IApplication	Restores the factory defaults for all kits.
Save	IApplication	Saves instrument state and calibration files to disk
SaveCitiDataData	IApplication5	Saves UNFORMATTED trace data to .cti file. Superseded with SaveData
SaveCitiFormattedData	IApplication5	Saves FORMATTED trace data to .cti file. Superseded with SaveData
SaveData	IApplication18	Saves trace data to files on disk.
SaveKits	IApplication	Saves all cal kits to disk.
SetFailOnOverRange	IApplication	Causes over range values to return an error code
SetIPConfiguration	IApplication14	Modifies settings of the PNAs computer networking configuration.
ShowStatusBar	IApplication	Shows and Hides the Status Bar.
ShowStimulus	IApplication	Shows and Hides Stimulus information.
ShowTitleBars	IApplication	Shows and Hides the Title Bars.
ShowToolbar	IApplication	Shows and Hides the specified Toolbar.
UserPreset	IApplication7	Performs a User Preset.
UserPresetLoadFile	IApplication7	Loads an existing instrument state file (.sta or .cst) to be used for User Preset.
UserPresetSaveState	IApplication7	Saves the current instrument settings as UserPreset.sta.

Properties

Description

<u>ActiveCalKit</u>	IApplication	Returns a pointer to the kit identified by kitNumber.
<u>ActiveChannel</u>	IApplication	Returns a handle to the Active Channel object.
<u>ActiveMeasurement</u>	IApplication	Returns a handle to the Active Measurement object.
<u>ActiveNAWindow</u>	IApplication	Returns a handle to the Active Window object.
<u>ArrangeWindows</u>	IApplication	Sets or returns the arrangement of all the windows.
<u>AuxiliaryTriggerCount</u>	IApplication11	Returns the number of Aux trigger input / output connector pairs in the instrument.
<u>CalKitType</u>	IApplication	Sets or returns the calibration kit type for to be used for calibration or for kit modification. Shared with the CalKit object.
<u>Capabilities</u>	IApplication4	Return capabilities of the remote PNA.
<u>Channels</u>	IApplication	Collection for iterating through the channels
<u>CoupledMarkers</u>	IApplication	Sets (or reads) coupled markers ON and OFF
<u>DisplayAutomationErrors</u>	IApplication2	Enables or disables automation error messages from being displayed on the screen. U
<u>DisplayGlobalPassFail</u>	IApplication6	Shows or hides the dialog which displays global pass/fail results.
<u>E5091Testsets</u>	IApplication8	Collection to control the E5091A testset.
<u>ENRFile</u>	IApplication13	Manages Noise ENR files.
<u>ExternalALC</u>	IApplication	Sets or returns the source of the analyzer leveling control.
<u>ExternalDevices</u>	IApplication16	Collection to control External Devices
<u>ExternalTestsets</u>	IApplication9	Collection to control External Test sets.
<u>FIFO</u>	IApplication15	Controls FIFO settings
<u>GlobalPowerLimit</u>	IApplication17	Controls Global Power Limit settings
<u>GPIBAddress</u>	IApplication8	Sets and returns the PNA GPIB address.
<u>GPIBMode</u>	IApplication	Makes the analyzer the system controller or a talker/listener.
<u>GridLineType</u>	IApplication17	Set and return the line type of the window grid (solid dotted)
<u>IDString</u>	IApplication	Returns the model, serial number and software revision of the analyzer

<u>InterfaceControl</u>	IApplication8	Control the Interface control features.
<u>IOConfiguration</u>	IApplication19	Provides access to IO Configuration commands
<u>LANConfiguration</u>	IApplication13	Returns the current status of the PNA computer networking configuration.
<u>LXIDeviceIDState</u>	IApplication14	Displays the LAN Status dialog with LAN Status Indicator showing IDENTIFY.
<u>LocalLockoutState</u>	IApplication4	Prevents use of the mouse, keyboard, and front panel while your program is running.
<u>Measurement</u>	IApplication	Create and manage measurements
<u>Measurements</u>	IApplication	Collection for iterating through the Application measurements.
<u>MessageText</u>	IApplication	Returns text for the specified eventID
<u>NaWindows</u>	IApplication	Collection for iterating through the Application windows.
<u>NoiseSourceState</u>	IApplication13	Sets and Reads the ON OFF state of the noise source
<u>NumberOfPorts</u>	IApplication	Returns the number of hardware source ports on the PNA
<u>Options</u>	IApplication	Returns the options on the analyzer
<u>PathConfigurationManager</u>	IApplication11	Provides access to hardware configuration.
<u>Port Extensions</u>	IApplication	Superseded with <u>Fixturing Object</u>
<u>Preferences</u>	IApplication5	Preferences for many PNA settings..
<u>ScpiStringParser</u>	IApplication	Provides the ability to send a SCPI command from within the COM command.
<u>SecurityLevel</u>	IApplication4	Turns ON or OFF the display of frequency information.
<u>SICL</u>	IApplication5	Allows control of the PNA via SICL
<u>SICLAddress</u>	IApplication8	Sets and returns the PNA SICL address
<u>SourcePowerCalibrator</u>	IApplication2	Allows capability for performing source power calibrations.
<u>SourcePowerState</u>	IApplication	Turns Source Power ON and OFF.
<u>SystemImpedanceZ0</u>	IApplication	Sets the analyzer impedance value.
<u>SystemName</u>	IApplication	Returns the full computer name of the PNA.

Touchscreen	IApplication12	Enables and disables touchscreen.
TriggerDelay	IApplication	Sets or returns the delay time for a trigger.
TriggerSetup	IApplication4	Controls triggering for the entire PNA application.
TriggerSignal	IApplication	Superseded with Source Property
TriggerType	IApplication	Superseded with Scope Property
UserPresetEnable	IApplication7	'Checks' and 'clears' the enable box on the User Preset dialog box.
VelocityFactor	IApplication	Sets the velocity factor to be used with Electrical Delay, Port Extensions, and Time Domain marker distance calculations.
Visible	IApplication	Makes the Network Analyzer application visible or not visible.
WindowState	IApplication	Sets or returns the window setting of Maximized, Minimized, or Normal. Shared with the NAWindow Object

Events	Interface	Description
OnCalEvent	IApplication	Triggered by a calibration event.
OnChannelEvent	IApplication	Triggered by a channel event.
OnDisplayEvent	IApplication	Triggered by a display event.
OnHardwareEvent	IApplication	Triggered by a hardware event.
OnMeasurementEvent	IApplication	Triggered by a measurement event.
OnSCPIEvent	IApplication	Triggered by a SCPI event.
OnSystemEvent	IApplication	Triggered by a system event.
OnUserEvent	IApplication	For future use

Last Modified:

17-Oct-2007 Updated IPathConfigMgr Prop

AuxiliaryTrigger Object

Description

These properties setup Auxiliary triggering on a channel.

Accessing the object

Use `chan.AuxTrigger (n)` to access the object.

where **n**= the connector pair to be used for Auxiliary Triggering.

- PNA-X models: Use **1** or **2**
- All other PNA models: Use **1** - **These models do NOT have an Aux Input; only an Output. Therefore, the following 'Input' commands will return an error when sent to PNA models other than the PNA-X.**

Use [app.AuxiliaryTriggerCount](#) to determine the number of auxiliary trigger pairs on the rear panel of a PNA.

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim AuxTrig as AuxTrigger
AuxTrig = chan.AuxTrigger(2)
```

Methods	Interface	Description
	See History (below)	

None

Properties		Description
Delay (Input)	IAuxTrigger	Specifies the delay that should be applied by the PNA after the Aux trigger input is received and before the acquisition is made
Enable	IAuxTrigger	Turns ON / OFF the trigger output.
HandshakeEnable (Input)	IAuxTrigger	Turns handshake ON / OFF.
Number	IAuxTrigger	Reads the number of the Aux I/O pair being used.
TriggerInPolarity (Input)	IAuxTrigger	Specifies the polarity of the trigger IN signal to which the PNA will respond.
TriggerInType (Input)	IAuxTrigger	Specifies the type of Aux trigger input being supplied to the PNA
TriggerOutDuration	IAuxTrigger	Specifies the width of the pulse or the time that the Aux trigger output will be asserted
TriggerOutInterval	IAuxTrigger	Specifies how often a trigger output signal is sent.
TriggerOutPolarity	IAuxTrigger	Specifies the polarity of the trigger output signal being supplied by the PNA.
TriggerOutPosition	IAuxTrigger	Specifies whether the Aux trigger out signal is sent Before or After the acquisition.

BalancedTopology Object

Description

The [DUTTopology](#) property sets and returns the topology of a balanced DUT.

The following methods **set** the port mappings for the DUT.

The remaining properties **return** the port mappings for the DUT.

Use the [BalancedMeasurement object](#) to set the measurement type.

Accessing the BalancedTopology object

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel

Dim balTopology as BalancedTopology
Set balTopology = chan.BalancedTopology
```

See Also:

Method	Interface	Description
	See History	
SetBBPorts	IBalancedTopology	Sets the physical port mappings for the Balanced - Balanced DUT topology.
SetBSPorts	IBalancedTopology2	Sets the physical port mappings for the Balanced - Single-Ended DUT topology.
SetSBPorts	IBalancedTopology	Sets the physical port mappings for the Single-Ended - Balanced DUT topology.
SetSSBPorts	IBalancedTopology	Sets the physical port mappings for the Single-Ended - Single-Ended - Balanced DUT topology.

Property	Interface	Description
<u>BB_BalPort1Negative</u>	IBalancedTopology	Returns the PNA port number that is connected to the Negative side of the DUT's logical Port 1 .
<u>BB_BalPort1Positive</u>	IBalancedTopology	Returns the first positive balanced port number in the Balanced - Balanced topology
<u>BB_BalPort2Negative</u>	IBalancedTopology	Returns the second negative balanced port number in the Balanced - Balanced topology.
<u>BB_BalPort2Positive</u>	IBalancedTopology	Returns the second positive balanced port number in the Balanced - Balanced topology.
<u>BS_BalPortNegative</u>	IBalancedTopology2	Returns the negative balanced port number in the Balanced - Single-ended topology.
<u>BS_BalPortPositive</u>	IBalancedTopology2	Returns the positive balanced port number in the Balanced - Single-ended topology.
<u>BS_SEPort</u>	IBalancedTopology2	Returns the single-ended port number in the Balanced - Single-ended topology.
<u>DUTTopology</u>	IBalancedTopology	Sets and returns the device topology setting.
<u>SB_BalPortNegative</u>	IBalancedTopology	Returns the negative balanced port number in the Single-Ended - Balanced topology.
<u>SB_BalPortPositive</u>	IBalancedTopology	Returns the positive balanced port number in the Single-Ended - Balanced topology.
<u>SB_SEPort</u>	IBalancedTopology	Returns the single ended port number in the Single-Ended - Balanced topology.
<u>SSB_BalPortNegative</u>	IBalancedTopology	Returns the negative balanced port number in the Single-Ended - Single-Ended - Balanced topology.
<u>SSB_BalPortPositive</u>	IBalancedTopology	Returns the positive balanced port number in the Single-Ended - Single-Ended - Balanced topology
<u>SSB_SEPort1</u>	IBalancedTopology	Returns the first single ended port in the Single-Ended - Single-Ended - Balanced topology.
<u>SSB_SEPort2</u>	IBalancedTopology	Returns the second single ended port in the Single-Ended - Single-Ended - Balanced topology.

BalancedTopology History

Interface	Introduced with PNA Rev:
IBalancedTopology	5.0
IBalancedTopology2	9.70

CalFactorSegments Collection

Description

A collection object that provides a mechanism for iterating through the segments of a power sensor cal factor table. The Cal Factor table can contain up to 100 segments.

Accessing the CalFactorSegments collection

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calFact As CalFactorSegments
Set calFact = app.SourcePowerCalibrator.PowerSensors(1).CalFactorSegments
```

See Also:

- [PowerSensorCalFactorSegment Object](#)
- [About Source Power Cal](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Description
Add	Adds a PowerSensorCalFactorSegment object to the collection
Item	Use to get a handle to a PowerSensorCalFactorSegment object in the collection.
Remove	Removes an object from the collection.
Properties	Description
Count	Returns the number of objects in the collection.
Parent	Returns a handle to the Parent object (PowerSensor) of this collection.

CalFactorSegmentsPMAR Collection

Description

A collection object that provides a mechanism for iterating through the segments of a power sensor cal factor table. The Cal Factor table can contain up to 100 segments. This collection is used when the Power Meter is used as a Receiver.

Accessing the CalFactorSegmentsPMAR collection

Example: [Create a PMAR Device and Measurement](#)

See Also:

- [PowerSensorCalFactorSegmentPMAR Object](#)
- [About PMAR](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)

Methods	Description
Add	Adds a PowerSensorCalFactorSegmentPMAR object to the collection
Item	Use to get a handle to a PowerSensorCalFactorSegmentPMAR object in the collection.
Remove	Removes an PowerSensorCalFactorSegmentPMAR object from the collection.

Properties	Description
Count	Returns the number of PowerSensorCalFactorSegmentPMAR objects in the collection.
Parent	Returns a handle to the Parent object of this collection.

CalibrateAllChannels Object

Description

Use this interface to Calibrate All Channels.

See Cal All Channels limitations .

Accessing the CalibrateAllChannels Object

```
Dim app as AgilentPNA835x.Application

Dim CalMgr

Set CalMgr = app.GetCalManager

Dim calAll

Set calAll = CalMgr.CalibrateAllChannels

'Then get a handle to the GuidedCal object

Dim guidedCal

Set guidedCal = CalAll.GuidedCalibration
```

See Also:

- Example program

Reset	ICalAllChans	Resets all properties associated with the Cal All session to their default values.

Properties

CalibrationPorts	ICalAllChans	For each channel, sets and returns the ports to be calibrated.
Channels	ICalAllChans	Sets and returns the list of channels to be calibrated during the Cal All session.
GeneratedCalsets	ICalAllChans	Returns the cal set names that were produced by the cal all session.
GuidedCalibration	ICalAllChans	Provides access to the GuidedCal object. Use this to perform the Calibration.
IFBW	ICalAllChans	Sets and returns the IFBW for a Cal All calibration
PathConfigurationElement	ICalAllChans	Sets and returns the Path Configuration settings for a Cal All calibration.
PowerLevel	ICalAllChans	Sets and returns the power level at which a Cal All calibration is to be performed.
PowerOffset	ICalAllChans	Sets and returns the power offset value for a Cal All calibration.
PropertyNames	ICalAllChans	Returns the settable properties for the current cal all session
PropertyValue	ICalAllChans	Sets and returns a value for a specific property name
PropertyValues	ICalAllChans	Returns the valid property values for a specific property name:
ReceiverAttenuator	ICalAllChans	Sets and returns the Receiver Attenuator setting for a Cal All calibration.
SourceAttenuator	ICalAllChans	Sets and returns the Source Attenuator setting for a Cal All calibration.
SParameterCalPorts	ICalAllChans	Returns a list of ports to be calibrated.
UserCalsetPrefix	ICalAllChans	Sets and returns the prefix to be used when saving User CalSets that result from the Cal All session.

Calibrator Object

See Also

- [Example Programs](#)
- [Calibrator Methods and Properties](#)
- [ICalData Interface](#) for putting and getting typed Calibration data.
- [Superseded commands](#)

Description

The Calibrator object, a child of the channel, is used to perform an **Unguided** calibration.

Important!

Do **NOT** use commands from the [GuidedCalibration](#) object when performing an Unguided calibration. Use **ONLY** the Calibrator object.

You can NOT perform a full 3 or 4-port using the Calibrator object. You must use the [GuidedCalibration object](#).

There must be a measurement present for the calibrator to use or you will receive a "no measurement found" error. Therefore, to perform a 2-port cal, you must have any S-parameter measurement on the channel. For a 1-port measurement, you must have the measurement (S11 or S22) on the channel. The same is true for a response measurement.

There are a number of approaches to calibration with the calibrator object:

- You can collect data yourself and download it to the ACQUISITION buffer. The acquisition buffer holds the actual measured data for each standard. See the PNA [data map](#).
 1. Calibrator.[SetCallInfo](#)
 2. Connect a standard
 3. Trigger a sweep
 4. Retrieve the data for the standard
 5. Download the data - calibrator.[putStandard](#)

6. Repeat for each standard
 7. Calibrator.[CalculateErrorCoefficients](#)
- You can tell the calibrator to acquire a standard. In this case, the calibrator collects the data and places it in the ACQUISITION buffer.
 1. Calibrator.[SetCallInfo](#)
 2. Connect a standard
 3. Calibrator.[AcquireCalStandard2](#)
 4. Repeat for each standard
 5. Calibrator.[CalculateErrorCoefficients](#)
 - You can put previously-retrieved error terms in the error correction buffer.
 1. [PutErrorTerm](#)
 2. Repeat for each term
 3. Measurement.[Caltype](#) = pick one
 - You can also "piece together" a 2-port cal from two 1-port calcs (S11 and S22) and four response (thru) calcs. The system will detect that all the standards needed for a 2-port cal have been acquired even though they may not have gathered at the same time.

Accessing the Calibrator object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim cal As ICalibrator
Set cal = app.ActiveChannel.Calibrator
```

AcquireCalConfidenceCheckECAL	ICalibrator	Superseded with AcquireCalConfidenceCheckECALEx
AcquireCalConfidenceCheckECALEx	ICalibrator4	Transfers ECAL confidence data into analyzer memory
AcquireCalStandard	ICalibrator	Superseded with AcquireCalStandard2
AcquireCalStandard2	ICalibrator	Causes the analyzer to measure a calibration standard. Also provides for sliding load.
CalculateErrorCoefficients	ICalibrator	Generates Error Terms from standard and actual data in the error correction buffer.
DoECAL1Port	ICalibrator	Superseded with DoECAL1PortEx
DoECAL1PortEx	ICalibrator4	Completes a 1 port ECAL
DoECAL2Port	ICalibrator	Superseded with DoECAL2PortEx
DoECAL2PortEx	ICalibrator4	Completes a 2 port ECAL
DoneCalConfidenceCheckECAL	ICalibrator	Concludes an ECAL confidence check
DoReceiverPowerCal	ICalibrator5	Perform a receiver power cal.
DoResponseCal	ICalibrator9	Perform a response (normalization) cal.
GetCalKitTypeString	ICalibrator8	Returns information about the attached modules
GetECALModuleInfo	ICalibrator	Superseded with GetECALModuleInfoEx
GetECALModuleInfoEx	ICalibrator4	Returns information about the attached module
getErrorTerm	ICalibrator	Superseded with GetErrorTermByString
getStandard	ICalibrator	Superseded with GetStandardByString
putErrorTerm	ICalibrator	Superseded with PutErrorTermByString
putStandard	ICalibrator	Superseded with PutStandardByString
SaveCalSets	ICalibrator	Superseded with CalSet.Save
setCalInfo	ICalibrator	Specifies the type of calibration and prepares the internal state for the rest of the calibration.
Properties	Interface	Description

AcquisitionDirection	ICalibrator	Specifies the direction in a 2-Port cal using one set of standards.
CalKitType	ICalibrator10	Sets and returns the name of the Cal Kit to use for unguided cal.
CalKitTypes	ICalibrator10	Returns the names of the first 50 mechanical cal kits in your PNA that can be used for unguided calibrations.
ECALCharacterization	ICalibrator2	Superseded with ECALCharacterizationEx
ECALCharacterizationEx	ICalibrator4	Specifies which set of characterization data within an ECal module will be used for ECal operations with that module.
ECALCharacterizationIndexList	ICalibrator6	Returns a list of characterizations stored in the specified ECal module.
ECAL Isolation	ICalibrator	Specifies whether the acquisition of the ECal calibration should include isolation or not.
ECALModuleNumberList	ICalibrator6	Returns a list of index numbers to be used for referring to the ECal modules that are currently attached to the PNA.
ECALPortMap	ICalibrator3	Superseded with ECALPortMapEx
ECALPortMapEx	ICalibrator4	Specifies which ports of the ECal module are connected to which ports of the PNA.
IsECALModuleFound	ICalibrator	Superseded with IsECALModuleFoundEx
IsECALModuleFoundEx	ICalibrator4	Superseded with ECALCharacterizationIndexList and ECALModuleNumberList
IsolationAveragingIncrement	ICalibrator7	Value to increase the channel's averaging factor.
OrientECALModule	ICalibrator3	Specifies if the PNA should perform orientation of the ECal module during calibration.
Simultaneous2PortAcquisition	ICalibrator	Allows the use of 2 sets of standards at the same time.

ICalData Interface

Description

Contains methods for putting Calibration data in and getting Calibration data out of the analyzer using typed data. This interface transfers data more efficiently than variant data. However, this interfaces is only usable from VB6, C, & C++. All other programming languages must use the [ICalSet interface](#).

There is also an [ICalDataInterface](#) on the CalSet Object

[Learn about reading and writing Calibration data.](#)

Methods	Description
getErrorTermComplex	Retrieves error term data
getStandardComplex	Retrieves calibration data from the acquisition data buffer (before error-terms are applied).
putErrorTermComplex	Puts error term data
putStandardComplex	Puts calibration data into the acquisition data buffer (before error-terms are applied).
Properties	Description
None	

ICalData History

Interface **Introduced with PNA**
Rev:

ICalData 1.0

CalKit Object

Description

The calkit object provides the properties and methods to access and modify a calibration kit.

Accessing a CalKit object

The **active** cal kit is the kit that is selected for use in **Unguided** calibrations. To get a handle to the active kit, use the [app.ActiveCalKit](#) property. To access the CalKit object for a specific cal kit, you must first make that kit the active kit using [app.CalKitType](#).

The CalKit object behaves differently from other objects in that you can only have a handle to **one** cal kit -- the active cal kit. Therefore, when you change the CalKitType from either the [Application object](#) or the [CalKit object](#), you may also be changing the object to which you may have other references.

For example, the following example specifies two CalKit type objects and in turn, assigns them to two different variables: ck1 and ck2.

```
Dim app As AgilentPNA835x.Application
Dim ck1 As calKit
Dim ck2 As calKit

Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
app.CalKitType = naCalKit_User1
Set ck1 = app.ActiveCalKit
ck1.Name = "My CalKit1"

app.CalKitType = naCalKit_User2
Set ck2 = app.ActiveCalKit
ck2.Name = "My CalKit2"

Print "ck1: " & ck1.Name
Print "ck2: " & ck2.Name
```

When the pointer to each of these kits is read (printed), they each have a pointer to the last kit to be assigned to the active cal kit:

```
ck1: My CalKit2
ck2: My CalKit2
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)

- [Example Programs](#)

(**Bold** Methods or Properties provide access to a child object)

Methods	Description
getCalStandard	Returns a handle to a calibration standard for modifying its definitions.
GetStandardsForClass	Returns the calibration standard numbers for a specified calibration class.
SetStandardsForClass	Sets the calibration standard numbers for a specified calibration class

Properties	Description
CalKitType	Sets or returns the calibration kit type to be used for calibration or for kit modification. Shared with the Application object.
Name	Sets and returns the name of the cal kit
PortLabel	Labels the ports for the kit; only affects the cal wizard annotation.
StandardForClass	Superseded with Use GetStandardForClass and SetStandardForClass . Maps a standard device to a cal class.

ICalKit History

Interface	Introduced with PNA Rev:
ICalKit	1.0

CalManager Object

Description

Use this interface to list, save, and delete Cal Sets.

Accessing the CalManager object

Get a handle to a the CalManager with the app.GetCalManager Method.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim mgr as ICalManager
Set mgr = app.GetCalManager
```

(**Bold** Methods or Properties provide access to a child object)

Methods	Interface	Description
	See History	
AllowChannelToSweepDuringCalAcquisition	ICalManager5	Specifies the channel to sweep during a Calibration.
CreateCalSet	ICalManager	Creates a new Cal Set
CreateCustomCal	ICalManager2	Creates an FCA cal object.
CreateCustomCalEx	ICalManager5	Creates a custom cal object.

Deembed	ICalManager8	De-embeds a fixture from an existing Cal Set based on an S2P file.
DeleteCalSet	ICalManager	Deletes a Cal Set
DisplayNAWindowDuringCalAcquisition	ICalManager5	Set the 'show' state of the window to be displayed during a calibration.
DisplayOnlyCalWindowDuringCalAcquisition	ICalManager5	Clears the flags for windows to be shown during calibrations.
Embed	ICalManager8	Embeds a fixture into an existing Cal Set based on an S2P file.
EnumerateCalSets	ICalManager4	Returns an array of Cal Set names being stored on the PNA.
GetCalSetByGUID	ICalManager	Get a handle to a Cal Set
GetCalSetCatalog	ICalManager	Superseded with EnumerateCalSets
GetCalSetUsageInfo	ICalManager	Returns the Cal Set ID and Error Term ID currently in use
GetCalTypes	ICalManager2	Query for a list of available calibration types.
GetEcalUserCharacterizer	ICalManager6	Returns the ECalUserCharacterizer object.
GetRequiredEtermNames	ICalManager2	Returns an array of strings specifying the error terms required by the Cal Type correction algorithm.

SaveCalSets	ICalManager	Superseded with CalSet.Save
-------------	-------------	---------------------------------------

SweepOnlyCalChannelDuringCalAcquisition	ICalManager5	Clears ALL flags for channels to sweep during calibration.
---	--------------	--

Properties

CalSets Collection	ICalManager	Collection for iterating through all the Cal Sets in the analyzer.
---------------------------	-------------	--

ECalModules Collection	ICalManager7	Collection of ECal Modules that are connected to the PNA.
-------------------------------	--------------	---

GuidedCalibration	ICalManager3	Used to perform a Guided Calibration.
--------------------------	--------------	---------------------------------------

ICalManager History

Interface	Introduced with PNA Rev:
ICalManager	2.0
CalManager2	3.1

CalManager4	5.0
ICalManager5	8.0
ICalManager6	8.3
ICalManager7	8.5
ICalManager8	9.33

CalSet Object

See [ICalData Interface](#) for putting and getting typed Cal Set data.

Description

Use this interface to query and or change the contents of a Cal Set.

Accessing the CalSet object

Get a handle to a CalSet object by using the CalSets collection. This is done through the CalManager object with the app.[GetCalManager](#) Method.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calst As ICalSet
Set calst = app.GetCalManager.CalSets.Item(1)
'OR Get a handle by CalSet Name
Set calst = app.GetCalManager.CalSets.Item("MyCalSet")
```

Methods	Interface	Description
	See History	
CloseCalSet	ICalSet	Obsolete - No longer necessary.
ComputeErrorTerms	ICalSet	Computes error terms for the CalType specified by a preceding OpenCal Set call.
Copy	ICalSet	Creates a new Cal Set and copies the current Cal Set data into it.
EnumerateItems	ICalSet6	Returns a list of all name-value pairs (items) in the Cal Set.

getErrorTerm	ICalSet	Superseded with getErrorTermByString
getErrorTermByString	ICalSet2	Returns variant error term data by specifying the string name of the error term.
getErrorTermList	ICalSet	Superseded with getErrorTermList2
getErrorTermList2	ICalSet2	Returns a list of error term names found in a calset.
GetErrorTermStimulus	ICalSet7	Returns the stimulus values over which the specific error term was acquired.
GetGUID	ICalSet	Returns the GUID identifying a Cal Set
getStandard	ICalSet	Superseded with getStandardByString
getStandardByString	ICalSet2	Returns variant standard acquisition data by specifying the string name of the standard.
getStandardsList	ICalSet	Superseded with getStandardList2
getStandardList2	ICalSet2	Returns a list of standard names found in a Cal Set.
HasCalType	ICalSet	Verifies that the Cal Set object contains the error terms required to apply the specified CalType to an appropriate measurement.
OpenCalSet	ICalSet	Obsolete - No longer necessary.
putErrorTerm	ICalSet	Superseded with putErrorTermByString
putErrorTermByString	ICalSet2	Writes variant error term data by specifying the string name of the error term.
PutErrorTermStimulus	ICalSet7	Adds stimulus data to the specified buffer.
putStandard	ICalSet	Superseded with putStandardByString
putStandardByString	ICalSet2	Writes variant standard acquisition data by specifying the string name of the standard.
RemoveItem	ICalSet6	Removes a name-value pair from the Cal Set.
Save	ICalSet	Saves the current Cal Set to disk.
StringToNACalClass	ICalSet	Converts string values from GetStandardsList into enumeration data
StringToNAErrorTerm2	ICalSet	Converts string values from GetErrorTermList into enumeration data
Properties		Description

<u>AlternateSweep</u>	ICalSet3	Reads sweep either alternate or chopped.
<u>Attenuator</u>	ICalSet3	Returns the value of the attenuator control for the specified port number.
<u>AttenuatorMode</u>	ICalSet3	Returns the mode of operation (auto or manual) of the attenuator control for the specified port number.
<u>CouplePorts</u>	ICalSet3	Returns state of couple ports (ON or OFF)
<u>CWFrequency</u>	ICalSet3	Returns CW Frequency
<u>Description</u>	ICalSet	Set or return the descriptive string assigned to the Cal Set
<u>DwellTime</u>	ICalSet3	Returns the dwell time for the channel.
<u>FrequencyOffsetCWOverride</u>	ICalSet3	Reads state of CW Override (ON or OFF)
<u>FrequencyOffsetDivisor</u>	ICalSet3	Reads Frequency Offset Divisor value
<u>FrequencyOffsetFrequency</u>	ICalSet3	Reads Offset Frequency
<u>FrequencyOffsetMultiplier</u>	ICalSet3	Reads Frequency Offset Multiplier value
<u>FrequencyOffsetState</u>	ICalSet3	Reads Frequency Offset state (ON or OFF)
<u>IFBandwidth</u>	ICalSet3	Reads IF Bandwidth of the channel
<u>Item</u>	ICalSet6	Add or change a name-value pair in the Cal Set, or read the value associated with a name.
<u>LastModified</u>	ICalSet3	Reads the time stamp of when the file was last modified
<u>Name</u>	ICalSet4	Sets and returns the Cal Set name.
<u>NumberOfPoints</u>	ICalSet3	Returns the Number of Points of the channel.
<u>OutputPorts</u>	ICalSet5	Returns the port mapping used for the Cal Set.
<u>PowerSlope</u>	ICalSet3	Returns the Power Slope value.
<u>ReceiverAttenuator</u>	ICalSet3	Returns the value of the specified receiver attenuator control.
<u>StartFrequency</u>	ICalSet3	Returns the start frequency of the channel.
<u>StartPower</u>	ICalSet3	Returns the start power of the PNA when sweep type is set to Power Sweep.
<u>StimulusValues</u>	ICalSet3	Returns x-axis values for stimulus or response frequencies
<u>StopFrequency</u>	ICalSet3	Returns the stop frequency of the channel.

StopPower	ICalSet3	Returns the stop power of the PNA when sweep type is set to Power Sweep.
SweepGenerationMode	ICalSet3	Returns the method being used to generate a sweep: analog or stepped.
SweepTime	ICalSet3	Returns the sweep time of the analyzer.
SweepType	ICalSet3	Returns the type of X-axis sweep that is performed on a channel.
TestPortPower	ICalSet3	Returns the RF power level for the channel.
TestSetType	ICalSet5	Returns the Test Set type used for the Cal Set.

ICalData3	3.1

Last modified:

2-May-2011	Added Get/Put ErrorTermStimulus
1-Nov-2006	New start and stop freq commands added

CalSets Collection

Description

A collection object that provides a mechanism for iterating through all the Cal Sets in the analyzer. There is no ordering to the items in the collection. Therefore make no assumptions about the formatting of the collection.

For the Item and Remove methods, you can specify either the Cal Set string name, or the integer item of the Cal Set in the collection.

Accessing the CalSets collection

Get a handle to the CalSets collection through the CalManager object with the app [GetCalManager](#) Method.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calsts As CalSets
Set calsts = app.GetCalManager.CalSets
```

See Also:

- [CalSet Object](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Interface	Description
Exists	ICalSets2	Returns whether the specified Cal Set exists
Item	ICalSets	Returns a handle to a CalSet object in the collection.
Remove	ICalSets	Deletes the Cal Set residing at position index in the collection.

Properties	Description
Count	ICalSets Returns the number of Cal Sets in the collection.

CalSets History

Interface	Introduced with PNA Rev:
ICalSets	1.0
ICalSets2	9.33

Last Modified:

28-Feb-2011 Added Exists (9.33)
30-Oct-2007 added item and remove note.

CalStandard Object

Description

Contains all of the settings that are required to modify a calibration standard.

For more information, read [Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers \(Application Note 1287-11\)](#)

Accessing the CalStandard object

Get a handle to a standard with the calkit.[GetCalStandard](#) Method.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim std As ICalStandard
Set std = app.ActiveCalKit.GetCalStandard(1)
std.Delay = 0.00000003
```

Properties	Interface	Description
	See History	
C0	ICalStandard	Sets and Returns the C0 (C-zero) value (the first capacitance value) for the calibration standard, when the Type is set to "naOpen".
C1	ICalStandard	Sets and Returns the C1 value (the second capacitance value) for the calibration standard, when the Type is set to "naOpen".
C2	ICalStandard	Sets and Returns the C2 value (the third capacitance value) for the calibration standard, when the Type is set to "naOpen".

C3	ICalStandard	Sets and Returns the C3 value (the fourth capacitance value) for the calibration standard, when the Type is set to "naOpen".
Delay	ICalStandard	Sets and Returns the electrical delay value for the calibration standard.
L0	ICalStandard	Sets and Returns the L0 (L-zero) value (the first inductance value) for the calibration standard, when the Type is set to "naShort".
L1	ICalStandard	Sets and Returns the L1 value (the second inductance value) for the calibration standard, when the Type is set to "naShort"..
L2	ICalStandard	Sets and Returns the L2 value (the third inductance value) for the calibration standard, when the Type is set to "naShort"..
L3	ICalStandard	Sets and Returns the L3 value (the third inductance value) for the calibration standard, when the Type is set to "naShort"..
Label	ICalStandard	Sets and Returns the label for the calibration standard.
loss	ICalStandard	Sets and Returns the insertion loss for the calibration standard.
Maximum Frequency	ICalStandard	Sets and Returns the maximum frequency for the calibration standard.
Medium	ICalStandard	Sets and Returns the media type of the calibration standard.
Minimum Frequency	ICalStandard	Sets and Returns the mininum frequency for the calibration standard.
Type	ICalStandard	Sets and Returns the type of calibration standard. Selections are: naOpen, naShort, naLoad, naThru, naArbitraryImpedance and naSliding.
TZReal	ICalStandard2	Sets and Returns the TZReal value (the Real Terminal Impedance value) for the calibration standard, when the Type is set to "naArbitraryImpedance".
TZImag	ICalStandard2	Sets and Returns the TZImag value (the Imaginary Terminal Impedance value) for the calibration standard, when the Type is set to "naArbitraryImpedance".
Z0	ICalStandard	Sets and Returns the characteristic impedance for the calibration standard.

GetPortNumber Method	ICapabilities4 Returns the port number for the specified string port name.

Properties	Description
AvailableMeasurementClasses	ICapabilities7 Returns the measurement classes on the PNA
CpuRevision	ICapabilities6 Returns the CPU speed of the PNA
DirectoryPath	ICapabilities10 Returns the directory location.
DspRevision	ICapabilities6 Returns the DSP Revision number
DspFpgaRevision	ICapabilities6 Returns the DSP FPGA Revision number
FirmwareMajorRevision	ICapabilities Returns integer portion of firmware revision number.

<u>FirmwareMinorRevision</u>	ICapabilities	Return decimal portion of firmware revision number.
<u>FirmwareSeries</u>	ICapabilities	Returns the Alpha portion of the firmware revision number.
<u> GPIBPortCount</u>	ICapabilities3	Returns the number of GPIB ports (1 or 2)
<u>IFBWList</u>	ICapabilities8	Returns a list of supported IFBW values.
<u>InternalTestsetPortCount</u>	ICapabilities	Returns the number of PNA test ports.
<u>IsFrequencyOffsetPresent</u>	ICapabilities	Returns the presence of Frequency Offset Option 080 (True or False).
<u>IsReceiverStepAttenuatorPresent</u>	ICapabilities	Returns the presence of receiver step attenuators (True or False).
<u>IsReferenceBypassSwitchPresent</u>	ICapabilities	Returns the presence of the reference switch (True or False).
<u>MaximumFrequency</u>	ICapabilities	Returns the maximum frequency of the PNA.
<u>MaximumNumberOfChannels</u>	ICapabilities2	Returns the maximum possible number of Channels
<u>MaximumNumberOfPoints</u>	ICapabilities	Returns the maximum possible number of data points.
<u>MaximumNumberOfTracesPerWindow</u>	ICapabilities2	Returns the maximum possible number of traces per window
<u>MaximumNumberOfWindows</u>	ICapabilities2	Returns the maximum possible number of windows
<u>MaximumReceiverStepAttenuator</u>	ICapabilities	Returns the maximum amount of receiver attenuation.
<u>MaximumSourceALCPower</u>	ICapabilities	Returns the maximum amount of source ALC power.
<u>MaximumSourceStepAttenuator</u>	ICapabilities	Returns the maximum amount of source attenuation.
<u>MeasurementClassProperties</u>	ICapabilities8	Returns a handle to the MeasurementClassProperties Object
<u>MinimumFrequency</u>	ICapabilities	Returns the minimum frequency of the PNA.

<u>MinimumNumberOfPoints</u>	ICapabilities	Returns the minimum possible number of data points.
<u>MinimumReceiverStepAttenuator</u>	ICapabilities	Returns the minimum amount of receiver attenuation.
<u>MinimumSourceALCPower</u>	ICapabilities	Returns the minimum amount of source ALC power.
<u>ModelNumber</u>	ICapabilities10	Returns the model number of the PNA.
<u>ReceiverCount</u>	ICapabilities	Returns the number of receivers in the PNA.
<u>ReceiverStepAttenuatorStepSize</u>	ICapabilities	Returns the step size of the attenuator.
<u>ReceiverTemperature Property</u>	ICapabilities9	Returns the temperature on the receiver board.
<u>ResBWList</u>	ICapabilities8	Returns a list of Res BW values that are supported by IM Spectrum.
<u>SerialNumber</u>	ICapabilities10	Returns the serial number of the PNA.
<u>SourceStepAttenuatorStepSize</u>	ICapabilities5	Returns a value indicating the step size of the source attenuator.
<u>SourceCount</u>	ICapabilities	Returns the number of sources.
<u>SourcePortCount</u>	ICapabilities4	Returns the number of source ports.
<u>SourcePortNames</u>	ICapabilities4	Returns the string names of source ports.
<u>SourceStepAttenuatorStepSize</u>	ICapabilities5	Returns a value indicating the step size of the source attenuator.

ICapabilities10	10.0

Channel Object

See [SourcePowerCalData Interface](#) for putting and getting typed source power calibration data.

Description

The channel object is like the engine that produces data. Channel settings consist of stimulus values like frequency, power, IF bandwidth, and number of points.

Accessing the Channel object

You can get a handle to a channel in a number of ways. But first you have to make sure that the channel exists. When you first startup the analyzer, there is one S11 measurement on channel 1. Thus there is only one channel in existence. You can do the following:

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan As IChannel
Set chan = app.ActiveChannel
```

or

```
Set chan = app.Channels(2)
```

The first method returns the channel object that is driving the active measurement. If there is no measurement, there may not be a channel. Once a channel is created, it does not go away. So if there once was a measurement (hence a channel), the channel will still be available.

If there is no channel you can create one in a couple ways. You can do the following:

```
Pna.CreateMeasurement( ch1, "S11", port1, window2)
```

or

```
Pna.Channels.Add(2)
```

The latter will have no visible effect on the analyzer. It will simply create channel 2 if it does not already exist.

(**Bold** Methods or Properties provide access to a child object)

Methods	Interface	Description
	See History	
Abort	IChannel	Aborts the current measurement sweep on the channel.
ApplySourcePowerCorrectionTo	IChannel11	Copies an existing Source Power Calibration to another channel.
AveragingRestart	IChannel	Clears and restarts averaging of the measurement data.
Continuous	IChannel	The channel continuously responds to trigger signals.
CopyToChannel	IChannel2	Sets up another channel as a copy of this objects channel.
GetConverter	IChannel17	Returns a handle to a Converter object.
GetErrorCorrection	IChannel8	Returns the channel error correction state.
GetNumberOfGroups	IChannel3	Returns the number of groups a channel has yet to acquire.
GetPortNumber	IChannel13	Returns the port number for the specified string port name.
GetRxLevelingConfiguration	IChannel17	Returns a handle to a RxLevelingConfiguration object
getSourcePowerCalData	IChannel	Superseded with Get SourcePowerCalDataEx
getSourcePowerCalDataEx	IChannel14	Returns requested source power calibration data, if it exists.
GetSupportedALCModes	IChannel10	Returns a list of supported ALC modes
GetXAxisValues	IChannel	Returns the channel's X-axis values into a dimensioned Variant array.
GetXAxisValues2	IChannel	Returns the channel's X-axis values into a dimensioned NON-Variant array.
Hold	IChannel	Puts the Channel in Hold - not sweeping.
Next_IFBandwidth	IChannel	A function that returns the Next higher IF Bandwidth value.

NumberOfGroups	IChannel	Sets the Number of trigger signals the channel will receive.
Preset	IChannel	Resets the channel to factory defined settings.
PreviousIFBandwidth	IChannel	Returns the previous IF Bandwidth value.
putSourcePowerCalData	IChannel	Superseded with Put SourcePowerCalDataEx Method
putSourcePowerCalDataEx	IChannel4	Inputs source power calibration data to this channel for a specific source port.
SelectCalSet	IChannel	Specifies the Cal Set to use for the Channel
Single	IChannel	Channel responds to one trigger signal from any source (internal, external, or manual). Then channel switches to Hold.

Properties	Interface	Description
ALCLevelingMode	IChannel10	Set or return the ALC leveling mode.
AlternateSweep	IChannel	Sets sweeps to either alternate or chopped.
Attenuator	IChannel	Sets or returns the value of the attenuator control for the specified port number.
AttenuatorMode	IChannel	Sets or returns the mode of operation of the attenuator control for the specified port number.
AuxiliaryTrigger	IChannel10	Provides access to Auxiliary Triggering
Averaging	IChannel	Turns trace averaging ON or OFF for all measurements on the channel.
AveragingCount	IChannel	Returns the number of sweeps that have been averaged into the measurements.
AveragingFactor	IChannel	Specifies the number of measurement sweeps to combine for an average.
AverageMode	IChannel16	Sets Point or Sweep averaging.
BalancedTopology	IChannel6	Provides access to the topology of a balanced DUT.
Calibrator	IChannel4	Provides access to Unguided calibration.
CalSet	IChannel7	Provides access to the contents of a Cal Set
centerFrequency	IChannel	Sets or returns the center frequency of the channel.
		Shared with the Segment Object

<u>channelNumber</u>	IChannel	Returns the Channel number. Shared with the Measurement Object
<u>Converter</u>	IChannel21	Provides access to a mixer/converter object.
<u>CorrectionMethods</u>	IChannel21	Provides access to channel correction properties.
<u>CoupleChannelParams</u>	IChannel5	Turns ON and OFF Time Domain Trace Coupling.
<u>CouplePorts</u>	IChannel	Turns ON and OFF port power coupling.
<u>CustomChannelConfiguration</u>	IChannel12	Provides access to custom application objects.
<u>CWFrequency</u>	IChannel	Set the Continuous Wave (CW) frequency.
<u>DefinedRoles</u>	IChannel22	Returns the roles for which sources can be used for the channel.
<u>DwellTime</u>	IChannel	Sets or returns the dwell time for the channel. Shared with the Segment Object
<u>ErrorCorrection</u>	IChannel17	Attempts to sets error correction ON or OFF for all of the measurements on the channel.
<u>ExternalTriggerDelay</u>	IChannel6	Sets or returns the external trigger delay value for the channel.
<u>FastCWPointCount</u>	IChannel16	Enables Fast CW sweep and sets the number of data points for the channel.
<u>Fixturing</u>	IChannel6	Provides access to Port Ext, Embedding, and De-embedding functions.
<u>FOM Collection</u>	IChannel9	Provides access to Frequency Offset Measurements
<u>FrequencyOffsetDivisor</u>	IChannel2	
<u>FrequencyOffsetFrequency</u>	IChannel2	
<u>FrequencyOffsetMultiplier</u>	IChannel2	Superseded with <u>FOM</u> and <u>FOMRange</u>
<u>FrequencyOffsetCWOverride</u>	IChannel2	
<u>FrequencyOffsetState</u>	IChannel2	
<u>FrequencySpan</u>	IChannel	Sets or returns the frequency span of the channel. Shared with the Segment Object.
<u>IFBandwidth</u>	IChannel	Sets or returns the IF Bandwidth of the channel. Shared with the Segment Object.

<u>IFConfiguration</u>	IChannel4	Provides access to the IF gain and source path settings for the H11 Option.
<u>IsContinuous</u>	IChannel3	Returns whether or not a channel is in <u>continuous</u> mode.
<u>IsHold</u>	IChannel3	Returns whether or not a channel is in <u>hold</u> mode.
<u>MeasurementClass</u>	IChannel15	Returns the measurement class name.
<u>NumberOfPoints</u>	IChannel	Sets or returns the Number of Points of the channel. Shared with the Segment Object.
<u>Parent</u>	IChannel	Returns a handle to the parent object of the channel.
<u>PathConfiguration</u>	IChannel10	Provides access to path configuration switches and setting.
<u>PathConfigurationManager</u>	IChannel10	Provides access to path configuration file management.
<u>PointSweepState</u>	IChannel16	Turns point sweep ON or OFF for all measurements on the channel.
<u>PowerSlope</u>	IChannel	Sets or returns the Power Slope value.
<u>PowerSlopeState</u>	IChannel18	Turns power slope ON or OFF
<u>PulseGenerator</u>	IChannel10	Provides access to pulse generator configuration.
<u>PulseGeneratorID</u>	IChannel23	Returns the ID for the specified Pulse Generator name.
<u>PulseGeneratorNames</u>	IChannel23	Returns a list of configured Pulse Generator names.
<u>PulseMeasControl</u>	IChannel20	Provides access to pulse measurement settings.
<u>R1InputPath</u>	IChannel2	Throws internal reference switch.
<u>ReceiverAttenuator</u>	IChannel	Sets or returns the value of the specified receiver attenuator control.
<u>ReduceIFBandwidth</u>	IChannel5	Sets or returns the state of the <u>Reduced IF Bandwidth at Low Frequencies</u> setting.
<u>RoleDevice</u>	IChannel22	Sets and returns the source to be used in the specified role.
<u>RXLevelingConfiguration</u>	IChannel21	Provides access to the ReceiverLeveling Object
<u>Segments</u>	IChannel	Provides access to the Collection for iterating through the sweep segments of a channel.
<u>SourcePortCount</u>	IChannel13	Returns the number of source ports.

<u>SourcePortMode</u>	IChannel9	Sets the state of the PNA sources. (AUTO ON OFF)
<u>SourcePortNames</u>	IChannel13	Returns the string names of source ports.
<u>SourcePowerCalPowerOffset</u>	IChannel4	Sets or returns a power level offset from the PNA test port power.
<u>SourcePowerCorrection</u>	IChannel	Turns source power correction ON or OFF for a specific source port.
<u>StartFrequency</u>	IChannel	Sets or returns the start frequency of the channel. Shared with the Segment Object
<u>StartPower</u>	IChannel	Sets the start power of the analyzer when sweep type is set to Power Sweep.
<u>StartPowerEx</u>	IChannel13	Sets and reads the power sweep start power value for a specific port.
<u>StopFrequency</u>	IChannel	Sets or returns the stop frequency of the channel. Shared with the Segment Object
<u>StopPower</u>	IChannel	Sets the Stop Power of the analyzer when sweep type is set to Power Sweep.
<u>StopPowerEx</u>	IChannel13	Sets and reads the power sweep stop power value for a specific port.
<u>SweepDelay</u>	IChannel19	Sets the time to wait just before acquisition begins for each sweep.
<u>SweepGenerationMode</u>	IChannel	Sets the method used to generate a sweep: continuous ramp (analog) or discrete steps (stepped).
<u>SweepSpeedMode</u>	IChannel14	Set or returns the sweep speed mode.
<u>SweepTime</u>	IChannel	Sets the Sweep time of the analyzer.
<u>SweepType</u>	IChannel	Sets the type of X-axis sweep that is performed on a channel.
<u>TestPortPower</u>	IChannel	Sets or returns the RF power level for the channel. Shared with the Segment Object
<u>TriggerMode</u>	IChannel	Determines the measurement that occurs when a trigger signal is sent to the channel.

UserRangeMax	IChannel	Superseded - Use meas. UserRangeMax Sets the stimulus stop value for the specified User Range.
UserRangeMin	IChannel	Superseded - Use meas. UserRangeMin Sets the stimulus start value for the specified User Range.
XAxisPointSpacing	IChannel	Sets X-Axis point spacing for the active channel.

ISourcePowerCalData Interface

Description

Contains methods for putting source power calibration data in and getting source power calibration data out of the analyzer using typed data. The methods in this interface transfer data more efficiently than methods that use variant data. However, this interfaces is only usable from VB6, C, & C++. All other programming languages must use the methods on the Channel Object.

Note: Interface **ISourcePowerCalData** is abbreviated as **ISPCD** in the following table.

Methods	Interface	Description
	See History	
getSourcePowerCalDataScalar	ISPCD	Superseded - use PutSourcePowerCalDataScalarEx Method
getSourcePowerCalDataScalarEx	ISPCD2	Returns requested source power calibration data, if it exists.
putSourcePowerCalDataScalar	ISPCD	Superseded - use PutSourcePowerCalDataEx Method
putSourcePowerCalDataScalarEx	ISPCD2	Inputs source power calibration data to a channel, for a specific source port.
Properties		Description

None

ISourcePowerCalData History

Interface	Introduced with PNA Rev:
ISourcePowerCalData	2.0
ISourcePowerCalData2	4.0

Channels Collection

Description

A collection object that provides a mechanism for iterating through the channels

Collections are, by definition, unordered lists of like objects. You cannot assume that Channels.Item(1) is always Channel 1.

Accessing the Channels collection

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chans As Channels
Set chans = app.Channels
```

See Also:

- [Channel Object](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Interface	Description
	See History	
Add	IChannels	An alternate way to create a measurement.
Hold	IChannels	Places all channels in Hold trigger mode.
Item	IChannels	Use to get a handle to a channel in the collection.
Remove	IChannels3	Delete a channel by specifying the index in the collection.
RemoveChannelNumber	IChannels3	Delete a channel by specifying the channel number.
Resume	IChannels2	Resumes the trigger mode of all channels that was in effect before sending the channels.Hold method.

Properties		Description
Count	IChannels	Returns the number of channels in the analyzer.
Parent	IChannels	Returns a handle to the current Application.
UnusedChannelNumbers	IChannels2	Returns an array of channel numbers that are NOT in use.
UsedChannelNumbers	IChannels2	Returns an array of channel numbers that are in use.

ComColors Object

Description

Provides access to the methods and properties used to modify the PNA Display and Print colors.

Accessing the ComColors object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835X.Application")
Set displayColors = app.Preferences.DisplayColors
'or
'Set printColors = app.Preferences.PrintColors
displayColors.ActiveLabels = 657930
```

Methods	Interface	
	See History	
LoadTheme	IComColors	Load a color theme from a disc file.
ResetTheme	IComColors	Resets the current theme to the default PNA colors.
StoreTheme	IComColors	Saves the current color theme to a disc file.
Properties		Description
ActiveLabels	IComColors	Sets labels and grid frame colors in the active window.
ActiveBackground	IComColors2	Set and return the background color for the active window on the PNA display or hardcopy print.

Background	IComColors	Set and return the background color for the inactive windows on the PNA display or hardcopy print.
FailedTraces	IComColors	Set and return the limit line color of failed traces.
Grid	IComColors	Set and return the inner lines of all grid in all windows.
InactiveLabels	IComColors	Set and return the Inactive (not selected) Window Labels.
Trace	IComColors	Provides access to the ComTraceColors Object for setting colors for the first 8 traces

ComTraceColors Object

Description

Provides access to the methods and properties used to modify the PNA Display and Print colors.

Both the Display and Print [ComColor objects](#) contain 8 Trace objects (1 to 8).

'1st Trace' is NOT always Trace1 (Tr1). For example, the first trace in a window might be Tr2 which is drawn with the "1st Trace" pen.

The first 8 traces are drawn with the defined pen colors. The next eight traces reuse the same colors, and so forth. For example, if all traces are numbered sequentially, the 9th and 17th traces are drawn using the same color as the 1st trace.

Accessing the ComTraceColors object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835X.Application")
Set displayColors = app.Preferences.DisplayColors
'or
'Set printColors = app.Preferences.PrintColors
dim Trace1

Set Trace1 = displayColors.Trace(1)
Trace1.DataAndLimits = RGB(1,251,1)
```

--------------------	-------------------------------------

IComTraceColors	9.0
-----------------	-----

Converter Object

Note: The Converter Object replaces the IMixer Interface .

Description

Contains the methods and properties to setup a mixer for ALL PNA Mixer/Converter applications .

Accessing the Converter Interface

```
Dim app as AgilentPNA835x.Application  
  
Dim chan as Channel  
  
Set chan = app.ActiveChannel  
  
Dim converter as Converter  
  
Set converter =chan.Converter
```

Scratch vs Applied Mixer Properties

Each mixer configuration has two sets of properties:

1. **Scratch mixer** contains the properties that have been set, but NOT YET applied. Send the Apply Method to copy these properties to the Applied mixer.
2. **Applied mixer** contains the properties that makeup the current mixer configuration.

Power settings are immediately applied to both the Scratch and Applied mixer.

A successful Calculate also performs an Apply.

Note: Queries always return the Applied mixer properties. Therefore, first send Apply Method before querying new settings.

See Also

- The PNA Object Model
- Mixer Setup UI topic

Methods	Interface	Description
	See History	
AddSegment	Converter5	Add segments to the segment table (FCA Only)
Apply	Converter	Applies mixer settings.
AssignSourceToRole	Converter	Assigns a configured source to the specified role.
Calculate	Converter	Automatically calculate Input and Output frequencies for mixer setup.
DeleteAllSegments	Converter5	Remove all segments from the segment table. (FCA Only)
DeleteSegment	Converter5	Remove segments from the segment table. (FCA Only)
DiscardChanges	Converter	Cancels changes that have been made to the Converter setup.
GetSourceByRole	Converter	Returns the name of a source that is assigned to the specified role.
GetSourceRoles	Converter	Returns the defined role names ("RF2", "LO1").
LoadFile	Converter	Loads a previously-configured mixer attributes file (.mxr)
ReCalculate	Converter5	Repeats the last calculation that was performed.
SaveFile	Converter	Saves the settings for the mixer/converter test setup to a mixer attributes file.
SegmentCalculate	Converter5	Performs calculate on a specific segment. (FCA Only)

Properties	Description
ActiveXAxisRange	Converter Sets or returns the swept frequency range to display on the X-axis.

AvoidSpurs	Converter5	Sets and returns the state of the avoid spurs feature.
ConverterEmbeddedLO	Converter2	Provides access to the ConverterEmbeddedLO Object
DeviceInputPort	Converter6	Read the PNA port number which is connected to the DUT Input.
DeviceOutputPort	Converter6	Read the PNA port number which is connected to the DUT Output.
EnablePhase	Converter3	Sets and returns the state of SMC + Phase measurements and calibrations. (SMC Only)
IFDenominator	Converter4	Sets or returns the denominator value of the IF Fractional Multiplier.
IFNumerator	Converter4	Sets or returns the numerator value of the IF Fractional Multiplier.
IFSideband	Converter4	Select sum or difference for IF product.
IFStartFrequency	Converter4	Sets or returns the IF start frequency.
IFStopFrequency	Converter4	Sets or returns the IF stop frequency.
IncludeReverseSweep	Converter4	Sets whether to include SC12 sweeps during measurements.
InputDenominator	Converter	Sets or returns the denominator value of the Input Fractional Multiplier.
InputFixedFrequency	Converter	Sets or returns the mixer fixed Input frequency value.
InputNumerator	Converter	Sets or returns the numerator value of the Input Fractional Multiplier.
InputPower	Converter	Sets or returns the value of the Input Power.
InputRangeMode	Converter	Sets or returns the Input sweep mode.
InputStartFrequency	Converter	Sets or returns the start frequency of the mixer input.
InputStartPower	Converter4	Sets and returns the Start Power value of the mixer Input Power.

InputStopFrequency	Converter	Sets or returns the stop frequency of the mixer input.
InputStopPower	Converter4	Sets and returns the Stop Power value of the mixer Input Power.
IsInputGreaterThanLO	Converter	Specifies whether to use the Input frequency that is greater than the LO or less than the LO.
LODenominator	Converter	Sets or returns the denominator value of the LO Fractional Multiplier.
LOFixedFrequency	Converter	Sets or returns the fixed frequency of the specified LO.
LOName	Converter	Sets or returns the LO name.
LONumerator	Converter	Sets or returns the numerator value of the LO Fractional Multiplier.
LOPower	Converter	Sets or returns the value of the LO Power.
LORangeMode	Converter	Sets or returns the LO sweep mode to fixed or swept.
LOStage	Converter	Returns the number of stages.
LOStartFrequency	Converter	Sets or returns the start frequency of the specified LO.
LOStartPower	Converter	Sets or returns the start value of a LO Power sweep.
LOStopFrequency	Converter	Sets or returns the start frequency of the specified LO.
LOStopPower	Converter	Sets or returns the stop value of a LO Power sweep.
NominalIncidentPowerState	Converter3	Sets or returns whether to use nominal power or measure actual incident power. (SMC ONLY)
NormalizePoint	Converter3	Sets or returns the data point used for normalizing an SMC phase measurement. (SMC Only)
OutputFixedFrequency	Converter	Sets or returns the fixed frequency of the mixer output.

OutputRangeMode	Converter	Sets or returns the Output sweep mode.
OutputSideband	Converter	Sets or returns the value of the output sideband.
OutputStartFrequency	Converter	Sets or returns the start frequency of the mixer output.
OutputStopFrequency	Converter	Sets or returns the stop frequency of the mixer output.
SegmentCount	Converter5	Read the number of segments. (FCA Only)
SegmentFixedFrequency	Converter5	Set and read the CW Frequency for mixer segments in CW Sweep mode. (FCA Only)
SegmentFixedPower	Converter5	Set and return the fixed power level for all ranges for mixer segments. (FCA Only)
SegmentIFBandwidth	Converter5	Set and return the IF Bandwidth for the sweep segment. (FCA Only)
SegmentIsInputGreaterThanLO	Converter5	Set and return whether to use the Input frequency that is greater than the LO. (FCA Only)
SegmentMixingMode	Converter5	Set and return whether to set the mixing mode to high side or low side. (FCA Only)
SegmentPoints	Converter5	Sets and returns the number of data points to be measured in the sweep segment. (FCA Only)
SegmentRangeMode	Converter5	Sets or returns the sweep mode of the segment (all ranges). (FCA Only)
SegmentStartFrequency	Converter5	Set and return the Start frequency for mixer segments. (FCA Only)
SegmentState	Converter5	Set and return the ON/OFF state for mixer segments. (FCA Only)
SegmentStopFrequency	Converter5	Set and return the Stop frequency for mixer segments. (FCA Only)

ConverterEmbeddedLO Object

Description

Provides access to the properties that allow IMDx and IMSpectrum measurements of converters that contain an embedded LO.

This interface contains all the same properties and methods of the Embedded LO interface (used for FCA measurements) EXCEPT access to the EmbeddedLODiagnostic Object .

Accessing the ConverterEmbeddedLO Interface

```
Access the Interface through the Converter Object.

Dim app

Set app = CreateObject("AgilentPNA835x.Application")

app.Reset

' Create a Measurement object, in this case using the IMeasurement interface

Dim meas

app.CreateCustomMeasurement 1, "Swept IMD Converters", -1

set meas = app.activemeasurement

dim converter

set converter = app.ActiveChannel.GetConverter

dim elo

set elo = converter.ConverterEmbeddedLO

elo.IsOn = 1
```

DCStimulus Object

Description

The DCStimulus object allows you to make DC Source settings for each channel.

Accessing the DCStimulus Object

You can obtain a handle to a DCStimulus object through the Channel object.

```
dim app
Set app = CreateObject("AgilentPNA835x.Application")
dim chan
Set chan = app.ActiveChannel
chan.NumberofPoints = 3
dim DC
Set DC = chan.DCStimulus
DC.EnableAllOutput = True
DC.State("A01")= True
```

E5091Testsets Collection

Description

Two testsets can be connected and controlled by the PNA at any time.

The item number in the testsets collection is set by the DIP switches on the testset rear-panel. The valid item numbers are 1 and 2. If the testset DIP switches are set to 1, then item number in the collection is 1, and so forth. See your E5091A documentation for more information.

If the specified testset is not connected to USB or not ON, then setting [Enabled](#) = True will return an error. All other properties can be set when the testset is not connected.

Accessing the E5091Testsets collection

Child of the **Application** Object. Get a handle to one of the [E5091Testset objects](#) by specifying an item of the collection.

```
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim testsets As E5091Testsets
Set testsets = pna.E5091Testsets
Dim tset1 As E5091Testset
Set tset1 = testsets(1)
```

E5091Testset Object

Description

There can be two test sets connected and controlled by the PNA at any time.

The item number in the testsets collection is set by the DIP switches on the test set rear-panel. The valid item numbers are 1 and 2. If the test set DIP switches are set to 1, then item number in the collection is 1, and so forth. See your E5091A documentation for more information.

If the specified test set is not connected to USB or not ON, then setting [Enabled](#) = True will return an error. All other properties can be set when the test set is not connected.

Accessing the E5091Testset object

Child of the **Application** Object. Get a handle to a E5091Testset object by specifying an item of the collection.

```
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim testsets As E5091Testsets
Set testsets = pna.E5091Testsets
Dim tset1 As E5091Testset
Set tset1 = testsets(1)
```

ECalModule Object

Allows access to ECal modules that are connected to the PNA.

Accessing the ECalModule object

Get a handle to a ECalModule object by using the ECalModules collection. This is done through the CalManager object with the app.[GetCalManager](#) Method.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim pna
pna.Preset

Const chanNum = 1

pna.Channels(chanNum).StopFrequency = 20E9 ' for a 20 GHz ECal mod

Const pnaPortNumber = 1

Const ecalCharacterizationNum = 0

Dim calMgr
Set calMgr = pna.GetCalManager

Dim ecalPortNumber ' The returned ECal port number is a 1-based number
' (1 = Port A, 2 = Port B, etc)

ecalPortNumber = calMgr.ECalModules(1).AutoOrient(chanNum, pnaPortNumber,
ecalCharacterizationNum)

MsgBox "ECal port number attached to PNA port 1 = " & ecalPortNumber
```

ECalUserCharacterizer Object

Description

Controls the settings used to perform an ECal User Characterization. An S-Parameter channel must already be calibrated. These commands will then measure the ECal module with adapters, cables, or fixtures to be included in the User Characterization, allow descriptive text to be entered, then save the User Characterization to the ECal module.

Up to 12 User Characterizations can be stored in an ECal module.

You can NOT perform a **remote** User Characterization of a 4-port ECal module using a 2-port PNA. This can only be done from the front panel user interface.

Accessing the ECalUserCharacterizer Interface

Access the Interface through the ICalManager Object.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")

Dim mgr as ICalManager
Set mgr = app.GetCalManager
Dim ecalCharacterizer
Set ecalCharacterizer = mgr.GetECalUserCharacterizer()
```

See Also:

Example: Perform an ECal User Characterization

[PNA Automation Interfaces](#)

[The PNA Object Model](#)

[About User Characterization](#)

Methods	Interface	Description
	See History	
AcquireStep	ECalUserCharacterizer	Measure the ECal module.
GenerateSteps	ECalUserCharacterizer	Returns the number of steps required to complete the calibration.

GetStepDescription	ECalUserCharacterizer	Returns the description of the specified step in the calibration process.
Initialize	ECalUserCharacterizer	Superseded with InitializeEx Method
InitializeEx	ECalUserCharacterizer2	Initiates a User Characterization of an ECal module.
SaveToDiskMemory	ECalUserCharacterizer2	Saves the User Characterization to PNA disk memory.
SaveToECal	ECalUserCharacterizer	Saves the User Characterization to the ECal module.

Properties		Description
CharacterizationNumber	ECalUserCharacterizer	Sets and reads the number to which the user characterization will be stored in the ECal module.
ConnectorType	ECalUserCharacterizer	Sets or queries the connector type for the specified port.
ECalID	ECalUserCharacterizer	Select the model and serial number of the ECal module to be characterized.
InSituCharacterization	ECalUserCharacterizer3	Sets or returns whether the CalPod module will be characterized as an in situ device.
PortDescription	ECalUserCharacterizer	Sets and reads the description of the adapters, cable, or fixture to be included in the user characterization.
SupportsInSituCharacterization	ECalUserCharacterizer3	Returns whether the device is a CalPod module

UserDescriptionofPNA	ECalUserCharacterizer	Sets and reads a user description of the PNA used to perform the User Characterization.
UserName	ECalUserCharacterizer	Sets and reads the description of the person and/or company who is producing the ECal user characterization.
ValidConnectorTypes	ECalUserCharacterizer	Returns a list of connector names that are valid for use with user-characterized ECal modules.

EmbeddedLO Object

Description

Provides access to the properties that allow measurement of mixers that contain an embedded LO.

Accessing the EmbeddedLO Interface

Access the Interface through the IMixer Object.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the
standard measurement
Dim standardMeas As IMeasurement
Set standardMeas = app.ActiveMeasurement
standardMeas.Delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas As IMeasurement
Set meas = app.CreateCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer As IMixer
Dim embeddedLO
Set embeddedLO = mixer.EmbeddedLO
```

Note: The **Find Now** feature on the Embedded LO dialog is performed remotely by doing a 'Single Sweep' with ELO enabled. See example program .

See an example program that shows how to create and calibrate a standard SMC or VMC measurement or a fixed output SMC measurement.

Fixturing Object

Description

Contains the properties for Embedding and De-embedding test fixtures.

Accessing the Fixturing object

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim fixt as Fixturing
Set fixt = chan.Fixturing
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [About Fixturing](#)
- [Example Programs](#)

Methods		Description
AutoPortExtMeasure	IFixturing2	Measures either an OPEN or SHORT standard.
AutoPortExtReset	IFixturing2	Clears old port extension delay and loss data.
NetworkPortMap	IFixturing2	Set the port mapping for a 4-port SNP file to be embedded.

Properties	Interface	Description
	See History	
AutoPortExtConfig	IFixturing2	Sets the frequency span that is used to calculate Automatic Port Extension.
AutoPortExtDCOffset	IFixturing2	Specifies whether or not to include DC Offset as part of Automatic port extension.
AutoPortExtLoss	IFixturing2	Specifies whether or not to include loss correction as part of Automatic Port Extension.
AutoPortExtSearchStart	IFixturing2	Set the start frequency for custom user span.

<u>AutoPortExtSearchStop</u>	IFixturing2	Set the stop frequency for custom user span.
<u>AutoPortExtState</u>	IFixturing2	Enables and disables automatic port extensions on the specified port.
<u>CmnModeZConvPortImag</u>	IFixturing2	Sets imaginary value for common port impedance conversion.
<u>CmnModeZConvPortReal</u>	IFixturing2	Sets real value for common port impedance conversion.
<u>CmnModeZConvState</u>	IFixturing2	Turns ON/OFF common port impedance conversion.
<u>CmnModeZConvPortZ0</u>	IFixturing2	Sets impedance value for common port impedance conversion.
<u>DiffPortMatch_C</u>	IFixturing2	Sets Capacitance value of the differential matching circuit.
<u>DiffPortMatch_G</u>	IFixturing2	Sets Conductance value of the differential matching circuit.
<u>DiffPortMatch_L</u>	IFixturing2	Sets Inductance value of the differential matching circuit.
<u>DiffPortMatch_R</u>	IFixturing2	Sets Resistance value of the differential matching circuit.
<u>DiffPortMatchMode</u>	IFixturing2	Sets type of circuit to embed.
<u>DiffPortMatchUserFilename</u>	IFixturing2	Specifies the 4-port touchstone file for user-defined differential matching circuit.
<u>DiffPortMatchState</u>	IFixturing2	Turns ON/OFF differential matching circuit function.
<u>DiffZConvPortImag</u>	IFixturing2	Sets imaginary value for differential port impedance conversion.
<u>DiffZConvPortReal</u>	IFixturing2	Sets real value for differential port impedance conversion.
<u>DiffZConvPortZ0</u>	IFixturing2	Sets impedance value for differential port impedance conversion.
<u>DiffZConvState</u>	IFixturing2	Turns ON/OFF differential port impedance conversion.
<u>Embed4PortA</u>	IFixturing2	Returns PNA portA connections.
<u>Embed4PortB</u>	IFixturing2	Returns PNA portB connections.

<u>Embed4PortC</u>	IFixturing2	Returns PNA portC connections.
<u>Embed4PortD</u>	IFixturing2	Returns PNA portD connections.
<u>Embed4PortList</u>	IFixturing2	Specifies all PNA port connections.
<u>Embed4PortNetworkFilename</u>	IFixturing2	Specifies *.s4p filename.
<u>Embed4PortNetworkMode</u>	IFixturing2	Specify embed, de-embed, or none.
<u>Embed4PortState</u>	IFixturing2	Turns ON or OFF 4-port Network Embed/De-embed.
<u>Embed4PortTopology</u>	IFixturing2	Specifies the PNA / DUT topology.
<u>EnablePowerCompensation</u>	IFixturing5	Compensates source power for combined loss through all fixturing functions.
<u>EnableSnPDataExtrapolation</u>	IFixturing6	Turns ON and OFF SNP file extrapolation for both 2-port and 4-port embedding/de-embedding.
<u>FixturingState</u>	IFixturing	Turns Fixturing ON and OFF on this channel.
<u>NetworkPortMapA</u>	IFixturing6	Read the port mapping of in A port for a 4-port SNP file to be embedded.
<u>NetworkPortMapB</u>	IFixturing6	Read the port mapping of in B port for a 4-port SNP file to be embedded.
<u>NetworkPortMapC</u>	IFixturing6	Read the port mapping of out A port for a 4-port SNP file to be embedded.
<u>NetworkPortMapD</u>	IFixturing6	Read the port mapping of out B port for a 4-port SNP file to be embedded.
<u>Port2PdeembedCktModel</u>	IFixturing	Sets and returns the 2 port De-embedding circuit model for the specified port number.
<u>Port2PdeembedState</u>	IFixturing	Turns 2 port de-embedding ON and OFF on this channel.
<u>PortArbzImag</u>	IFixturing3	Sets and returns the imaginary impedance value for the specified single-ended port number.
<u>PortArbzReal</u>	IFixturing3	Sets and returns the real impedance value for the specified single-ended port number.
<u>PortArbzState</u>	IFixturing	Turns single-ended port impedance ON and OFF on the specified channel.
<u>PortArbzZ0</u>	IFixturing3	Sets and returns the real and imaginary impedance value for the specified single-ended port number.

<u>PortCoupleToSystemMedia</u>	IFixturing4	Couples to system Media type
<u>PortCoupleToSystemVelocity</u>	IFixturing4	Couples to system Velocity Factor
<u>PortDelay</u>	IFixturing	Sets and returns the Port Delay value for the specified port number.
<u>PortDistance</u>	IFixturing4	Sets Port Ext in distance
<u>PortDistanceUnit</u>	IFixturing4	Sets distance units
<u>PortExtState</u>	IFixturing	Turns Port Extension ON and OFF on this channel.
<u>PortExtUse1</u>	IFixturing	Sets and returns the USE1 ON/OFF state for the Loss1 and Freq1 values for the specified port number.
<u>PortExtUse2</u>	IFixturing	Sets and returns the USE2 ON/OFF state for the Loss2 and Freq2 values for the specified port number.
<u>PortFreq1</u>	IFixturing	Sets and returns the 1st Port Frequency value for the specified port number.
<u>PortFreq2</u>	IFixturing	Sets and returns the 2nd Port Frequency value for the specified port number.
<u>PortLoss1</u>	IFixturing	Sets and returns the 1st Port Loss value for the specified port number.
<u>PortLoss2</u>	IFixturing	Sets and returns the 2nd Port Loss value for the specified port number.
<u>PortLossDC</u>	IFixturing	Sets and returns the Port Loss at DC value for the specified port number.
<u>PortMatching_C</u>	IFixturing	Sets and returns the Capacitance, 'C' value for the specified port number.
<u>PortMatching_G</u>	IFixturing	Sets and returns the Conductance, 'G' value for the specified port number.
<u>PortMatching_L</u>	IFixturing	Sets and returns the Inductance, 'L' value for the specified port number.
<u>PortMatching_R</u>	IFixturing	Sets and returns the Resistance, 'R' value for the specified port number.
<u>PortMatchingCktModel</u>	IFixturing	Sets and returns the Port Matching circuit model for the specified port number.

<u>PortMatchingState</u>	IFixturing	Turns Port Matching ON and OFF on this channel.
<u>PortMedium</u>	IFixturing4	Sets Media per port
<u>PortVelocityFactor</u>	IFixturing4	Set Velocity Factor per port
<u>PortWGCutoffFreq</u>	IFixturing4	Sets waveguide cutoff frequency per port
<u>Reverse2PortAdapter</u>	IFixturing6	Set and read whether or not to reverse ports on a 2-port fixture or adapter to be de-embedded.
<u>strPort2Pdeembed_S2PFile</u>	IFixturing	Sets and returns the 2 port De-embedding 'S2P' file name for the specified port number.
<u>strPortMatch_S2PFile</u>	IFixturing	Sets and returns the Port Matching 'S2P' file name for the specified port number.

IFixturing History

Interface	Introduced with PNA Rev:
IFixturing	5.0
IFixturing2	5.2
IFixturing3	5.25
IFixturing4	8.50
IFixturing5	9.20
IFixturing6	9.33

FOM Collection

Description

The FOM collection provides access to the source and receiver range objects which are used for configuring frequency offset measurements.

The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)

External devices can appear in the list of range names. [Learn more.](#)

Accessing the FOM Collection and [FOMRange](#) objects

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel

Dim ifom as FOM
Set ifom = chan.FOM

ifom.item(2).Coupled = false
```

[Item](#) IFOM

Property	Interface	Description
----------	-----------	-------------

DisplayRange	IFOM	Sets the range to be displayed on the PNA x-axis.
FOMRange	IFOM	Object
RangeCount	IFOM	Returns the number of FOM ranges available on the PNA.
State	IFOM	Turns Frequency Offset ON and OFF.

FOM History

Interface	Introduced with PNA Rev:
IFOM	7.10

Last Modified:

8-Mar-2007 Modified Access

FOMRange Object

Description

The FOM Range object provides access to the properties and methods for configuring a specific Range for frequency offset measurements.

Accessing an FOMRange object

Get a handle to a FOM Range by specifying an item in the [FOM collection](#).

The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)

External devices can appear in the list of range names. [Learn more](#).

```
Dim app as AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim ranges as FOM
Set ranges = app.ActiveChannel.FOM
ranges.item(2).Coupled = False
```

Method	Interface	Description
	See History	

None

Property	Interface	Description
Coupled	IFOMRange	Sets and returns the state of coupling (ON or OFF) of this range to the primary range.
CWFrequency	IFOMRange	Set the Continuous Wave (CW) frequency.
Divisor	IFOMRange	Sets and returns the Divisor value to be used when coupling this range to the primary range.
Multiplier	IFOMRange	Sets and returns the Multiplier value to be used when coupling this range to the primary range.
Name	IFOMRange	Returns the name of this FOM range object.
Offset	IFOMRange	Sets and returns the offset value to be used when coupling this range to the primary range.
rangeNumber	IFOMRange	Returns the index number of the range within the FOM collection .
Segments	IFOMRange	Collection - Used to add segment sweep capability to a range.
StartFrequency	IFOMRange	Sets or returns the start frequency of this FOM Range.
StopFrequency	IFOMRange	Sets or returns the stop frequency of this FOM Range.
Sweep Type	IFOMRange	Sets the type of range sweep.

Note: Use the [Start Power](#) and [Stop Power](#) settings from the [channel object](#).

Gain Compression Measurement Object

Description

Controls the Gain Compression Analysis settings.

Accessing the GainCompressionMeas object

```
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset
app.ActiveMeasurement.Delete
' create a GCA measurement
app.CreateCustomMeasurementEx 1, "Gain Compression","CompIn21", 1
Set meass = app.Measurements ' get the measurements collection
Set ana = meass(1).CustomMeasurementConfiguration 'get the measurement
ana.AnalysisEnable = true ' enable the analysis mode
```

Note: Set the Start/Stop Frequency and Start/Stop Power Settings using the [Channel Object](#).

Method	Interface	Description
	See History	
GetRaw2DData	IGainCompression	Reads Gain Compression data from specified location.
GetDataIm	IGainCompression	Reads Imaginary part of specified frequency or power points.
GetDataRe	IGainCompression	Reads REAL part of specified frequency or power points.
SetPortMap	IGainCompression	Maps the PNA ports to the DUT ports

Property	Interface	Description
<u>AcquisitionMode</u>	IGainCompression	Set and read the method by which gain compression data is acquired.
<u>CompressionAlgorithm</u>	IGainCompression	Set and read the algorithm method used to compute gain compression.
<u>CompressionBackoff</u>	IGainCompression	Set and read value for the BackOff compression algorithm.
<u>CompressionDeltaX</u>	IGainCompression	Set and read the 'X' value in the delta X/Y compression algorithm.
<u>CompressionDeltaY</u>	IGainCompression	Set and read the 'Y' value in the delta X/Y compression algorithm.
<u>CompressionInterpolation</u>	IGainCompression	Sets whether or not to interpolate the final power level when the measured compression level deviates from the specified level.
<u>CompressionLevel</u>	IGainCompression	Set and read the decrease in gain which indicates that the amplifier is compressing.
<u>DeviceInputPort</u>	IGainCompression	Read the PNA port number which is connected to the DUT input.
<u>DeviceOutputPort</u>	IGainCompression	Read the PNA port number which is connected to the DUT output.
<u>EndOfSweepOperation</u>	IGainCompression	Set and read the action which should be taken at the end of the last frequency or power sweep in the measurement.
<u>InputLinearPowerLevel</u>	IGainCompression	Set and read the input power level that should produce linear gain.
<u>MaximumNumberOfPoints</u>	IGainCompression	Returns the maximum possible number of data points.
<u>NumberOfFrequencyPoints</u>	IGainCompression	Set and read the number of data points in each frequency sweep.
<u>NumberOfPowerPoints</u>	IGainCompression	Set and read the number of data points in each power sweep.
<u>ReverseLinearPowerLevel</u>	IGainCompression	Set and read the reverse power level to the DUT.

<u>SafeSweepCoarsePowerAdjustment</u>	IGainCompression	Set and read the Safe Sweep COARSE power adjustment.
<u>SafeSweepEnable</u>	IGainCompression	Set and read the (ON OFF) state of Safe Sweep mode.
<u>SafeSweepFinePowerAdjustment</u>	IGainCompression	Set and read the Safe Sweep FINE power adjustment.
<u>SafeSweepFineThreshold</u>	IGainCompression	Set and read the compression level in which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment.
<u>SafeSweepMaximumLimit</u>	IGainCompression4	When the DUT Output reaches this value, the input power to the DUT is no longer incremented at that frequency.
<u>SaturationLevel</u>	IGainCompression3	Set and read the deviation dB from the maximum Pout.
<u>SearchFailures</u>	IGainCompression	Read number of points that did not achieve compression.
<u>SearchSummary</u>	IGainCompression	Returns if a compression search is complete, and if the search was a success or failure.
<u>SmartSweepMaximumIterations</u>	IGainCompression	Set and read the maximum number of iterations to be used to find the compression level in a SMART sweep.
<u>SmartSweepSettlingTime</u>	IGainCompression	Set and read SMART sweep settling time.
<u>SmartSweepShowIterations</u>	IGainCompression	Set and read whether to show results for each SMART sweep iteration.
<u>SmartSweepTolerance</u>	IGainCompression	Set and read the level of tolerance to be used to find the compression level in a SMART sweep.
<u>TotalIterations</u>	IGainCompression2	Returns the total number of iteration required for the SMART Sweep.
<u>TotalNumberOfPoints</u>	IGainCompression	Set and read the total number of data points.(Freq x Power)

IGainCompression History

Interface	Introduced with PNA Rev:
IGainCompression	8.0
IGainCompression2	8.2
IGainCompression3	9.0
IGainCompression4	9.2

Gain CompressionCal Object

Description

Sets properties that are unique to a Gain Compression Cal (opt 086).

The remaining commands to perform a GCA Cal use the [Guided Calibration commands](#).

Accessing the GainCompressionCal object

```
Dim app as AgilentPNA835x.Application

Set GCACal = pna.GetCalmanager.CreateCustomCalEx\(channelNum\)

Set GCACalExtension = GCACal.CustomCalConfiguration

GCACalExtension.PowerLevel = 5
```

Gating Object

Description

Contains the methods and properties that control Time Domain Gating.

Accessing the Gating Object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim gate As Gating
Set gate = app.ActiveMeasurement.Gating
```

Methods

None

Properties

Interface Description

(see
[History](#))

Center	IGating	Sets or returns the Center time. Shared with the Transform Object
CoupledParameters	IGating2	Select Gating parameters to couple
Shape	IGating	Specifies the shape of the gate filter.
Span	IGating	Sets or returns the Span time. Shared with the Transform Object
Start	IGating	Sets or returns the Start time. Shared with the Transform Object

State	IGating	Turns an Object ON and OFF.
Stop	IGating	Sets or returns the Stop time.
		Shared with the Transform Object
Type	IGating	Specifies the type of gate filter used.

History

Interface	Introduced with PNA Rev:
IGating	1.0
IGating2	4.2

GlobalPowerLimit Object

Description

Provides access to the properties and methods for setting power limits for PNA ports.

Accessing the GlobalPowerLimit object

```
Dim app as AgilentPNA835x.Application
Dim gpl as IGlobalPowerLimit
Set gpl = app.GlobalPowerLimit
```

See Also:

- [About GlobalPowerLimit](#)
- [PNA Automation Interfaces](#)

Methods	Description
None	

Properties	Interface	Description
	See History	
Limit	IGlobalPowerLimit	Sets and returns the power limit for the specified port.
Lock	IGlobalPowerLimit	Enables or disables the ability to change the power limit values through the user interface.
State	IGlobalPowerLimit	Turns GlobalPowerLimit ON and OFF

IGlobalPowerLimit History

Interface	Introduced with PNA Rev:
IGlobalPowerLimit	9.0

Last Modified:

5-Aug-2009 MX New topic

GroupDelayAperture Object

Description

Contains the methods and properties that set Group Delay Aperture.

Accessing the GroupDelayAperture Object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")

Dim GDAperture As GroupDelayAperture
Set GDAperture = app.ActiveMeasurement.GroupDelayAperture
```

See Also:

- [Group Delay Measurements](#)
- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Interface	Description
None		
Properties	Description	
Frequency	IGroupDelayAperture	Sets group delay aperture using a fixed frequency range.
Percent	IGroupDelayAperture	Sets group delay aperture using a percent of the channel frequency span.
Points	IGroupDelayAperture	Sets group delay aperture using a fixed number of data points.

IGroupDelayAperture History

Interface	Introduced with PNA Rev:
IGroupDelayAperture	A.09.20

Last Modified:

23-Feb-2010 MX New topic

GuidedCalibration Object

Description

Contains the methods and properties used to perform a Guided Calibration.

Important!

Do **NOT** use commands from the [Calibrator](#) (Unguided calibration) object when performing a Guided calibration. Use **ONLY** the [GuidedCalibration](#) object.

The **ONLY** exception is:

Use [OrientECalModule_Property](#) and [ECalPortMapEx_Property](#) on the [Calibrator Object](#) to specify orientation for both guided and unguided calibrations.

A Guided Calibration must be performed on the Active Channel. To activate a channel, activate any measurement on that channel. Do this using [meas.Activate](#), which requires you already have a handle to the measurement.

Accessing the GuidedCalibration object

For standard S-parameter channels:

```
Dim app as AgilentPNA835x.Application
Dim CalMgr
Set CalMgr = App.GetCalManager
Dim guidedCal
Set guidedCal = CalMgr.GuidedCalibration
```

To calibrate an [Application](#) channel, see [CreateCustomCalEx](#) Method.

THRU Pairs sequence

The Smart/Guided Cal logic always determines the best calibration based on your specified connectors and ports.

The following three commands overwrite the SmartCal logic. Send these commands ONLY if you have a deliberate reason for overwriting the SmartCal logic.

- [ThruPortList](#)
- [PathThruMethod](#)
- [PathCalMethod](#)

When sending one or more of these commands, they must be sent in the following sequence with the other commands listed here.

Note: The [Initialize](#) command is sent before and after these three commands.

1. [ConnectorType](#) (ports)
2. [CalKitType](#) (ports)
3. [Initialize](#)
4. [ThruPortList](#)
5. [PathThruMethod](#)
6. [PathCalMethod](#)
7. calMethod = guidedCal.[PathCalMethod](#) (ports) (recommended)
8. [Initialize](#)

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods

Description

[AcquireStep](#)

IGuidedCalibration

Acquire data for a cal step.

ApplyDeltaMatchFromCalSet Method	IGuidedCalibration2	Apply a cal as Delta Match Cal.
GenerateErrorTerms	IGuidedCalibration	Generates the error terms for the calibration.
GenerateGlobalDeltaMatchSequence	IGuidedCalibration2	Initiates a global delta match calibration.
GenerateSteps	IGuidedCalibration	Request to generate a connection list and return the number of steps required.
GetCompatibleCalKits	IGuidedCalibration5	Returns the list of cal kits for the connector type.
GetIsolationPaths	IGuidedCalibration3	Gets the list of port pairings for which isolation standards will be measured during calibration.
GetStepDescription	IGuidedCalibration	Query description of a step.
Initialize	IGuidedCalibration	Initial setup with channel context for the remote cal object.
ResetStep	IGuidedCalibration10	
SetIsolationPaths	IGuidedCalibration3	Sets the list of port pairings for which isolation standards will be measured during calibration.
SetupMeasurementsForStep	IGuidedCalibration4	Show the Cal Window, or custom Cal Window, before acquiring a Cal standard.

Properties

Interface

Description

[See History](#)

CalKitType	IGuidedCalibration	Sets the cal kit for the port.
CompatibleCalKits	IGuidedCalibration	Superseded with GetCompatibleCalKits Method
ConnectorType	IGuidedCalibration	Sets the connector type for the port.
CustomCalConfiguration	IGuidedCalibration4	Provides access to additional Properties and Methods which extends the GuidedCal Object.

IsolationAveragingIncrement	IGuidedCalibration3	Value by which to increment the channel's averaging factor during measurement of isolation standards.
IterationCountForStep	IGuidedCalibration10	
MinimumIterationsForStep	IGuidedCalibration10	
PathCalMethod	IGuidedCalibration3	Specifies the calibration method for each port pair.
PathThruMethod	IGuidedCalibration3	Specifies the calibration THRU method for each port pair.
PerformPowerCalibration	IGuidedCalibration7	Perform Guided Power Cal
PortsNeedingDeltaMatch	IGuidedCalibration2	Returns port numbers that need delta match cal.
PowerCalibrationPowerLevel	IGuidedCalibration6	Sets power level for power cal in several applications.
PowerSensorCalKitType	IGuidedCalibration6	Sets Cal Kit for power cal in several applications.
PowerSensorConnectorType	IGuidedCalibration6	Sets Power sensor connector for power cal in several applications.
SlidingLoadAcquisitionBehavior	IGuidedCalibration10	
ThruCalMethod	IGuidedCalibration	Superseded with PathCalMethod and PathThruMethod
ThruPortList	IGuidedCalibration	Sets the thru connection port pairs.
UseCalWindow	IGuidedCalibration	Obsolete - Use Custom Cal Window commands.
ValidConnectorTypes	IGuidedCalibration	Gets Valid Connector Types.

IGuidedCalibration History

Interface	Introduced with PNA Rev:
IGuidedCalibration	5.0

HWAuxIO Object

Description

Contains the methods and properties that control the rear panel Material Handler I/O and Power I/O connector.

Note: The Aux I/O connector is mentioned in these topics, but NO PNA models supported by this PNA firmware have that connector.

Accessing the HWAuxIO object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim AuxIO As HWAuxIO
Set AuxIO = app.GetAuxIO
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Interface	Description
	See History	
get_InputVoltage	IHWAuxIO	Superseded by get InputVoltageEX
get_OutputVoltage	IHWAuxIO	Reads ADC output voltages.
get_OutputVoltageMode	IHWAuxIO2	Reads mode setting for either DAC output.
get_PortCData	IHWAuxIO	Reads a 4-bit value from Port C
put_OutputVoltage	IHWAuxIO	Writes voltages to the DAC/Analog Output 1 and Output 2
put_OutputVoltageMode	IHWAuxIO2	Writes the mode setting for either DAC output.
put_PortCData	IHWAuxIO	Writes a 4-bit value to Port C
Properties		Description
FootSwitch	IHWAuxIO	Obsolete - Reads the Footswitch Input

FootswitchMode	IHWAuxIO3	Obsolete -Determines the action that occurs when the footswitch is pressed.
InputVoltageEX	IHWAuxIO5	Reads the ADC input voltage
PassFailLogic	IHWAuxIO	Sets and reads the logic of the PassFail line Shared with the HWMaterialHandler Object
PassFailMode	IHWAuxIO	Sets and reads the mode of the PassFail line Shared with the HWMaterialHandler Object
PassFailPolicy	IHWAuxIO4	Sets the policy used to determine how global pass/fail is computed. Shared with the HWMaterialHandler Object
PassFailScope	IHWAuxIO	Sets and reads the scope of the PassFail line Shared with the HWMaterialHandler Object
PassFailStatus	IHWAuxIO4	Returns the most recent pass/fail status value. Shared with the HWMaterialHandler Object
PortCLogic	HWAuxIO	Sets and reads the logic mode of Port C
PortCMode	HWAuxIO	Sets and reads the mode of Port C
SweepEndMode	HWAuxIO	Sets and reads the event that causes the Sweep End line to go to a false state. Shared with the HWMaterialHandler Object

IHWAuxIO History

Interface	Introduced with PNA Rev:
IHWAuxIO	2.0
IHWAuxIO2	3.0
IHWAuxIO3	3.0
IHWAuxIO4	5.0
IHWAuxIO5	7.5

Last Modified:

5-Aug-2008 Updated for InputVoltageEX command
10-Jul-2007 Added new command
29-Jun-2007 Updated for PNA-X ADC commands

HWExternalTestSetIO Object

Description

Contains the methods and properties that control the rear panel External Test Set Input / Output connector

Accessing the HWExternalTestSetIO object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim ExtTS As HWExternalTestSetIO
Set ExtTS = app.GetExternalTestSetIO
```

See Also:

HWMaterialHandlerIO Object

Description

Contains the methods and properties that control the rear panel Material Handler Input / Output connector.

Accessing the HWMaterialHandlerIO object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim MatHdlr As HWMaterialHandlerIO
Set MatHdlr = app.GetMaterialHandlerIO
```

See Also:

- [Pinout for the Material HandlerIO Connector](#)
- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Interface	Description
get_Input1	HWMaterialHandlerIO	Reads a hardware latch that captures low to high transition on Input1
get_Output	HWMaterialHandlerIO	Returns the last value written to the selected output pin.
get_Port	HWMaterialHandlerIO	Returns the value from the specified "readable" port.
put_Output	HWMaterialHandlerIO	Writes a TTL HI or TTL Low to output pins 3 or 4.
put_Port	HWMaterialHandlerIO	Writes a value to the specified port.
Properties		Description
IndexState	HWMaterialHandlerIO2	Determines the control of Material Handler connector Pin 20

<u>ReadyForTriggerState</u>	HWMaterialHandlerIO2	Determines the control of Material Handler connector Pin 21
<u>PassFailLogic</u>	HWMaterialHandlerIO	Sets and reads the logic of the PassFail line Shared with the HWAuxIO Object
<u>PassFailMode</u>	HWMaterialHandlerIO	Sets and reads the mode for the PassFail line Shared with the HWAuxIO Object
<u>PassFailPolicy</u>	HWMaterialHandlerIO2	Sets the policy used to determine how global pass/fail is computed. Shared with the HWAuxIO Object
<u>PassFailScope</u>	HWMaterialHandlerIO	Sets and reads the scope for the PassFail line Shared with the HWAuxIO Object
<u>PassFailStatus</u>	HWMaterialHandlerIO2	Returns the most recent pass/fail status value. Shared with the HWAuxIO Object
<u>PortLogic</u>	HWMaterialHandlerIO	Sets and returns the logic mode of data ports A-H
<u>PortMode</u>	HWMaterialHandlerIO	Sets and returns whether Port C or Port D is used for writing or reading data
<u>SweepEndMode</u>	HWMaterialHandlerIO	Sets and reads the event that cause the Sweep End line to go to a low state. Shared with the HWAuxIO Object

IMixer Interface (Option 083) - Superseded

Note: This object and all properties and methods are replaced with Converter Object which can be used for all converter application.

Description

Contains the methods and properties to setup FCA Mixer measurements.

For performing calibrations, use either the SMC Type Object or the VMC Type Object .

Accessing the IMixer Interface

Access the IMixer Interface through the Measurement Object. If the particular type of Measurement that was created supports IMixer, then the program determines this at run time and can access the functionality exposed by IMixer. Because the determination of IMixer support is not made until runtime, the program should handle the case where IMixer is not supported on the object.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", "analyzerName ")
app.Preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the
standard measurement
Dim standardMeas As IMeasurement
Set standardMeas = app.ActiveMeasurement
standardMeas.Delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas As IMeasurement
Set meas = app.CreateCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer As IMixer
Set mixer = meas
```

See Also:

PNA Automation Interfaces

The PNA Object Model

Example: How to create and calibrate a standard SMC or VMC measurement or a fixed output SMC measurement.

Methods	Interface	Description
	See History	

Apply	IMixer3	Applies mixer settings.
Calculate	IMixer	Automatically calculate Input and Output frequencies for mixer setup.
LoadFile	IMixer	Loads a previously-configured mixer attributes file (.mxr)
SaveFile	IMixer	Saves the settings for the mixer/converter test setup to a mixer attributes file.
SetDutPorts	IMixer8	Sets the PNA to DUT port mapping.

Properties	Description
------------	-------------

ActiveXAxisRange	IMixer3	Sets or returns the swept parameter to display on the X-axis.
AvoidSpurs	IMixer	Sets and returns the state of the avoid spurs feature.
EmbeddedLO	IMixer7	Provides measurements of mixers with an embedded LO.
DeviceInputPort	IMixer8	Reads the PNA port that is mapped to the DUT Input port
DeviceOutputPort	IMixer8	Reads the PNA port that is mapped to the DUT Output port
EnablePhase	IMixer12	Include phase in SMC measurements and calibrations.
IFSideband	IMixer	Sets or returns the value of the IF sideband.
IFStartFrequency	IMixer	Returns the start frequency of the mixer IF.
IFStopFrequency	IMixer	Returns the stop frequency of the mixer IF.
IncludeReverseSweep	IMixer12	Sets or returns whether to include SC12 sweep.
InputDenominator	IMixer	Sets or returns the denominator value of the Input Fractional Multiplier.

InputFixedFrequency	IMixer6	Sets or returns the mixer fixed Input frequency value.
InputNumerator	IMixer	Sets or returns the numerator value of the Input Fractional Multiplier.
InputPower	IMixer	Sets or returns the value of the Input Power.
InputRangeMode	IMixer6	Sets or returns the Input sweep mode.
InputStartFrequency	IMixer	Sets or returns the start frequency of the mixer input.
InputStopFrequency	IMixer	Sets or returns the stop frequency of the mixer input.
IsInputGreaterThanLO	IMixer2	Specifies whether to use the Input frequency that is greater than the LO or less than the LO.
LODenominator	IMixer	Sets or returns the denominator value of the LO Fractional Multiplier.
LOFixedFrequency	IMixer	Sets or returns the fixed frequency of the specified LO.
LOName	IMixer	Sets or returns the LO name.
LONumerator	IMixer	Sets or returns the numerator value of the LO Fractional Multiplier.
LOPower	IMixer	Sets or returns the value of the LO Power.
LORangeMode	IMixer3	Sets or returns the LO sweep mode to fixed or swept.
LOStage	IMixer	Returns the number of LOs (1 or 2).
LOStartFrequency	IMixer3	Sets or returns the start frequency of the specified LO.
LOStopFrequency	IMixer3	Sets or returns the start frequency of the specified LO.
NominalIncidentPowerState	IMixer4	Toggles Nominal Incident Power ON and OFF.
NormalizePoint	IMixer12	Set or return the data point used to normalize SMC phase measurements.
OutputFixedFrequency	IMixer3	Sets or returns the fixed frequency of the mixer output.

OutputRangeMode	IMixer6	Sets or returns the Output sweep mode.
OutputSideband	IMixer	Sets or returns the value of the output sideband.
OutputStartFrequency	IMixer	Sets or returns the start frequency of the mixer output.
OutputStopFrequency	IMixer	Sets or returns the stop frequency of the mixer output.

SetPortMap	IIMSpectrum	Sets limited port mapping
Property	Interface	Description
CoupleTonePower	IIMSpectrum	ON OFF state of power coupling for F1 and F2.
DeviceInputPort	IIMSpectrum	Read input port map
DeviceOutputPort	IIMSpectrum	Read output port map
DeltaFrequency	IIMSpectrum	Fixed tone spacing value.
EqualTonePower	IIMSpectrum2	Superseded with LevelingMethod Set Equal Tone Power state.
F1Frequency	IIMSpectrum	Frequency of the F1 tone.

F2Frequency	IIMSpectrum	Frequency of the F2 tone.
FrequencyCenter	IIMSpectrum	Center frequency of the main tones.
LevelingMethod	IIMSpectrum3	Set tone power leveling mode
ResolutionBW	IIMSpectrum	Resolution Bandwidth for the measurement.
SpectrumCenterFrequency	IIMSpectrum	Receiver Center frequency
SpectrumSpanFrequency	IIMSpectrum	Receiver frequency span.
SpectrumStartFrequency	IIMSpectrum	Receiver Start frequency.
SpectrumStopFrequency	IIMSpectrum	Receiver Stop frequency.
TonePowerSetAt	IIMSpectrum2	Superseded with LevelingMethod Set power at DUT input or Output
TrackingChannel	IIMSpectrum	IMD channel number to which the IM Spectrum channel is coupled.
TrackingEnable	IIMSpectrum	Enables tracking with an IMD channel.
TrackingManualStepEnable	IIMSpectrum	Step sweep mode for the IM Spectrum channel.
TrackingStepIndex	IIMSpectrum	IMD data point number at which the IM spectrum measurement occurs.
SweepOrder	IIMSpectrum	IM product to view when SweepType = NTH is specified.
SweepType	IIMSpectrum	Type of sweep for an IIMSpectrum measurement.
TonePower	IIMSpectrum	Power level of the Main Tones

InterfaceControl	5.2

Limit Test Collection

Description

Child of the **Measurement** Object. A collection that provides a mechanism for iterating through the Measurement's Limit Segment objects (Limit Lines). The collection has 100 limit lines by default.

Accessing the LimitTest collection

Get a handle to an individual limit segment by specifying an item of the LimitTest collection.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim limSegs As LimitTest
Set limSegs = app.ActiveMeasurement.LimitTest
limSegs.Item(1).BeginStimulus = 1000000000
limSegs.Item(1).EndStimulus = 1000000000
limSegs.Item(1).BeginResponse = 3.5
limSegs.Item(1).EndResponse = 3.5
```

See Also:

- [Limit Line Testing Example](#)

Methods	Description
GetTestResult	Retrieves the Pass/Fail results of the Limit Test (State).
Item	Use to get a handle on a limit line in the collection.

Properties	Description
Count	Returns the number of limit lines used in the measurement.
LineDisplay	Displays the limit lines on the screen.
SoundOnFail	Enables a beep on Limit Test fails.
State	Turns ON and OFF limit testing.

LimitTest History

Interface	Introduced with PNA Rev:
ILimitTest	1.0

LimitSegment Object

Description

The LimitSegment object is an individual limit line.

Accessing the LimitSegment object

Get a handle to an individual limit line by using the LimitTest collection.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim limSegs As LimitTest
Set limSegs = app.ActiveMeasurement.LimitTest
limSegs(1).BeginResponse = 1000000000#
```

[BeginResponse](#) Specifies the Y-axis value that corresponds with Begin Stimulus (X-axis) value.

[BeginStimulus](#) Specifies the beginning X-axis value of the Limit Line.

[EndResponse](#) Specifies the Y-axis value that corresponds with End Stimulus (X-axis) value.

[EndStimulus](#) Specifies the End X-axis value of the Limit Line.

[Type](#) Specifies the Limit Line type.

LimitSegment History

Interface

**Introduced with PNA
Rev:**

ILimitSegment

1.0

Marker Object

Description

Contains the methods and properties that control Markers. There are 10 markers available per measurement:

- 1 reference marker
- 9 markers for absolute data or data relative to the reference marker (delta markers).

There are two ways to control markers through COM.

1. The [Measurement object](#) has properties that apply to ALL of the markers for that measurement. For example, **meas.MarkerFormat = naLinMag** applies formatting to all markers.
2. Marker object properties override the Measurement object properties. For example, you can then override the format setting for an individual marker by specifying **mark.Format = naLogMag** on the marker object.

Note: [SearchFilterBandwidth](#) is available through the [measurement object](#).

Accessing the Marker object

To turn ON a marker, get a handle to the marker through the [measurement object](#). If not already activated, this command will turn ON marker 1

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

app.ActiveMeasurement.marker(1).Format = naLinMag
```

You can also set the marker object to an object variable:

```
Dim m1 As Marker
Set m1 = app.ActiveMeasurement.Marker(1)
m1.Format = naMarkerFormat_LinMag
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)
- [All about Markers](#)

Methods	Interface	Description
Activate	IMarker	Makes an object the Active Object. Shared with the Marker Object
SearchCompressionPoint	IMarker4	Searches the marker domain for the compression level.
SearchMax	IMarker	Searches the marker domain for the maximum value.
SearchMin	IMarker	Searches the marker domain for the minimum value.
SearchNextPeak	IMarker	Searches the marker's domain for the next largest peak value.
SearchPeakLeft	IMarker	Searches the marker's domain for the next VALID peak to the left of the marker.
SearchPeakRight	IMarker	Searches the marker's domain for the next VALID peak to the right of the marker.
SearchTarget	IMarker	Searches the marker's domain for the target value.
SearchTargetLeft	IMarker	Moving to the left of the marker position, searches the marker's domain for the target value.
SearchTargetRight	IMarker	Moving to the right of the marker position, searches the marker's domain for the target value.
SetCenter	IMarker	Changes the analyzer's center frequency to the X-axis position of the marker.
SetCW	IMarker	Changes the sweep type to CW mode and makes the CW frequency the marker's frequency.
SetCWFreq	IMarker3	Changes the CW frequency to the frequency of the active marker.
SetElectricalDelay	IMarker	Changes the measurement's electrical delay to the marker's delay value.
SetReferenceLevel	IMarker	Changes the measurement's reference level to the marker's Y-axis value.
SetStart	IMarker	Changes the analyzer's start frequency to the X-axis position of the marker.
SetStop	IMarker	Changes the analyzer's stop frequency to the X-axis position of the marker.

Properties		Description
Bucket Number	IMarker	Marker data point number
CompressionLevel	IMarker4	Set and read the marker compression level.
CompressionPin	IMarker4	Reads the input power at the marker compression level.
CompressionPout	IMarker4	Reads the output power at the marker compression level.
DeltaMarker	IMarker	Makes a marker relative to the reference marker
Distance	IMarker2	Sets or returns distance value for time domain trace.
Format	IMarker	Linear, SWR, and so forth
Interpolated	IMarker	Turn marker interpolation ON and OFF
Number	IMarker	Read the number of the active marker
PeakExcursion	IMarker	Sets and reads the peak excursion value for the specified marker.
PeakThreshold	IMarker	Sets peak threshold for the specified marker.
SearchFunction	IMarker	Emulates the Tracking function in the marker search dialog box.
Stimulus	IMarker	Sets and reads the X-Axis value of the marker.
Target Value	IMarker	Sets the target value for the marker when doing Target Searches.
Tracking	IMarker	The tracking function finds the selected search function every sweep.
Type	IMarker	Sets and reads the marker type.
UserRange	IMarker	Assigns the marker to the specified User Range.
UserRangeMax	IMarker	Sets the stimulus stop value for the specified User Range.
UserRangeMin	IMarker	Sets the stimulus start value for the specified User Range.
Value	IMarker	Reads the Y-Axis value of the marker.

IMarker4	8.50

Measurement Object

See [IArrayTransferInterface](#) for putting and getting typed data.

See [IMixer Interface](#) (used with [Option 083](#))

Description

The Measurement object is probably the most used object in the PNA Object Model. A measurement object represents the chain of data processing algorithms that take raw data from the channel and make it ready for display, which then becomes the scope of the [Trace object](#).

A Measurement object is defined by its parameter (S11, S22, A/R1, B and so forth). The measurement object is associated with a [channel](#) which drives the hardware that produces the data that feeds the measurement. The root of a measurement is the raw data. This buffer of complex paired data then flows through a number of processing blocks: error-correction, trace math, phase correction, time domain, gating, formatting. All of these are controlled through the measurement object.

The ACTIVE measurement is the measurement that will be acted upon if you make a setting from the front panel. It is the measurement whose "button" is pressed in the window with the red "active window" frame. If you create a new measurement, that measurement becomes the active measurement.

Therefore, all automation methods with the word "Active" in them refer to the object associated with the Active measurement, whether that object is a Channel, Window, Trace or Limit line.

Learn about the [IMeasurement2 Interface](#) for reading stimulus properties.

Accessing the Measurement object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim meas As IMeasurement
Set meas = app.ActiveMeasurement
```

or

```
Set meas = app.Measurements(n)
```

You can access four other objects through the Measurement object: markers, limit test, transform, and gating. For example, because each measurement has its own set of markers, you can set a marker by doing this:

```
Dim meas as measurement
Set meas = app.ActiveMeasurement
meas.marker(1).Stimulus = 900e6
```

IMeasurement2 Interface

Some of the properties and methods for the IMeasurement2 Interface return stimulus values that are set using the channel object. The following is the reason these properties and methods are duplicated.

Every measurement carries with it a snapshot of the stimulus properties of the channel that were in effect when the measurement last acquired data. Therefore, it is the measurement that provides the most accurate stimulus description of its data. Any change made to the channel after the measurement was acquired renders the IChannel interface unreliable in terms of describing the measurement.

- [Superseded commands](#)

(**Bold** Methods or Properties provide access to a child object)

Methods	Interface	Description
Activate	IMeasurement	Makes a measurement the active measurement. Shared with the Marker Object
ActivateMarker	IMeasurement	Makes a marker the Active Marker.
ChangeParameter	IMeasurement	Changes the parameter of the measurement.
DataToDivisor	IMeasurement	Superseded with DoReceiverPowerCal Method
DataToMemory	IMeasurement	Stores the active measurement into memory.
Delete	IMeasurement	Deletes the measurement object.
DeleteAllMarkers	IMeasurement	Deletes all of the markers from the measurement.
DeleteMarker	IMeasurement	Deletes a marker from the active measurement.
getData	IMeasurement	Retrieves Complex data from analyzer memory

getDataByString	IMeasurement	Retrieves variant data from the specified location in your choice of formats.
GetFilterStatistics	IMeasurement	Returns all four Filter Statistics
GetReferenceMarker	IMeasurement	Returns a handle to the reference marker.
Get SnPData	IMeasurement3	Returns SnP data.
GetSnPDataWithSpecifiedPorts	IMeasurement7	Returns sNp data for the specified ports.
GetTraceStatistics	IMeasurement	Returns the Trace Statistics.
GetXAxisValues	IMeasurement2	Returns the stimulus values for the measurement.
InterpolateMarkers	IMeasurement	Turns All Marker Interpolation ON and OFF for the measurement.
putDataComplex	IMeasurement	Puts complex data into one of five data buffers.
putDataScalar	IMeasurement	Puts formatted variant data into the measurement results buffer.
SearchFilterBandwidth	IMeasurement	Searches the domain with the current BW target.
WriteSnPFileWithSpecifiedPorts	IMeasurement7	Write sNp data for specified ports to a file.

Properties	Interface	Description
ActiveMarker	IMeasurement	Returns a handle to the Active Marker object.
ActiveXAxisRange	IMeasurement4	Sets the X-axis range to display for GCX, SMC, and VMC measurements.
BalancedMeasurement	IMeasurement5	Sets the measurement type that is used with balanced topologies.
BandwidthTarget	IMeasurement	The insertion loss value at which the bandwidth of a filter is measured.
BandwidthTracking	IMeasurement	Turns Bandwidth Tracking function ON and OFF.
CalibrationName	IMeasurement2	Returns the name of the cal type.
CalibrationType	IMeasurement	Superseded with CalibrationTypeID_property

<u>CalibrationTypeID</u>	IMeasurement2	Sets or returns the cal type for the current measurement.
<u>Center</u>	IMeasurement2	Returns the stimulus value of the center point for the measurement.
<u>channelNumber</u>	IIMeasurement	Returns the channel number. Shared with the Channel Object
<u>CustomMeasurementConfiguration</u>	IIMeasurement12	Provides access to custom measurement properties and methods.
<u>Domain</u>	IMeasurement2	Returns the domain (frequency, time, power) for the measurement.
<u>ElectricalDelay</u>	IMeasurement	Sets electrical delay.
<u>ElecDelayMedium</u>	IMeasurement2	Sets or returns the characteristic of the electrical delay medium.
<u>ElecDistanceDelay</u>	IMeasurement11	Sets delay in distance
<u>ElecDistanceDelayUnit</u>	IMeasurement11	Sets distance units
<u>Equation</u>	IMeasurement6	Access Equation Editor
<u>ErrorCorrection</u>	IMeasurement	Set or get the state of error correction for the measurement.
<u>ErrorCorrectionIndicator</u>	IMeasurement14	Returns the error correction status of the measurement.
<u>FilterBW</u>	IMeasurement	Returns the results of the SearchBandwidth method.
<u>FilterCF</u>	IMeasurement	Returns the Center Frequency result of the SearchBandwidth method.
<u>FilterLoss</u>	IMeasurement	Returns the Loss value of the SearchBandwidth method.
<u>FilterQ</u>	IMeasurement	Returns the Q (quality factor) result of the SearchBandwidth method.
<u>Format</u>	IMeasurement	Sets display format.
<u>FormatUnit</u>	IMeasurement9	Sets units for unratioded measurements.
<u>Gating</u>	IMeasurement	Controls Time Domain Gating.
<u>GroupDelayAperture</u>	IMeasurement13	Provides access to the Group Delay Aperture settings.

InterpolateCorrection	IMeasurement	Turns ON and OFF the calculation of new error terms when stimulus values change.
InterpolateNormalization	IMeasurement	Superseded with DoReceiverPowerCal Method
IsSparameter	IMeasurement2	Returns true if measurement represents an S-Parameter.
LimitTest	IMeasurement	Collection for iterating through the Limit Segment objects (Limit Lines).
LimitTestFailed	IMeasurement	Returns the results of limit testing
LoadPort	IMeasurement	Returns the load port number associated with an S-parameter reflection measurement.
LogMagnitudeOffset	IMeasurement	Superseded with DoReceiverPowerCal Method
MagnitudeOffset	IMeasurment4	Offsets the magnitude of the entire data trace to a specified value.
MagnitudeSlopeOffset	IMeasurment4	Offsets the magnitude of the data trace to a value that changes linearly with frequency.
Marker	IMeasurement	Provides access to Marker settings.
MarkerFormat	IMeasurement	Sets or returns the format of all the markers in the measurement.
Marker State	IMeasurement3	Sets or returns the ON / OFF state of a marker.
Mean	IMeasurement	Returns the mean value of the measurement.
Name	IMeasurement	Sets or returns the name of the measurement.
NA Window	IMeasurement	Controls the part of the display that contains the graticule, or what is written on the display.
Normalization	IMeasurement	Superseded with DoReceiverPowerCal Method
Number	IMeasurement	Returns the number of the measurement.
NumberOfPoints	IMeasurement2	Returns the Number of Points of the measurement.
Parameter	IMeasurement	Returns the measurement Parameter.

<u>PeakToPeak</u>	IMeasurement	Returns the Peak to Peak value of the measurement.
<u>PhaseOffset</u>	IMeasurement	Sets the Phase Offset for the active channel.
PNOP	IMeasurement13	Provides access to the Power Normal Operating Point marker search object.
PSaturation	IMeasurement13	Provides access to the Power Saturation marker search object.
<u>ReceivePort</u>	IMeasurement2	Returns the receiver port of the measurement.
<u>ReferenceMarkerState</u>	IMeasurement	Turns the reference marker ON or OFF
<u>ShowStatistics</u>	IMeasurement	Displays and hides the measurement statistics (peak-to-peak, mean, standard deviation) on the screen.
<u>Smoothing</u>	IMeasurement	Turns ON and OFF data smoothing.
<u>SmoothingAperture</u>	IMeasurement	Specifies or returns the amount of smoothing as a ratio of the number of data points in the measurement trace.
<u>SourcePort</u>	IMeasurement2	Returns the source port of the measurement.
<u>Span</u>	IMeasurement2	Returns the stimulus span (stop - start) for the measurement.
<u>StandardDeviation</u>	IMeasurement	Returns the standard deviation of the measurement.
<u>Start</u>	IMeasurement2	Returns the stimulus value of the first point for the measurement.
<u>StatisticsRange</u>	IMeasurement	Sets the User Range number for calculating measurement statistics.
<u>Stop</u>	IMeasurement2	Returns the stimulus value of the last point for the measurement.
Trace	IMeasurement	Controls scale, reference position, and reference line.
<u>TraceMath</u>	IMeasurement	Performs math operations on the measurement object and the trace stored in memory.

TraceMax	IMeasurement10	Maximizes the active trace.
TraceTitle	IMeasurement8	Writes and reads a trace title.
TraceTitleState	IMeasurement8	Turns trace title ON and OFF
Transform	IMeasurement	Controls Time Domain transforms.
UserRangeMax	IMeasurement15	Sets the stimulus stop value for the specified User Range.
UserRangeMin	IMeasurement15	Sets the stimulus start value for the specified User Range.
View	IMeasurement	Sets (or returns) the type of trace displayed on the screen.
WGCutoffFreq	IMeasurement2	Sets or returns the value of the waveguide cut off frequency.

IArrayTransfer Interface

Description

Contains methods for putting data in and getting data out of the analyzer using typed data. This interface transfers data more efficiently than the IMeasurement Interface. However, this interfaces is

only usable from VB6, C, & C++.

Methods	Description
getComplex	Retrieves real and imaginary data from the specified buffer.
getNAComplex	Retrieves typed NAComplex data from the specified buffer.
getPairedData	Retrieves magnitude and phase data pairs from the specified buffer.
getScalar	Retrieves scalar data from the specified buffer.
putComplex	Puts real and imaginary data into the specified buffer.
putNAComplex	Puts typed NAComplex data into the specified buffer.
putScalar	Puts scalar data into the measurement result buffer.

Properties	Description
------------	-------------

None

IArrayTransfer History

Interface	Introduced with PNA Rev:
IArrayTransfer	1.0

MeasurementClassProperties Object

Description

These properties return properties of specific measurement classes.

Accessing the MeasurementClassProperties object

```
Set app = CreateObject("AgilentPNA835x.Application")  
Set cap = app.Capabilities  
  
'Access the MeasurmentClassProperties Object  
  
Set measProps = cap.MeasurmentClassProperties ("Swept IMD")  
  
list=measProps.SupportedParameters
```

Measurement Collection

Description

A collection object that provides a mechanism for iterating through the Application measurements.

Accessing the Measurements collection

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim measments As Measurements
Set measments = app.Measurements
```

See Also:

- [Measurement Object](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Description
Add	Adds a Measurement to the collection.
Item	Use to get a handle on a measurement in the collection.
Remove	Removes a measurement from the measurements collection.

Properties	Description
Count	Returns the number of measurements in the analyzer.
Parent	Returns a handle to the current Application.

NAWindow Object

Description

The NAWindow object controls the part of the display that contains the graticule, or what is written on the display.

Accessing the NaWindow object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim window As NAWindow
Set window = app.NAWindows(1)
window.AutoScale
```

OR

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")

app.NAWindows(1).AutoScale
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)

(**Bold** Methods or Properties provide access to a child object)

Methods	Description
Autoscale	Autoscales all measurements in the window. Shared with the Trace Object
ShowMarkerReadout	Shows and Hides the Marker readout for the active marker in the upper-right corner of the window object.
ShowTable	Shows or Hides the specified table for the active measurement in the lower part of the window object.
Properties	Description

<u>ActiveTrace</u>	Sets a trace to the Active Trace.
<u>MarkerReadout</u>	Sets and reads the state of the Marker readouts.
<u>MarkerReadoutResponsePlaces</u>	
<u>MarkerReadoutSize</u>	Specifies the size of font used when displaying Marker readout in the selected window.
<u>MarkerReadoutsPerTrace</u>	
<u>MarkerReadoutStimulusPlaces</u>	
<u>MarkerReadoutXPosition</u>	
<u>MarkerReadoutYPosition</u>	
<u>MarkerSymbol</u>	
<u>OneMarkerReadoutPerTrace</u>	Superseded with <u>MarkerReadoutsPerTrace Property</u>
<u>ScaleCouplingMethod</u>	Sets and returns the method of scale coupling.
<u>ScaleCouplingState</u>	Enables and disables scale coupling for the specified window.
<u>Title</u>	Writes or reads a custom title for the window.
<u>TitleState</u>	Turns ON and OFF the window title.
<u>Traces</u>	Collection for getting a handle to a trace or iterating through the traces in a window.
<u>WindowNumber</u>	Reads the number of the active window.
<u>WindowState</u>	Maximizes or minimizes a window.
	Shared with the Application Object

INaWindow History

Interface	Introduced with PNA Rev:
INaWindow	1.0
INaWindow2	9.0

NAWindows Collection

Description

A collection object that provides a mechanism for iterating through the Application windows.

Accessing the NaWindows collection

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim windows As NAWindows
Set windows = app.NAWindows
```

See Also:

- [NAWindow Object](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Methods	Description
Add	Adds a window to the NAWindows collection.
Item	Use to get a handle to a window in the collection.
Remove	Removes a window from the NAWindows collection.

Properties	Description
Count	Returns the number of windows on the analyzer.
Parent	Returns a handle to the current Application.

NoiseCal Object

Description

Controls the noise figure calibration settings for amplifiers and converters. These commands supplement the standard calibration commands on the [GuidedCalibration Object](#).

Accessing the NoiseCal object

```
Dim app as AgilentPNA835x.Application

Set noiseCal = pna.GetCalmanager.CreateCustomCalEx\(channelNum\)

Set noiseCalExtension = noiseCal.CustomCalConfiguration

noiseCalExtension.NoiseSourceCold = 300
```

None

Property	Interface	Description
AutoOrientTuner	INoiseCal2	Sets the state of auto orientation for a noise tuner during Noise Figure for NFX.
CalMethod	INoiseCal	Sets and returns the method for performing calibration on a noise channel.
EnableLOPowerCal	INoiseCal2	Enables and disables LO power calibration for NFX.
ENRFile	INoiseCal	Sets and returns the name of the ENR file associated with the noise source.
ForceDeEmbedENRAdapter	INoiseCal2	Sets and reads the state of ENR adapter de-embedding.
ForceDeEmbedSensorAdapter	INoiseCal2	Sets and reads the state of noise source adapter de-embedding.
NoiseSourceCalKitType	INoiseCal	Sets and reads the Cal Kit type used to perform a cal at the adapter which is used to connect the noise source (if required.)
NoiseSourceCold	INoiseCal	Sets and returns the current temperature at the noise source.
NoiseSourceConnectorType	INoiseCal	Sets and reads the connector type of the noise source used during the cal.
RcvCharMethod	INoiseCal3	Set and read the method used to characterize the noise receivers.

NoiseConfiguration History

Interface	Introduced with PNA Rev:

Method	Interface	Description
	See History	
GetSnPData	INoiseFigure7	Reads noise parameter snp data.
SetPortMap	INoiseFigure6	Maps DUT ports to PNA-X ports (Opt 028)
WriteSnPData	INoiseFigure7	Reads noise parameter data to snp file.

Property	Interface	Description
AmbientTemperature	INoiseFigure	Sets the air temperature at which the measurement is being performed.
DeviceInputPort	INoiseFigure6	Read DUT input port map
DeviceOutputPort	INoiseFigure6	Read DUT output port map
ImpedanceStates	INoiseFigure	Sets the number of impedance states to use during calibrated measurements.
NoiseAverageFactor	INoiseFigure	Set averaging of noise receiver.
NoiseAverageState	INoiseFigure	Turn noise averaging ON and OFF
NoiseBandwidth	INoiseFigure	Set bandwidth of noise receiver.
NoiseGain	INoiseFigure	Set gain state of noise receiver.
NoiseReceiver	INoiseFigure5	Sets and returns the receiver to use for noise measurements.
NoiseReceiverSweepTime	INoiseFigure3	Returns an estimate of sweep time.
NoiseTuner	INoiseFigure	Sets and returns the noise tuner identifier,
NoiseTunerIn	INoiseFigure	Sets and returns the port identifier of the ECal noise tuner Input
NoiseTunerOut	INoiseFigure	Sets and returns the port identifier of the ECal noise tuner Output
SourcePullForSParameters	INoiseFigure4	Set and read the use of source pull technique to compute S22 on Noise Figure on Converters.

PathConfiguration Object

Description

Provides access to the path configuration currently active on the channel object.

To load, store, or delete a configuration, see [ConfigurationManager](#) Object.

Accessing the PathConfiguration object in VB

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan as Channel
Set chan = app.ActiveChannel

Dim pathConfig As PathConfiguration
Set pathConfig = chan.PathConfiguration
```

Accessing the PathConfiguration object in C#

```
Type pnaType = Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");

AgilentPNA835x.Application pna =
(AgilentPNA835x.Application)Activator.CreateInstance(pnaType);

AgilentPNA835x.Channel chan = (AgilentPNA835x.Channel)pna.ActiveChannel;

AgilentPNA835x.PathConfiguration path =
(AgilentPNA835x.PathConfiguration)chan.get_PathConfiguration();
```

Note:

To learn how to make configuration (element) settings, see this [Path Configuration Example](#)

Also see this [list of configurable elements and settings](#).

See Also:

- [PathConfigurationManager Object](#)

Methods	Interface	Description
	See History	

CopyFrom	IPathConfiguration2	Copy the mechanical switch settings and attenuator settings from the specified channel to the active channel.
Store	IPathConfiguration	Saves the current configuration to the specified name.

Properties	Interface	Description
	See History	

DescriptiveText	IPathConfiguration	Write and read descriptive text associated with the configuration.
Elements	IPathConfiguration	Collection of Elements that can be configured (switches and so forth). See the list of elements and settings.
Element	IPathConfiguration	Returns a handle to a IPathElement object.
Name	IPathConfiguration	Returns the name of the current configuration.
Parent	IPathConfiguration	Returns a pointer to the parent COM object (Channel).

IPathConfiguration History

Interface	Introduced with PNA Rev:
IPathConfiguration	7.2
IPathConfiguration2	9.4

PathConfigurationManager Object

Description

These commands allow configurations to be stored, loaded, or deleted on the PNA.

To **make** path configuration settings, see [PathConfiguration Object](#) and the [PathElement Object](#)

Accessing the PathConfigurationManager object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim pathConfig As PathConfigurationManager
Set pathConfig = app.PathConfigurationManager
```

Note:

To learn how to make configuration (element) settings, see this [Path Configuration Example](#)

Also see this [list of configurable elements and settings](#).

PathElement Object

Description

Provides access to the settings for the PathElement object.

Accessing the PathElement object in VB

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan as Channel
Set chan = app.ActiveChannel

Dim pathConfig As PathConfiguration
Set pathConfig = chan.PathConfiguration

Dim element as PathElement
Set element = pathConfig.PathElement("Src1")
```

Accessing the PathElement object in C#

```
Type pnaType = Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");

AgilentPNA835x.Application pna =
(AgilentPNA835x.Application)Activator.CreateInstance(pnaType);

AgilentPNA835x.Channel chan = (AgilentPNA835x.Channel)pna.ActiveChannel;

AgilentPNA835x.PathConfiguration path =
(AgilentPNA835x.PathConfiguration)chan.get_PathConfiguration();

path.get_Element("Port1RefMxr").Value = "External";
```

Note:

To learn how to make configuration (element) settings, see this [Path Configuration Example](#)

Also see this [list of configurable elements and settings](#).

[See History](#)

CouplePhasePortSettings	IPhaseControl	Set and return whether to couple phase control settings.
FixedPhase	IPhaseControl	Set and return the fixed phase value.
FixedRatioedPower	IPhaseControl	Set and return the fixed ratioed power value.
PhaseControlMode	IPhaseControl	Set and return the ON/Off state of phase control.
PhaseCorrectionData	IPhaseControl	Set and return an array of phase offsets.
PhaseCorrectionEnabled	IPhaseControl	Set and return whether to use the phase correction offset array.

<u>PhaseIterationNumber</u>	IPhaseControl	Set and return max number of leveling sweeps
<u>PhaseParameter</u>	IPhaseControl	Set and return the ratioed receivers (parameter) to use for phase control.
<u>PhaseParameterModes</u>	IPhaseControl	Returns the available phase control modes for the specified port.
<u>PhaseReferencePort</u>	IPhaseControl	Sets and returns the reference port for the Phase Control measurement.
<u>PhaseTolerance</u>	IPhaseControl	Set and return tolerance value for leveling sweeps
<u>RatioedPowerCorrectionData</u>	IPhaseControl	Set and return ratioed power offset data
<u>RatioedPowerCorrectionEnabled</u>	IPhaseControl	Set and return whether to use the ratioed power offset array
<u>StartPhase</u>	IPhaseControl	Set and return the start value of phase sweep.
<u>StartRatioedPower</u>	IPhaseControl	Set and return the start ratioed power value.
<u>StopPhase</u>	IPhaseControl	Set and return the stop value of phase sweep.
<u>StopRatioedPower</u>	IPhaseControl	Set and return the stop ratioed power value.

PhaseReferenceCalibration Object

Description

Use this interface to perform a Phase Reference Calibration. This calibration is performed as a 'Tier 1' cal. After it is performed and saved, it can then be recalled into an SMC+Phase Calibration.

- It is NOT necessary to create an SMC measurement before performing a **remote** Phase Reference Cal. It is necessary when performed from the user interface.
- Port selection is made remotely by selecting connectors and Cal Kits for the ports to be included in the SOLT calibration.

Accessing the PhaseReferenceCalibration Object

```
Dim app as AgilentPNA835x.Application

Dim CalMgr

Set CalMgr = app.GetCalManager

Dim phaseRefCal

Set phaseRefCal = CalMgr.PhaseReferenceCalibration

'Then get a handle to the GuidedCal object

Dim guidedCal

Set guidedCal = phaseRefCal.GuidedCalibration
```

See Also:

- Example program
- Learn about Calibrate All Channels .
- PNA Automation Interfaces
- The PNA Object Model
- **Superseded** commands

(**Bold** Methods or Properties provide access to a child object)

In the following table IPhaseReferenceCalibration is abbreviated to IPhaseRefCal

Methods	Interface	Description
	See History	

GetConnectedPhaseReferences	IPhaseRefCal	Reads the ID strings of the phase references that are currently connected to the PNA USB
Reset	IPhaseRefCal	Resets all properties associated with the Cal All session to their default values.

Properties

CalKitType	IPhaseRefCal2	Sets and returns the Cal Kit to be used during the S-parameter portion of a Phase Reference calibration.
CalSet	IPhaseRefCal	Sets and reads the Cal Set name into which the calibration will be saved.
GuidedCalibration	IPhaseRefCal	Provides access to the GuidedCal object. Use this to perform the Calibration.
IncludePort	IPhaseRefCal2	Sets and returns the enable state for the specified port.
IncludeUnknownMixer	IPhaseRefCal2	Sets and returns the state of Unknown Mixer calibration.
PhaseReference	IPhaseRefCal	Sets and returns the Phase Reference ID to be used for the Phase Reference calibration.
SourceAttenuator	IPhaseRefCal	Sets and returns the Source Attenuator setting.
StartFrequency	IPhaseRefCal	Sets and returns the phase reference cal start frequency.
StopFrequency	IPhaseRefCal	Sets and returns the phase reference cal stop frequency.
UnknownMixerInputPower	IPhaseRefCal2	Sets and returns the input power level to the unknown mixer.

UnknownMixerLOFrequency IPhaseRefCal2 Sets and returns the LO Frequency of the unknown mixer.

UnknownMixerLOPower IPhaseRefCal2 Sets and returns the LO power level to the unknown mixer.

PortExtension Object **Superseded**

ALL methods and properties on the PortExtension Object are Superseded with the [Fixturing Object](#).

Description

Contains the methods and properties that control Port Extensions.

Accessing a PortExtension object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim PortExt As PortExtension
Set PortExt = app.PortExtension
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)
- [Superseded commands](#)

Methods

None

Property	Description
Input A	Sets the Input A extension value.
Input B	Sets the Input B extension value.
Input C	Sets the Input C extension value.
Port 1	Sets the Port 1 extension value.
Port 2	Sets the Port 2 extension value.
Port 3	Sets the Port 3 extension value.
State	Turns Port Extensions ON and OFF.

IPort Extension History

Interface	Introduced with PNA Rev:
IPort Extension	1.0

PowerLossSegment Object

Description

Contains the properties describing a segment of the power loss table used in source power calibration.

You can get a handle to one of these segments through the [segments.Item](#) Method of the PowerLossSegments collection.

Accessing the PowerLossSegment object

You can get a handle to one of these segments through `PowerLossSegments.Item(n)`

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim PwrLossSeg As PowerLossSegment
Set PwrLossSeg = app.SourcePowerCalibrator.PowerLossSegments(1)
```

See Also:

IPowerMeterInterface	7.50

Last Modified:

5-Jul-2007 MX New topic

PowerMeterInterfaces Collection

Description

A collection object that provides a mechanism for accessing the PowerMeterInterface objects.

The collection size is limited to one PowerMeterInterface object. By default, that PowerMeterInterface object refers to GPIB, and to the GPIB address that is currently set for the power meter on that PNA.

The power meter is specified by using the [Path](#) property.

Accessing the PowerMeterInterfaces collection

Get a handle to a power meter object using the PowerMeterInterfaces collection.

```
Dim app As AgilentPNA835x.Application

Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim pwrMtrInterfaces As PowerMeterInterfaces

Set pwrMtrInterfaces = app.SourcePowerCalibrator.PowerMeterInterfaces

If pwrMtrInterfaces.Count > 0 Then

    Dim pwrMtrInterface As PowerMeterInterface

    Set pwrMtrInterface = pwrMtrInterfaces(1)

    pwrMtrInterface.Path = naUSB

    pwrMtrInterface.Locator = "Agilent Technologies,U2000A,MY12345678"

End If
```

PowerSensor Object

Description

Each power sensor connected to the power meter associated with Source Power Calibration will have a PowerSensor object created to represent it. These PowerSensor objects reside in the [PowerSensors](#) collection within the SourcePowerCalibrator object. You cannot directly create PowerSensor objects, but can only retrieve existing ones from the PowerSensors collection.

The PowerSensorCalFactorSegment object is also accessed through the PowerSensor object. These are accessed through the CalFactorSegments collection in the PowerSensor object.

Accessing a PowerSensor object

```
Dim pna As AgilentPNA835x.Application
Set pna = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim powerCalibrator as SourcePowerCalibrator
Dim powerSensor as PowerSensor
Dim calFactorSegment as PowerSensorCalFactorSegment

Set powerCalibrator = pna.SourcePowerCalibrator

' Specify GPIB address of the power meter.
powerCalibrator.PowerMeterGPIBAddress = 13

' Each time the PowerSensors collection is accessed, the power meter is queried to
determine which channels have sensors attached. The collection is updated
accordingly.

If powerCalibrator.PowerSensors.Count > 0 Then
' If channel B of the meter has a sensor attached but channel A does not, then
element 1 of the
' collection is sensor B. Whenever channel A has a sensor, sensor A will be element
1.
Set powerSensor = powerCalibrator.PowerSensors(1)
' Insert one new PowerSensorCalFactorSegment at the beginning of the collection
(index 1).

powerSensor.CalFactorSegments.Add(1)
' Assign our variable to refer to that object.
Set calFactorSegment = powerSensor.CalFactorSegments(1)

' Set property values for that object.
calFactorSegment.Frequency = 300000
' frequency in Hz
calFactorSegment.CalFactor = 98
' cal factor in percent
```

End If

PowerMeterChannel	Identifies which power sensor this object corresponds to (or which channel of the power meter the sensor is connected to).
ReferenceCalFactor	Reference cal factor (%) associated with this power sensor.

IPowerSensor History

Interface	Introduced with PNA Rev:
IPowerSensor	2.0

PowerSensors Collection

Description

A collection object that provides a mechanism for iterating through the PowerSensor objects which are connected to the power meter. Each time this collection object is accessed, the power meter is queried to determine how many sensors are connected to it. The collection size and order of objects is then adjusted accordingly before the requested method or property operation is performed. The power meter is specified by using the [PowerMeterGPIBAddress](#) property of the [SourcePowerCalibrator](#) object.

Accessing the PowerSensors Collection

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim PwrSensors As PowerSensors
Set PwrSensors = app.SourcePowerCalibrator.PowerSensors
```

Methods	Description
Item	Use to get a handle to a PowerSensor object in the collection.
Properties	Description
Count	Returns the number of objects in the collection.
Parent	Returns a handle to the Parent object (SourcePowerCalibrator) of this collection.

PowerSensorCalFactorSegment Object

Description

Contains the properties describing a segment of a power sensor cal factor table.

Accessing the PowerSensorCalFactorSegment object

You can get a handle to one of these segments through [CalFactorSegments.Item\(n\)](#)

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calFactSeg As CalFactorSegments
Set calFactSeg = app.SourcePowerCalibrator.PowerSensors(1).CalFactorSegments(1)
```

PowerSensorAsReceiver Object

Description

Provides the settings for configuring a Power Meter to be used as a PNA Receiver (PMAR).

Accessing a PowerSensorAsReceiver object

This object is accessed through ExternalDevice.ExtendedProperties. When an external device is added to the [ExternalDevices collection](#), and the DeviceType property is set to Power Meter, then ExtendedProperties is used to get a handle to this object.

```
externalDevices.Add "NewPMAR"  
  
dim newExternalDevice  
  
Set newExternalDevice = externalDevices.Item("NewPMAR")  
  
newExternalDevice.DeviceType = "Power Meter"  
  
dim PMAR  
  
Set PMAR = newExternalDevice.ExtendedProperties  
  
PMAR.ReadingsPerPoint = 10
```

(**Bold** Methods or Properties provide access to a child object)

Methods**Description**

None

Properties**Description****[CalFactorSegmentsPMAR](#)**

Provides access to the collection of segments of a power sensor cal factor table.

[LimitFrequency](#)

Enable or disable the use of the power meter min and max frequencies.

[MaximumFrequency](#)

Maximum usable frequency (Hz) specified for this power sensor.

[MinimumFrequency](#)

Minimum usable frequency (Hz) specified for this power sensor.

[PowerLossSegmentsPMAR](#)

Provides access to the collection of segments of the power loss table.

[PowerMeterChannel](#)

Identifies which power sensor this object corresponds to (or which channel of the power meter the sensor is connected to).

[ReadingsPerPoint](#)

Allows for settling of the power sensor READINGS.

[ReadingsTolerance](#)

Allows for settling of the power sensor READINGS.

[ReferenceCalFactor](#)

Reference cal factor (%) associated with this power sensor.

[SensorIndex](#)

Sets the power sensor channel (1 or 2) to be used.

[UsePowerLossSegments](#)

Specifies if subsequent power readings will use of the loss table.

AuxTriggerScopeIsGlobal	IPreferences5	Sets the External Trigger OUT behavior to have either Global or Channel scope.
---	---------------	--

CitiContents	IPreferences	Specifies the contents of subsequent citifile saves. Superseded with SaveData
------------------------------	--------------	--

CitiFormat	IPreferences	Specifies the format of subsequent citifile saves. Superseded with SaveData
----------------------------	--------------	--

<u>DisplayColors</u>	IPreferences10	Provides access to the <u>ComColors</u> Object.
<u>EnableSourceUnleveledEvents</u>	IPreferences6	Specifies whether or not to report Source Unleveled errors as system events.
<u>ExternalDeviceDeActivatePolicy</u>	IPreferences10	External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.
<u>FrequencyOffsetRangeForCalComputations</u>	IPreferences10	Specifies the FOM frequency range to use when performing calibration.
<u>IMDECalExtrapolation</u>	IPreferences14	Allow ECal beyond stop frequency for IMD apps.
<u>OffsetReceiverAttenuator</u>	IPreferences6	Mathematically offset the test port receiver.
<u>OffsetSourceAttenuator</u>	IPreferences6	Mathematically offset the reference receiver.
<u>Port1NoiseTunerSwitchPresetsToExternal</u>	IPreferences8	Sets default setting for Noise Figure switch.
<u>PowerOnDuringRetraceMode</u>	IPreferences4	Specify whether to turn RF power ON or OFF during a retrace for single-band frequency or segment sweeps ONLY.
<u>PowerSweepRetracePowerMode</u>	IPreferences3	At the end of a power sweep, specifies whether to maintain source power at the start or stop power level.
<u>PreferInternalTriggerOnChannelSingle</u>	IPreferences2	Sets the preference for chan.Single behavior.
<u>PreferInternalTriggerOnUnguidedCal</u>	IPreferences2	Set the preference for the trigger behavior when performing an Unguided calibration.
<u>PresetPowerState</u>	IPreferences11	Set and return the Preset Power ON/OFF state.
<u>PrintColors</u>	IPreferences10	Provides access to the <u>ComColors</u> Object.
<u>RecallSoftkeysMostRecent</u>	IPreferences13	List files for recall on softkeys by name or alphabetically.

[RemoteCalStoragePreference](#)

IPreferences7 Specifies the default manner in which calibrations performed via SCPI or COM are to be stored.

[ReportReceiverOverload](#)

IPreferences12 Set whether to display receiver overload warnings.

[RFOffOnReceiverOverload](#)

IPreferences12 Set whether to turn source power OFF when a receiver is overloaded.

[SnPFormat](#)

IPreferences Specifies the format of subsequent .S1P, .S2P, .S3P file saves.

[TwoPointGroupDelayAperture](#)

IPreferences11 Sets Group Delay Aperture default to 2 points.

IPSaturation	A.09.20

PulseGenerator Object

Description

Contains the properties for configuring the five internal pulse generators in the PNA-X.

[Learn more about the PNA-X Pulse Generators.](#)

Accessing the PulseGenerator object

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim pulse as PulseGenerator
Set pulse = chan.PulseGenerator
```

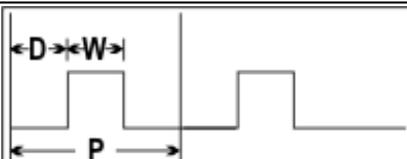

Each pulse generator is specified in the Pulse Generator properties.

External Pulse Generators

Beginning with A.09.50, [External Pulse Generators](#) can be used with the [Integrated Pulse Application](#).

Use chan.[PulseGeneratorNames](#) and chan.[PulseGeneratorID](#) to refer to the external pulse generator when setting properties on this (PulseGenerator) Object.

Pulse Definitions

- D = Delay; the time before each pulse begins
- W = Width; the time the pulse is ON
- P = Period; one complete pulse cycle
- W/P = Duty Cycle; the ratio of pulse ON/OFF

Important: If **D + W** is greater than **P**, then undefined PNA behavior results. There is NO error message or warning.

20-Jul-2009	Added SubPointTrig
1-Jan-2007	MX New topic

PulseMeasControl Object

Description

Contains the properties for configuring pulse measurements in the PNA-X.

Some of these settings require Opt H08 / 008.

[Learn about Integrated Pulse Application.](#)

Accessing the PulseMeasControl object

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim pulse as PulseMeasControl
Set pulse = chan.PulseMeasControl
```

The following shows how to make two new settings introduced with A.09.50:

- **Master Pulse Trigger** - to select an external pulse generator as the master trigger, use `IPathElement.Value` and using "PulseTrigInput" = "Internal" or "External". However, there is no way to tell which external pulse generator is selected.
- To select an external pulse generator for a receiver, use [IPathElement.Value](#) commands. For example, to select an external pulse generator for RCVR A, send "IFGateA","RearPanel".

SCPIStringParser Object

Description

Provides the ability to send a SCPI command from within the COM command. The two commands differ in the following ways:

Execute - will not return an error unless the Execute command itself fails, which is unlikely.

Otherwise, you are required to read the SCPI error queue for errors that were caused by the SCPI command. The Execute command operates with minimal interference between you, the programmer, and the SCPI parser. It does not presume how you want to handle errors: handle by ignore, handle by reading the status byte, etc. This command was defined because automation engines like VB throw runtime errors when a COM method returns a failed HRESULT.

Parse - parses the input command, and then reads the SCPI error queue until the queue is empty. If the queue contains errors, Parse returns a failed HRESULT (E_NA_BAD_SCPI_EXECUTE). It then creates an IErrorInfo object and bundles the error numbers and descriptions into the error object. This object is available so that you can detect the failed HRESULT and interrogate the errorInfo object for more details.

The SCPIStringParser Methods can NOT be used with:

- [SCPI Status Reporting](#). However, the *OPC? will work.
- Transferring Binary (block) data with commands such as: [MMEM:TRAN](#) or [CALC:DATA](#) with [Format:Data](#) set to Real32 or Real64

Accessing the ScpiStringParser object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim SCPI As IScpiStringParser
Set SCPI = app.ScpiStringParser
```

Segments Collection

Description

The segment collection provides a mechanism for iterating through the sweep segments of a channel. Sweep segments are a potentially faster method of sweeping the analyzer through only the frequencies of interest. Learn more about [Segment Sweep](#).

Accessing the Segments collection

There are two paths to the Segments Collection:

1. From the [Channel](#) object
2. From the [FOMRange](#) object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim segs As ISegments
Set segs = app.ActiveChannel.Segments
```

or

```
Set segs = app.ActiveChannel.FOM.FOMRange(1).Segments
```

Methods	Interface	Description
	See History	
AcquireStep	ISMCType	Acquire the measurement data for the specified step in the calibration process.
GenerateErrorTerms	ISMCType	Generates the error terms for the calibration.
GenerateSteps	ISMCType	Returns the number of steps required to complete the calibration.
GetStepDescription	ISMCType	Returns the description of the specified step calibration process.
ImportDataSet	ISMCType4	Imports separate power meter data for SMC cal.

[Initialize](#) ISMCType Begins a calibration.

Properties

Description

[AutoOrient](#) ISMCType Sets ECAL module automatic orientation ON or OFF.

[CalibrationPort](#) ISMCType Sets or returns the calibration source port for the calibration.

[CalKitType](#) ISMCType Sets and returns a calibration kit type for calibration.

[CompatibleCalKits](#) ISMCType Returns a list of cal kits that are compatible with the connector type for the specified port.

[ConnectorType](#) ISMCType Sets or queries the connector type for the specified port.

[Do2PortEcal](#) ISMCType **Superseded** - Replaced by [CalKitType](#)
Specify ECAL or Mechanical calibration.

[EcalCharacterization](#) ISMCType **Superseded** - Replaced by [CalKitType](#)
Specifies the characterization data within an ECal module to be used for the calibration.

[EcalOrientation](#) ISMCType Specifies which port of the ECal module is connected to which port of the PNA when the AutoOrient property = False.

[EnableLOPowerCal](#) ISMCType5 Enable LO Power Cal

[FixedDelay](#) ISMCType5 Set and return the known delay through the calibration mixer.

[MixerCharacterizationFile](#) ISMCType5 Set the filename of the S2P file used to characterize the calibration mixer.

[NetworkFilename](#) ISMCType2 Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement.

[NetworkMode](#) ISMCType2 Embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement.

[OmitIsolation](#) ISMCType **Superseded** - Replaced by [SetIsolationPaths](#) and [GetIsolationPaths](#)
Sets and returns whether Isolation portion of the calibration will be performed or not.

[SeparatePowerCal](#) ISMCType4 Use a Thru standard or to use two power sensor connections during the SMC power cal

[ThruCalMethod](#)

ISMCType **Superseded** - Replaced by [PathThruMethod Property](#)

Sets and returns the method for performing the thru portion of the calibration.

[ValidConnectorTypes](#)

ISMCType Returns a list of connector types for which there are calibration kits.

ISMCType History

Interface	Introduced with PNA Rev:
ISMCType	3.5
ISMCType2	6.0
ISMCType4	9.0

SourcePowerCalibrator Object

Description

This object is a child of the Application object and is a vehicle for performing source power calibrations.

Accessing the SourcePowerCalibrator Object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim ispc As ISourcePowerCalibrator
Set ispc = app.SourcePowerCalibrator
```

Note: If you see this error:

The target NA stimulus channel has not been set. With the SourcePowerCalibrator object, you must first call SetCalInfoEx with the channel number. SetCalInfoEx must not be made against a temporary copy of the SourcePowerCalibrator object.

Or this error:

Channel not found.

It is either because you set the wrong channel number in the SetCalInfoEx call or because the SourcePowerCalibrator object is unique in that you **MUST** use the **SAME** instance of the SourcePowerCalibrator object for every property that is set. Do this by naming/setting a variable as in this vbs example:

```
set sourcepowercalibrator = app.sourcepowercalibrator
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Example Programs](#)

Note: Interface **ISourcePowerCalibrator** is abbreviated as **ISPC** in the following table.

(**Bold** Methods or Properties provide access to a child object)

Methods	Interface	Description
	See History	
AbortPowerAcquisition	ISPC	Aborts a source power cal acquisition sweep that is currently in progress.
AcquirePowerReadings	ISPC	Superseded with AcquirePowerReadingsEx
AcquirePowerReadingsEx	ISPC4	Initiates a source power cal acquisition.
ApplyPowerCorrectionValues	ISPC	Superseded with ApplyPowerCorrectionValuesEx
ApplyPowerCorrectionValuesEx	ISPC5	Applies correction values after completing a source power cal acquisition sweep. Optionally perform a calibration of the reference receiver used in the source power cal.
CheckPower	ISPC2	Measures power at a specific frequency. Used to test power level before and/or after applying a source power calibration.
LaunchPowerMeterSettingsDialog	ISPC2	Launches the Power Meter Settings dialog on the PNA.
SetCalInfo	ISPC	Superseded with SetCalInfoEx Method
SetCalInfo2	ISPC3	Superseded with SetCalInfoEx Method
SetCalInfoEx Method	ISPC4	Specifies the channel and source port to be used for the source power calibration.
SetPowerAcquisitionDevice	ISPC3	Sets the power sensor channel (A or B) to be used. This method is ONLY necessary when performing an SMC calibration.
Properties	Interface	Description
CalPower	ISPC	Specifies the power level that is expected at the desired reference plane.
IterationsTolerance	ISPC3	Sets the maximum desired deviation from the sum of the test port power and the offset value.
LastCalPassedTolerance	ISPC7	Returns pass / fail status of the user-specified tolerance limits on the target cal power.
MaximumIterationsPerPoint	ISPC3	Specifies maximum number of readings to take at each data point for iterating the source power.

<u>PowerAcquisitionDevice</u>	ISPC2	Specifies the power sensor channel (A or B) that is currently selected for use at a specific frequency.
<u>PowerLossSegments (collection)</u>	ISPC2	Collection for iterating through the segments of the power loss table used in source power calibration.
<u>PowerMeterGPIBAddress</u>	ISPC	Specifies the GPIB address of the power meter.
<u>PowerMeterInterfaces</u>	ISPC6	Collection for getting a handle to the available power meters.
<u>PowerSensors (collection)</u>	ISPC2	Collection for iterating through the PowerSensor objects which are connected to the power meter for a source power cal.
<u>ReadingsPerPoint</u>	ISPC	Specifies the maximum power readings for power meter settling.
<u>ReadingsTolerance</u>	ISPC3	Power meter settling tolerance value.
<u>USBPowerMeterCatalog</u>	ISPC6	Returns a list of USB power meters that are connected to the PNA.
<u>UsePowerLossSegments</u>	ISPC	Specifies if subsequent calls to the AcquirePowerReadings method will make use of the loss table (PowerLossSegments).
<u>UsePowerSensorFrequencyLimits</u>	ISPC	Specifies if subsequent calls to the AcquirePowerReadings method will make use of power sensor frequency checking capability.

SweptIMD Object

Description

Controls the Swept IMD Application settings.

See [Properties to set for each sweep type](#).

Accessing the SweptIMD object

```
Dim app as AgilentPNA835x.Application

Set app = CreateObject("AgilentPNA835x.Application")

app.CreateCustomMeasurementEx(1, "SweptIMD", "PwrMain", 1)

Dim IMD

Set IMD = app.ActiveChannel.CustomChannelConfiguration
```

SetPortMap	ISweptIMD	Sets port mapping
Property	Interface	Description
CompositeNormalizationMode	ISweptIMD	Sets and returns the method by which CTB and CSO calculations are performed.
CompositeNormalizedCSOPower	ISweptIMD	Sets and returns the CSO Power.
CompositeNormalizedCTBPower	ISweptIMD	Sets and returns the CTB Power.

CoupleTonePower	ISweptIMD ON OFF state of power coupling for F1 and F2.
CSONumDistortionProducts	ISweptIMD Sets the “N = number of distortion products” value for the calculation of the CSO parameter.
CSOOffset Property	ISweptIMD Sets and returns the offset that is applied to CSO measurements.
CTBOffset Property	ISweptIMD Sets and returns the offset that is applied to CTB measurements.
CTBXMomodNumCarriers	ISweptIMD Sets the “N = Total number of carriers” value used in the calculation of the XMOD and CTB parameter.
DeltaFrequency	ISweptIMD Fixed tone spacing value.
DeltaFrequencyStart	ISweptIMD Start spacing of the main tones.
DeltaFrequencyStop	ISweptIMD Stop spacing of the main tones.
DeviceInputPort	ISweptIMD Reads input port map
DeviceOutputPort	ISweptIMD Reads output port map
EqualTonePower	ISweptIMD2 Superseded with LevelingMethod Set Equal Tone Power state.
F1Frequency	ISweptIMD Frequency of the F1 tone.
F2Frequency	ISweptIMD Frequency of the F1 tone.
FrequencyCenter	ISweptIMD Center frequency of the main tones.
FrequencyCenterCenter	ISweptIMD Sweep center frequency when sweeping the main tones.
FrequencyCenterSpan	ISweptIMD Frequency span when sweeping the main tones.
FrequencyCenterStart	ISweptIMD Start frequency when sweeping the main tones.
FrequencyCenterStop	ISweptIMD Stop frequency when sweeping the main tones.
HighestOrderProduct	ISweptIMD Reads the highest product that can be measured by SweptIMD.
IMToneIFBandwidth	ISweptIMD IF Bandwidth for measurement of the intermodulation products.
LevelingMethod	ISweptIMD Set power leveling mode
MainToneIFBandwidth	ISweptIMD IF Bandwidth for measurement of the Main tones.
SweepType	ISweptIMD Type of sweep for a Swept IMD measurement.

TonePower	ISweptIMD	Power level of the Main Tones.
TonePowerSetAt	ISweptIMD2	Superseded with LevelingMethod Set power level at DUT Input or Output
TonePowerStart	ISweptIMD	Start power level of the Main tones.
TonePowerStop	ISweptIMD	Stop power level of the Main tones.

TestsetControl Object

Description

A TestsetControl object is used to control one of the [supported test sets](#). Only one external test set can be controlled by the PNA at any time. The Testset Control object appears as an item in the ExternalTestsets collection, which in turn is a property of the main application object.

If the specified test set is not connected to the PNA or is not ON, then setting [Enabled](#) = True will return an error. All other properties can be set even if the test set is not connected.

Note: The ONLY way to load a test set configuration file is by sending the [testsets.Add](#) method. There is no method to query the test set type. See an [example program](#).

Accessing a TestsetControl object

The [ExternalTestsets collection](#) is a property of the main **Application** Object. You can obtain a handle to a testset object by specifying an item in the collection.

Visual Basic Example

```
Dim pna
Dim testsets As ExternalTestsets
Dim tset1 As TestsetControl
Set pna = CreateObject("AgilentPNA835x.Application")
Set testsets = pna.ExternalTestsets
Set tset1 = testsets(1)
' make COM calls on tset1 object
End Sub
```

See Also:

- [E5091A Testset Object](#)
- [About External Testset Control](#)
- [ExternalTestset Control Example](#)
- [ExternalTestsets Collection](#)

Methods	Interface	Description
---------	-----------	-------------

([See history](#))

None

Properties		Description
------------	--	-------------

ControlLines	IExternalTestset	Sets the control lines of the specified Test set.
Enabled	IExternalTestset	Enables and disables (ON/OFF) the port mapping and control line output of the specified test set.
ID	IExternalTestset	Returns the test set ID number.
Label	IExternalTestset	Returns the label on a given channel for the specified test set.
NumberOfPorts	IExternalTestset	Reads the number of ports that are on the specified test set.
OutputPorts	IExternalTestset	Sets or returns the port mappings for ALL ports.
PortCatalog	IExternalTestset	Returns the selections available for a given logical port.
SelectPort	IExternalTestset	Sets and returns the logical port value.
ShowProperties	IExternalTestset	Turns status bar display of test set properties on or off.
Type	IExternalTestset	Returns the test set model.

ExternalTestset History

	Interface	Introduced with PNA Rev:
--	-----------	--------------------------

	IExternalTestset	6.0
	IExternalTestset	6.0

Trace Object

Description

The Trace object controls how the measurement data is displayed. You can control scale, reference position, and value from the Trace Object.

Accessing a Trace object

There are several ways to get a handle to a trace.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trace As Trace
```

Then you can do any of the following:

```
Set trace = app.NAWindows(1).traces(1)
```

```
set trace = app.NAWindows.item(1).ActiveTrace
```

```
set trace = app.ActiveNAWindow.traces.item(1)
```

```
set trace = app.ActiveNAWindow.ActiveTrace
```

```
Set trace = app.Measurements(1).trace
```

```
Set trace = app.ActiveMeasurement.trace
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Traces, Channels, and Windows on the PNA](#)
- [Example Programs](#)

Methods	Interface	Description
---------	-----------	-------------

Autoscale	ITrace	Autoscales the trace or all of the traces in the selected window. Shared with the NAWindow Object
Move	ITrace3	Moves a trace from one window to another.

Property		Description
----------	--	-------------

Measurement	ITrace2	Returns a measurement handle from trace object.
Name	ITrace	Sets or returns the trace name
ReferencePosition	ITrace	Sets or returns the Reference Position of the active trace.
ReferenceValue	ITrace	Sets or returns the value of the Y-axis Reference Level of the active trace.
YScale	ITrace	Sets or returns the Y-axis Per-Division value of the active trace.

ITrace History

Interface	Introduced with PNA Rev:
ITrace	1.0
ITrace2	9.40
ITrace3	9.50

Traces Collection

Description

Child of the **Application** Object. A collection that provides a mechanism for getting a handle to a trace or iterating through the traces in a window.

Accessing the Traces collection

Get a handle to the traces collection through the NaWindows collection. The following example sets the variable **trcs** to the collection of traces in window 1 of the NaWindows collection.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trcs As traces
Set trcs = app.NAWindows(1).traces
```

See Also:

- [Trace Object](#)
- [Collections in the Analyzer](#)
- [The PNA Object Model](#)
- [Example Programs](#)

	Description
Methods	
Item	Use to get a handle to a trace
Properties	
Count	Returns the number of traces in the collection.
Parent	Returns a handle to the current Application.

Transform Object

Description

Contains the methods and properties that control Time Domain transforms.

Accessing the Transform Object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trans As Transform
Set trans = app.ActiveMeasurement.Transform
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Time Domain Topics](#)
- [Example Programs](#)

Note: [Sweep Type](#) must be set to Linear before setting Time Domain Transform (state) ON.

Methods	Interface	Description
SetFrequencyLowPass	ITransform	Sets low frequencies for low pass.
Properties		Description
Center	ITransform	Sets or returns the Center time. Shared with the Gating Object
CoupledParameters	ITransform2	Select Transform parameters to couple
DistanceMarkerMode	ITransform2	Sets the measurement type in order to determine the correct marker distance.
DistanceMarkerUnit	ITransform2	Sets the unit of measure for the display of marker distance values.
ImpulseWidth	ITransform	Sets or returns the Impulse Width of Time Domain transform windows.

<u>KaiserBeta</u>	ITransform	Sets or returns the Kaiser Beta of Time Domain transform windows.
<u>Mode</u>	ITransform	Sets the type of transform.
<u>Span</u>	ITransform	Sets or returns the Span time. Shared with the Gating Object
<u>Start</u>	ITransform	Sets or returns the Start time. Shared with the Gating Object
<u>State</u>	ITransform	Turns an Object ON and OFF.
<u>StepRiseTime</u>	ITransform	Sets or returns the Rise time of the stimulus in Low Pass Step Mode.
<u>Stop</u>	ITransform	Sets or returns the Stop time. Shared with the Gating Object

ITransform History

Interface	Introduced with PNA Rev:
ITransform	1.0
ITransform2	4.2

TriggerSetup Object

Description

These properties setup Global triggering that effects the entire PNA application.

Accessing the TriggerSetup object

```
Dim app as AgilentPNA835x.Application
Dim trigSetup as ITriggerSetup
Set trigSetup = app.TriggerSetup
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)
- [Triggering in the PNA](#)
- [Example Programs](#)

Methods	Interface	Description
	See History (below)	

None

Properties		Description
AcceptTriggerBeforeArmed	ITriggerSetup2	Allows a trigger signal to be remembered and then used when the PNA becomes armed (ready to be triggered).
ExternalTriggerConnectionBehavior	ITriggerSetup	Configures the external triggering signal for the PNA
ReadyForTriggerPolarity	ITriggerSetup3	Specifies the polarity of Ready for Trigger output.
Scope	ITriggerSetup	Determines whether a trigger signal affects a single channel or all channels in the PNA.

[Source](#)

ITriggerSetup Sets or returns the source of triggering in the PNA.

[TriggerOutputEnabled](#)

ITriggerSetup2 **Superseded**

Enables the PNA to send trigger signals out the rear-panel TRIGGER OUT connector.

ITriggerSetup History

Interface	Introduced with PNA Rev:
ITriggerSetup	4.0
ITriggerSetup2	4.2
ITriggerSetup3	7.50.2 and 8.2

VMC Type Object

Description

Contains the methods and properties to perform a Vector Measurement Calibration for the Frequency Converter Application (option 083).

Accessing the VMCType object

See an example which [creates and calibrates a VMC measurement](#).

You can also do the following:

```
Set app = CreateObject("AgilentPNA835x.Application")

Set CalMgr = app.GetCalManager

Set guidedCal = CalMgr.CreateCustomCalEx(1)

Set VMC = guidedCal.CustomCalConfiguration

VMC.ConnectorType(1) = "APC 3.5 male"
```

See Also:

- [PNA Automation Interfaces](#)
- [The PNA Object Model](#)

Methods	Interface	Description
	See History	
AcquireStep	IVMCType	Acquire the measurement data for the specified step in the calibration process.
GenerateErrorTerms	IVMCType	Generates the error terms for the calibration.
GenerateSteps	IVMCType	Returns the number of steps required to complete the calibration.
GetStepDescription	IVMCType	Returns the description of the specified step in the calibration process.
Initialize	IVMCType	Begins a calibration.

Properties		Description
AutoOrient	IVMCType	Sets ECAL module automatic orientation ON or OFF.
CalKitType	IVMCType	Sets and returns a calibration kit type for calibration.
CharacterizeMixerOnly	IVMCType	Sets and returns whether to perform a mixer characterization ONLY or full 2-port calibration.
CharFileName	IVMCType	Specifies the .S2P mixer characterization file name.
CharMixerReverse	IVMCType2	Specifies the direction in which to characterize the calibration mixer.
CompatibleCalKits	IVMCType	Returns a list of cal kits that are compatible with the connector type for the specified port.
ConnectorType	IVMCType	Sets or queries the connector type for the specified port.
Do1PortEcal	IVMCType	Superseded with CalKitType Specify ECAL or Mechanical calibration for the mixer characterization portion of a VMC calibration.
Do2PortEcal	IVMCType	Superseded with CalKitType Specify ECAL or Mechanical calibration for the 2-port calibration portion of a VMC calibration.
EcalCharacterization	IVMCType	Superseded with CalKitType Specifies the characterization data within an ECal module to be used for the calibration.
EcalOrientation1Port	IVMCType	For Mixer Characterization ONLY - Specifies which port of the ECal module is connected to which port of the PNA
EcalOrientation2Port	IVMCType	For full 2-port VMC cal - Specifies which port of the ECal module is connected to which port of the PNA
EnableLOPowerCal	IVMCType4	Perform LO Power Cal
LoadCharFromFile	IVMCType	Specifies and loads a mixer characterization (S2P) file.
NetworkFilename	IVMCType3	Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement.
NetworkMode	IVMCType3	Embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement.
OmitIsolation	IVMCType	Superseded - Replaced by SetIsolationPaths and

[GetIsolationPaths](#)

Sets and returns whether Isolation portion of the calibration will be performed or not.

[ThruCalMethod](#)

IVMCType

Superseded - Replaced by [PathThruMethod Property](#)

Sets and returns the method for performing the thru portion of the calibration.

[ValidConnectorTypes](#)

IVMCType

Returns a list of connector types for which there are calibration kits.

IVMCType History

Interface	Introduced with PNA Rev:
IVMCType	3.5
IVMCType2	3.53
IVMCType3	6.0
IVMCType4	9.1

AcceptTriggerBeforeArmed Property

Description Determines what happens to an EDGE trigger signal if it occurs before the PNA is ready to be triggered. (LEVEL trigger signals are always ignored.) For more information, see [External triggering](#).

VB Syntax *trigsetup.AcceptTriggerBeforeArmed = boolean*

Variable [\(Type\)](#) - Description

trigsetup A [TriggerSetup2](#) (object)

boolean Choose from:

False - A trigger signal is ignored if it occurs before the PNA is ready to be triggered.

True - A trigger signal is remembered and then used when the PNA becomes armed (ready to be triggered). The PNA remembers only one trigger signal.

Return Type Boolean

Default False

Examples `trigsetup.AcceptTriggerBeforeArmed = True 'Write`

`atba = trigsetup.AcceptTriggerBeforeArmed 'Read`

C++ Syntax HRESULT get_AcceptTriggerBeforeArmed(BOOL *pVal);

HRESULT put_AcceptTriggerBeforeArmed(BOOL newVal);

Interface ITriggerSetup2

AcquisitionDirection Property

Description	Specifies the direction of each part of a 2-port calibration.
VB Syntax	<code>cal.AcquisitionDirection = value</code>
Variable	(Type) - Description
<i>cal</i>	A Calibrator (object)
<i>value</i>	(enum NADirection) - Choose from: 0 - naForward - measures the forward direction 1 - naReverse - measures the reverse direction
Return Type	Long Integer
Default	naForward
Examples	<code>cal.AcquisitionDirection = naForward</code>
C++ Syntax	HRESULT AcquisitionDirection(tagNADirection dir);
Interface	ICalibrator

AcquisitionMode Property

Description Set and read the method by which gain compression data is acquired.

VB Syntax `gca.AcquisitionMode = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**NAGCAAcquisitionMode**) Choose from:

- **naSmartSweep (0)** Iterate quickly to find compression point
- **naSweepPowerAtEachFreq2D (1)** Sweep power at each frequency
- **naSweepFreqAtEachPower2D (2)** Sweep frequency at each power level

Return Type Enum

Default **naSmartSweep**

Examples

```
gca.AcquisitionMode = naSmartSweep 'Write'
acqMode = gca.AcquisitionMode 'Read'
```

C++ Syntax HRESULT get_AcquisitionMode(tagNAGCAAcquisitionMode* mode)
HRESULT put_AcquisitionMode(tagNAGCAAcquisitionMode mode)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

ActiveCalKit Property

Description Returns a handle to the Active CalKit object. The active cal kit is the kit selected for use in **Unguided** calibrations.

You can either **(1)** use the handle directly to access CalKit properties and methods, or **(2)** set a variable to the CalKit object. The variable retains a handle to the original object if another CalKit becomes active.

VB Syntax 1) `app.ActiveCalKit.<setting>`
or
2) Set `cKit = app.ActiveCalKit`

Variable [\(Type\) - Description](#)

app An [Application](#) (object)

<setting> A CalKit property (or method) and arguments

cKit (object) - A CalKit object

Return Type CalKit object

Default None

Examples

```
Public cKit as calKit
Set cKit = app.ActiveCalKit 'read
```

C++ Syntax HRESULT get_ActiveCalKit (ICalKit * kit)

Interface IApplication

Last Modified:

3-Jun-2008 Added Unguided

ActiveChannel Property

Description	Returns a handle to the Active Channel object. You can either (1) use the handle directly to access channel properties and methods, or (2) set a variable to the channel object. The variable retains a handle to the original channel if another channel becomes active.
VB Syntax	(1) <code>app.ActiveChannel.<setting></code> or (2) Set <code>chan = app.ActiveChannel</code>
Variable	(Type) - Description
<i>chan</i>	A Channel (object)
<i>app</i>	An Application (object)
<i><setting></i>	A channel property (or method) and arguments
Return Type	Channel object
Default	Not applicable
Examples	<pre>1) app.ActiveChannel.Averaging = 1 2) Public chan as Channel Set chan = app.ActiveChannel</pre>
C++ Syntax	HRESULT get_ActiveChannel(IChannel* *pVal)
Interface	IApplication

Active (ExtDev) Property

Description Set and return the state of activation of the device. When [extDev.IOEnable](#) = True, and this command is set to True, the PNA will attempt communication with the external device. An error is returned if communication cannot be verified.

Note: Send this command AFTER sending other External Device settings to avoid communicating with the device before it has been fully configured.

See Also [ExternalDeviceDeActivatePolicy Property](#) - Determines whether External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.

VB Syntax *extDevices.Active* = *value*

Variable [\(Type\)](#) - [Description](#)

extDevices An [ExternalDevice](#) (object)

value (Boolean) Choose from:

True - Device is active.

False - Device is NOT active.

Return Type Boolean

Default False - When configured using the front panel user interface, the device is ON (activated) by default.

Examples

```
extDevices.Active = True 'Write
bool = extDevices.Active 'Read

See example program to configure PMAR device
See example program to configure External Source
```

C++ Syntax HRESULT get_Active(VARIANT_BOOL* value);

HRESULT put_Active(VARIANT_BOOL newVal);

Interface IExternalDevices

31-Jul-2009 MX New topic

ActiveMarker Property

Description	Returns a handle to the Active Marker object. You can either (1) use the handle directly to access Marker properties and methods, or (2) set a variable to the Marker object. The variable retains a handle to the original object if another Marker becomes active.
VB Syntax	1) <code>meas.ActiveMarker.<setting></code> or 2) Set <code>mark = meas.ActiveMarker</code>
Variable	(Type) - Description
<code>meas</code>	(object) - An Measurement object
<code><setting></code>	A marker property (or method) and arguments
<code>mark</code>	(object) - A marker object
Return Type	marker object
Default	None
Examples	<pre>Public mark as marker Set mark = meas.ActiveMarker</pre>
C++ Syntax	HRESULT get_ActiveMarker(IMarker** marker)
Interface	IMeasurement

ActiveMeasurement Property

Description	Returns a handle to the Active Measurement object. You can either (1) use the handle directly to access measurement properties and methods, or (2) set a variable to the measurement object. The variable retains a handle to the original measurement.
VB Syntax	1) <code>app.ActiveMeasurement.<setting></code> or 2) Set <code>meas = app.ActiveMeasurement</code>
Variable	(Type) - Description
<code>meas</code>	A Measurement (object)
<code>app</code>	An Application (object)
<code><setting></code>	A measurement property (or method) and arguments
Return Type	Measurement object
Default	None
Examples	<pre>1) app.ActiveMeasurement.Averaging = 1 2) Public meas as Measurement Set meas = app.ActiveMeasurement</pre>
C++ Syntax	<code>HRESULT get_ActiveMeasurement(IMeasurement **ppMeas)</code>
Interface	IApplication

ActiveNAWindow Property

Description	Returns a handle to the Active Window object. You can either (1) use the handle directly to access window properties and methods, or (2) set a variable to the window object. The variable retains a handle to the original window if another window becomes active.
VB Syntax	1) <code>app.ActiveNAWindow.<setting></code> or 2) Set <code>win = app.ActiveNAWindow</code>
Variable	(Type) - Description
<code>win</code>	A NAWindow (object)
<code>app</code>	An Application (object)
<code><setting></code>	A NAWindow property (or method) and arguments
Return Type	A NAWindow object
Default	Not applicable
Examples	<pre>Public win as NAWindow Set win = app.ActiveWindow</pre>
C++ Syntax	HRESULT get_ActiveNAWindow(INAWindow **ppWindow)
Interface	IApplication

ActiveTrace Property

Description	Returns a handle to the Active Trace object. You can either (1) use the handle directly to access trace properties and methods, or (2) set a variable to the trace object. The variable retains a handle to the original trace if another trace becomes active.
VB Syntax	1) <code>win.ActiveTrace.<setting></code> or 2) <code>Set trce = win.ActiveTrace</code>
Variable	(Type) - Description
<i>trce</i>	A Trace (object)
<i>win</i>	An NAWindow (object)
<i><setting></i>	A trace property (or method) and arguments
Return Type	An NAWindow object
Default	None
Examples	<pre>1) win.ActiveTrace.Autoscale 2) Public trce as Trace Set trce = Application.ActiveNAWindow.ActiveTrace</pre>
C++ Syntax	HRESULT get_ActiveTrace(ITrace**pVal)
Interface	INAWindow

ActiveBackground Property

Description Set and return the background color of the active window for the PNA display or hardcopy print.

VB Syntax `colors.ActiveBackground = value`

Variable [\(Type\)](#) - Description

colors A [ComColors](#) (object)

value **(Long Integer)** - RGB color of the ActiveBackground pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Display = 0,0,24

Examples

```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.ActiveBackground = RGB 'Write
color = colors.ActiveBackground 'Read
```

C++ Syntax HRESULT get_ActiveBackground(long* pVal);

HRESULT put_ActiveBackground(long newVal);

Interface IComColors2

Last Modified:

22-Feb-2010 MX New topic

ActiveLabels Property

Description Set and return the labels and grid frame colors in the active window for the PNA display or hardcopy print. (Active labels, Grid frame)

VB Syntax `colors.ActiveLabels = value`

Variable [\(Type\)](#) - Description

colors A [ComColors](#) (object)

value **(Long Integer)** - RGB color of the ActiveLabels pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Display = 175,175,175

Print = 0,0,0 (Black)

Examples

```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.ActiveLabels = RGB 'Write
color = colors.ActiveLabels 'Read
```

C++ Syntax HRESULT get_ActiveLabels(long* pVal);

HRESULT put_ActiveLabels(long newVal);

Interface IComColors

7-Aug-2009 MX New topic

ActiveXAxisRange Property

Description For [FCA](#) and [GCX](#) measurements, sets the swept parameter to display on the X-axis. This command does not change the default setting for new traces.

Use [Converter.ActiveXAxisRange](#) to change all existing traces and make the setting the default setting for new traces.

This command is NOT used for NFX, IMDX, and IMSX measurements. Use [Converter.ActiveXAxisRange](#).

VB Syntax `mixer.ActiveXAxisRange = value`

Variable [\(Type\)](#) - Description

mixer A Mixer (**object**)

value (**Enum as MixerStimulusRange**) - Parameter to display on the X-axis.

Choose from:

0 - mixINPUT - Input frequency span

1 - mixLO_1 - First LO frequency span

2 - mixLO_2 - Second LO frequency span

3 - mixOUTPUT - Output frequency span

Return Type Enum

Default OUTPUT

Examples `mixer.ActiveXAxisRange = 1 'Write`

`variable = mixer.ActiveXAxisRange 'Read`

C++ Syntax `HRESULT get_ActiveXAxisRange(tagMixerStimulusRange *Val)`

`HRESULT put_ActiveXAxisRange(tagMixerStimulusRange newVal)`

Interface IMixer3

Last Modified:

27-Sep-2010 Clarification

26-Jan-2009 Corrected enums

ActiveXAxisRange Property

Description Sets the swept frequency range to display on the X-axis for all existing traces and sets the default for all future traces.

VB Syntax *obj.ActiveXAxisRange = value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#) (for IMDX and NFX measurements)

or

A [Measurement Object](#) (for GCX, SMC, and VMC measurements)

value **(Enum as ConverterStimulusRange)**

Swept stimulus range to display on the X-axis. Choose from:

0 - naInputRange - Input frequency range

1 - naLO1Range - LO 1 frequency range

2 - naLO2Range - LO 2 frequency range

3 - naOutputRange - Output frequency range

4 - naPerMeasurementRange - reserved for future use.

If the specified frequency range is not swept, the default swept range is used.

Return Type Enum

Default Search is performed in the following order until a swept range is found:

1. OUTPUT
2. INPUT (If the OUTPUT is fixed)
3. Number of Points (If ALL ranges are fixed)

Examples

```
conv.ActiveXAxisRange = naInputRange 'Write
```

```
variable = meas.ActiveXAxisRange 'Read
```

C++ Syntax HRESULT get_ActiveXAxisRange(tagConverterStimulusRange range *Val)

HRESULT put_ActiveXAxisRange(tagConverterStimulusRange range
newVal)

Interface IConverter

IMeasurement4

Last Modified:

23-Dec-2011	Added IMeas
9-Sep-2010	Added LO2 range and Modified for all converter apps.
2-Feb-2009	Added converter
26-Jan-2009	Corrected enums

ADCCaptureMode Property

Description Sets and returns the ADC capture mode modeled as a 2-pole switch in the diagram on the [SignalProcessingModuleFour](#) page. The switch either bypasses or routes the IF through the 3-stage digital filter.

VB Syntax `spm4.ADCCaptureMode = value`

Variable [\(Type\)](#) - Description

`spm4` A [SignalProcessingModuleFour](#) (object)

`value` (Enum as NAStates) Capture mode.

naOFF (0) - The digital filters are used to process IF information. The filters can be configured automatically or manually using [FilterMode Property](#).

naON (1) - The digital filters are bypassed and the raw ADC readings are taken directly. With DSP 4 versions, a maximum of 4096 data points per sweep can be acquired.

With DSP 5 versions, the [PNA maximum data points](#) per sweep can be acquired.

[Learn more about DSP Versions.](#)

Return Type Enum

Default OFF

Examples

```
spm4.ADCCaptureMode = 0 'Write
mode = spm4.ADCCaptureMode 'Read
```

C++ Syntax HRESULT get_ADCCaptureMode(tagNAStates* pCaptureMode);
 HRESULT put_ADCCaptureMode(tagNAStates pCaptureMode);

Interface ISignalProcessingModuleFour

26-Aug-2010 Updated for DSP 5 (A.09.30)

18-Jun-2007 MX New topic

ALCLevelingMode Property

Description Sets and returns the ALC mode for the specified channel and port. Use [GetSupportedALCModes](#) to return a list of valid ALC modes for the PNA.

[Learn more about ALC mode.](#)

VB Syntax *chan.ALCLevelingMode (sourcePort) = value*

Variable [\(Type\)](#) - Description

chan **(object)** - A [Channel](#) object

sourcePort **(long integer)** - The source port for which to make this setting. If ports are [remapped](#), specify the logical port number.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

value **(enum as naALCLevelingMode)** - Choose from:

- **0** naALCInternal
- **1** naALCExternal (E835x Only)
- **2** naALCOpenLoop (PNA-X only)

Return Type Enum

Default naALCInternal

Examples

```
chan.ALCLevelingMode(1) = 'Write
state = chan.ALCLevelingMode(4) 'Read
```

C++ Syntax HRESULT get_ALCLevelingMode(long port, tagNAALCLevelingMode* pVal);

HRESULT put_ALCLevelingMode(long port, tagNAALCLevelingMode newVal);

Interface IChannel9

10/18/06	MX New topic

AllowArbitrarySegments Property

Description Enables you to setup a segment sweep with arbitrary frequencies. The start and stop frequencies of each segment can overlap other segments. Also, each segment can have a start frequency that is greater than its stop frequency which causes a reverse sweep over that segment. Learn more about [Arbitrary Segment Sweep](#).

VB Syntax *segs.AllowArbitrarySegments = value*

Variable [\(Type\)](#) - Description

segs A [Segments](#) collection (**object**)

value (**boolean**)

True - Allows the setup of arbitrary segment sweep.

False - Prevents the setup of arbitrary segment sweep.

Return Type Boolean

Default False

Examples

```
segs.AllowArbitrarySegments = True 'Write
```

```
AllowArbSegs = AllowArbitrarySegments 'Read
```

C++ Syntax HRESULT get_AllowArbitrarySegments(VARIANT_BOOL *pVal)

HRESULT put_AllowArbitrarySegments(VARIANT_BOOL newVal)

Interface ISegments3

AlternateSweep Property

Description Sets sweeps to either alternate or chopped.

VB Syntax *object*.AlternateSweep = *value*

Variable [\(Type\)](#) - Description

object Channel (**object**)

or

CalSet (**object**) - Read-only property

value (**boolean**) - Choose either:

False - Sweep mode set to **Chopped** - reflection and transmission are measured on the same sweep.

True - Sweep mode set to **Alternate** - reflection and transmission measured on separate sweeps. Improves Mixer bounce and Isolation measurements. Increases cycle time.

Return Type boolean

Default False (0)

Examples `chan.AlternateSweep = True 'Write`

`altSwp = chan.AlternateSweep 'Read`

C++ Syntax HRESULT AlternateSweep(VARIANT_BOOL *pVal)
HRESULT AlternateSweep(VARIANT_BOOL newVal)

Interface IChannel

ICalSet3

AmbientTemperature Property

Description Sets and returns the temperature at which the current noise measurement is occurring.
[Learn more.](#)

VB Syntax *noiseCal.AmbientTemperature = value*

Variable [\(Type\)](#) - Description

noiseCal A [NoiseCal](#) (**object**)

value (**double**) Ambient temperature in Kelvin.

Return Type Double

Default 295

Examples `noise.AmbientTemperature = 289` **Write**

`temp = noise.AmbientTemperature` **Read**

C++ Syntax HRESULT get_AmbientTemperature(Double* pValue)

HRESULT put_AmbientTemperature(Double pNewValue)

Interface INoiseCal

6-Sep-2007 MX New topic

AnalysisCWFreq Property

Description Set and return the CW frequency for a compression analysis trace.

VB Syntax `gcaMeas.AnalysisCWFreq = value`

Variable [\(Type\)](#) - Description

gcaMeas A [GainCompressionMeas](#) (object)

value (**Double**) CW frequency in Hz. Choose a frequency within the range of the gain compression channel.

Return Type Double

Default Not Applicable

Examples `gcaMeas.AnalysisCWFreq = 1e9 'Write`

`cwfreq = gca.AnalysisCWFreq 'Read`

C++ Syntax HRESULT get_AnalysisCWFreq(Double* value)

HRESULT put_AnalysisCWFreq(Double value)

Interface IGainCompressionMeas

Last Modified:

3-Sep-2009 MX New topic

AnalysisEnable Property

Description Set and read the (ON | OFF) state of Gain Compression Analysis.

VB Syntax `gcaMeas.AnalysisEnable = value`

Variable [\(Type\)](#) - Description

`gcaMeas` A [GainCompressionMeas](#) (**object**)

`value` (**Boolean**) Choose from:

False - Disable GCA analysis trace.

True - Enable GCA analysis trace.

Return Type Boolean

Default False

Examples `gcaMeas.AnalysisEnable = True` 'Write

`analysis = gca.AnalysisEnable` 'Read

C++ Syntax HRESULT get_AnalysisEnable(VARIANT_BOOL* value)

HRESULT put_AnalysisEnable(VARIANT_BOOL value)

Interface IGainCompressionMeas

Last Modified:

3-Sep-2009 MX New topic

AnalysisIsDiscreteFreq Property

Description Sets and returns whether the CW frequency for the compression analysis trace can be set to only the discrete frequencies or provides interpolation.

VB Syntax `gcaMeas.AnalysisIsDiscreteFreq = value`

Variable [\(Type\)](#) - Description

gcaMeas A [GainCompressionMeas](#) (**object**)

value (**Boolean**) Choose from:

False - Interpolated data points.

True - Discrete data points only.

Return Type Boolean

Default False

Examples

```
gcaMeas.AnalysisIsDiscreteFreq = True 'Write  
isDisc = gca.AnalysisIsDiscreteFreq 'Read
```

C++ Syntax HRESULT get_AnalysisIsDiscreteFreq(VARIANT_BOOL* value)
HRESULT put_AnalysisIsDiscreteFreq(VARIANT_BOOL value)

Interface IGainCompressionMeas

Last Modified:

3-Sep-2009 MX New topic

AnalysisXAxis Property

Description Sets and returns the type of data to display on the x-axis of a compression analysis trace.

VB Syntax `gcaMeas.AnalysisXAxis = value`

Variable [\(Type\)](#) - Description

gcaMeas A [GainCompressionMeas](#) (object)

value (Enum as NAGCAAnalysisXAxis) Choose from:

naPsourceAsXAxis (0) - Power from the source.

naPinAsXAxis (1) - Input power to the DUT.

Return Type Enum

Default naPinAsXAxis (1)

Examples `gcaMeas.AnalysisXAxis = naPinAsXAxis 'Write`

`xAxis = gca.AnalysisXAxis 'Read`

C++ Syntax HRESULT get_AnalysisXAxis(tagNAGCAAnalysisXAxis* value)

HRESULT put_AnalysisXAxis(tagNAGCAAnalysisXAxis value)

Interface IGainCompressionMeas

Last Modified:

3-Sep-2009 MX New topic

Read-only

Application Property

Description Returns the name of the Analyzer making measurements on the channel.

VB Syntax *chan*.Application

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

Return Type object

Default None

Examples `rfna = chan.Application 'returns the Analyzer name`

C++ Syntax HRESULT get_Application(IApplication** Application)

Interface IChannel

ArrangeWindows Property

Description Sets the arrangement of all the windows. Overlay, Stack2, Split3 and Quad4 will create windows.

To control the state of one window, use [app.WindowState](#).

VB Syntax `app.ArrangeWindows = value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (enum **NAWindowModes**) - Choose from:

0 - naTile

1 - naCascade

2 - naOverlay

3 - naStack2

4 - naSplit3

5 - naQuad4

Return Type Not Applicable

Default naTile

Examples `app.ArrangeWindow = naTile 'Write`

C++ Syntax HRESULT put_ArrangeWindows(tagNAWindowModes newVal)

Interface IApplication

AttenuatorMode Property

Description	Sets or returns the mode of operation of the attenuator control for the specified port number. This command is automatically set to Manual when an Attenuator value is set.
VB Syntax	<i>object</i> .AttenuatorMode(<i>portNum</i>) = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object)
	or
	CalSet (object) - Read-only property
<i>portNum</i>	(long) - Port number of attenuator control to be changed.
<i>value</i>	(enum NAModes) - Choose from:
	0 - naAuto - Attenuator control set to automatic. The analyzer will set the attenuator control appropriately to deliver the specified power at the source.
	1 - naManual - Specify the attenuator setting using chan. Attenuator (which automatically sets AttenuatorMode = naManual).
Return Type	NAModes
Default	0 - Auto
Examples	<pre>chan.AttenuatorMode(1) = naAuto 'Write</pre>
	<pre>attn = chan.AttenuatorMode(1) 'Read</pre>
C++ Syntax	HRESULT get_AttenuatorMode(long port, tagNAModes* pVal) HRESULT put_AttenuatorMode(long port, tagNAModes newVal)
Interface	IChannel ICalSet3

Attenuator Property

Description Sets or returns the value of the source attenuator for the specified port number. Sending this command automatically sets [AttenuatorMode](#) to Manual.

VB Syntax *object*.Attenuator(*portNum*) = *value*

Variable [\(Type\)](#) - Description

object [Channel](#) (**object**)

or

[CalSet](#) (**object**) - Read-only property

portNum (**long integer**) - Port number of source attenuator to be changed.

value (**double**) - Attenuation value. The range of settable values depends on the PNA model. To determine the valid settings, do one of the following:

- See [PNA models and options](#) to see the range and step size for each model / option.
- To determine the maximum attenuator value use [MaximumSourceStepAttenuator](#).

If an invalid attenuation setting is entered, the PNA will select the next lower valid value. For example, if 19 is entered, then for an E8361A, 10 dB attenuation will be selected.

Return Type Double

Default 20 dB

Examples

```
chan.Attenuator(1) = 20 'Write
```

```
attn = chan.Attenuator(cnum) 'Read
```

C++ Syntax HRESULT get_Attenuator(long port, double *pVal)
HRESULT put_Attenuator(long port, double newVal)

AutoCWSweepTime Property

Description This command replaces [AutoIFBandWidth Property](#).

Sets and returns the state of automatic CW sweep time (used in Pulse Profile mode).

VB Syntax `pulseMeas.AutoCWSweepTime = bool`

Variable [\(Type\) - Description](#)

pulseMeas A [PulseMeasurementControl](#) (object)

bool **True** - In Pulse Profile mode, adjusts the default X-axis start time to zero and the stop time to double the Pulse Width. This allows you to see one complete pulse.

False - The Sweep Time is not changed.

Return Type Boolean

Default True

Examples

```
pulse.AutoCWSweepTime = True 'Write  
value = pulse.AutoCWSweepTime 'Read
```

C++ Syntax HRESULT get_AutoCWSweepTime(VARIANT_BOOL *pVal);
HRESULT put_AutoCWSweepTime(VARIANT_BOOL newVal);

Interface IPulseMeasurementControl2

9-May-2011 New topic

AutoDetection Property

Description Choose to automatically or manually set pulse mode (Narrowband or Wideband) for the channel.

VB Syntax `pulseMeas.AutoDetection = bool`

Variable [\(Type\)](#) - Description

pulseMeas A [PulseMeasurementControl](#) (object)

bool **False** - Manually set the pulse mode. Use [WideBandDectionState](#) to set the pulse mode.

True - Automatically set the pulse mode.

Return Type Boolean

Default True

Examples

```
pulse.AutoDetection = True 'Write  
value = pulse.AutoDetection 'Read
```

C++ Syntax HRESULT get_AutoDetection(VARIANT_BOOL *pVal);
HRESULT put_AutoDetection(VARIANT_BOOL newVal);

AutoIFBWAdjustment Property

Description Set and read auto IFBW adjustment ON | OFF state for Gain Compression measurements.

VB Syntax `gca.AutoIFBWAdjustment = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Boolean**) - Auto IFBW adjustment state. Choose from:

False - Sets auto IFBW adjustment OFF

True - Sets auto IFBW adjustment ON

Return Type Boolean

Default ON

Examples `gca.AutoIFBWAdjustment = True 'Write`

`aifbw = gca.AutoIFBWAdjustment 'Read`

C++ Syntax HRESULT get_AutoIFBWAdjustment(VARIANT_BOOL* bState)

HRESULT put_AutoIFBWAdjustment(VARIANT_BOOL bState)

AutoOptimizePRF Property

Description In Narrowband pulse mode, choose to set the Pulse Repetition Frequency automatically or manually. This is labeled "Optimize Pulse Frequency" on the user-interface. To make changes manually, use [MasterFrequency Property](#) or [MasterPeriod Property](#).

VB Syntax `pulseMeas.AutoOptimizePRF = bool`

Variable [\(Type\)](#) - Description

pulseMeas A [PulseMeasurementControl](#) (object)

bool **False** - Manually set the PRF for the measurement.

True - Automatically set the PRF for the measurement.

Return Type Boolean

Default True

Examples

```
pulse.AutoOptimizePRF = True 'Write  
value = pulse.AutoOptimizePRF 'Read
```

C++ Syntax HRESULT get_AutoOptimizePRF(VARIANT_BOOL *pVal);
HRESULT put_AutoOptimizePRF(VARIANT_BOOL newVal);

AutoOrient Property

Description Sets ECAL module automatic orientation ON or OFF.

VB Syntax *obj*.**AutoOrient** = *bool*

Variable [\(Type\)](#) - Description

obj [SMCType](#) (object)

or

[VMCType](#) (object)

bool (Boolean)

True - Set AutoOrientation ON

False - Set AutoOrientation OFF

Return Type Boolean

Default True

Examples `Smc.AutoOrient = True`

C++ Syntax HRESULT put_AutoOrient(VARIANT_BOOL bAutoOrient);

HRESULT get_AutoOrient(VARIANT_BOOL *bAutoOrient);

Interface SMCType

VMCType

AutoOrientTunerTuner Property

Description	Sets the state of auto orientation for a noise tuner during Noise Figure for NFX.
VB Syntax	<i>nfCal</i> . AutoOrientTuner = <i>bool</i>
Variable	(Type) - Description
<i>nfCal</i>	A NoiseCal (object)
<i>bool</i>	(Boolean)
	True - Set AutoOrientTuner ON
	False - Set AutoOrientTuner OFF
Return Type	Boolean
Default	True
Examples	<pre>nfCal.AutoOrientTuner = True</pre>
C++ Syntax	HRESULT put_AutoOrientTuner(VARIANT_BOOL bEnable); HRESULT get_AutoOrientTuner(VARIANT_BOOL *bEnable);
Interface	INoiseCal2

AutoPortExtConfig Property

Description Sets the frequency span that is used to calculate Automatic Port Extension. [Learn more about calculating Automatic Port Extension.](#)

VB Syntax `fixture.AutoPortExtConfig = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (ENUM as NAAutoPortExtConfig)

0 naAPEC_CSPN - Use current span.

1 naAPEC_AMKR - Use active marker frequency.

2 naAPEC_USPN - Use custom user span. Use [AutoPortExtSearchStart Property](#) and [AutoPortExtSearchStop Property](#) to specify start and stop frequency.

Return Type ENUM

Default **0 naAPEC_CSPN**

Examples

```
fixture.AutoPortExtConfig = naAPEC_AMKR
```

```
value = fixture.AutoPortExtConfig 'Read
```

C++ Syntax HRESULT get_AutoPortExtConfig(tagNAAutoPortExtConfig *pVal);

HRESULT put_AutoPortExtConfig(tagNAAutoPortExtConfig Val);

Interface IFixturing2

AutoPortExtDCOffset Property

Description Specifies whether or not to include DC Offset as part of automatic port extension. Learn more about [Automatic DC Offset](#). Only allowed when [AutoPortExtLoss Property](#) is set to ON.

VB Syntax *fixture.AutoPortExtDCOffset = bool*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

bool **True** - Includes DC Offset correction.

False - Does NOT include DC Offset correction.

Return Type Boolean

Default False

Examples

```
fixture.AutoPortExtDCOffset = True
```

```
value = fixture.AutoPortExtDCOffset 'Read
```

C++ Syntax HRESULT get_AutoPortExtDCOffset(VARIANT_BOOL *pState);
HRESULT put_AutoPortExtDCOffset(VARIANT_BOOL bState);

Interface IFixturing2

AutoPortExtLoss Property

Description Specifies whether or not to include loss correction as part of automatic port extension.
[Learn more about Loss Compensation in port extension.](#)

VB Syntax *fixture*.AutoPortExtLoss = *bool*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

bool **True** - Includes Loss correction.

False - Does NOT include Loss correction.

Return Type Boolean

Default False

Examples

```
fixture.AutoPortExtLoss = True
```

```
value = fixture.AutoPortExtLoss 'Read
```

C++ Syntax HRESULT get_AutoPortExtLoss(VARIANT_BOOL *pState);
HRESULT put_AutoPortExtLoss(VARIANT_BOOL bState);

Interface IFixturing2

AutoPortExtSearchStart Property

Description Set the start frequency for custom user span. Only applies when [fixture.AutoPortExtConfig = 0 naAPEC_CSPN](#).

[Learn more about User Span.](#)

VB Syntax `fixture.AutoPortExtSearchStart = value`

Variable (Type) - Description

fixture A [Fixturing](#) (object)

value (Double) User span start value. Must be within the frequency range of the active channel and less than the value set by [AutoPortExtSearchStop Property](#)

Return Type Double

Default Start frequency of the current active channel.

Examples

```
fixture.AutoPortExtSearchStart = 1E9  
value = fixture.AutoPortExtSearchStart 'Read
```

C++ Syntax HRESULT get_AutoPortExtSearchStart(double *pdVal);

HRESULT put_AutoPortExtSearchStart(double dVal);

Interface IFixturing2

AutoPortExtSearchStop Property

Description Set the stop frequency for custom user span. Only applies when [fixture.AutoPortExtConfig = 0 naAPEC_CSPN](#).

[Learn more about User Span.](#)

Only applies when [fixture.AutoPortExtConfig = 0 naAPEC_CSPN](#)

VB Syntax `fixture.AutoPortExtSearchStop = value`

Variable (Type) - Description

fixture A [Fixturing \(object\)](#)

value (Double) User span stop value. Must be within the frequency range of the active channel and greater than the value set by [AutoPortExtSearchStart Property](#)

Return Type Double

Default Stop frequency of the current active channel.

Examples

```
fixture.AutoPortExtSearchStop = 1E9
```

```
value = fixture.AutoPortExtSearchStop 'Read
```

C++ Syntax HRESULT get_AutoPortExtSearchStop(double *pdVal);
HRESULT put_AutoPortExtSearchStop(double dVal);

Interface IFixturing2

AutoPortExtState Property

Description Enables and disables automatic port extensions on the specified port. All enabled ports will have their reference plane automatically adjusted after performing Automatic Port Extension.

VB Syntax *fixture.AutoPortExtState (port) = bool*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to enable or disable.

bool (Boolean)

True - Enables Auto Port Extensions

False - Disables Auto Port Extensions

Return Type Boolean

Default False

Examples `fixture.AutoPortExtState(1) = True`

`value = fixture.AutoPortExtState(2) 'Read`

C++ Syntax HRESULT get_AutoPortExtState(short port, VARIANT_BOOL *pState);

HRESULT put_AutoPortExtState(short port, VARIANT_BOOL bVal);

Interface IFixturing2

AutoPulseTiming Property

Description In Narrowband pulse mode, choose to set the delay and width automatically or manually. This is labeled "Autoselect Width and Delay" on the user-interface.

VB Syntax *pulseMeas.AutoPulseTiming = bool*

Variable [\(Type\)](#) - Description

pulseMeas A [PulseMeasurementControl](#) (object)

bool **False** - Manually set the delay and width for the measurement.

True - Automatically set the delay and width for the measurement.

Return Type Boolean

Default True

Examples

```
pulse.AutoPulseTiming = True 'Write  
value = pulse.AutoPulseTiming 'Read
```

C++ Syntax HRESULT get_AutoPulseTiming(VARIANT_BOOL *pVal);
HRESULT put_AutoPulseTiming(VARIANT_BOOL newVal);

Interface IPulseMeasurementControl

Last Modified:

11-Mar-2010 New topic

AutoSelectPulseGen Property

Description In Narrowband pulse mode, choose to set the pulse generator used to drive the source modulation automatically or manually.

VB Syntax *pulseMeas*.AutoSelectPulseGen = *bool*

Variable [\(Type\)](#) - Description

pulseMeas A [PulseMeasurementControl](#) (object)

bool **False** - Manually set source modulation drive for the measurement.

True - Automatically set source modulation drive for the measurement.

Return Type Boolean

Default True

Examples `pulse.AutoSelectPulseGen = True 'Write`

`value = pulse.AutoSelectPulseGen 'Read`

C++ Syntax HRESULT get_AutoSelectPulseGen(VARIANT_BOOL *pVal);

HRESULT put_AutoSelectPulseGen(VARIANT_BOOL newVal);

Interface IPulseMeasurementControl

Last Modified:

11-Mar-2010 New topic

AuxiliaryTriggerCount Property

Description Returns the number of aux trigger input / output connector pairs in the PNA

VB Syntax *value* = *app*.**AuxiliaryTriggerCount**

Variable [\(Type\)](#) - Description

value **(Long Integer)** Variable to store the returned value.

2 = PNA-X models

1 = All other PNA models

app An [Application](#) (**object**)

Return Type Long Integer

Default Not Applicable

Examples `ioConns = app.AuxiliaryTriggerCount`

C++ Syntax HRESULT AuxiliaryTriggerCount(long *count);

Interface IApplication11

Last Modified:

6-Apr-2009 Replaced N5242A with PNA-X

14-Dec-2006 MX New topic

AuxTriggerScopeIsGlobal Property

Description Sets the Trigger OUT behavior to either Global or Channel. [Learn more about this setting.](#)

This command will cause the PNA to [Preset](#).

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

See the [AuxTrigger Object](#).

VB Syntax `pref.AuxTriggerScopeIsGlobal = value`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (Boolean) - Choose from:

- **True** - Trigger properties apply to ALL channels (Global).
 - Default setting for **E836x and PNA-L** models.
 - Allows use of `command` to configure the external trigger properties.
 - "Per Point" trigger property is not settable. Use the channel's [Point trigger](#) setting.
- **False** - External Trigger properties apply to each channel independently.
 - Default setting for **PNA-X** models.
 - Must use [AuxTrigger](#) commands to configure the external trigger properties. [ExternalTriggerConnectionBehavior Property](#) will NOT work.
 - "Per Point" trigger output property is set using the channel's [Point trigger](#) setting **AND** [TriggerOutInterval Property](#).

Return Type Boolean

Default **True** - E836xB and PNA-L models

False - PNA-X models

Examples

```
pref.AuxTriggerScopeIsGlobal = 1 'Write
```

```
auxTrigPref = pref.AuxTriggerScopeIsGlobal 'Read
```

C++ Syntax HRESULT get_AuxTriggerScopeIsGlobal(VARIANT_BOOL * pref);

HRESULT put_AuxTriggerScopeIsGlobal(VARIANT_BOOL pref);

Interface IPreferences5

25-Feb-2008 Clarification

Jan 3, 2007 MX New command

AvailableMeasurementClasses Property

Description Returns a list of available measurement classes on the PNA.

VB Syntax *value* = *cap*.**AvailableMeasurementClasses**

Variable [\(Type\)](#) - Description

value (Variant) - Variable to store the returned list of measurement classes.

cap A [Capabilities](#) (object)

Return Type Variant

Default Not Applicable

Examples

```
'Read all measurement classes
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
meas=cap.AvailableMeasurementClasses
dim i
For i = 0 To UBound(meas)
    msg = msg & meas(i) & vbCrLf
Next
MsgBox msg
```

C++ Syntax HRESULT get_AvailableMeasurementClasses(Variant *value);

Interface ICapabilities7

4-Nov-2010 MX New topic

AverageMode Property

Description Specifies the type of averaging to perform: Point or Sweep.

VB Syntax *chan.AverageMode = value*

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

value (Enum as **naAverageMode**) - Average Type. Choose from:

0 - naPoint Averaging measurements are made on each data point before stepping to the next data point. (Not available on 'C' models).

1 - naSweep Averaging measurements are made on subsequent sweeps until the required number of averaging sweeps are performed.

Return Type Enum

Default 1- **naSweep**

Examples

```
chan.AverageMode = naSweep 'Write
```

```
avgType = chan.AverageMode ' Read
```

C++ Syntax HRESULT get_AverageMode(NAAverageMode * mode);

HRESULT put_AverageMode(NAAverageMode mode);

Interface IChannel16

Last Modified:

8-Jun-2009 Not available on 'C' models.

13-Oct-2008 MX New topic

AveragingCount Property

Description	Returns the number of sweeps that have been acquired and averaged into the measurements on this channel. AveragingFactor specifies the number of sweeps to average. AveragingCount indicates the progress toward that goal.
VB Syntax	<i>value</i> = <i>chan.AveragingCount</i>
Variable	(Type) - Description
<i>chan</i>	A Channel (object)
<i>value</i>	(Long Integer) - Variable to store the returned count
Return Type	Long Integer
Default	Not Applicable
Example	<pre>avgcount = chan.AveragingCount</pre>
C++ Syntax	HRESULT get_AveragingCount(long* count)
Interface	IChannel

AveragingFactor Property

Description Specifies the number of measurements to combine for an average. Must also turn averaging ON by setting *chan.Averaging* = 1.

VB Syntax *chan.AveragingFactor* = *value*

Variable [\(Type\)](#) - Description

chan A Channel (**object**)

value (**Long Integer**) - Number of measurement sweeps to average. Choose any number between **1** and **65536** (2¹⁶).

Return Type Long Integer

Default 1

Examples

```
chan.AveragingFactor = 5 'Write
avgfact = chan.AveragingFactor ' Read
```

C++ Syntax HRESULT get_AveragingFactor(long *pVal)
HRESULT put_AveragingFactor(long newVal)

Interface IChannel

Last Modified:

16-Apr-2009 Updated for Point Averaging

Averaging Property

Description Turns trace averaging ON or OFF for all measurements on the channel. Averaging is only allowed on ratioed measurements; not on single input measurements.

VB Syntax `chan.Averaging = state`

Variable [\(Type\)](#) - Description

chan A [Channel](#) (**object**)

state (**boolean**)
False - Turns averaging OFF
True - Turns averaging ON

Return Type Boolean

Default False

Examples

```
chan.Average = True 'Write
```

```
averg = chan.Averaging 'Read
```

C++ Syntax HRESULT get_Averaging(BOOL *pVal)
HRESULT put_Averaging(BOOL newVal)

Interface IChannel

AvoidSpurs Property

Description	Sets and returns the state of the avoid spurs feature.
VB Syntax	<i>mixer</i> . AvoidSpurs = <i>boolean</i>
Variable	(Type) - Description
<i>mixer</i>	A Mixer (object)
	A Converter (object)
<i>value</i>	(Boolean) - State of avoid spurs feature. Choose from
	False Avoid spurs OFF
	True Avoid spurs ON
Return Type	Boolean
Default	False
Examples	<pre>conv.AvoidSpurs = True 'Write</pre>
	<pre>variable = conv.AvoidSpurs 'Read</pre>
C++ Syntax	HRESULT get_AvoidSpurs(Bool *bVal)
	HRESULT put_AvoidSpurs(Bool newVal)
Interface	IMixer3
	IConverter5

Last Modified:

25-Jan-2011 Added converter object

Background Property

Description Set and return the background color for the PNA display or hardcopy print.

VB Syntax *colors*.**Background** = *value*

Variable [\(Type\)](#) - Description

colors A [ComColors](#) (object)

value (**Long Integer**) - RGB color of the Background pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Display = 0,0,0 (Black)

Print = 255,255,255 (White)

Examples

```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.Background = RGB 'Write
color = colors.Background 'Read
```

C++ Syntax HRESULT get_Background(long* pVal);

HRESULT put_Background(long newVal);

Interface IComColors

Last Modified:

7-Aug-2009 MX New topic

BackOff Property

Description Sets and returns the backoff value used to calculate various PNOP parameters.

Also set [PinOffset Property](#).

A sweep must be executed (single or continuous) and [SearchPowerNormalOperatingPoint Method](#) must be sent before reading marker results.

To turn off the PNOP markers, either turn them off individually or [DeleteAllMarkers](#).

To search a [User Range](#) with the PNOP search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

VB Syntax *pnop*.**BackOff** = *value*

Variable [\(Type\)](#) - Description

pnop A [PNOP](#) (object)

value (**double**) - Backoff value in dB. Choose any number between:-**500** and **500**

Return Type Double

Default 0 dB

Examples `backoff = pnop.BackOff 'Read`

[See example program](#)

C++ Syntax HRESULT put_BackOff(double newVal);

HRESULT get_BackOff(double* pNewVal)

Interface IPNOP

Last Modified:

19-Feb-2010 MX New topic

BackOffGain Property

Description Returns the BackOffGain result of the PNOP marker search.

$PBO\ Gain = PBO\ Out - PBO\ In$

VB Syntax *bOffGain* = *pnop*.**BackOffGain**

Variable [\(Type\)](#) - [Description](#)

bOffGain (**double**) - Variable to store returned value

pnop A [PNOP](#) (**object**)

Return Type Double

Default Not applicable

Examples `bOffGain = pnop.BackOffGain 'Read`

[See example program](#)

C++ Syntax HRESULT get_BackOffGain(double* pNewVal)

Interface IPNOP

Last Modified:

19-Feb-2010 MX New topic

BackOffPin Property

Description Returns the BackOffPin result of the PNOP marker search.

PBO In = Marker 2 X-axis

VB Syntax *bOffPin* = *pnop*.**BackOffPin**

Variable [\(Type\)](#) - **Description**

bOffPin (**double**) - Variable to store returned value

pnop A [PNOP](#) (**object**)

Return Type Double

Default Not applicable

Examples `bOffPin = pnop.BackOffPin 'Read`

[See example program](#)

C++ Syntax HRESULT get_BackOffPin(double* pNewVal)

Interface IPNOP

Last Modified:

19-Feb-2010 MX New topic

BackOffPout Property

Description Returns the BackOffPout result of the PNOP marker search.

PBO Out = Marker 2 Y-axis

VB Syntax *bOffPout* = *pnop*.**BackOffPout**

Variable [\(Type\)](#) - [Description](#)

bOffPout (**double**) - Variable to store returned value

pnop A [PNOP](#) (**object**)

Return Type Double

Default Not applicable

Examples `bOffPout = pnop.BackOffPout 'Read`

[See example program](#)

C++ Syntax HRESULT get_BackOffPout(double* pNewVal)

Interface IPNOP

Last Modified:

19-Feb-2010 MX New topic

BalancedMode Property

Description	Sets and returns whether the balanced transform is ON or OFF
VB Syntax	<i>balMeas</i> . BalancedMode = <i>value</i>
Variable	(Type) - Description
<i>balMeas</i>	A BalancedMeasurement (object)
<i>value</i>	(Boolean) - State of balanced transform. Choose from False Balanced Transform OFF True Balanced Transform ON
Return Type	Boolean
Default	False
Examples	<pre>balMeas.BalancedMode = True 'Write</pre> <pre>variable = balMeas.BalancedMode 'Read</pre>
C++ Syntax	HRESULT get_BalancedMode(VARIANT_BOOL *bVal) HRESULT put_BalancedMode(VARIANT_BOOL newVal)
Interface	IBalancedMeasurement

BalPort1PhaseOffset Property

Description Sets and returns the phase offset between the two ports that comprise Balanced port 1. [balStim.Mode](#) must be set to a True Stimulus mode. Applicable only with [Opt 460 - iTMSA](#).

VB Syntax *balStim.BalPort1PhaseOffset* = *value*

Variable [\(Type\)](#) - Description

balStim A [BalancedStimulus](#) (object)

value (**Double**) - Phase Offset in degrees. Choose a value between -360 and 360.

Return Type Double

Default 0

Examples `balStim.BalPort1PhaseOffset = 10 'Write`

`variable = balStim.BalPort1PhaseOffset 'Read`

C++ Syntax HRESULT get_BalPort1PhaseOffset (double *pVal)

HRESULT put_BalPort1PhaseOffset (double newVal)

Interface IBalancedStimulus

VB Syntax *balStim.BalPort2StopPhase = value*

Variable [\(Type\)](#) - Description

balStim A [BalancedStimulus](#) (object)

value (**Double**) - Stop phase in degrees. Choose a value between -360 and 360.

Return Type Double

Default 0

Examples `balStim.BalPort2StopPhase = 10` 'Write

`variable = balStim.BalPort2StopPhase` 'Read

C++ Syntax HRESULT get_BalPort2StopPhase (double *pVal)

HRESULT put_BalPort2StopPhase (double newVal)

Interface IBalancedStimulus2

Last Modified:

3-Mar-2009 MX New topic (A.08.50)

BandwidthTarget Property

Description Sets the insertion loss value at which the bandwidth of a filter is measured (using [BandwidthTracking](#) or [SearchFilterBandwidth](#)). For example, if you want to determine the filter bandwidth 3 db below the bandpass peak value, set BandwidthTarget to **-3**.

VB Syntax *meas*.BandwidthTarget = *value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**single**) - Target value. Choose any number between **-500** and **500**

Return Type Single

Default -3

Examples `meas.BandwidthTarget = -3 'Write`

`fbw = meas.BandwidthTarget 'Read`

C++ Syntax HRESULT put_BandwidthTarget(float target)
HRESULT get_BandwidthTarget(float* target)

Interface IMeasurement

BandwidthTracking Property

Description Searches continually (every sweep) for the current [BandwidthTarget](#) (default is -3). To search the filter bandwidth for ONE SWEEP only (not continually), use `meas.SearchFilterBandwidth`.

This feature uses markers 1-4. To turn off these markers, either turn them off individually or [DeleteAllMarkers](#).

The bandwidth statistics are displayed on the analyzer screen. To get the bandwidth statistics, use either [GetFilterStatistics](#) or [FilterBW](#), [FilterCF](#), [FilterLoss](#), or [FilterQ](#).

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To restrict the search to a [UserRange](#) with the bandwidth search, first activate marker 1 and set the desired UserRange. Then send the SearchFilterBandwidth command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

VB Syntax `meas.BandwidthTracking = value`

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

value (boolean)

True - Turns bandwidth tracking ON

False - Turns bandwidth tracking OFF

Return Type Boolean

Default **False**

Examples `meas.BandwidthTracking = False 'Write`

`bwtrack = meas.BandwidthTracking 'Read`

C++ Syntax HRESULT put_BandwidthTracking(VARIANT_BOOL state)
HRESULT get_BandwidthTracking(VARIANT_BOOL* state)

Interface IMeasurement

BB_BalPort1Negative Property

Description With a Balanced - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT's logical Port 1.

Use [SetBBPorts Method](#) to set the port mapping for a Balanced - Balanced topology.

VB Syntax `var = balTopology.BB_BalPort1Negative`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BB_BalPort1Negative` 'Read

C++ Syntax HRESULT get_BB_BalPort1Negative(long *bVal)

Interface IBalancedTopology

BB_BalPort1Positive Property

Description With a Balanced - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's logical Port 1.

Use [SetBBPorts Method](#) to set the port mapping for a Balanced - Balanced topology.

VB Syntax `var = balTopology.BB_BalPort1Positive`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BB_BalPort1Positive` 'Read

C++ Syntax HRESULT get_BB_BalPort1Positive(long *bVal)

Interface IBalancedTopology

BB_BalPort2Negative Property

Description With a Balanced - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT's logical Port 2.

Use [SetBBPorts Method](#) to set the port mapping for a Balanced - Balanced topology.

VB Syntax `var = balTopology.BB_BalPort2Negative`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BB_BalPort2Negative` 'Read

C++ Syntax HRESULT get_BB_BalPort2Negative(long *bVal)

Interface IBalancedTopology

BB_BalPort2Positive Property

Description With a Balanced - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's logical Port 2.

Use [SetBBPorts Method](#) to set the port mapping for a Balanced - Balanced topology.

VB Syntax `var = balTopology.BB_BalPort2Positive`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BB_BalPort2Positive` **'Read**

C++ Syntax HRESULT get_BB_BalPort2Positive(long *bVal)

Interface IBalancedTopology

BalSMeasurement Property

Description Sets and returns the measurement for the Balanced - Single-ended topology.

VB Syntax *balMeas*.BalSMeasurement = *value*

Variable [\(Type\)](#) - Description

balMeas A [BalancedMeasurement](#) (object)

value (**String**) - Balanced - Single-ended measurement parameter. Not case sensitive. Choose from:

Sdd11	Sdc11	Sds12
Scd11	Sc11	Scs12
Ssd21	Ssc21	Sss22
Imb	CMRR1 (Ssd21/Ssc21)	CMRR2 (Sds12/Scs12)

Return Type String

Default Sdd11

Examples

```
balMeas.BalSMeasurement = "Sdd11" 'Write
```

```
variable = balMeas.BalSMeasurement 'Read
```

C++ Syntax HRESULT get_BalSMeasurement(BSTR *pVal)

HRESULT put_BalSMeasurement(BSTR newVal)

Interface IBalancedMeasurement3

Last Modified:

Unknown MX New topic

BBalMeasurement Property

Description Sets and returns the measurement for the Balanced - Balanced topology.

VB Syntax `balMeas.BBalMeasurement = value`

Variable [\(Type\)](#) - Description

`balMeas` A [BalancedMeasurement](#) (object)

`value` (**String**) - Balanced - Balanced Measurement parameter. Not case sensitive.
Choose from:

Sdd11	Sdd12	Sdc11	Sdc12
Sdd21	Sdd22	Sdc21	Sdc22
Scd11	Scd12	Sc11	Sc12
Scd21	Scd22	Sc21	Sc22
Imb1	Imb2	CMRR -(Sdd21/Sc11)	

Return Type String

Default Sdd11

Examples `balMeas.BBalMeasurement = "Sdd11" 'Write`

`variable = balMeas.BBalMeasurement 'Read`

C++ Syntax HRESULT get_BBalMeasurement(BSTR *pVal)

BeginResponse Property

Description When constructing a limit line, specifies the amplitude value of the start of a limit segment.

VB Syntax *limtseg*.BeginResponse = *value*

Variable [\(Type\)](#) - Description

limtseg A LimitSegment (**object**)

value (**double**) - Amplitude value. No units

Return Type Double

Default 0

Examples

```
Set limtseg = meas.LimitTest(1)
limtseg.BeginResponse = 10 'Write
```

```
BegResp = limtseg.BeginResponse 'Read
```

C++ Syntax HRESULT get_BeginResponse(double *pVal)
HRESULT put_BeginResponse(double newVal)

Interface ILimitSegment

BeginStimulus Property

Description When constructing a limit line, specifies the beginning X-axis value.

VB Syntax *limtseg*.BeginStimulus = *value*

Variable [\(Type\)](#) - Description

limtseg A LimitSegment (**object**)

value (**double**) - Stimulus value. No units

Return Type Double

Default 0

Examples

```
Set limtseg = meas.LimitTest(1)
limtseg.Type = naLimitSegmentType_Maximum
limtseg.BeginStimulus = 3e9
limtseg.EndStimulus = 4e9
limtseg.BeginResponse = 10
limtseg.EndResponse = 10
```

```
BegStim = limtseg.BeginStimulus 'Read
```

C++ Syntax HRESULT get_BeginStimulus(double *pVal)
HRESULT put_BeginStimulus(double newVal)

Interface ILimitSegment

BroadbandTuningSpan Property

Description Sets and returns the frequency span for the broadband tuning sweep.

VB Syntax *obj*.**BroadbandTuningSpan** = *value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Double**) Broadband frequency span in Hz.

Return Type (**Double**)

Default 3 MHz

Examples

```
embedLO.BroadbandTuningSpan = 1E6 'write
```

```
value = embedLO.BroadbandTuningSpan 'read
```

C++ Syntax HRESULT get_BroadbandTuningSpan(double* span);

HRESULT put_BroadbandTuningSpan(double span);

Interface IEmbeddedLO

BS_BalPortNegative Property

Description With a Balanced - Single-ended topology, returns the PNA port number that is connected to the Negative side of the DUT's balanced port.

Use [SetSBPorts Method](#) to set the port mapping for a Balanced - Single-ended topology.

VB Syntax *var* = *balTopology*.**BS_BalPortNegative**

Variable [\(Type\)](#) - Description

var (Long Integer) Variable to store the returned value.

balTopology A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BS_BalPortNegative 'Read`

C++ Syntax HRESULT get_BS_BalPortNegative(long *bVal)

Interface IBalancedTopology2

Last modified:

25-Apr-2012 New topic

BS_BalPortPositive Property

Description With a Balanced - Single-ended topology, returns the PNA port number that is connected to the Positive side of the DUT's balanced port.

Use [SetSBPorts Method](#) to set the port mapping for a Balanced - Single-ended topology.

VB Syntax `var = balTopology.BS_BalPortPositive`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BS_BalPortPositive 'Read`

C++ Syntax HRESULT get_BS_BalPortPositive(long *bVal)

Interface IBalancedTopology2

Last modified:

25-Apr-2012 New topic

BS_SEPort Property

Description With a Balanced - Single-ended topology, returns the PNA port number that is connected to the Single-ended port.

Use [SetSBPorts Method](#) to set the port mapping for a Balanced - Single-ended topology.

VB Syntax *var* = *balTopology*.**BS_SEPort**

Variable [\(Type\)](#) - Description

var (Long Integer) Variable to store the returned value.

balTopology A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.BS_SEPort` **'Read'**

C++ Syntax HRESULT get_BS_SEPort(long *bVal)

Interface IBalancedTopology2

Last modified:

25-Apr-2012 New topic

BucketNumber Property

Description	Sets or returns the bucket number (data point) for the active marker. When the markers are interpolated (non-discrete) , the returned value is the nearest marker bucket position.
VB Syntax	<i>mark</i> . BucketNumber = <i>value</i>
Variable	(Type) - Description
<i>mark</i>	A Marker (object)
<i>value</i>	(long integer) - Data point. Choose any number between 0 and the measurement's number of data points - 1. For example, with Number of points = 201, choose between 0 and 200
Return Type	Long Integer
Default	The first marker is set to the middle of the span. Subsequent markers are set to the bucket number of the previously active marker.
Examples	<pre>mark.BucketNumber = 100 'moves the active marker to data point 100 -Write pointNumber = mark.BucketNumber 'returns the data point number of the marker object. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.</pre>
C++ Syntax	HRESULT get_BucketNumber(long *pVal) HRESULT put_BucketNumber(long newVal)
Interface	IMarker

C0 Property

Description Sets and Returns the C0 (C-zero) value (the first capacitance value) for the calibration standard.

To set the other capacitance values, use [C1](#), [C2](#), [C3](#)

VB Syntax `calstd.C0 = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for C0 in femtofarads (1E-15)

Return Type Single

Default Not Applicable

Examples `calstd.C0 = 15 'Write the value of C0 to 15femtofarads`

`cap0 = calstd.C0 'Read the value of C0`

C++ Syntax HRESULT get_C0(float *pVal)
HRESULT put_C0(float newVal)

Interface ICalStandard

C1 Property

Description Sets and Returns the C1 value (the second capacitance value) for the calibration standard.

To set the other capacitance values, use [C0](#), [C2](#), [C3](#).

VB Syntax *calstd.C1 = value*

Variable [\(Type\)](#) - **Description**

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for C1.

Return Type Single

Default Not Applicable

Examples `calstd.C1 = 15 'Write the value of C1.`

`cap1 = calstd.C1 'Read the value of C1.`

C++ Syntax HRESULT get_C1(float *pVal)
HRESULT put_C1(float newVal)

Interface ICalStandard

C2 Property

Description Sets and Returns the C2 value (the third capacitance value) for the calibration standard.

To set the other capacitance values, use [C0](#), [C1](#), [C3](#).

VB Syntax `calstd.C2 = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for C2.

Return Type Single

Default Not Applicable

Examples

```
calstd.C2 = 15 'Write the value of C2.
```

```
cap2 = calstd.C2 'Read the value of C2
```

C++ Syntax HRESULT get_C2(float *pVal)
HRESULT put_C2(float newVal)

Interface ICalStandard

C3 Property

Description Sets and Returns the C3 value (the fourth capacitance value) for the calibration standard.

To set the other capacitance values, use [C0](#), [C1](#), [C2](#)

VB Syntax `calstd.C3 = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for C3.

Return Type Single

Default Not Applicable

Examples `calstd.C3 = 15 'Write the value of C3.`

`cap3 = calstd.C3 'Read the value of C3`

C++ Syntax HRESULT get_C3(float *pVal)
HRESULT put_C3(float newVal)

Interface ICalStandard

CalFactor Property

Description	Sets or returns the cal factor value associated with a power sensor cal factor segment.
VB Syntax	<i>calFactSeg</i> . CalFactor = <i>value</i>
Variable	(Type) - Description
<i>calFactSeg</i>	A PowerSensorCalFactorSegment (Object) or A PowerSensorCalFactorSegmentPMAR (Object)
<i>value</i>	(double) – Cal factor in percent. Choose any value between 1 and 150
Return Type	Double
Default	0
Examples	<pre>calFactSeg.CalFactor = 98 'Write factor = calFactSeg.CalFactor 'Read</pre>
C++ Syntax	HRESULT put_CalFactor(Double newVal); HRESULT get_CalFactor(Double *pVal);
Interface	IPowerSensorCalFactorSegment IPowerSensorCalFactorSegmentPMAR

Last Modified:

27-Aug-2009 MX New topic

CalibrationType Property **Superseded**

Description **Note:** This command has been replaced by [CalibrationTypeID_property](#), which provides selection of Calibration Type by string.

Specifies the type of calibration to perform or apply to the active S-Parameter measurement. This command determine the ports involved in the CalType by the ports being used by the active measurement.

For example:

- If the measurement is an S23, it uses ports 2 and 3.
- If the measurement is an S22 it will use the legacy load port to figure out which two ports form the caltype. The legacy load port is set using [CreateMeasurement](#).
- If **naCalType_ThreePort_SOLT** is specified on a 4-port PNA, an E_NA_DEPRECATED_COMMAND error is returned. There is no way to determine the intended three ports.
- If **naCalType_FourPort_SOLT** is specified on a 4-port PNA, it is obvious that the ports involved are ports 1,2,3, and 4.

Note: For FCA measurements, use [CalibrationName](#) and [CalibrationTypeID](#).

VB Syntax *meas.CalibrationType = type*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

type (enum NACalType) - Calibration type. Choose from:

0 - naCalType_Response_Open

1 - naCalType_Response_Short

2 - naCalType_Response_Thru

3 - naCalType_Response_Thru_And_Isol

4 - naCalType_OnePort

5 - naCalType_TwoPort_SOLT

6 - naCalType_TwoPort_TRL

7 - naCalType_None

8 - naCalType_ThreePort_SOLT

9 - Custom

10 - naCalType_FourPort_SOLT

**Return
Type** NACalType

Default naCalType_None

Examples `meas.CalibrationType = naCalType_Response_Open 'Write`

`meascal = meas.CalibrationType 'Read`

C++ Syntax HRESULT put_CalibrationType (tagNACalType CalType)
HRESULT get_CalibrationType (tagNACalType* pCalType)

Interface IMeasurement

Read only

CalibrationName Property

Description Returns the name of the current Cal Type.

VB Syntax *value* = *meas*.**CalibrationName**

Variable [\(Type\)](#) - Description

value **(string)** - Variable to store the returned value.

meas A [Measurement](#) **(object)**

Return Type String

Default Not Applicable

Examples `ct = meas.CalibrationName`

C++ Syntax HRESULT get_CalibrationName(BSTR* CalibrationName);

Interface IMeasurement2

CalibrationPort Property - Obsolete

Description **Note:** Beginning with Rev 6.0, this command is no longer necessary. [Learn more](#). Because of improved calibration techniques, **Both** is always selected although a power meter measurement is performed only on port 1.

Specifies which SMC port to calibrate.

VB Syntax `SMC.CalibrationPort = value`

Variable [\(Type\)](#) - Description

SMC [SMCType](#) (object)

value (String) Port number to be calibrated. Choose from:

- 1 - SMC forward
- 2 - SMC reverse
- **Both**

Return Type String

Default 1

Examples `value = SMC.CalibrationPort = "Both"`

C++ Syntax `HRESULT put_CalibrationPort(BSTR port);`

`HRESULT get_CalibrationPort(BSTR *port);`

Interface `SMCType`

`VMCType`

CalibrationPorts Property

Description For each channel to be calibrated, sets and returns the ports to be calibrated. The port numbers need to be specified only for standard channels. Apps channels have designated input/output/LO ports.

Select any of the native PNA ports.

VB Syntax `calAll.CalibrationPorts (chan) = ports`

Variable [\(Type\)](#) - Description

calAll A [CalibrateAllChannels](#) (object)

chan Channel to be calibrated with a Calibrate All Channels calibration.

port (Variant Array) Ports to be calibrated for the specified channel.

Return Type Variant Array

Default Standard channels - ports 1 and 2

Apps channels - the designated input and output ports.

Examples

```
calAll.CalibrationPorts(2) = 0 'Ports to calibrate for channel 2
```

```
value = calAll.CalibrationPorts(2) 'returns the ports for channel 2
```

C++ Syntax HRESULT get_CalibrationPorts (long channel, Variant ports);

HRESULT put_CalibrationPorts (long channel, Variant* ports);

Interface ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

CalibrationTypeID Property

Description **Note:** This command replaces [Calibration Type Property](#).

Sets or returns the current cal type for the measurement using a Cal Type Name.

This command is used to set the Cal Type after recalling a Cal Set. [Learn more](#)

You can also use the CLSID or GUID associated with the Cal Type.

VB Syntax *meas*.**CalibrationTypeID** = *id*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

id (**String**) Cal type. Case sensitive. Use one of the following:

For Full Calibrations:

This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.

"Full n Port(x,y,z...)"

where

n = the number of ports to calibrate

x,y,z = the port numbers to calibrate

For example:

```
"Full 7 Port(2,3,4,5,6,7,8)"
```

For Response Calibrations:

"Response(param)" OR

"ResponseAndIsolation(param)"

Where param =

- S-parameter. For example"

- "Response (S21) "
- "ResponseAndIsolation(A/R) "
- Single or ratioed receivers using either [logical receiver notation](#) or physical receiver notation. For example:
 - "Response (A) "
 - "ResponseAndIsolation(a3/b4) "

For FCA Calibrations:

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.
- "SMCRsp+IN" No Output match. All four sweeps required.
- "SMCRsp+OUT" No Output match. All four sweeps required.
- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.

For Gain Compression Cal

where r = receive port; s = source port

- "GCA 2P (r,s)" - full 2-port cal
- "GCA Enh Resp (r,s)" - Enhanced Response Cal

Return Type String

Default Not Applicable

Examples

```
Dim pna
Dim m

Set pna = CreateObject("AgilentPNA835x.Application")
Set m = pna.ActiveMeasurement
m.CalibrationTypeID = "Scalar Mixer Cal"
m.ErrorCorrection = True
MsgBox m.CalibrationName
```

C++ Syntax HRESULT get_CalibrationTypeID(BSTR* CalibrationTypeID);

HRESULT put_CalibrationTypeID(BSTR CalibrationTypeID);

Interface IMeasurement2

Last modified:

22-Sep-2009	Removed VMC strings
27-May-2008	Edit channel vs meas
11-Feb-2008	Fixed typo
9/12/06	MQ Added for multiport.

CalibrationFrequencies Property

Description Sets and returns the whether to perform the source power cal at the center frequencies midway between the main tones, or at all main tone frequencies.

VB Syntax *imd.CalibrationFrequencies = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMDCal](#) (object)

value (Enum as NAIMDCalibrationFrequencies) Choose from:

0 - naIMDCenterFrequencies -Perform source power calibration at only the center frequencies midway between the main tones.

1 - naIMDALLFrequencies - Perform source power calibration at all main tone frequencies.

Return Type Enum

Default 0 - naIMDCenterFrequencies

Examples

```
imd.CalibrationFrequencies = naIMDALLFrequencies 'Write  
calFreq = imd.CalibrationFrequencies 'Read
```

C++ Syntax HRESULT get_CalibrationFrequencies(tagNAIMDCalibrationFrequencies * Val)
HRESULT put_CalibrationFrequencies(tagNAIMDCalibrationFrequencies newVal)

Interface ISweptIMD

9-Sep-2008 MX New topic

CalKitType Property

Description Sets and returns a calibration kit type to be used for **UNGUIDED** calibration and for cal kit modification. To get a handle to this kit, use `app.ActiveCalKit` .

Although an unlimited number of cal kits can be imported into the PNA, **ONLY** mechanical cal kits #1 through #95 can be accessed.

There is also a CalKitType property for use during a Guided, SMC, and VMC Calibration.

VB Syntax `object .CalKitType = value`

Variable (Type) - Description

object calkit (object) or

Application (object)

Note: `app .CalKitType` and `calkit .calKitType` perform exactly the same function.

value (**enum naCalKit**) - Calibration Kit type. Choose from:

1 - naCalKit_User1
 2 - naCalKit_User2
 3 - naCalKit_User3
 4 - naCalKit_User4
 ..
 ..
 ..
 94 - naCalKit_User94
 95 - naCalKit_User95

These enumerated values correspond with the calibration kit ID on the Advanced Cal Kit Modify dialog box .

To change the cal kit name, use Name property .

Return Type NACalKit

Default Not Applicable

Examples `calkit.CalKitType = naCalKit_User27`

`kitype = app.CalKitType`

C++ Syntax HRESULT get_CalKitType(tagNACalKit *pVal);
HRESULT put_CalKitType(tagNACalKit newVal);

Interface IApplication
ICalKit

Last Modified:

12-Oct-2011 Increased limit to 95

CalKitType Property

Description Sets and returns the ECal or mechanical cal kit for the specified port number to be used during the calibration.

There is also a [CalKitType Property](#) for use during an Unguided Cal.

Note: Sliding loads are not fully supported from the GuidedCalibration object. The **Measure** button must be pressed manually on the PNA.

Note: This command replaces [Do1PortEcal Property](#) and [Do2PortEcal Property](#) for SMC and VMC Calibrations.

VB Syntax *object.CalKitType (port) = value*

Variable (Type) - Description

object Any of the following:

[GuidedCalibration](#) (object)

[SMCType](#) (object)

[VMCType](#) (object)

port (Long) Port number to which the cal kit will be assigned.

For Guided Cals and SMC, select port number.

For VMC calibrations:

- 1 - Mixer Input.
- Any unused port can be used for the mixer output.
- **Output port of MUT +1** - Output port of the calibration mixer. Generally this is port 3.

value (**string**) - Calibration Kit type. **Case-sensitive.**

Use [GetCompatibleCalKits](#) to return a list of valid Cal Kits.

Return Type String

Default Not Applicable

Examples

```
'Note: All of the following specify port 1 only
' Mechanical Cal Kit
```

```
guidedCal.CalKitType(1) = "85052C"
' Standard ECal modules
guidedCal.CalKitType(1) = "N4691-60004 ECal"
' Non-factory ECal characterizations are specified as follows:
guidedCal.CalKitType(1) = "N4691-60004 User 1 ECal"
' When two or more ECal modules with the same model number are
' connected, also specify the serial number as follows:
guidedCal.CalKitType(1) = "N4691-60004 ECal 01234"
' When Disk Memory ECal user characterizations are used,
' specify both the User char and the serial number as follows:
'guidedCal.CalKitType(1) = "N4691-60004 MyDskChar ECal 01234"
' Turn on auto orientation for the ECal (default behavior).
value = smc.CalKitType(1) 'Read
```

C++ Syntax HRESULT get_CalKitType(long port, BSTR *calkit)

HRESULT put_CalKitType(long port, BSTR calkit)

Interface IGuidedCalibration

CalKitType Property

Description	Sets and returns the name of the Cal Kit to use for unguided cal.
VB Syntax	<i>cal</i> .CalKitType (<i>port</i>) = <i>value</i>
Variable	(Type) - Description
<i>cal</i>	Calibrator (object)
<i>port</i>	(Long) Currently unused
<i>value</i>	(String) Cal Kit name enclosed in quotes. Use CalKitTypes to read a list of all available Cal Kits in the PNA.
Return Type	String
Default	Last kit selected
Examples	<pre>cal.CalKitType(1)= "85052B"</pre>
C++ Syntax	HRESULT put_CalKitType(long port, BSTR calKit); HRESULT get_CalKitType(long port, BSTR* pCalKit);
Interface	ICalibrator10

17-Mar-2010 MX New topic

CalKitTypes Property

Description

VB Syntax *cal.CalKitTypes (port) = value*

Variable [\(Type\)](#) - Description

cal [Calibrator](#) (object)

port

value **(String)**

Return Type Long

Default

Examples `cal.CalKitTypes(4)=`

C++ Syntax HRESULT put_CalKitTypes(long port, BSTR calKit);

HRESULT get_CalKitTypes(long port, BSTR*
pCalKit);

Interface ICalibrator10

Last Modified:

17-Mar-2010 MX New topic

CalMethod Property

Description Sets and returns the method for performing calibration on a noise channel.

VB Syntax *noise*.**CalMethod** = *value*

Variable [\(Type\)](#) - Description

noise A [NoiseCal](#) (**object**)

value (**string**) Cal Method. Choose from:

- "VectorFull" or "Vector"
- "SParameter" (Not available for NFX measurements)
- "ScalarFull" or "Scalar"

Return Type String

Default "VectorFull"

Examples

```
noise.CalMethod = "VectorFull" 'Write
```

```
calMethod = noise.CalMethod 'Read
```

C++ Syntax HRESULT get_CalMethod(BSTR* pValue)

HRESULT put_CalMethod(BSTR pNewValue)

Interface INoiseCal

Last Modified:

27-Oct-2009 Updated for NFX

29-May-2007 MN New topic

CalMethod Property

Description Sets and returns the method by which the match-correction portion of an IMD calibration is performed. [Learn more.](#)

VB Syntax `imd.CalMethod = value`

Variable [\(Type\)](#) - Description

imd A [SweptIMDCal](#) (object)

value (Enum as NAIMDCalMethod) Choose from:

0 - naIMDMatchCorrectedResponse -Performs a full 2-port cal for full match-correction.

1 - naIMDResponseOnly - Performs only a response cal instead of a full 2-port cal.

Return Type Enum

Default 0 - **naIMDMatchCorrectedResponse**

Examples

```
imd.CalMethod = naIMDMatchCorrectedResponse 'Write
```

```
calMeth = imd.CalMethod 'Read
```

C++ Syntax HRESULT get_CalMethod(tagNAIMDCalMethod * Val)
HRESULT put_CalMethod(tagNAIMDCalMethod newVal)

Interface ISweptIMD

CalPower Property **Superseded**

Description This command is replaced by [SetCalInfoEx Method](#).

Specifies the power level that is expected at the desired reference plane (DUT input or output). This is not used for [segment sweep with independent power levels](#) or [power sweeps](#).

VB Syntax *value* = *powerCalibrator*.**CalPower** (*chan*, *sourcePort*)

Variable **(Type) - Description**

value **(double)** - Variable to store the returned Cal power value in dBm.

powerCalibrator **(object)** - A SourcePowerCalibrator object

chan **(long integer)** - Channel number of the PNA.

sourcePort **(long integer)** - Source port number.

Use [GetPortNumber](#) to return the port number of a source that only has a string name, such as an [External Source](#).

Return Type None

Default Not applicable

Examples

```
Set powerCalibrator = pna.SourcePowerCalibrator
power = powerCalibrator.CalPower(1,2) 'Read
```

C++ Syntax HRESULT get_CalPower(long channel, long sourcePort, double *pVal);

Interface ISourcePowerCalibrator

Last Modified:

7-Nov-2011 Fixed example

30-Apr-2007 Superseded

CalSet Property

Description	Set and read the Cal Set name into which the calibration will be saved. The phase reference cal can NOT be saved to a cal register. The Cal Set is saved by calling GenerateErrorTerms at the conclusion of the Guided Cal.
VB Syntax	<i>phasRef</i> .CalSet = <i>value</i>
Variable	(Type) - Description
<i>phasRef</i>	A PhaseReferenceCalibration Object
<i>value</i>	(String) Cal Set name.
Return Type	String
Default	Not Applicable
Examples	<pre>phase.CalSet = "PhaseRefCal"</pre> See example program
C++ Syntax	HRESULT get_CalSet(BSTR CalSet* pVals); HRESULT put_CalSet(BSTR CalSet newVals);
Interface	IPhaseReferenceCalibration

Last Modified:

3-Apr-2012 MX New topic

Center Property

Description Sets or returns the Center time of either Gating or Time Domain transform windows

VB Syntax *object.Center = value*

Variable [\(Type\) - Description](#)

object **(object)** As Gating

or

(object) As Transform

value **(double)** - Center time in seconds. Choose any number between:
 $\pm (\text{points}-1) / \text{frequency span}$

Return Type Double

Default 0

Examples

```
trans.Center = 4.5e-9 'sets the Center time of a transform window  
-Write  
gate.Center = 4.5e-9 'sets the Center time of a gating window -  
Write
```

```
cnt = trans.Center 'Read
```

C++ Syntax HRESULT get_Center(double *pVal)
HRESULT put_Center(double newVal)

Interface ITransform
IGating

Read-only

Center Property

Description Returns the stimulus value of the center data point for the measurement. This function does NOT work for segment sweep measurements. To understand how this property is useful, see [IMeasurement2 Interface](#).

VB Syntax *value* = *meas.Center*

Variable [\(Type\)](#) - Description

value **(Double)** - Variable to store the returned value.

meas A Measurement **(object)**

Return Type Double

Default Not Applicable

Examples `Print meas.Center 'prints the center data point`

C++ Syntax HRESULT get_Center(double * Val);

Interface IMeasurement2

CenterFrequency Property

Description Sets or returns the center frequency of the channel
or
Sets or returns the center frequency of the segment.

See the [Measurement2 Interface](#) to learn how this method differs from [meas.Center](#).

VB Syntax *object*.centerFrequency = *value*

Variable [\(Type\)](#) - Description

object A [Channel](#) (**object**)

or

A [Segment](#) (**object**)

value (**double**) - Center frequency in Hertz. Choose any number between the **minimum** and **maximum** frequencies of the analyzer.

Return Type Double

Default Center of the frequency range

Examples `chan.centerFrequency = 4.5e9 'sets the center frequency of a linear sweep for the channel object -Write`

`centfreq = chan.centerFrequency 'Read`

C++ Syntax HRESULT get_CenterFrequency(double *pVal)
HRESULT put_CenterFrequency(double newVal)

Interface IChannel
ISegment

ChannelNumber Property

Description Returns the Channel number of the Channel or Measurement object.

VB Syntax *object*.ChannelNumber

Variable [\(Type\)](#) - Description

object A Channel (**object**)
or
A Measurement (**object**)

Return Type Long Integer

Default Not applicable

Examples

```
chanNum = chan.ChannelNumber 'returns the channel number
chanNum = meas.ChannelNumber 'returns the channel number of the
measurement
```

C++ Syntax HRESULT get_ChannelNumber(long *pVal)

Interface IChannel
IMeasurement

Channels Property

Description	Sets and returns the list of channels to be calibrated during the Cal All session.
VB Syntax	<i>calAll.Channels</i> = <i>chans</i>
Variable	(Type) - Description
<i>calAll</i>	A CalibrateAllChannels (object)
<i>chans</i>	(Variant) Array of channel numbers to be calibrated, separated by commas. These channels must already exist.
Return Type	Variant
Default	The existing channels
Examples	<pre>calAll.Channels = Array(1,2,3) 'sets channels to be cal'd</pre> <pre>chans = calAll.Channels 'returns the channel numbers to be cal'd</pre>
C++ Syntax	HRESULT get_Channels (VARIANT selectedChannels); HRESULT put_Channels (VARIANT* selectedChannels);
Interface	ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

CharacterizationNumber Property

Description Sets and reads the number to which the user characterization will be stored in the ECal module. The number must be set before sending [Initialize](#) or the default value (1) will be used.

VB Syntax *userChar.CharacterizationNumber = value*

Variable [\(Type\)](#) - Description

userChar An [ECalUserCharacterizer](#) Object

value (Long) User Characterization number. Choose a value between 1 and 12.

Return Type Long Integer

Default Not Applicable

Examples `userChar.CharacterizationNumber = 5`

C++ Syntax HRESULT put_CharacterizationNumber(long *Number);

Interface IECalUserCharacterizer

Last Modified:

2-Nov-2008 New topic (8.33)

CharacterizeMixerOnly Property

Description Sets and returns whether to perform ONLY a mixer characterization.

VB Syntax `VMC.CharacterizeMixerOnly = bool`

Variable [\(Type\)](#) - Description

`VMC` [VMCType](#) (object)

`bool` (Boolean)

True - Perform ONLY mixer characterization.

False - Perform both mixer characterization and calibration.

Return Type Boolean

Default **False**

Examples `value = VMC.CharacterizeMixerOnly`

C++ Syntax `HRESULT put_CharacterizeMixerOnly(VARIANT_BOOL
bCharMixerOnly);`

`HRESULT get_CharacterizeMixerOnly(VARIANT_BOOL
*bCharMixerOnly);`

Interface VMCType

CharFileName Property

Description	Specifies the mixer characterization (.S2P) file and immediately loads the file. Also specify the use of a characterization file with LoadCharFromFile Property
VB Syntax	<i>VMC.CharFileName</i> = <i>value</i>
Variable	(Type) - Description
<i>VMC</i>	VMCType (object)
<i>value</i>	(String) Full path, file name, and extension of the mixer characterization file.
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>VMC.CharFileName = "c:\users\public\network analyzer\documents/default.S2P"</pre>
C++ Syntax	<pre>HRESULT put_CharFileName(BSTR filename); HRESULT get_CharFileName(BSTR *filename);</pre>
Interface	VMCType

CharMixerReverse Property

Description	Specifies the direction in which to characterize the calibration mixer. Learn more about the calibration mixer.
VB Syntax	<code>VMC.CharMixerReverse = bool</code>
Variable	(Type) - Description
<code>VMC</code>	VMCType (object)
<code>bool</code>	(Boolean)
	0 - Characterize the calibration mixer in the SAME direction as that specified in the mixer setup.
	1 - Characterize the calibration mixer in the REVERSE direction as that specified in the mixer setup.
Return Type	Boolean
Default	0
Examples	<pre>VMC.CharMixerReverse = 0</pre>
C++ Syntax	<pre>HRESULT put_CharMixerReverse(VARIANT_BOOL bcharReverse); HRESULT get_CharMixerReverse(VARIANT_BOOL *bcharReverse);</pre>
Interface	VMCType2

CitiContents Property - Superseded

Description	This command is replaced with SaveData Method Specifies the contents of subsequent citifile saves using app. SaveCitiDataData or app. SaveCitiFormattedData
VB Syntax	<i>pref.CitiContents</i> = <i>value</i>
Variable	(Type) - Description
<i>pref</i>	A Preferences (object)
<i>value</i>	(string) - Contents that will be saved with subsequent save commands. Choose from: "Single" - Single trace "Displayed" - All displayed traces "Auto" - All displayed traces
Return Type	String
Default	"Auto"
Examples	<pre>pref.CitiContents = "Single" 'Write content = pref.CitiContents 'Read</pre>
C++ Syntax	HRESULT get_CitiContents(BSTR *Contents) HRESULT put_CitiContents(BSTR Contents)
Interface	IPreferences

CitiFormat Property - Superseded

Description	This command is replaced with SaveData Method Specifies the format of subsequent citifile saves using app. SaveCitiFormattedData
VB Syntax	<i>pref.CitiFormat</i> = <i>value</i>
Variable	(Type) - Description
<i>pref</i>	A Preferences (object)
<i>value</i>	(string) - Format in which the citifile will be saved with subsequent save commands. Choose from: "MA" - Linear Magnitude / degrees "DB" - Log Mag / degrees "RI" - Real / Imaginary "Auto" - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.
Return Type	String
Default	"Auto"
Examples	<pre>pref.CitiFormat = "MA" 'Write format = pref.CitiFormat 'Read</pre>
C++ Syntax	HRESULT get_CitiFormat(BSTR *Format) HRESULT put_CitiFormat(BSTR Format)
Interface	IPreferences

CmnModeZConvPortImag Property

Description Sets the imaginary part of the impedance value for the common port impedance conversion function.

VB Syntax `fixture.CmnModeZConvPortImag(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value **(Double)** Imaginary part of the Impedance value. Choose a value between 0 and 1E18.

Return Type Double

Default 0

Examples `fixture.CmnModeZConvPortImag(2) = 75 'Write`

`value = fixture.CmnModeZConvPortImag(1) 'Read`

C++ Syntax HRESULT get_CmnModeZConvPortImag(short portNum, double *pVal)
HRESULT put_CmnModeZConvPortImag(short portNum, double newVal)

Interface IFixturing2

CmnModeZConvPortReal Property

Description Sets the real part of the impedance value for the common port impedance conversion function.

VB Syntax `fixture.CmnModeZConvPortReal(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum (**Integer**) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value (**Double**) Real part of the Impedance value. Choose a value between 0 and 1E18.

Return Type Double

Default See [Common Mode Port Z Conversion Default](#)

Examples

```
fixture.CmnModeZConvPortReal(2) = 75 'Write
```

```
value = fixture.CmnModeZConvPortReal(1) 'Read
```

C++ Syntax HRESULT get_CmnModeZConvPortReal(short portNum, double *pVal)

HRESULT put_CmnModeZConvPortReal(short portNum, double newVal)

Interface IFixturing2

Last Modified:

31-May-2013 Fixed Typo

CmnModeZConvPortZ0 Property

Description Sets the impedance value for the common port impedance conversion function. Set either this single value or set the [real](#) and [imaginary](#) parts separately. The imaginary part is set to 0.0 using this command.

VB Syntax `fixture.CmnModeZConvPortZ0(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum (**Integer**) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value (**Double**) Impedance value. Choose a value between 0 and 1E7.

Return Type
Double

Default See [Common Mode Port Z Conversion Default](#)

Examples

```
fixture.CmnModeZConvPortZ0(2) = 75 'Write  
value = fixture.CmnModeZConvPortZ0(1) 'Read
```

C++ Syntax HRESULT get_CmnModeZConvPortZ0(short portNum, double *pVal)

HRESULT put_CmnModeZConvPortZ0(short portNum, double newVal)

Interface IFixturing2

Last Modified:

31-May-2013 Fixed Typo

CmnModeZConvState Property

Description Turns ON or OFF 4-port common port impedance conversion function. Must also set the fixture simulator function to ON using [FixturingState Property](#).

VB Syntax *fixture.CmnModeZConvState = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (**Boolean**)

False - Turns common port impedance conversion OFF

True - Turns common port impedance conversion ON

Return Type Boolean

Default False

Examples

```
fixture.CmnModeZConvState = False 'Write
```

```
value = fixture.CmnModeZConvState 'Read
```

C++ Syntax HRESULT get_CmnModeZConvState(VARIANT_BOOL *pVal)

HRESULT put_CmnModeZConvState(VARIANT_BOOL newVal)

Interface IFixturing2

CompatibleCalKits Property

Description Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the PNA, and all user characterizations stored in PNA disk memory.

Note: Beginning with PNA Rev 9.1, the serial number is returned for ALL ECal modules that are connected with the connector type of the specified port. Previously, the returned list would include the serial numbers to distinguish the ECal modules only when two or more identical ECal models were connected to the PNA.

VB Syntax *value* = *obj*.CompatibleCalKits (*port*)

Variable [\(Type\)](#) - Description

value (Variant) Variable to store the returned list of Cal Kits.

obj Any of the following:

[GuidedCalibration](#) (object) **Superseded** Replaced with [GetCompatibleCalKits Method](#)

[SMCType](#) (object)

[VMCType](#) (object)

port (Long) Port number for which you want compatible kits.

First set the [ConnectorType](#) for the port.

Return Type Variant

Default Not Applicable

Examples

```
Dim kits As Variant
kits = MySMC.CompatibleCalKits(1)
```

C++ Syntax HRESULT get_CompatibleCalKits(long port, VARIANT* Kits);

Interface IGuidedCalibration

SMCType

VMCType

16-Nov-2009 Added Note (9.1)

16-Nov-2009 Superseded

CompositeNormalizationMode Property

Description Sets and returns the method by which CTB and CSO calculations are performed.

VB Syntax *imd.CompositeNormalizationMode* = *value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Enum)

0 - naNone - the normalized power is not used in calculation

1 - naNumberOfCarriers - CTB and CSO is corrected by subtracting $10 \cdot \log(N/2)$, where

- N = # of carriers for CTB
- N = # of distortion products for CSO

2 - naPdBm - the composited normalized power for CTB or CSO is treated as a dBm value

3 - naPdBmV - the composited normalized power for CTB or CSO is treated as a dBmV value.

Note: Power values are stored using the currently-set units. Therefore, first set units with this command, then set power values using:

[CompositeNormalizedCSOPower](#)

[CompositeNormalizedCTBPower](#)

Return Type Enum

Default **naNumberOfCarriers**

Examples `imd.CompositeNormalizationMode = naNone 'Write`

`value = imd.CompositeNormalizationMode 'Read`

C++ Syntax HRESULT

get_CompositeNormalizationMode(tagNAIMDCompositeNormalizationMode *pVal)

HRESULT

put_CompositeNormalizationMode(tagNAIMDCompositeNormalizationMode pVal)

Interface ISweptIMD

Last Modified:

16-Sep-2008 MX New topic

CompositeNormalizedCSOPower Property

Description Sets and returns the CSO Power for POWER [normalization mode](#). Valid only with measurement parameters: CSO2Lo and CSO2Hi and for Normalization Modes **dBm** and **dBmV**.

VB Syntax *imd.CompositeNormalizedCSOPower = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Power level. The units are determined by [CompositeNormalizationMode Property](#), which must be set first.

Return Type Double

Default 0

Examples

```
imd.CompositeNormalizedCSOPower = -5 'Write
```

```
value = imd.CompositeNormalizedCSOPower 'Read
```

C++ Syntax HRESULT get_CompositeNormalizedCSOPower(double *pVal)
HRESULT put_CompositeNormalizedCSOPower(double pVal)

Interface ISweptIMD

Last Modified:

16-Sep-2008 MX New topic

CompositeNormalizedCTBPower Property

Description Sets and returns the CSO Power. Valid only with measurement parameters: CTBLo and CTBHi and for Normalization Modes **dBm** and **dBmV**.

VB Syntax *imd.CompositeNormalizedCTBPower = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Power level. The units are determined by [CompositeNormalizationMode Property](#), which must be set first.

Return Type Double

Default 0

Examples

```
imd.CompositeNormalizedCTBPower = -5 'Write
```

```
value = imd.CompositeNormalizedCTBPower 'Read
```

C++ Syntax HRESULT get_CompositeNormalizedCTBPower(double *pVal)
HRESULT put_CompositeNormalizedCTBPower(double pVal)

Interface ISweptIMD

Last Modified:

7-Apr-2009 Corrected parameters

16-Sep-2008 MX New topic

Compression Property

Description	Returns the Compression result of the PNOP marker search. Pnop Comp = Pnop Gain - Linear Gain (not shown on marker readout).
VB Syntax	<i>comp</i> = <i>pnop</i> . Compression
Variable	(Type) - Description
<i>comp</i>	(double) - Variable to store returned value
<i>pnop</i>	A PNOP (object)
Return Type	Double
Default	Not applicable
Examples	<pre>comp = pnop.Compression 'Read</pre> See example program
C++ Syntax	HRESULT get_Compression(double* pNewVal)
Interface	IPNOP

Last Modified:

19-Feb-2010 MX New topic

CompressionAlgorithm Property

Description Set and read the algorithm method used to compute gain compression.

VB Syntax `gca.CompressionAlgorithm = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**tagNAGCACCompressionAlgorithm**) - Algorithm method. Choose from:

- **naCompressionFromLinearGain (0)**
- **naCompressionFromMaximumGain (1)**
- **naBackoffCompression (2)**
- **naXYCompression (3)**
- **naSaturation (4)**

Return Type Enum

Default `naCompressionFromLinearGain (0)`

Examples

```
gca.CompressionAlgorithm = naXYCompression 'Write  
compAlg = gca.CompressionAlgorithm 'Read
```

C++ Syntax `HRESULT get_CompressionAlgorithm(tagNAGCACCompressionAlgorithm* pVal)`
`HRESULT put_CompressionAlgorithm(tagNAGCACCompressionAlgorithm newVal)`

Interface `IGainCompression`

Last Modified:

11-Sep-2007 MX New topic

CompressionBackoff Property

Description Set and read value for the BackOff compression algorithm.

VB Syntax `gca.CompressionBackoff = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Double**) Backoff value in dB. Choose from 30 to (-30)

Return Type Double

Default 10

Examples `gca.CompressionBackoff = 7 'Write`

`acqMode = gca.CompressionBackoff 'Read`

C++ Syntax HRESULT get_CompressionBackoff(double* pValue)

HRESULT put_CompressionBackoff(double newValue)

Interface IGainCompression

Last Modified:

21-Nov-2007 MX New topic

CompressionDeltaX Property

Description Set and read the 'X' value in the delta X/Y compression algorithm.

VB Syntax `gca.CompressionDeltaX = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**double**) X value in dB. Choose from 30 to (-30)

Return Type Double

Default 10

Examples

```
gca.CompressionDeltaX = 'Write
```

```
xDelta = gca.CompressionDeltaX 'Read
```

C++ Syntax HRESULT get_CompressionDeltaX(double* pVal)

HRESULT put_CompressionDeltaX(double newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

CompressionDeltaY

Description Set and read the 'Y' value in the delta X/Y compression algorithm.

VB Syntax `gca.CompressionDeltaY = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (double) -

Return Type Double

Default 9

Examples `gca.CompressionDeltaY = 7 'Write`

`xDelta = gca.CompressionDeltaY 'Read`

C++ Syntax HRESULT get_CompressionDeltaY(double* pVal)

HRESULT put_CompressionDeltaY(double newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

CompressionInterpolation Property

Description Sets whether or not interpolation should be performed on 2D measured compression data. Applies ONLY to [2D acquisition modes](#).

VB Syntax `gca.CompressionInterpolation = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (boolean) - Choose from:

True Interpolate the results

False Do NOT interpolate the results but return the value closest to compression.

Return Type Boolean

Default False

Examples

```
gca.CompressionInterpolation = True 'Write
compInt = gca.CompressionInterpolation 'Read
```

C++ Syntax HRESULT get_CompressionInterpolation(VARIANT_BOOL* pVal)
HRESULT put_CompressionInterpolation(VARIANT_BOOL newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

CompressionLevel Property

Description Set and read the desired gain reduction (from reference gain).

This value is used for [Compression Methods](#): Compression from Linear Gain and Compression from Maximum Gain.

VB Syntax `gca.CompressionLevel = value`

Variable (Type) - Description

gca A [GainCompression](#) (object)

value (**Double**) - Compression level in dB. Choose a value greater than 0.1 dB.

Return Type Double

Default 1

Examples `gca.CompressionLevel = 1.5 'Write`

`compLevel = gca.CompressionLevel 'Read`

C++ Syntax HRESULT get_CompressionLevel(double* pVal)

HRESULT put_CompressionLevel(double newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

CompressionMax Property

Description Returns the Compression Max result of a PSat or PNOP marker search.

Comp Max = Gain Max - Linear Gain (not shown on PNOP marker readout).

VB Syntax *compMax* = *pMarker*.**CompressionMax**

Variable [\(Type\)](#) - Description

compMax (**double**) - Variable to store returned value

pMarker A [PNOP](#) (object) or a [PSaturation](#) (object)

Return Type Double

Default Not applicable

Examples `compMax = pMark.CompressionMax 'Read`

[See example program](#)

C++ Syntax HRESULT get_CompressionMax(double* pNewVal)

Interface IPNOP or IPSaturation

Last Modified:

19-Feb-2010 MX New topic

CompressionLevel (Marker) Property

Description	Set and read the marker compression level. First use SearchCompressionPoint to create the compression marker.
VB Syntax	<i>mkr.CompressionLevel = value</i>
Variable	(Type) - Description
<i>mkr</i>	A Marker (object)
<i>value</i>	(Double) - Compression level in dB. Choose any number between: -500 dB to 500 dB Standard gain compression values are positive.
Return Type	Double
Default	1
Examples	See example program
C++ Syntax	HRESULT get_CompressionLevel(double* pVal) HRESULT put_CompressionLevel(double newVal)
Interface	IMarker4

Last Modified:

8-Feb-2009 MX New topic

CompressionPin Property

Description	Reads the input power at the marker compression level. First issue SearchCompressionPoint Method or Tracking Property .
VB Syntax	<i>value</i> = <i>mkr</i> . CompressionPin
Variable	(Type) - Description
<i>mkr</i>	A Marker (object)
<i>value</i>	(Double) - Variable to store the returned input power value.
Return Type	Double
Default	Not Applicable
Examples	<pre>compLevel=mkr.CompressionPin 'Read</pre> See example program
C++ Syntax	HRESULT get_CompressionPin(double* pVal)
Interface	IMarker4

Last Modified:

8-Feb-2009 MX New topic

CompressionPout Property

Description	Reads the output power at the marker compression level. First issue SearchCompressionPoint Method or Tracking Property .
VB Syntax	<i>value</i> = <i>mkr</i> . CompressionPout
Variable	(Type) - Description
<i>mkr</i>	A Marker (object)
<i>value</i>	(Double) - Variable to store the returned output power value.
Return Type	Double
Default	Not Applicable
Examples	<pre>compLevel=mkr.CompressionPout 'Read</pre> See example program
C++ Syntax	HRESULT get_CompressionPout(double* pVal)
Interface	IMarker4

Last Modified:

8-Feb-2009 MX New topic

CompressionSaturation Property

Description Returns the Compression Saturation result of a PSat marker search.

Comp Sat = Gain Sat - Gain Linear

VB Syntax *compSat* = *pSat*.**CompressionSaturation**

Variable [\(Type\)](#) - Description

compSat (**double**) - Variable to store returned value

pSat A [PSaturation](#) (object)

Return Type Double

Default Not applicable

Examples `compSat = pSat.CompressionSaturation 'Read`

[See example program](#)

C++ Syntax HRESULT get_CompressionSaturation(double* pNewVal)

Interface IPSaturation

Last Modified:

22-Feb-2010 MX New topic

ConnectorType Property

Description Sets or queries the connector type for the specified port.

VB Syntax `obj.ConnectorType (port) = value`

Variable [\(Type\) - Description](#)

obj Any of the following:

[GuidedCalibration](#) (object)

[SMCType](#) (object)

[VMCType](#) (object)

port (Long) Port number of the connector type.

For Guided Cals and SMC, select port number.

For VMC calibrations:

- 1 - Mixer Input.
- Any unused port can be used for the mixer output.
- Output port of MUT +1 - Output port of the calibration mixer. Generally this is port 3.

value (String) - Connector type. **Case-sensitive.**

Use [ValidConnectorType Property](#) to list connector types.

Return Type String

Default None

Examples

```
SMC.ConnectorType(1) = "APC 3.5 male"
value = SMC.ConnectorType(1)
```

C++ Syntax HRESULT get_ConnectorType(long port, BSTR *connector)

HRESULT put_ConnectorType(long port, BSTR connector)

Interface IGuidedCalibration

SMCType

VMCType

Last Modified:

1-Dec-2011	Updated with VMC
13-Aug-2007	Added detail to port argument

ConnectorType Property

Description Sets or queries the connector type for the specified port.

VB Syntax *ecalUser.ConnectorType (port) = value*

Variable [\(Type\) - Description](#)

ecalUser An [ECalUserCharacterizer](#) (object)

port (Enum) ECal port for which connector type is to be set. Choose from:

1 or **naECalPort_A**

2 or **naECalPort_B**

3 or **naECalPort_C**

4 or **naECalPort_D**

value (String) - Connector type.

When the User Characterization is to be stored in the ECal module, then the connector type is limited to a Factory-defined connector type. [See the list](#).

When the User Characterization is to be stored in PNA disk memory, then the connector type can also be a User-defined connector type.

Return Type String

Default "" (Empty String)

Examples

```
ecalUser.ConnectorType(naECalPort_B) = "APC 3.5 male" ' Write
```

```
Value = ecalUser.ConnectorType(naECalPort_B)
```

C++ Syntax

```
HRESULT get_ConnectorType(NAECalPort port, BSTR *connector);
```

```
HRESULT put_ConnectorType(NAECalPort port, BSTR connector);
```

Interface IECalUserCharacterizer

Last Modified:

18-Sep-2009 Modified for factory connectors (A.09.00)

5-Nov-2008 New topic (8.33)

ControlLines Property

Description Sets the control lines of the specified test set. Control lines, provided through the front panel connector of a test set, are used to control external equipment such as a part handler. See your test set documentation to learn more about control lines.

VB Syntax *tset*.ControlLines (*chNum*) = *value*

Variable [\(Type\)](#) - Description

tset A [TestsetControl](#) object.

OR

An [E5091Testset](#) object.

chNum **(Integer)** Channel number of the measurement.

value **(Double)** Data value used to set control lines. Values are obtained by adding weights from the following table that correspond to individual lines.

Line	Weight
1	1
2	2
3	4
4	8
5	16
6	32
7	64
8	128

- The E5091A interprets SENS:MULT1:OUTP 0 as all lines LOW.
- All "Z" and "H" series test sets interpret SENS:MULT1:OUTP 0 as all lines HIGH.

Refer to your test set documentation for setting control line values.

Return Type Variant

Default 0

Examples `'For a Z5623A K64 test set, the following sets line 3 and 4 OFF; all other lines ON.'`

```
testset1.ControlLines(2) = 12
```

[See E5091A Example Program](#)

[See External Testset Program](#)

C++ Syntax HRESULT get_ControlLines(long channelNum, VARIANT *stateByte);
HRESULT put_ControlLines(long channelNum, VARIANT stateByte);

Interface ITestsetControl

IE5091Testset

Last Modified:

17-Aug-2007 Added different test sets active High and low

Read-only

Count Property

Description Returns the number of items in a collection of objects.

VB Syntax *object*.Count

Variable [\(Type\)](#) - Description

object Any of the following **(objects)**:

- [CalFactorSegments Collection](#)
- [CalFactorSegmentsPMAR Collection](#)
- [Cal Sets Collection](#)
- [Channels Collection](#)
- [E5091Testset Collection](#)
- [ExternalDevices Collection](#)
- [ExternalTestsets Collection](#)
- [GuidedCalibrationPowerSensors Collection](#)
- [LimitTest Collection](#)
- [Measurements Collection](#)
- [NaWindows Collection](#)
- [PowerLossSegments Collection](#)
- [PowerLossSegmentsPMAR_Collection.htm](#)
- [PowerSensors Collection](#)
- [Segments Collection](#)
- [Traces Collection](#)
- [PowerMeterInterfaces Collection](#)

Return Type Long Integer

Default Not applicable

Examples

```
numofchans = chans.Count 'return the number of channels  
-Read
```

[C++ Syntax](#) HRESULT get_Count(long *pInterface)

Interface All listed above

Last Modified:

8-Feb-2011	Added GuidedCalibratioPowerSensors (9.33)
31-Jul-2009	Added ExternalDevices (9.0)
6-Mar-2009	PowerMeterInterfaces

CouplePorts Property

Description Turns ON and OFF port power coupling. ON means the power level is the same for both ports. OFF means the power level may be set independently for each port.

VB Syntax *object.CouplePorts* = *value*

Variable [\(Type\)](#) - Description

object Channel (**object**)

or

CalSet (**object**) - Read-only property

value (**enum NAStates**) Choose from:

0 - **NaOff** - Turns coupling OFF

1 - **NaOn** - Turns coupling ON

Return Long Integer

Type **1** - ON

0 - OFF

Default NaON (1)

Examples

```
chan.CouplePorts = NaOff 'Write
```

```
couplport = chan.CouplePorts 'Read
```

C++ Syntax HRESULT get_CouplePorts(tagNAStates *pState)
 HRESULT put_CouplePorts(tagNAStates newState)

Interface IChannel

|CalSet3

CoupleChannelParams Property

Description Turns ON and OFF Time Domain Trace Coupling. All of the measurements in the specified channel are coupled.

- To select Transform parameters to couple, use [Trans.CoupledParameters Property](#)
- To select Gating parameters to couple, use [Gate.CoupledParameters Property](#)

VB Syntax *chan.CoupleChannelParams = state*

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

state (**boolean**)
False - Turns Trace Coupling OFF

True - Turns Trace Coupling ON

Return Type Boolean

Default True

Examples `chan.CoupleChannelParams = False 'Write`

`couple = chan.CoupleChannelParams 'Read`

C++ Syntax HRESULT get_CoupleChannelParams(VARIANT_BOOL *isCoupled);

HRESULT put_CoupleChannelParams(VARIANT_BOOL isCoupled);

Interface IChannel5

Coupled Property

Description	Sets and returns the state of coupling (ON or OFF) of this range to the primary range.
VB Syntax	<i>FOMRange.Coupled</i> = <i>value</i>
Variable	(Type) - Description
<i>object</i>	An FOMRange (object)
<i>value</i>	(boolean) - State of coupling. True - Couple range to primary range. False - Do NOT couple to primary range.
Return Type	Boolean
Default	True
Examples	<pre>fomRange.Coupled = False 'this range is NOT coupled to the primary range.</pre> <pre>coupl = fomRange.Coupled 'Read</pre>
C++ Syntax	HRESULT get_Coupled(VARIANT_BOOL *pVal) HRESULT put_Coupled(VARIANT_BOOL pVal)
Interface	IFOMRange

CoupledMarkers Property

Description Sets and Reads the state of Coupled Markers (ON and OFF)

VB Syntax `app.CoupledMarkers = state`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

state (boolean)
False (0) - Turns Coupled Markers OFF
True (1) - Turns Coupled Markers ON

Return Type Boolean
False - OFF
True - ON

Default **False**

Examples
`app.CoupledMarkers = True 'Write`
`coupl = app.CoupledMarkers 'Read`

C++ Syntax HRESULT put_CoupledMarkers(VARIANT_BOOL bState)
HRESULT get_CoupledMarkers(VARIANT_BOOL *bState)

Interface IApplication

CoupledParameters Property (Gating)

Description Specifies the time domain gating parameters to be coupled. The settings for those parameters will be copied from the active measurement to all other measurements on the channel.

To turn coupling ON and OFF, use [CoupleChannelParams Property](#)

To specify Transform parameters to couple, use [Transform.CoupledParameters Property](#)

VB Syntax `gate.CoupledParameters = value`

Variable [\(Type\)](#) - Description

trans A [Gating](#) (object)

value (**Enum As NAGatingCoupledParams**) - Parameters to couple. To specify more than one parameter, add the numbers. Choose from:

1 - naGatingStimulusCoupled (Start, Stop, Center, and Span TIME settings.)

2 - naGateStateCoupled (ON / OFF)

4 - naGatingShapeCoupled (Minimum, Normal, Wide, and Maximum)

8 - naGatingTypeCoupled (Bandpass and Notch)

Return Type Enum

Default 29

Examples `gate.CoupledParameters = 15 'Couple all parameters`

`CP = gate.CoupledParameters 'Read`

C++ Syntax `HRESULT get_CoupledParameters(long *IParams);`

`HRESULT put_CoupledParameters(long IParams);`

Interface IGating2

CoupledParameters Property (Transform)

Description Specifies the time domain transform parameters to be coupled. The settings for those parameters will be copied from the active measurement to all other measurements on the channel.

To turn coupling ON and OFF, use [CoupleChannelParams Property](#)

To specify Gating parameters to couple, use [Gate.CoupledParameters Property](#)

VB Syntax *trans.CoupledParameters* = *value*

Variable [\(Type\)](#) - Description

trans A [Transform](#) (object)

value **(Enum As NATransformCoupledParams)** - Parameters to couple. To specify more than one parameter, add the numbers. Choose from:

1 - naTransformStimulusCoupled (Start, Stop, Center, and Span TIME settings.)

2 - naTransformStateCoupled (ON / OFF)

4 - naTransformWindowCoupled (Kaiser Beta / Impulse Width)

8 - naTransformModeCoupled (Low Pass Impulse, Low Pass Step, Band Pass)

16 - naTransformDistMkrUnitCoupled (Distance maker Units)

Return Type Enum

Default 29

Examples `trans.CoupledParameters = 31 'Couple all parameters`

`CP = trans.CoupledParameters 'Read`

C++ Syntax HRESULT get_CoupledParameters(long *IParams);

HRESULT put_CoupledParameters(long IParams);

Interface ITransform2

CouplePhasePortSettings Property

Description	Sets and returns whether to couple phase control settings (IFBW, Tolerance, Max Iterations).
VB Syntax	<i>phase.CouplePhasePortSettings(srcPort) = value</i>
Variable	(Type) - Description
<i>phase</i>	A PhaseControl Object
<i>srcPort</i>	(Long Integer) Source port for which to make phase control settings.
	<p>Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port</p>
<i>value</i>	(Boolean) Coupling state. Choose from: <p>True - Couple phase control settings. The phase control settings from <port> are copied to the other phase-controlled ports.</p> <p>False - Do NOT couple phase control settings. The phase control settings for each phase-controlled port are made independently.</p>
Return Type	Boolean
Default	False
Examples	<pre>phase.CouplePhasePortSettings 1 = True ' Write value = phase.CouplePhasePortSettings 2 ' Read</pre>
C++ Syntax	<pre>HRESULT get_CouplePhasePortSettings(long port, VARIANT_BOOL* pVal); HRESULT put_CouplePhasePortSettings(long port, VARIANT_BOOL newVal);</pre>
Interface	IPhaseControl

CoupleTonePower Property

Description Sets and returns the ON | OFF state of power coupling for F1 and F2.

VB Syntax *object.CoupleTonePower* = *value*

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IIMSpectrum](#) Object

value (Boolean) - Choose from:

True - F1 and F2 power is coupled.

False - F1 and F2 power is NOT coupled. Set power levels individually.

Return Type Boolean

Default True

Examples `ims.CoupleTonePower = true 'Write`

`value = ims.CoupleTonePower 'Read`

C++ Syntax HRESULT get_CoupleTonePower(VARIANT_BOOL* val)
HRESULT put_CoupleTonePower(VARIANT_BOOL val)

Interface ISweptIMD

IIMSpectrum

19-Aug-2008 MX New topic

CpuRevision Property

Description	Returns a number that corresponds to the CPU speed of the PNA.
VB Syntax	<i>value</i> = <i>cap</i> . CpuRevision
Variable	(Type) - Description
<i>value</i>	(String) - Variable to store the returned number. Use the following table to learn the CPU speed. Reported CPU version - Clock speed 1.0 - 266 MHz 2.0 - 500 MHz 3.0 - 1100 MHz 4.0 - 1600 MHz 5.0 - 2000 MHz 6.0 - 2000 MHz dual core.
<i>cap</i>	A Capabilities (object)
Return Type	String
Default	Not Applicable
Examples	<code>value = cap.CpuRevision 'Read</code>
C++ Syntax	HRESULT get_CpuRevision(BSTR *value);
Interface	ICapabilities6

Last Modified:

5-Jan-2012	Added 6.0 dual core
30-Nov-2009	MX New topic

CSONumDistortionProducts Property

Description Sets and returns the “N = number of distortion products” value for the calculation of the CSO parameter.
[Learn more.](#)

VB Syntax *imd.CSONumDistortionProducts = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Long Integer) Number of distortion products

Return Type Long Integer

Default 40

Examples

```
imd.CSONumDistortionProducts = True 'Write
```

```
value = imd.CSONumDistortionProducts 'Read
```

C++ Syntax HRESULT get_CSONumDistortionProducts(long *pVal)
HRESULT put_CSONumDistortionProducts(long *pVal)

Interface ISweptIMD

CSOOffset Property

Description Sets and returns the offset that is applied to CSO measurements. Valid only with measurement parameters: CSO2Lo and CSO2Hi.

VB Syntax *imd.CSOOffset = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Offset value in dBm.

Return Type Double

Default 0

Examples

```
imd.CSOOffset = 2 'Write  
value = imd.CSOOffset 'Read
```

C++ Syntax HRESULT get_CSOffset(double *pVal)
HRESULT put_CSOffset(double pVal)

Interface ISweptIMD

Last Modified:

16-Sep-2008 MX New topic

CTBOffset Property

Description Sets and returns the offset that is applied to CTB measurements. Valid only with measurement parameters: CTB, CTBLo, CTBHi, CTBE, CTBELo, and CTBEHi.

VB Syntax *imd.CTBOffset = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Offset value in dBm.

Return Type Double

Default 0

Examples

```
imd.CTBOffset = 2 'Write  
value = imd.CTBOffset 'Read
```

C++ Syntax HRESULT get_CTBOffset(double *pVal)
HRESULT put_CTBOffset(double pVal)

Interface ISweptIMD

CustomCalConfiguration Property

Description Calibration for the following PNA Applications is performed using the [GuidedCalibration Object](#). This command provides access to additional Properties and Methods which extends the GuidedCal Object.

Meas Type	Custom Cal Interface
Gain Compression	IGainCompressionCal Object
Noise Figure	INoiseCal Object
Swept IMD	ISweptIMD Cal Object

VB Syntax *set custCal = cal.***CustomCalConfiguration()**

Variable [\(Type\)](#) - Description

custCal **(object)** The handle to an interface that provides application-specific calibration properties..

cal [GuidedCalibration Object](#).

Return Type Depends on the MeasType. See above table.

Default None

Examples See examples: [NoiseFigure](#) [GainCompression](#) [SweptIMD](#)

C++ Syntax HRESULT CustomCalConfiguration(IDispatch** value);

Interface IGuidedCalibration4

Last Modified:

22-Jul-2009 Updated description

8-Sep-2008 MX New topic

CustomChannelConfiguration Property

Description Returns a handle to the custom application object on the active channel. You can either **(1)** use the handle directly to access measurement properties and methods, or **(2)** set a variable to the measurement object. The variable retains a handle to the original measurement.

Currently, the custom application objects to which this property provides access are:

- [NoiseFigure Object](#)
- [GainCompression Object](#)
- [SweptIMD Object](#)

VB Syntax 1) *set custChan = chan.CustomChannelConfiguration.* <setting>
or
2) *set custChan = app.ActiveChannel.CustomChannelConfiguration*

Variable [\(Type\)](#) - Description

custChan A variable in which the handle to a custom application is returned. **(object)**

chan A [Channel](#) **(object)**

<setting> A property or method setting on the custom application object.

Return Type Custom application object

Default None

Examples See examples: [NoiseFigure](#) [GainCompression](#) [SweptIMD](#)

C++ Syntax HRESULT CustomChannelConfiguration(IDispatch** value);

Interface IChannel12

Last Modified:

27-Aug-2008 Added Swept IMD
16-Oct-2007 MX New topic

CustomMeasurementConfiguration Property

Description Returns a handle to a custom measurement object on the active channel. You can use the handle to access custom measurement properties and methods.

Currently, the custom measurement objects to which this property provides access is:

- [GainCompressionMeas Object](#)

VB Syntax *Set custMeas = meas.***CustomMeasurementConfiguration**

Variable [\(Type\)](#) - **Description**

custMeas A variable in which the handle to a custom measurement is returned. **(object)**

chan A [Measurement](#) **(object)**

Return Type Custom Measurement object

Default None

Examples See examples: [GainCompression](#)

C++ Syntax HRESULT CustomMeasurementConfiguration(IDispatch** value);

Interface IMeasurement12

Last Modified:

3-Sep-2009 MX New topic

CWFrequency Property

Description Set the Continuous Wave (CW) frequency. Must first send `chan.SweepType = naCWTimeSweep`.

See Also: [calset.CWFrequency Property](#)

VB Syntax `object.CWFrequency = value`

Variable [\(Type\)](#) - Description

object One of the following:

- [Channel](#) (object)
- [FOMRange](#) (object) Range must be [UNCOUPLED](#).

See also [Measurement2](#) interface.

value **(double)** CW frequency. Choose any number between:
the **minimum** and **maximum** frequency limits of the analyzer
Units are Hz

Return Type Double

Default 1e9

Examples

```
chan.CWFrequency = 5e9 'Write
```

```
cwfreq = chan.CWFrequency 'Read
```

C++ Syntax HRESULT put_CWFrequency(double newVal)
HRESULT get_CWFrequency(double *pVal)

Interface IChannel

IFOMRange

CWFrequency (Cal Set) Property

Description Returns the CW frequency that is stored in the Cal Set.

VB Syntax *value* = *CalSet.CWFrequency* (*range*)

Variable [\(Type\)](#) - Description

value **(double)** - returned CW frequency in Hertz.

CalSet [CalSet](#) **(object)**

range **(Long)** Choose: **0**

Return Type Double

Default Not Applicable

Examples `cw = calset.CWFrequency(0) 'Reads the CW frequency stored in the cal set.`

C++ Syntax HRESULT get_CWFrequency(long range, double *pVal)

Interface |CalSet3

Last modified:

15-Feb- 2011 Added new topic

Data Property

Description Reads the next specified number of data points from the FIFO buffer. The data is returned in 32 bit real/imaginary pair. Data is cleared as it is read.

Note: This method is the slowest way to transfer data using COM. However, it is supported by all COM client programming languages. For better performance, try using [DataInCompactForm](#).

VB Syntax `array = fifo.Data (count)`

Variable [\(Type\) - Description](#)

`array` (Variant) Variable to store the returned data.

`fifo` A [FIFO](#) Object

`count` (Long Integer) Number of data points to read.

Return Type Variant array. Each VARIANT is typed as a 4-byte floating point number.

Default Not Applicable

Examples `value = fifo.Data(500) 'Read`

C++ Syntax `HRESULT get_Data(long count, VARIANT * data);`

Interface IFIFO

Last Modified:

7-Oct-2008 MX New topic

DataAndLimits Property

Description Set and return the color of Data and Limit Lines for nth trace in a window.

VB Syntax `trace(n).DataAndLimits = value`

Variable [\(Type\)](#) - Description

`trace(n)` One of the 8 [ComTraceColors](#) objects

`value` **(Long Integer)** - RGB color of the DataAndLimits pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Varies for each trace.

Examples

```
R = 10
G = 10
B = 10
RGB = 10+(10*2^8)+(10*2^16)
tracel.DataAndLimits = RGB 'Write
color = tracel.DataAndLimits 'Read
```

C++ Syntax HRESULT get_DataAndLimits(long* pVal);

HRESULT put_DataAndLimits(long newVal);

Interface IComTraceColors

Last Modified:

7-Aug-2009 MX New topic

DataCount Property

Description	Returns the total number of data points in the FIFO buffer.
VB Syntax	<i>value</i> = <i>fifo</i> . DataCount
Variable	(Type) - Description
<i>value</i>	(Long Integer) Variable to store the returned number of data points.
<i>fifo</i>	A FIFO Object
Return Type	Long Integer
Default	Not Applicable
Examples	<code>value = fifo.DataCount 'Read</code>
C++ Syntax	HRESULT get_DataCount(long *value)
Interface	IFIFO

Last Modified:

7-Oct-2008 MX New topic

DataInCompactForm Property

Description Reads FIFO data the same as [Data Property](#) but returns the data in a more compact form of SAFEARRAY. This is significantly faster but it is not supported in all client environments.

VB Syntax `array = fifo.DataInCompactForm (count)`

Variable [\(Type\)](#) - Description

`array` (Variant) Variable to store the returned data

`fifo` A [FIFO](#) Object

`count` (Long Integer) Number of data points to read.

Return Type Returns an array of 4 byte floating point numbers.

Default Not Applicable

Examples `value = fifo.DataInCompactForm(500) 'Read`

C++ Syntax HRESULT get_DataInCompactForm(long count, VARIANT * data);

Interface IFIFO

DCCorrection Property

Description Sets and returns the correction ON/OFF state for a DC Meter and a DC Source.

VB Syntax `extDC.DCCorrection = value`

Variable [\(Type\)](#) - Description

extDC An [ExternalDCDevice](#) (object)

value (**Boolean**) Correction ON/OFF state. Choose from:

True - Turn Correction ON

False - Turn Correction OFF

Return Type Boolean

Default False

Examples `extDC.DCCorrection = True 'Write`

`bool = extDC.DCCorrection 'Read`

C++ Syntax HRESULT get_DCCorrection (BOOL *pValue)

HRESULT put_DCCorrection (BOOL newVal)

Interface IExternalDCDevice

Last Modified:

15-Feb-2012 New topic

DOffset Property

Description Sets and returns the offset correction value for an external DC Device which can be configured as either a DC Meter or a DC Source.

VB Syntax *extDC.DOffset = value*

Variable [\(Type\)](#) - Description

extDC An [ExternalDCDevice](#) (**object**)

value (**Double**) DC offset value.

The PNA will display readings from a DC Meter as:

```
Display = (Meas'd value - Offset) * Scale
```

The PNA will adjust the output from a DC Source as:

```
Output = (Set value - Offset) * Scale
```

Return Type Double

Default 0

Examples `extDC.DOffset = 4 'Write`

```
offset = extDC.DOffset 'Read
```

C++ Syntax HRESULT get_DOffset (double *pValue)

HRESULT put_DOffset (double newVal)

Interface IExternalDCDevice

Last Modified:

15-Feb-2012 New topic

DCScale Property

Description Sets and returns the scale correction value for an external DC Device which can be configured as either a DC Meter or a DC Source.

VB Syntax *extDC.DCScale = value*

Variable [\(Type\)](#) - Description

extDC An [ExternalDCDevice](#) (**object**)

value (**Double**) DC scale value.

The PNA will display readings from a DC Meter as:

```
Display = (Meas'd value - Offset) * Scale
```

The PNA will adjust the output from a DC Source as:

```
Output = (Set value - Offset) * Scale
```

Return Type Double

Default 1

Examples `extDC.DCScale = -2 'Write`

```
slope = extDC.DCScale 'Read
```

C++ Syntax HRESULT get_DCScale (double *pValue)

HRESULT put_DCScale (double newVal)

Interface IExternalDCDevice

Last Modified:

15-Feb-2012 New topic

DCType Property

Description Sets and returns the DC Type for an external DC Device which can be configured as either a DC Meter or a DC Source. This setting is used as the units for display on the PNA X-axis.

VB Syntax `extDC.DCType = value`

Variable [\(Type\) - Description](#)

extDC An [ExternalDCDevice](#) (object)

value **(String)** DC type. Choose from:
"dBm", "A", "V", "W", "K", "F", "C"

Return Type String

Default "V"

Examples
`extDC.DCType = "A" 'Write`
`units = extDC.DCType 'Read`

C++ Syntax HRESULT get_DCType (BSTR *pValue)
HRESULT put_DCType (BSTR newVal)

Interface IExternalDCDevice

Last Modified:

15-Feb-2012 New topic

DefinedRoles Property

Description	This command replaces GetSourceRoles Method . Returns the roles for which sources can be used for the channel. Use RoleDevice to assign a source to a role.
VB Syntax	<i>value</i> = <i>chan</i> . DefinedRoles
Variable	(Type) - Description
	<i>value</i> (Variant) - Variable to store the returned channel roles.
	<i>chan</i> A Channel (object)
Return Type	Variant
Default	Not Applicable
Examples	<pre>vRoles = chan.DefinedRoles 'Read</pre>
C++ Syntax	HRESULT get_DefinedRoles(Variant* roles);
Interface	IChannel22

Last modified:

12-Mar-2014 New topic

Delay Property

Description Sets and Returns the electrical delay value for the calibration standard.

VB Syntax *calstd.Delay* = *value*

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Electrical delay in picoseconds

Return Type Single

Default Not Applicable

Exaamples `calstd.Delay = 12 'Write 12ps Delay`
`stdDelay = calstd.Delay 'Read the value of Delay`

C++ Syntax HRESULT get_Delay(float *pVal)
HRESULT put_Delay(float newVal)

Interface ICalStandard

Last Modified:

5-Jan-2007 MX New topic

Delay (pulse) Property

Description Sets the pulse delay - the amount of time before a new pulse begins.

VB Syntax *pulse*.Delay(*n*) = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (object)

n (**Integer**) Pulse generator number. Choose from 0 to 4.

Or use [PulseGeneratorID](#) to refer to an external pulse generator.

0 is the generator that pulses the ADC.

value (**Double**) Delay value in seconds. Choose a value from about 33ns to about 70 seconds.

Return Type Double

Default 0

Examples `pulse.Delay(1) = 1ms 'Write`

`value = pulse.Delay(4) 'Read`

C++ Syntax HRESULT get_Delay(integer pulse, double* delay);

HRESULT put_Delay(integer pulse, double delay);

Interface IPulseGenerator

Last Modified:

16-Feb-2012 Edit for ext PG

1-Jan-2007 MX New topic

Delay Property

Description Specifies the delay that should be applied by the PNA after the aux trigger input is received and before the acquisition is made.

Note: Use on PNA-X ONLY. Other models do NOT have an Aux Input.

VB Syntax `auxTrig.Delay = value`

Variable [\(Type\)](#) - Description

`auxTrig` An [AuxTrigger](#) (object)

`value` (**double**) - Delay value in seconds. Choose a value between 0 and 3.0 seconds.

Return Type Double

Default Not Applicable

Examples

```
auxTrig.Delay = 1.2 'Write 1.2s Delay
value = auxTrig.Delay 'Read the value
```

C++ Syntax HRESULT get_Delay(double *val);
HRESULT put_Delay(double val);

Interface IAuxTrigger

Last Modified:

5-Sep-2008 Added Note
14-Dec-2006 MX New topic

DelayCalculationMethod Property

Description Set and return the method of setting the delay through the calibration mixer.

To select Phase Reference Cal method for correcting an SMC+Phase measurement, use [ImportDataSet Method](#).

VB Syntax `smc.DelayCalculationMethod = value`

Variable [\(Type\)](#) - Description

`smc` An [SMCType](#) (object)

`value` (Enum as `NADelayCalculationMethod`)

0 - `naDelayCalculationMethod_FixedDelay` - use a known delay value set with [FixedDelay Property](#)

1 - `naDelayCalculationMethod_MixerCharacterizationFile` - use the S2P file set with [MixerCharacterizationFile Property](#)

Return Type Enum

Default **0 - `naDelayCalculationMethod_FixedDelay`**

Example `SMC.DelayCalculationMethod = naDelayCalculationMethod_FixedDelay`

C++ Syntax `HRESULT put_DelayCalculationMethod(tagNADelayCalculationMethod Value);`

`HRESULT get_DelayCalculationMethod(tagNADelayCalculationMethod* Value);`

Interface `SMCType5`

Last Modified:

25-Mar-2010 MX New topic

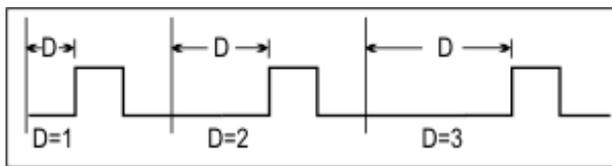

DelayIncrement Property

Description Sets the pulse delay increment. The delay increments with each pulse by the <value> amount.

For example, in this diagram the delay starts as 1. On the second pulse, delay=2. On the third pulse, delay=3.

Important: If $D + W$ is greater than P , then undefined PNA behavior results. There is NO error message or warning. Delay includes the incremented value.

This is useful for pulse profiling.

VB Syntax `pulse.DelayIncrement(n) = value`

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (object)

n (**Integer**) Pulse generator number. Choose from 0 to 4.

Or use [PulseGeneratorID](#) to refer to an external pulse generator.

0 is the generator that pulses the ADC.

value (**Double**) Delay increment value in seconds.

Return Type Double

Default 0

Examples `pulse.DelayIncrement(1) = 1ms 'Write`

`value = pulse.DelayIncrement(4) 'Read`

C++ Syntax `HRESULT get_DelayIncrement(integer pulse, double* dIncr);`

`HRESULT put_DelayIncrement(integer pulse, double dIncr);`

Interface IPulseGenerator

18-Jun-2007 MX New topic

DeltaFrequency Property

Description Sets and returns the fixed tone spacing value. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`
- `naIMDToneCenterFreqSweep`

VB Syntax `object.DeltaFrequency = value`

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IMSpectrum](#) Object

value (Double) - Tone spacing frequency in Hz. Both the F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 1 MHz

Examples

```
imd.DeltaFrequency = 1e6 'Write
```

```
value = imd.DeltaFrequency 'Read
```

C++ Syntax HRESULT get_DeltaFrequency(double *pVal)
HRESULT put_DeltaFrequency(double newVal)

Interface ISweptIMD
IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

DeltaFrequencyStart Property

Description Sets and returns the starting main tone separation for [sweep type](#)=naIMDDeltaFrequencySweep

VB Syntax *imd.DeltaFrequencyStart = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) - Starting tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the PNA where:

$F1 \text{ (start)} = imd.FrequencyCenter - imd.DeltaFrequencyStart / 2$

$F2 \text{ (start)} = imd.FrequencyCenter + imd.DeltaFrequencyStart / 2$

Return Type Double

Default 1 MHz

Examples

```
imd.DeltaFrequencyStart = 5e6 'Write
```

```
value = imd.DeltaFrequencyStart 'Read
```

C++ Syntax HRESULT get_DeltaFrequencyStart(double *pVal)
HRESULT put_DeltaFrequencyStart(double newVal)

Interface ISweptIMD

Last Modified:

19-Aug-2008 MX New topic

DeltaFrequencyStop Property

Description Sets and returns the stop spacing of the main tones. Use with [sweep type](#)=naIMDDeltaFrequencySweep

VB Syntax *imd.DeltaFrequencyStop = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) - Stopping tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the PNA where:

$F1 \text{ (stop)} = \text{imd.FrequencyCenter} - \text{imd.DeltaFrequencyStop} / 2$

$F2 \text{ (stop)} = \text{imd.FrequencyCenter} + \text{imd.DeltaFrequencyStop} / 2$

Return Type Double

Default 10 MHz

Examples

```
imd.DeltaFrequencyStop = 20e6 'Write
```

```
value = imd.DeltaFrequencyStop 'Read
```

C++ Syntax HRESULT get_DeltaFrequencyStop(double *pVal)
HRESULT put_DeltaFrequencyStop(double newVal)

Interface ISweptIMD

Last Modified:

19-Aug-2008 MX New topic

DeltaMarker Property

Description Sets a marker as a delta marker. The reference marker must already be turned ON. See [meas.ReferenceMarkerState](#)

VB Syntax `mark.DeltaMarker = state`

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

state (boolean) -

True - marker is a delta marker

False - marker is NOT a delta marker

Return Type Boolean

Default False

Examples `mark.DeltaMarker = True 'Write`

`delta = mark.DeltaMarker 'Read`

C++ Syntax HRESULT get_DeltaMarker(VARIANT_BOOL bState)
HRESULT put_DeltaMarker(VARIANT_BOOL *bState)

Interface IMarker

Description Property

Description	Sets or returns the descriptive string assigned to the Cal Set. Change this string so that you can easily identify each Cal Set constructed.
VB Syntax	<i>CalSet</i> . Description = <i>value</i>
Variable	(Type) - Description
<i>CalSet</i>	(object) - A Cal Set object
<i>value</i>	(string) – Description of the Cal Set
Return Type	String
Default	“CalSet_n” where n is an integer number.
Examples	<pre>CalSet.Description = "My Cal Set" 'Write desc = CalSet.Description 'Read</pre>
C++ Syntax	HRESULT get_Description(BSTR *pVal) HRESULT put_Description(BSTR newVal);
Interface	ICalSet

Last modified:

Dec.12, 2006 MX New topic

DescriptiveText Property

Description	Write and read descriptive text associated with the configuration. This text is displayed in the path configuration dialog. Text is generally used to describe external connections that must be made manually to complete the configuration setup.
VB Syntax	<i>pathConfig</i> . DescriptiveText = <i>text</i>
Variable	(Type) - Description
<i>name</i>	(String) Variable to store the returned configuration name.
<i>pathConfig</i>	A PathConfiguration (object)
<i>text</i>	(String) Descriptive text enclosed in quotes.
Return Type	String
Default	Not Applicable
Examples	<pre>pathConf.DescriptiveText "here are the instructions for connecting the device for this configuration"</pre>
C++ Syntax	<pre>HRESULT get_DescriptionText(BSTR* pConnectionText); HRESULT put_DescriptionText(BSTR connectionText);</pre>
Interface	IPathConfiguration

DeviceInputPort Property

Description Returns the PNA port number to be used for the DUT input.

VB Syntax *port* = *obj*.**DeviceInputPort**

Variable [\(Type\)](#) - Description

port **(long)** Variable to store the PNA port number of the DUT input.

mixer A [Mixer](#) **(object)**

Return Type Long

Default 1

Examples `value = mixer.DeviceInputPort`

C++ Syntax HRESULT get_DeviceInputPort(long *pVal)

Interface IMixer8

Last Modified:

23-Apr-2008 New topic.

DeviceInputPort Property

Description Read the PNA port number which is connected to the DUT input.

Use [SetPortMap Method](#) to change the port mapping.

VB Syntax *obj*.DeviceInputPort

Variable [\(Type\)](#) - Description

obj A [Converter](#) (**object**) or
A [GainCompression](#) (**object**) or
A [SweptIMD](#) (**object**) or
An [IMSpectrum](#) (**object**)
A [NoiseFigure](#) (**object**)

Return Type Integer

Default 1

Examples `inPort = gca.DeviceInputPort 'Read`

C++ Syntax HRESULT get_DeviceInputPort(int* pVal)

Interface IGainCompression

ISweptIMD

IMSpectrum

INoiseFigure6

IConverter6

DeviceNames Property

Description	Returns a list of configured device names of the specified device type.
VB Syntax	<i>value</i> = <i>extDevices</i> . DeviceNames (<i>devType</i>)
Variable	(Type) - Description
<i>value</i>	(Variant) Variable to store the device names.
<i>extDevices</i>	An ExternalDevices (collection)
<i>devType</i>	(String) Device Type such as "Source" and "Power Meter". See a complete list of valid device types .
Return Type	Variant Array
Default	Not Applicable
Examples	<pre>devices = extDevices.DeviceNames("Power Meter") 'Read</pre>
C++ Syntax	HRESULT get_DeviceNames(VARIANT *names);
Interface	IExternalDevices2

Last Modified:

19-Jul-2011 New topic

DeviceOutputPort Property

Description Returns the PNA port number to be used for the DUT output.

VB Syntax *port* = *mixer*.**DeviceOutputPort**

Variable [\(Type\)](#) - Description

port **(long)** Variable to store the PNA port number of the DUT output.

mixer A [Mixer](#) **(object)**

Return Type Long

Default 2

Examples `value = mixer.DeviceOutputPort`

C++ Syntax HRESULT get_DeviceOutputPort(long *pVal)

Interface IMixer8

Last Modified:

23-Apr-2008 New topic.

InputLinearPowerLevel Property

Description Set and read the input power at which Linear Gain and all S-parameters are measured.

VB Syntax `gca.InputLinearPowerLevel = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**double**) Linear input power level in dBm. Choose a value from +30 to (-30).

Return Type Double

Default - 25 dBm

Examples `gca.InputLinearPowerLevel = -10 'Write`

`LinPwr = gca.InputLinearPowerLevel 'Read`

C++ Syntax HRESULT get_InputLinearPowerLevel(double* pVal)

HRESULT put_InputLinearPowerLevel(double newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

DeviceOutputPort Property

Description Read the PNA port number which is connected to the DUT Output.

Use [SetPortMap Method](#) to change the port mapping.

VB Syntax *obj*.DeviceOutputPort

Variable (Type) - Description

obj A [Converter](#) (object) or

A [GainCompression](#) (object) or

A [SweptIMD](#) (object) or

An [IMSpectrum](#) (object)

A [NoiseFigure](#) (object)

Return Type Integer

Default 2

Examples `outPort = gca.DeviceOutputPort 'Read`

C++ Syntax HRESULT get_DeviceOutputPort(int* pVal)

Interface IGainCompression

ISweptIMD

IMSpectrum

INoiseFigure6

IConverter6

Last Modified:

23-May-2011	Added Converter
30-Apr-2010	Added NF
11-Aug-2009	Added IMD and IMS
11-Sep-2007	MX New topic

DeviceType Property

Description Sets and returns the DeviceType for the external device.

VB Syntax *extDevices.DeviceType = value*

Variable [\(Type\)](#) - Description

extDevices An [ExternalDevice](#) (object)

value (String) Device Type. Choose from:

"Source" for external source.

"Power Meter" for power meter.

Return Type String

Default "Unknown"

Examples

```
extDevices.DeviceType = "source" Write
```

```
value = extDevices.DeviceType 'Read
```

```
See example program to configure PMAR device
```

```
See example program to configure External Source
```

C++ Syntax HRESULT get_DeviceType(BSTR* value);

HRESULT put_DeviceType(BSTR newVal);

Interface IExternalDevices

Last Modified:

31-Jul-2009 MX New topic

DiffPortMatch_C Property

Description Sets the Capacitance value of the differential matching circuit.

VB Syntax *fixture*.DiffPortMatch_C (*portNum*) = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1,2 ,3. [Learn more about logical ports.](#)

value **(Double)** Capacitance value in farads. Choose a value between **-1E18** to **1E18**.

Return Type Double

Default 0

Examples `fixture.DiffPortMatch_C(2) = 1e-6 'Write`

`value = fixture.DiffPortMatch_C(1) 'Read`

C++ Syntax HRESULT get_DiffPortMatch_C(short portNum, double *pVal)
HRESULT put_DiffPortMatch_C(short portNum, double newVal)

Interface IFixturing2

DiffPortMatch_G Property

Description Sets the Conductance value of the differential matching circuit.

VB Syntax *fixture*.DiffPortMatch_G(*portNum*) = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value **(Double)** Conductance value in siemens. Choose a value between **-1E18** to **1E18**.

Return Type Double

Default 0

Examples `fixture.DiffPortMatch_G(2) = 1e-3 'Write`

`value = fixture.DiffPortMatch_G(1) 'Read`

C++ Syntax HRESULT get_DiffPortMatch_G(short portNum, double *pVal)
HRESULT put_DiffPortMatch_G(short portNum, double newVal)

Interface IFixturing2

DiffPortMatch_L Property

Description Sets the Inductance value of the differential matching circuit.

VB Syntax *fixture.DiffPortMatch_L(portNum) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value **(Double)** Inductance value in henries. Choose a value between **-1E18** to **1E18**.

Return Type Double

Default 0

Examples `fixture.DiffPortMatch_L(2) = 1e-3 'Write`

`value = fixture.DiffPortMatch_L(1) 'Read`

C++ Syntax HRESULT get_DiffPortMatch_L(short portNum, double *pVal)
HRESULT put_DiffPortMatch_L(short portNum, double newVal)

Interface IFixturing2

DiffPortMatch_R Property

Description Sets the Resistance value of the differential matching circuit.

VB Syntax `fixture.DiffPortMatch_R(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value **(Double)** Resistance value in ohms. Choose a value between **-1E18** to **1E18**.

Return Type Double

Default 0

Examples `fixture.DiffPortMatch_R(2) = 1e3 'Write`

`value = fixture.DiffPortMatch_R(1) 'Read`

C++ Syntax HRESULT get_DiffPortMatch_R(short portNum, double *pVal)
HRESULT put_DiffPortMatch_R(short portNum, double newVal)

Interface IFixturing2

DiffPortMatchMode Property

Description Sets the differential matching circuit type. To select a user-defined circuit, specify IN ADVANCE the 2-port touchstone filename with [DiffPortMatch_UserFilename Property](#). If you do not specify the appropriate file and you select USER, an error occurs and naNO_CIRCUIT is automatically selected.

VB Syntax *fixture*.DiffPortMatchMode(*pNum*) = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

pNum (**Integer**) Balanced (logical) port number. Choose from logical ports **1, 2, or 3**. [Learn more about logical ports](#).

value (**Enum as NADiffPortMatchCircuitMode**) Choose from:

0 or **naSHUNT_L_SHUNT_C_CIRCUIT** - Specifies the circuit that consists of shunt L and shunt C.

1 or **naUSER_FILE_CIRCUIT** - Specifies the user-defined circuit.

2 or **naNO_CIRCUIT** - Specifies no-circuit.

Return Type Enum

Default **naSHUNT_L_SHUNT_C_CIRCUIT**

Examples

```
fixture.DiffPortMatchMode(2) = naNO_CIRCUIT 'Write
value = fixture.DiffPortMatchMode(1) 'Read
```

C++ Syntax HRESULT get_DiffPortMatchMode(short port, tagNADiffPortMatchCircuitMode *eVal)

HRESULT put_DiffPortMatchMode(short port, tagNADiffPortMatchCircuitMode eVal)

Interface IFixturing2

DiffPortMatchState Property

Description Turns ON or OFF 4-port differential port matching function. Must also set the fixture simulator function to ON using [FixturingState Property](#).

VB Syntax *fixture.DiffPortMatchState = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (Boolean)

False - Turns differential port matching OFF

True - Turns differential port matching ON

Return Type Boolean

Default False

Examples

```
fixture.DiffPortMatchState = False 'Write
```

```
value = fixture.DiffPortMatchState 'Read
```

C++ Syntax HRESULT get_DiffPortMatchState(VARIANT_BOOL *pVal)
HRESULT put_DiffPortMatchState(VARIANT_BOOL newVal)

Interface IFixturing2

DiffPortMatchUserFilename Property

Description Specifies the 2-port touchstone file in which the information on the user-defined differential matching circuit is saved. Following this command, send [DiffPortMatchCircuit Property](#). If the specified file does not exist, an error occurs when you set the type of differential matching circuit to USER.

VB Syntax *fixture.DiffPortMatchUserFilename(pNum) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

pNum (**Integer**) Balanced (logical) port number. Choose from logical ports **1, 2** or **3**. [Learn more about logical ports.](#)

value (**String**) Full path, file name, and extension (.s2P) of the de-embedding circuit.

Files are typically stored in "c:\users\public\network analyzer\documents

Return Type String

Default Not Applicable

Examples

```
fixture.DiffPortMatchUserFilename(2) = "c:\users\public\network analyzer\documents/myFile.s4p" 'Write
```

```
value = fixture.DiffPortMatchUserFilename(1) 'Read
```

C++ Syntax HRESULT get_DiffPortMatchUserFilename(short port, BSTR *bstrFile)

HRESULT put_DiffPortMatchUserFilename(short port, BSTR bstrFile)

Interface IFixturing2

DiffZConvPortImag Property

Description Sets the imaginary part of the impedance value for the differential port impedance conversion function.

VB Syntax `fixture.DiffZConvPortImag(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value **(Double)** Imaginary part of the Impedance value. Choose a value between 0 and 1E18

Return Type Double

Default 0

Examples `fixture.DiffZConvPortImag(2) = 75 'Write`

`value = fixture.DiffZConvPortImag(1) 'Read`

C++ Syntax HRESULT get_DiffZConvPortImag(short portNum, double *pVal)
HRESULT put_DiffZConvPortImag(short portNum, double newVal)

Interface IFixturing2

DiffZConvPortReal Property

Description Sets the real part of the impedance value for the differential port impedance conversion function.

VB Syntax `fixture.DiffZConvPortReal(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum **(Integer)** Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value **(Double)** Real part of the Impedance value. Choose a value between 0 and 1E18

Return Type Double

Default See [Differential Port Z Conversion Default](#)

Examples

```
fixture.DiffZConvPortReal(2) = 75 'Write
```

```
value = fixture.DiffZConvPortReal(1) 'Read
```

C++ Syntax HRESULT get_DiffZConvPortReal(short portNum, double *pVal)
HRESULT put_DiffZConvPortReal(short portNum, double newVal)

Interface IFixturing2

Last Modified:

31-May-2013 Fixed typo

DiffZConvPortZ0 Property

Description Sets the impedance value for the differential port impedance conversion function. Set either this single value or set the [real](#) and [imaginary](#) parts separately. The imaginary part is set to 0.0 using this command.

VB Syntax `fixture.DiffZConvPortZ0(portNum) = value`

Variable [\(Type\) - Description](#)

fixture A [Fixturing](#) (object)

portNum (**Integer**) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

value (**Double**) Impedance value. Choose a value between 0 and 1E18

Return Type Double

Default See [Differential Port Z Conversion Default](#)

Examples

```
fixture.DiffZConvPortZ0(2) = 75 'Write
value = fixture.DiffZConvPortZ0(1) 'Read
```

C++ Syntax HRESULT get_DiffZConvPortZ0(short portNum, double *pVal)
HRESULT put_DiffZConvPortZ0(short portNum, double newVal)

Interface IFixturing2

DiffZConvState Property

Description Turns ON or OFF 4-port differential impedance conversion function. Must also set the fixture simulator function to ON using [FixturingState Property](#).

VB Syntax `fixture.DiffZConvState = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (Boolean)

False - Turns differential impedance conversion OFF.

True - Turns differential impedance conversion ON.

Return Type Boolean

Default False

Examples

```
fixture.DiffZConvState = False 'Write  
value = fixture.DiffZConvState 'Read
```

C++ Syntax HRESULT get_DiffZConvState(VARIANT_BOOL *pVal)
HRESULT put_DiffZConvState(VARIANT_BOOL newVal)

Interface IFixturing2

Format Property

Description Sets or returns the display format of the measurement.

VB Syntax *meas.Format = value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**enum NADataFormat**) - Choose from:

0 - naDataFormat_LinMag

1 - naDataFormat_LogMag

2 - naDataFormat_Phase

3 - naDataFormat_Polar

4 - naDataFormat_Smith

5 - naDataFormat_Delay

6 - naDataFormat_Real

7 - naDataFormat_Imaginary

8 - naDataFormat_SWR

9 - naDataFormat_PhaseUnwrapped

10 - naDataFormat_InverseSmith

11 - naDataFormat_Kelvin

12 - naDataFormat_Fahrenheit

13 - naDataFormat_Celsius

Return Type Long Integer

Default 1 - naDataFormat_LogMag

Examples

```
meas.Format = naDataFormat_Real 'Write
```

```
fmt = meas.Format 'Read
```

C++ Syntax HRESULT get_Format(tagDataFormat *pVal)
HRESULT put_Format(tagDataFormat newVal)
Interface IMeasurement

Last Modified:

1-Oct-2007 Added temperature formats

DisplayAutomationErrors Property

Description Enables or disables automation error messages from being displayed on the screen.

VB Syntax `app.DisplayAutomationErrors = value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (Boolean)

True allows error to show on display,

False turns error off from display.

Return Type Boolean

Default True

Examples

```
Dim app As Application
Set app = New Application
app.DisplayAutomationErrors = False      'Turns off display
print app.DisplayAutomationErrors       'prints False
```

C++ Syntax HRESULT get_DisplayAutomationErrors(VARIANT_BOOL * Val);

HRESULT put_DisplayAutomationErrors(VARIANT_BOOL Val);

Interface IApplication2

DisplayGlobalPassFail Property

Description Shows or hides the dialog which displays global pass/fail results. [Learn more about Global Pass/Fail.](#)

VB Syntax `app.DisplayGlobalPassFail = value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (Boolean)

True - displays the pass/fail dialog.

False - hides the pass/fail dialog.

Return Type Boolean

Default False

Examples

```
Dim app As Application
Set app = New Application
app.DisplayGlobalPassFail = true 'shows dialog
```

C++ Syntax HRESULT get_DisplayGlobalPassFail(VARIANT_BOOL * Val);

HRESULT put_DisplayGlobalPassFail(VARIANT_BOOL Val);

Interface IApplication6

DisplayRange Property

Description	Sets or returns the range to be displayed on the PNA x-axis. All traces in the channel have this same x-axis scaling.
VB Syntax	<i>FOM.DisplayRange = value</i>
Variable	(Type) - Description
<i>object</i>	An FOM (object)
<i>value</i>	(string) - Range to be displayed on the PNA x-axis. Case insensitive.
Return Type	String
Default	"Receivers"
Examples	<pre>fom.DisplayRange = "Source" 'sets the x-axis to the frequency range of "source"</pre> <pre>disprange = fom.DisplayRange 'Read</pre>
C++ Syntax	HRESULT get_DisplayRange(BSTR *pDspRange) HRESULT put_DisplayRange(BSTR pDspRange)
Interface	IFOM

Last Modified:

7-Mar-2007 Changed to receivers

Distance Property

Description Set or query marker distance on a time domain trace.

The Write command moves the marker to the specified distance value. Once moved, you can read the [Y axis](#) value or [read the X-axis time](#) value. (Distance is calculated from the X-axis time value.)

The Read command reads the distance of the marker.

If the marker is set as delta, the WRITE and READ data is relative to the reference marker.

VB Syntax *mark.Distance = value*

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (**double**) - Marker distance in the unit of measure specified with [DistanceMarkerUnit Property](#)

Return Type Double

Default Not Applicable

Examples

```
mark.Distance = 3e9 'Write
xVal = mark.Distance 'Read
```

C++ Syntax HRESULT get_Distance(double *pVal);
HRESULT put_Distance(double newVal);

Interface IMarker2

DistanceMarkerMode Property

Description Specifies the measurement type in order to determine the correct marker distance.

- Select Auto for S-Parameter measurements.
- Select Reflection or Transmission for arbitrary ratio or unratiod measurements.

This settings affects the display of ALL markers for only the ACTIVE measurement.

VB Syntax *trans*.DistanceMarkerMode = *value*

Variable [\(Type\)](#) - [Description](#)

trans A [Transform](#) (object)

value (enum As NADistanceMarkerMode) - Choose from:

0 - naDistanceMarkerModeAuto

1 - naDistanceMarkerModeReflection

2 - naDistanceMarkerModeTransmission

Return Type Enum

Default 0 - naDistanceMarkerModeAuto

Examples `trans.DistanceMarkerMode = naDistanceMarkerModeReflection 'Write`

`DMM = trans.DistanceMarkerMode 'Read`

C++ Syntax HRESULT get_DistanceMarkerMode(tagNADistanceMarkerMode *pVal);

HRESULT put_DistanceMarkerMode(tagNADistanceMarkerMode newVal);

Interface ITransform2

DistanceMarkerUnit Property

Description	Specifies the unit of measure for the display of marker distance values. This settings affects the display of ALL markers for only the ACTIVE measurement (unless Distance Maker Units are coupled using CoupledParameters Property).
VB Syntax	<i>trans</i> . DistanceMarkerUnit = <i>value</i>
Variable	(Type) - Description
<i>trans</i>	A Transform (object)
<i>value</i>	(Enum As NADistanceMarkerUnit) - Distance Marker Units. Choose from 0 - naDistanceMarkerUnitMeter 1 - naDistanceMarkerUnitFeet 2 - naDistanceMarkerUnitInch
Return Type	Enum
Default	0 - naDistanceMarkerUnitMeter
Examples	<pre>trans.DistanceMarkerUnit = naDistanceMarkerUnitFeet 'sets the U = trans.DistanceMarkerUnit 'Read</pre>
C++ Syntax	HRESULT get_DistanceMarkerUnit(tagNADistanceMarkerUnit *pVal); HRESULT put_DistanceMarkerUnit(tagNADistanceMarkerUnit newVal);
Interface	ITransform2

Divisor Property

Description	Sets and returns the Divisor value to be used when coupling this range to the primary range. This setting is valid only if the specified range is coupled to the primary range.
VB Syntax	<i>FOMRange</i> . Divisor = <i>value</i>
Variable	(Type) - Description
<i>object</i>	An FOMRange (object)
<i>value</i>	(Double) - Divisor value.-(Unitless)
Return Type	Double
Default	0
Examples	<pre>fomRange.Divisor = .5 'Write</pre> <pre>Div = fomRange.Divisor 'Read</pre>
C++ Syntax	HRESULT get_Divisor(double *pVal) HRESULT put_Divisor(double *pVal)
Interface	IFOMRange

Do1PortEcal Property - Superseded

Description	Note: This command is replaced with CalKitType which sets the ECal module or mechanical cal kit. Specify ECAL or Mechanical calibration for the mixer characterization portion of a VMC calibration.
VB Syntax	<code>VMC.Do1PortEcal = bool</code>
Variable	(Type) - Description
<code>VMC</code>	VMCType (object)
<code>bool</code>	(Boolean)
	True - ECAL
	False - Mechanical
Return Type	Boolean
Default	False
Examples	<code>value = VMC.Do1PortEcal</code>
C++ Syntax	<code>HRESULT put_Do1PortEcal(VARIANT_BOOL bDoEcal);</code> <code>HRESULT get_Do1PortEcal(VARIANT_BOOL *bDoEcal);</code>
Interface	VMCType

Do2PortEcal Property - Superseded

Description	Note: This command is replaced with CalKitType which sets the ECal module or mechanical cal kit. Specify ECAL or Mechanical calibration. For VMC, this selection only applies to the 2-port calibration portion. For mixer characterization (VMC), use Do1PortEcal Property
VB Syntax	<i>object</i> . Do2PortEcal = <i>bool</i>
Variable	(Type) - Description
<i>object</i>	SMCType (object) or VMCType (object)
<i>bool</i>	(Boolean) True - ECAL False - Mechanical
Return Type	Boolean
Default	False
Examples	<code>value = VMC.Do2PortEcal</code>
C++ Syntax	HRESULT put_Do2PortEcal(VARIANT_BOOL bDoEcal); HRESULT get_Do2PortEcal(VARIANT_BOOL *bDoEcal);
Interface	SMCType VMCType

Domain Property

Description	Returns the domain (frequency,time, power, phase) of the measurement. To understand how this property is useful, see IMeasurement2 Interface .
VB Syntax	<i>value</i> = <i>meas</i> . Domain
Variable	(Type) - Description
<i>value</i>	(Enum as NADomainType) - variable to store the returned value
	0 - naDomainFrequency
	1 - naDomainTime
	2 - naDomainPower
	4 - naDomainPhase
<i>meas</i>	A Measurement (object)
Return Type	Enum as NADomainType
Default	Not Applicable
Examples	<pre>Print meas.Domain 'prints the value of the domain enum</pre>
C++ Syntax	HRESULT get_Domain(tagNADomainType * Val);
Interface	IMeasurement2

Last Modified:

3-May-2011 Updated for phase

Driver Property

Description Sets and returns the external device driver (model).

VB Syntax *extDevices.Driver* = *value*

Variable [\(Type\)](#) - Description

extDevices An [ExternalDevice](#) (object)

value (String) External device driver (model). Choose from the following:

"AGPM" for all power meters.

[See a list of supported external source drivers.](#)

Return Type String

Default "AGGeneric"

Examples

```
extDevices.Driver = "AGESG" 'Write
value = extDevices.Driver 'Read
See example program to configure PMAR device
See example program to configure External Source
```

C++ Syntax HRESULT get_Driver(BSTR* value);

HRESULT put_Driver(BSTR newVal);

Interface IExternalDevices

Last Modified:

15-Jan-2010 Added 'AG' to example

31-Jul-2009 MX New topic

DspFpgaRevision Property

Description	Returns the DSP FPGA Revision number that is visible in the Help, About Network Analyzer dialog box. Learn more.
VB Syntax	<i>value</i> = <i>cap</i> . DspFpgaRevision
Variable	(Type) - Description
<i>value</i>	(String) - Variable to store the returned DSP revision number.
<i>cap</i>	A Capabilities (object)
Return Type	String
Default	Not Applicable
Examples	<pre>value = cap.DspFpgaRevision 'Read</pre>
C++ Syntax	HRESULT get_DspFpgaRevision(BSTR *value);
Interface	ICapabilities6

Last Modified:

30-Nov-2009 MX New topic

DspRevision Property

Description	Returns the DSP Revision number that is visible in the Help, About Network Analyzer dialog box. Learn more.
VB Syntax	<i>value</i> = <i>cap</i> . DspRevision
Variable	(Type) - Description
<i>value</i>	(String) - Variable to store the returned DSP revision number.
<i>cap</i>	A Capabilities (object)
Return Type	String
Default	Not Applicable
Examples	<code>value = cap.DspRevision 'Read</code>
C++ Syntax	HRESULT get_DspRevision(BSTR *value);
Interface	ICapabilities6

DUTTopology Property

Description Returns the device topology setting.

VB Syntax *balTopology.DUTTopology = value*

Variable [\(Type\)](#) - Description

balTopology A [BalancedTopology](#) (object)

value (enum NADUTTopology) - Choose either:

0 naSEBal: Single-Ended - Balanced topology

1 naSESEBal: Single-Ended - Single-Ended - Balanced topology

2 naBalBal: Balanced - Balanced topology

3 naBalSE: Balanced - Single-ended topology

Return Type Enum as NADUTTopology

Default naSEBal

Examples `balTop.DUTTopology = naSESEBal 'Write`

`DutTop = balTop.DUTTopology 'Read`

C++ Syntax HRESULT get_DUTTopology(tagNADUTTopology* pVal)
HRESULT put_DUTTopology(tagNADUTTopology newVal)

Interface IBalancedTopology

Last Modified:

25-Apr-2012 Added Bal-Se topo (9.70)

DwellTime Property

Description Sets or returns the dwell time at the start of each sweep point for all measurements in a channel. Dwell time is only available with Chan.[SweepGenerationMode](#) = **naSteppedSweep** (not naAnalogSweep).

Sets or returns the dwell time of a specified sweep segment.

VB Syntax *object.DwellTime* = *value*

Variable [\(Type\)](#) - Description

object A Channel (object)

or CalSet (object) - Read-only property

or Segment (object)

value **(double)** - Dwell Time in seconds. Choose any number between **0** and **86400**

Return Type Double

Default 0

Examples

```
chan.DwellTime = 3e-3 'sets the dwell time for the channel -Write
```

```
segs(3).DwellTime = 1e9 'sets the dwell time of segment 3 -Write
```

```
dwell = chan.DwellTime 'Read
```

C++ Syntax HRESULT get_DwellTime(double *pVal)
HRESULT put_DwellTime(double newVal)

Interface IChannel
ISegment

|CalSet3

DwellPerPoint Property

Description Sets and returns the amount of time the PNA should wait after for an external source to settle before making a measurement at each data point.

VB Syntax *extSource.DwellPerPoint = value*

Variable [\(Type\)](#) - Description

chan An [ExternalSource](#) (**object**)

value (**Double**) Dwell time in milliseconds.

Return Type Double

Default 3

Examples `extSource.DwellPerPoint = 10 'Write`

`dpp = extSource.DwellPerPoint 'Read`

C++ Syntax HRESULT get_DwellPerPoint (tagNAExtDevDwellPerPoint *pValue)
HRESULT put_DwellPerPoint (tagNAExtDevDwellPerPoint newVal)

Interface IExternalSource

ECALCharacterization Property - Superseded

Description	<p>Note: This command is replaced with CalKitType which sets the ECal module and User Characterization.</p> <p>Specifies the characterization data within an ECal module to be used for the SMC calibration.</p> <p>Learn more about ECal User Characterization.</p>
VB Syntax	<code>SMC.ECALCharacterization(mod) = value</code>
Variable	(Type) - Description
<i>SMC</i>	SMCType (object)
<i>module</i>	1- ECal module
<i>value</i>	<p>(Long) – Characterization data within the ECal module to be used for ECal operations. Choose from:</p> <ul style="list-style-type: none"> 0 – Factory Characterization 1 – UserCharacterization1 2 – UserCharacterization2 3 – UserCharacterization3 4 – UserCharacterization4 5 – UserCharacterization5
Return Type	Long
Default	0 - Factory Characterization
Examples	<code>SMC.ECALCharacterization(1)= 2</code>
C++ Syntax	<pre>HRESULT put_ECALCharacterization(long moduleNumber, long characterization); HRESULT get_ECALCharacterization(long moduleNumber, long* characterization);</pre>
Interface	ISMCType

ECALCharacterization Property - Superseded

Description	<p>Note: This command is replaced with CalKitType which sets the ECal module and User Characterization.</p> <p>Specifies the characterization data within an ECal module to be used, and the portion of the VMC calibration.</p> <p>Learn more about ECal User Characterization.</p>
VB Syntax	<code>VMC.ECALCharacterization (module,port) = value</code>
Variable	(Type) - Description
<i>VMC</i>	VMCType (object)
<i>module</i>	(long integer)
	1 - ECAL module
<i>port</i>	(boolean)
	True - 2-port calibration portion of the VMC
	False - 1-port (mixer characterization portion of the VMC cal)
<i>value</i>	(Long) – Characterization data within the ECal module to be used for ECal operations. Choose from:
	0 – Factory Characterization
	1 – UserCharacterization1
	2 – UserCharacterization2
	3 – UserCharacterization3
	4 – UserCharacterization4
	5 – UserCharacterization5
Return Type	Long
Default	0 - Factory Characterization
Examples	<code>VMC.ECALCharacterization (1,True) = 4</code>

C++ Syntax HRESULT put_ECALCharacterization(long moduleNumber, long characterization);

HRESULT get_ECALCharacterization(long moduleNumber, long* characterization);

Interface IVMCType

ECALCharacterizationEx Property

Description	<p>This property replaces ECALCharacterization Property.</p> <p>Specifies the characterization data within an ECal module to be used for the calibration.</p> <p>Learn more about ECal User Characterization.</p>
VB Syntax	<i>cal</i> . ECALCharacterizationEx (<i>module</i>) = <i>value</i>
Variable	(Type) - Description
<i>cal</i>	Calibrator (object)
<i>module</i>	(long integer) Optional argument. ECal module.
	Choose from modules 1 through 8
	Use IsECALModuleFoundEx to determine the number of modules connected to the PNA
	Use GetECALModuleInfoEx to returns the model and serial number of each module.
<i>value</i>	<p>(Long) – Characterization data within the ECal module to be used for ECal operations. Choose from:</p> <p>0 – Factory Characterization</p> <p>1 – UserCharacterization1</p> <p>2 – UserCharacterization2</p> <p>..and so forth up to...</p> <p>12 – UserCharacterization12</p>
Return Type	Long
Default	0 - Factory Characterization
Examples	<code>cal.ECALCharacterizationEx (4) = 2</code>
C++ Syntax	<pre>HRESULT put_ECALCharacterizationEx(long moduleNumber, long characterization); HRESULT get_ECALCharacterizationEx(long moduleNumber, long* characterization);</pre>

Interface ICalibrator4

15-Jun-10 Updated for 12 User chars

ECalID Property

Description	Selects the model and serial number of the ECal module to be characterized. This command does NOT set the model and serial number of the ECal module.
VB Syntax	<i>userChar.ECalID = value</i>
Variable	(Type) - Description
<i>userChar</i>	An ECalUserCharacterizer Object
<i>value</i>	(String) Model and serial number of the ECal module to be characterized.
Return Type	String
Default	"" (Empty String)
Examples	<code>userChar.ECalID = "N4433A,00001"</code>
C++ Syntax	HRESULT put_ECalID(BSTR id);
Interface	IECalUserCharacterizer

Last Modified:

2-Nov-2008 New topic (8.33)

ECALIsolation Property

Description **Note:** The inherent isolation of the PNA is better than that attained with this command. ONLY use this command when using an external test set, and ONLY using a 8509x ECal module.

Specifies whether the acquisition of the ECal calibration should include isolation or not.

VB Syntax *cal*.**ECALIsolation** = *value*

Variable [\(Type\)](#) - Description

cal A Calibrator (**object**)

value (**boolean**)

False - Exclude Isolation

True - Include Isolation

Return Type Boolean

Default False

Examples

```
Dim oPNA as AgilentPNA835x.Application
Dim oCal as Calibrator
Set oPNA = CreateObject("AgilentPNA835x.Application",
"MachineName")
Set oCal = oPNA.ActiveChannel.Calibrator
' Uncomment the following line to have the cal include isolation
' oCal.ECALIsolation = True
' Uncomment the following line to have the cal omit isolation
' oCal.ECALIsolation = False
oCal.DoECAL2Port ' Do the cal
```

C++ Syntax HRESULT put_ECALIsolation (VARIANT_BOOL bIsolationState);

HRESULT get_ECALIsolation (VARIANT_BOOL *bIsolationState);

Interface Calibrator

Last Modified:

16-Apr-2007 Un-obsolete

Read-only

ECALModuleNumberList Property

Description Returns a list of index numbers to be used for referring to the ECal modules that are currently attached to the PNA.

VB Syntax *clist* = *cal*.**ECALModuleNumberList**

Variable [\(Type\)](#) - Description

clist Variable to store the returned list of index numbers.

cal [Calibrator](#) (object)

Return Type Variant

Default Not Applicable

Examples

```
clist = cal.ECALModuleNumberList
'If 2 modules are attached to the PNA
'then the returned list will be:
1,2
```

C++ Syntax HRESULT get_ECALModuleNumberList(VARIANT *modules);

Interface ICalibrator6

EcalOrientation Property

Description Specifies which port of the ECal module is connected to which port of the PNA when the [AutoOrient](#) property = False.

VB Syntax `SMC.EcalOrientation (mod) = value`

Variable [\(Type\)](#) - Description

SMC [SMCType](#) (object)

mod (Long)

1 - Use ECAL Module for the calibration.

value **(string)** -Format this parameter in the following manner:

`Aw,Bx,Cy,Dz`

where

- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for PNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: `A2,B3,D1`

Return Type String

Default "A1,B2"

Examples `SMC.EcalOrientation (1) = "A2,B1"`

C++ Syntax HRESULT put_EcalOrientation(long lModuleNum, BSTR orientation);
HRESULT get_EcalOrientation(long lModuleNum, BSTR *orientation);

Interface SMCType

EcalOrientation1Port Property

Description	For Mixer Characterization ONLY Specifies which port of the ECal module is connected to which port of the PNA for the Do1PortECAL property when the AutoOrient property = False.
VB Syntax	<code>VMC.EcalOrientation1Port (mod) = value</code>
Variable	(Type) - Description
<code>VMC</code>	VMCType (object)
<code>mod</code>	(Long)
	1 - Use ECAL Module for the calibration.
<code>value</code>	(string) - Choose from: "A1" - ECAL module port A is connected to PNA port 1 "B1" - ECAL module port A is connected to PNA port 1
Return Type	String
Default	"A1"
	If anything other than port 1 is specified, "B1" will be used. For example, if "A2" is specified, "B1" is used.
Examples	<code>VMC.EcalOrientation1Port(1) = "B1"</code>
C++ Syntax	<code>HRESULT put_EcalOrientation1Port(long lModuleNum, BSTR orientation);</code> <code>HRESULT get_EcalOrientation1Port(long lModuleNum, BSTR</code>
Interface	VMCType

EcalOrientation2Port Property

Description Specifies which port of the ECal module is connected to which port of the PNA for the [Do2PortECAL](#) property when the [AutoOrient](#) property = False.

VB Syntax `VMC.EcalOrientation2Port (mod) = value`

Variable [\(Type\)](#) - Description

VMC [VMCType](#) (**object**)

mod (Long) Module being used for the calibration.

Choose from 1 or 2.

value (**string**) -Format this parameter in the following manner:

`Aw,Bx,Cy,Dz`

where

- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for PNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: `A2,B3,D1`

Return Type String

Default "A1,B2"

Examples `VMC.EcalOrientation1Port(1) = "A2,B1"`

C++ Syntax HRESULT put_EcalOrientation2Port(long lModuleNum, BSTR orientation);
HRESULT get_EcalOrientation2Port(long lModuleNum, BSTR *orientation);

Interface VMCType

ECALPortMapEx Property

Description This property replaces [ECALPortMap Property](#)

Specifies which ports of the ECal module are connected to which ports of the PNA for the [DoECAL1PortEx](#) and [DoECAL2PortEx](#) methods when the [OrientECALModule](#) property = False.

This setting remains until the PNA is restarted or this command is sent again.

Note: For guided calibrations where Orient is OFF and the same ECal module is used in more than one Connection Step, you are not allowed to specify how the ECal module is connected. Instead, the PNA determines the orientation. The PNA does not verify that you made the connection properly.

This command, and [OrientECALModule_Property](#), can be used to perform ECal orientation using the [Guided Calibration](#) interface.

VB Syntax `cal.ECALPortMapEx (module) = value`

Variable [\(Type\) - Description](#)

cal A Calibrator (**object**)

module (**long integer**) Optional argument. ECal module.

Choose from modules **1** through **8**

Use [IsECALModuleFoundEx](#) to determine the number of modules connected to the PNA

Use [GetECALModuleInfoEx](#) to return the model and serial number of each module.

value (**string**) -Format this parameter in the following manner:

Aw,Bx,Cy,Dz

where

- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for PNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: A2,B3,D1

DoECAL1PortEx or **DoECAL2PortEx** methods will fail if the port numbers passed to those methods are not in the string of this property and [OrientECALModule](#) property = False.

Return Type String

Default Not Applicable

Examples

```
Dim cal As Calibrator
Dim sPortMap As String
Set cal = PNAapp.ActiveChannel.Calibrator
cal.ECALPortMapEx = "a2,b1" 'Write
sPortMap = cal.ECALPortMap 'Read
```

C++ Syntax HRESULT put_ECALPortMapEx(long moduleNumber, BSTR strPortMap);
HRESULT get_ECALPortMapEx(long moduleNumber, BSTR *strPortMap);

Interface ICalibrator4

Last Modified:

7-May-2007 Added note about orient

ElecDelayMedium Property

Description Sets or returns the electrical delay medium.

VB Syntax *meas.ElecDelayMedium = value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**enum NACalStandardMedium**) choose from

0 - naCoax

1 - naWaveGuide

Return Type NACalStandardMedium

Default Not Applicable

Examples `Print meas.ElecDelayMedium 'prints the value of the electrical delay medium`

C++ Syntax `HRESULT get_ElecDelayMedium(tagNACalStandardMedium *pVal);`

`HRESULT put_ElecDelayMedium(tagNACalStandardMedium newVal);`

Interface IMeasurement2

ElecDistanceDelay Property

Description Sets the electrical delay in physical length (distance) for the selected measurement.

VB Syntax *meas.ElecDistanceDelay = value*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

value (**double**) - Electrical Delay in distance.

Set units using [ElecDistanceDelayUnit](#).

Return Type Double

Default 0

VB `meas.ElecDistanceDelay = 1e-3 'Write`

Examples `edelay = meas.ElecDistanceDelay 'Read`

C# `Meas.ElecDistanceDelay = 1e-3 'Write`

Examples

```
// This property returns an object, and the object must be cast to a double to access the value.
```

```
Edelay = (double)meas.ElecDistanceDelay 'read
```

C++ Syntax HRESULT get_ElecDistanceDelay(VARIANT *pVal)
HRESULT put_ElecDistanceDelay(VARIANT newVal)

Interface IMeasurement11

Last Modified:

12-Nov-2010 Added C# example

6-Feb-2009 MX New topic

ElecDistanceDelayUnit Property

Description Sets and returns the units for specifying electrical delay in physical length (distance).

VB Syntax *meas.ElecDistanceDelayUnit* = *value*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

value (enum naDistanceUnit) Choose from:

0 – naDistanceUnit_Meter

1 – naDistanceUnit_Feet

2 – naDistanceUnit_Inch

Return Type Enum

Default 0 – naDistanceUnit_Meter

Examples `meas.ElecDistanceDelayUnit = naDistanceUnit_Meter` **'Write**

`edelay = meas.ElecDistanceDelayUnit` **'Read**

C++ Syntax HRESULT get_ElecDistanceDelayUnit(tagNADistanceUnit *pVal)
HRESULT put_ElecDistanceDelayUnit(tagNADistanceUnit newVal)

Interface IMeasurement11

Last Modified:

6-Feb-2009 MX New topic

ElectricalDelay Property

Description Sets the Electrical Delay for the active channel.

VB Syntax *meas*.**ElectricalDelay** = *value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**double**) - Electrical Delay in seconds. Choose any number between **-9.99** and **9.99**

Return Type Double

Default 0

Examples

```
meas.ElectricalDelay = 1e-3 'Write
edelay = meas.ElectricalDelay 'Read
```

C++ Syntax HRESULT get_ElectricalDelay(double *pVal)
HRESULT put_ElectricalDelay(double newVal)

Interface IMeasurement

Element Property

Description Returns a handle to the specified [PathElement](#) object. Each element object contains a unique set of values. The [Value Property](#) is used to set the value for each element.

This command is used to set both RF and IF Path Configuration.

- See [RF Path Configuration \(elements, value\)](#)
- See [IF Path Configuration \(elements,value\)](#)

VB Syntax Set elem = *pathConfig*.**Element** (*element*)

Variable [\(Type\)](#) - Description

elem **(Object)** [IPathElement](#)

pathConfig A [PathConfiguration](#) **(object)**

element **(String)** Configurable element. Use [pathConfig.Elements](#) to return a list of configurable elements or [see a list of configurable elements](#) for various PNA models.

Return Type Object

Default Not Applicable

Examples See examples:

[IF Path Config](#)

[RF Path Config](#)

C++ Syntax HRESULT Element(BSTR elemName, IPathElement** ppElement);

Interface IPathConfiguration

Last Modified:

27-Mar-2012 Several edits

14-Dec-2006 MX New topic

Elements Property

Description Returns an array containing the names of configurable elements.

See a [list of configurable elements and settings](#) for various PNA models.

VB Syntax *values* = *pathConfig*.**Elements**

Variable **(Type) - Description**

values **(Variant array)** Variable to store the array of configurable elements.

pathConfig A [PathConfiguration](#) **(object)**

Return Type Variant array

Default Not Applicable

Examples `elems=pathconfig.Elements`

C++ Syntax HRESULT Elements(VARIANT* pElements);

Interface IPathConfiguration

Embed4PortA Property

Description	Returns the PNA port number associated with 'a' based on the device topology. To see 'a' for all topologies, and to specify the port connections, use Embed4PortList Property Specify topology using Embed4PortTopology Property
VB Syntax	<i>value</i> = <i>fixture</i> . Embed4PortA
Variable	(Type) - Description <i>value</i> (Short Integer) Variable to store the returned PNA port number. <i>fixture</i> A Fixturing (object)
Return Type	Integer
Default	Not Applicable
Examples	<pre>value = fixture.Embed4PortA 'Read'</pre>
C++ Syntax	HRESULT get_Embed4PortA(short *portA);
Interface	IFixturing2

Embed4PortB Property

Description Returns the PNA port number associated with 'b' based on the device topology.

To see 'b' for all topologies, and to specify the port connections, use [Embed4PortList Property](#).

Specify topology using [Embed4PortTopology Property](#)

VB Syntax *value* = *fixture*.**Embed4PortB**

Variable [\(Type\)](#) - Description

value (Short Integer) Variable to store the returned PNA port number.

fixture A [Fixturing](#) (**object**)

Return Type Integer

Default Not Applicable

Examples `value = fixture.Embed4PortB 'Read'`

C++ Syntax HRESULT get_Embed4PortB(short *portB);

Interface IFixturing2

Embed4PortC Property

Description	Returns the PNA port number associated with 'c' based on the device topology. To see 'c' for all topologies, and to specify the port connections, use Embed4PortList Property . Specify topology using Embed4PortTopology Property
VB Syntax	<i>value</i> = <i>fixture</i> . Embed4PortC
Variable	(Type) - Description
	<i>value</i> (Short Integer) Variable to store the returned PNA port number.
	<i>fixture</i> A Fixturing (object)
Return Type	Integer
Default	Not Applicable
Examples	<pre>value = fixture.Embed4PortC 'Read'</pre>
C++ Syntax	HRESULT get_Embed4PortC(short *portC);
Interface	IFixturing2

Embed4PortD Property

Description Returns the PNA port number associated with '**d**' based on the device topology.

To see '**d**' for all topologies, and to specify the port connections, use [Embed4PortList Property](#).

Specify topology using [Embed4PortTopology Property](#)

VB Syntax *value* = *fixture*.**Embed4PortD**

Variable [\(Type\)](#) - Description

value (Short Integer) Variable to store the returned PNA port number.

fixture A [Fixturing](#) (**object**)

Return Type Integer

Default Not Applicable

Examples `value = fixture.Embed4PortD 'Read`

C++ Syntax HRESULT get_Embed4PortD(short *portD);

Interface IFixturing2

Embed4PortList Property

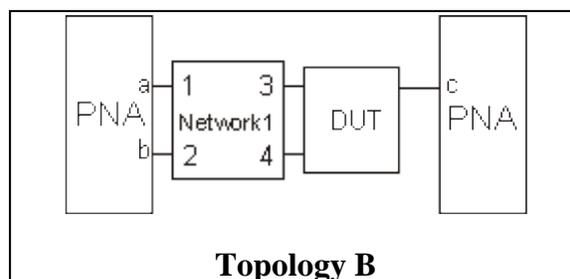

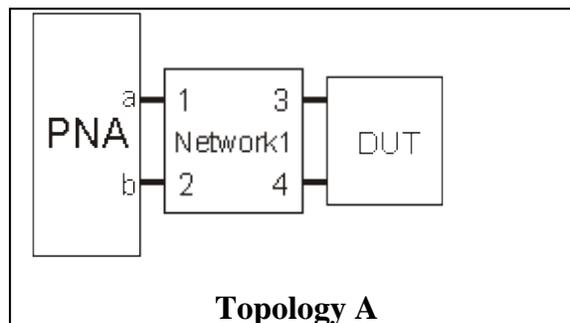

Description Specifies the PNA port connections for ALL topologies. The port assignment is dependent on the DUT topology. All four port numbers are required. However, for:

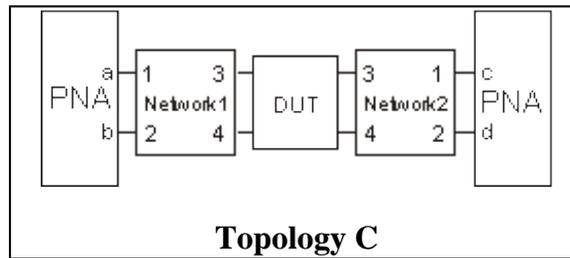

- Topology A, only the first **two** arguments are valid,
- Topology B, only the first **three** arguments are valid,
- Topology C, **ALL** arguments are valid.

Specify topology using [Embed4PortTopology Property](#).

Read the port assignments using the following commands. A, B, C, and D, refer to the port; NOT the topology.

- [Embed4PortA Property](#)
- [Embed4PortB Property](#)
- [Embed4PortC Property](#)
- [Embed4PortD Property](#)

VB Syntax `fixture.Embed4PortList = p1, p2, p3, p4`

Variable [\(Type\) - Description](#)

fixture A [Fixturing](#) (object)

p1 PNA Port number assigned to **a** in above graphic.

p2 PNA Port number assigned to **b** in above graphic.

p3 PNA Port number assigned to **c** in above graphic.

p4 PNA Port number assigned to **d** in above graphic.

Return Type Four Integers

Default 1,2,3,4

Examples `fixture.4PortNetworkTopoCPorts = 4,3,2,1` **Write**

C++ Syntax HRESULT put_4PortNetworkTopoCPorts(short ChannelNum, short pPortA, short pPortB, short pPortC, short pPortD)

Interface IFixturing2

Embed4PortNetworkFilename Property

Description Specifies the 4-port touchstone file (*.s4p) in which the network to embed or de-embed resides. If the specified file does not exist, an error occurs when type command is sent.

Following this command, send [Embed4PortNetworkMode Property](#).

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.Embed4PortNetworkFilename(netNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

netNum (**Integer**) Network position. Choose from **1** or **2**. See [Embed4PortTopology Property](#)

value (**String**) Full path, file name, and extension (.s4P) of the circuit.

Files are typically stored in "c:\users\public\network analyzer\documents"

Return Type String

Default Not Applicable

Examples `fixture.Embed4PortNetworkFilename(2) = "c:\users\public\network analyzer\documents/myFile.s4p" 'Write`

`value = fixture.Embed4PortNetworkFilename(1) 'Read`

C++ Syntax `HRESULT get_Embed4PortNetworkFilename(short networkNum, BSTR *filename);`

`HRESULT put_Embed4PortNetworkFilename(short networkNum, BSTR filename);`

Interface IFixturing2

Embed4PortNetworkMode Property

Description Specify the type of processing to take place on the specified 4-port network. First specify the network filename with [FSim.Embed4PortNetworkFilename Property](#).

VB Syntax `fixture.Embed4PortNetworkMode(netNum) = value`

Variable [\(Type\) - Description](#)

fixture A [Fixturing \(object\)](#)

netNum **(Integer)** Network position. Choose from **1** or **2**. See [Embed4PortTopology Property](#)

value **(Enum as NA4PortEmbedNetworkMode)** Processing mode. Choose from:

- **0** or **naNO_NETWORK** - The same as disabling.
- **1** or **naEMBED_NETWORK** - Add Network circuit.
- **2** or **naDEEMBED_NETWORK** - Remove Network circuit

Return Type Enum

Default naNO_NETWORK

Examples

```
fixture.Embed4PortNetworkMode(1) = naNO_NETWORK 'Write  
value = fixture.Embed4PortNetworkMode(2) 'Read
```

C++ Syntax

```
HRESULT get_Embed4PortNetworkMode( short networkNum,  
tagNA4PortEmbedNetworkMode *eVal );  
HRESULT put_Embed4PortNetworkMode( short networkNum,  
tagNA4PortEmbedNetworkMode eVal );
```

Interface IFixturing2

Embed4PortState Property

Description Turns ON or OFF 4-port Network embedding for all ports on the channel.

VB Syntax *fixture*.Embed4PortState = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (**Boolean**)

False - Turns Embedding OFF

True - Turns Embedding ON

Return Type Boolean

Default False (OFF)

Examples `fixture.Embed4PortState = False 'Write`

`value = fixture.Embed4PortState 'Read`

C++ Syntax HRESULT get_Embed4PortState(VARIANT_BOOL *pVal)
HRESULT put_Embed4PortState(VARIANT_BOOL newVal)

Interface IFixturing2

Embed4PortTopology Property

Description	Specifies the PNA / DUT topology. Learn more about these and other PNA/DUT configurations.
VB Syntax	<i>fixture</i> .Embed4PortTopology = <i>value</i>
Variable	(Type) - Description
<i>fixture</i>	A Fixturing (object)
<i>value</i>	(Enum as NA4PortEmbedTopology) PNA / DUT topology. Choose from: 0 or naTOPOLOGY_A - 2 PNA/DUT Ports 1 or naTOPOLOGY_B - 3 PNA/DUT Ports 2 or naTOPOLOGY_C - 4 PNA/DUT Ports
Return Type	Enum
Default	naTOPOLOGY_A (2 PNA/DUT Ports)
Examples	<pre>fixture.Embed4PortTopology = naTOPOLOGY_A 'Write value = fixture.Embed4PortTopology 'Read</pre>
C++ Syntax	<pre>HRESULT get_Embed4PortTopology(tagNA4PortEmbedTopology *eVal); HRESULT put_Embed4PortTopology(tagNA4PortEmbedTopology eVal);</pre>
Interface	IFixturing2

Enable Property

Description Turns ON / OFF the trigger output.

VB Syntax *auxTrig.Enable* = *state*

Variable [\(Type\)](#) - Description

auxTrig An [AuxTrigger](#) (object)

state (boolean)

True - Trigger Output ON

False - Trigger Output OFF

Return Type Boolean

Default False

Exaamples `auxTrig.Enable = True 'Write`

`value = auxTrig.Enable 'Read`

C++ Syntax HRESULT get_Enable(VARIANT_BOOL * enable);

HRESULT put_Enable(VARIANT_BOOL enable);

Interface IAuxTrigger

Last Modified:

14-Dec-2006 MX New topic

EnableAllOutput Property

Description Sets and returns the ON / OFF state of all DC sources for the channel.

VB Syntax `dc.EnableAllOutput = state`

Variable [\(Type\)](#) - Description

dc An [DCStimulus](#) (object)

state (boolean)

True - All DC sources ON

False - All DC sources OFF

Return Type Boolean

Default False

Examples `dc.EnableAllOutput = True 'Write`

`value = dc.EnableAllOutput 'Read`

C++ Syntax HRESULT get_EnableAllOutput(VARIANT_BOOL * pValue);
HRESULT put_EnableAllOutput(VARIANT_BOOL newValue);

Interface IDCStimulus

21-Feb-2012 MX New topic

Enabled Property

Description Enables and disables (ON/OFF) the port mapping and control line output of the specified test set.

If the specified test set is not connected or not ON, then setting Enabled = True will report an error. All other properties can be set when the test set is not connected.

When this command is set to ON or OFF, then the display of the test set status bar ([ShowProperties Property](#)) is also set to ON or OFF.

VB Syntax *tset.Enabled* = *value*

Variable [\(Type\)](#) - Description

tset A [TestsetControl](#) object

OR

An [E5091Testset](#) object

value **(Boolean)**

True Enables test set control.

False Disables test set control.

Return Type Boolean

Default False

Examples [See E5091A Example Program](#)

[See External Testset Program](#)

C++ Syntax HRESULT get_Enabled(VARIANT_BOOL *state);
HRESULT put_Enabled(VARIANT_BOOL state);

Interface ITestsetControl

IE5091Testsets

EnableLOPowerCal Property

Description Sets and returns whether or not the LO power cal step is included in the cal steps when a Cal is performed.

VB Syntax *obj.EnableLOPowerCal(n) = value*

Variable [\(Type\)](#) - Description

obj A [SMCType](#) (object)

A [VMCType](#) (object)

A [SweptIMDCal](#) (object)

A [NoiseCal](#) (object)

n LO Stage. Choose 1. (Only single LO allowed)

value (Boolean) Choose from:

False - Skips over the LO Power Cal when calibrating.

True - Includes a step for LO Power Cal when calibrating.

Return Type Boolean

Default PNA Rev. 9.1 and above: **False**

Before Rev 9.1: **True**

Examples

```
imd.EnableLOPowerCal(1)= true 'Write
```

```
loPwrCal = imd.EnableLOPowerCal(1) 'Read
```

C++ Syntax HRESULT get_EnableLOPowerCal (long stage, BOOL *enable)

HRESULT put_EnableLOPowerCal (long stage, BOOL enable)

Interface ISMCType

IVMCType

ISweptIMD2

INoiseCal2

EnablePhase Property

Description Sets and returns the state of SMC Phase measurements.

In the User Interface, there are two "enable phase" checkboxes: in the [Phase Settings dialog](#) and in the [Calibration Wizard](#). Checking one enables both. This single command also enables both.

VB Syntax *obj.EnablePhase = bool*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

A [Converter](#) (Object)

bool **(Boolean)** -

True - Include phase in SMC measurements

False - Do NOT include phase in SMC measurements

Return Type Boolean

Default False

Examples `mixer.EnablePhase = True`

C++ Syntax `HRESULT get_EnablePhase(VARIANT_BOOL * val);`

`HRESULT put_EnablePhase(VARIANT_BOOL val);`

Interface IMixer13

Last Modified:

25-Mar-2010 MX New topic

EnablePowerCompensation Property

Description Adjusts the source power at the specified port by the combined amount of loss through ALL enabled fixturing operations. Use this function to set the power level at the DUT input. [Learn more.](#)

Note: This command affects ALL measurements on the specified channel.

VB Syntax `fixture.EnablePowerCompensation (port) = bool`

Variable [\(Type\) - Description](#)

fixture A [Fixturing \(object\)](#)

port (**Integer**) Port number to receive power compensation.

bool (Boolean)

True - Compensate source power

False - Do NOT compensate source power

Return Type Boolean

Default False

Examples

```
fixture.EnablePowerCompensation(1) = True
value = fixture.EnablePowerCompensation(2) 'Read
```

C++ Syntax `HRESULT get_EnablePowerCompensation(short port, VARIANT_BOOL *pState);`
`HRESULT put_EnablePowerCompensation(short port, VARIANT_BOOL bVal);`

Interface IFixturing5

EnableSnPDataExtrapolation

Description Turns ON and OFF SNP file extrapolation for both 2-port and 4-port embedding/de-embedding.

VB Syntax `fixture.EnableSnPDataExtrapolation = bool`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

bool **True** - Turns Extrapolation ON

False - Turns Extrapolation OFF

Return Type Boolean

Default False

Examples

```
fixture.EnableSnPDataExtrapolation = True  
value = fixture.EnableSnPDataExtrapolation 'Read
```

C++ Syntax HRESULT get_EnableSnPDataExtrapolation(VARIANT_BOOL *pExtrap);
HRESULT put_EnableSnPDataExtrapolation(VARIANT_BOOL bExtrap);

EnableSourceUnleveledEvents Property

Description Specifies whether or not to report [Source Unleveled](#) errors as system events. These events can trigger an [OnSystemEvent](#) call.

This setting will revert to the default (False) setting on Instrument Preset.

VB Syntax `pref.EnableSourceUnleveledEvents = bool`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

bool (**Boolean**) - Choose from:

False - Do NOT report Source Unleveled Errors.

True - Report Source Unleveled Errors.

Return Type Boolean

Default False

Examples

```
pref.EnableSourceUnleveledEvents = False 'Write
```

```
prefer = pref.EnableSourceUnleveledEvents 'Read
```

C++ Syntax

```
HRESULT put_EnableSourceUnleveledEvents( VARIANT_BOOL bsourcUnlEnable)
```

```
HRESULT get_EnableSourceUnleveledEvents( VARIANT_BOOL *bsourcUnlEnable)
```

Interface IPreferences3

EndOfSweepOperation Property

Description Set and read the action which should be taken at the end of the last frequency or power sweep in the measurement. This setting is used to protect a sensitive device from too much power during the sweep retrace.

VB Syntax `gca.EndOfSweepOperation = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**NAGCAEndOfSweepOperation**)

- **naStandard (0)** Use the default PNA method. [Learn more.](#)
- **naSetToStartPower (1)** Sweep Start power
- **naSetToStopPower (2)** Sweep Stop power.
- **naSetRFOff (3)** Always turn power OFF while waiting.

Return Type Enum

Default naStandard

Examples

```
gca.EndOfSweepOperation = naSetToStartPower 'Write
eos = gca.EndOfSweepOperation 'Read
```

C++ Syntax HRESULT get_EndOfSweepOperation(tagNAGCAEndOfSweepOperation* pVal)
 HRESULT put_EndOfSweepOperation(tagNAGCAEndOfSweepOperation newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

ENRFile Property

Description Sets and returns the name of the ENR file associated with the noise source.

VB Syntax *noise*.**ENRFile** = *value*

Variable [\(Type\)](#) - Description

noise A [NoiseCal](#) (**object**)

value (**string**) Full path and ENR filename.

Return Type String

Default Not Applicable

Examples

```
noise.ENRFile = "c:/ProgramFiles/Agilent/Network  
Analyzer/Documents/ENR/346C.enr" 'Write
```

```
ENR = noise.ENRFile 'Read
```

C++ Syntax HRESULT get_ENRFile(BSTR* pValue)

HRESULT put_ENRFile(BSTR pNewValue)

Interface INoiseCal

Last Modified:

29-May-2007 MN New topic

ENRID Property

Description Sets and returns ID of ENR table.

VB Syntax *enr*.ENRSN = *ID*

Variable [\(Type\)](#) - Description

enr An [ENRFile](#) (**object**)

ID Identifier for the ENR table

Return Type String

Default Not Applicable

Examples [See example program](#)

C++ Syntax HRESULT get_ENRID(BSTR *Val);
HRESULT put_ENRID(BSTR Val);

Interface IENRFile

Last Modified:

2-Aug-2007 MX New topic

ENRSN Property

Description	Sets and returns the serial number of the noise source for which the ENR file applies.
VB Syntax	<i>enr.ENRSN = serialNumber</i>
Variable	(Type) - Description
<i>enr</i>	An ENRFile (object)
<i>serialNumber</i>	(String) Serial number of the noise source.
Return Type	String
Default	Not Applicable
Examples	See example program
C++ Syntax	<pre>HRESULT get_ENRSNBSTR *Val); HRESULT put_ENRSN(BSTR Val);</pre>
Interface	IENRFile

Last Modified:

2-Aug-2007 MX New topic

EqualTonePower Property - Superseded

Description	Note: This command is replaced with LevelingMethod Property Sets and returns the ON OFF state of Equal Tone Power for the Swept IMD or IMSpectrum measurement.
VB Syntax	<i>object</i> . EqualTonePower = <i>value</i>
Variable	(Type) - Description
<i>object</i>	A SweptIMD or IMSpectrum Object
<i>value</i>	(Boolean) - Choose from: True - Set equal tone power. False - Do NOT set equal tone power.
Return Type	Boolean
Default	False
Examples	<pre>ims.EqualTonePower = true 'Write value = imd.EqualTonePower 'Read</pre>
C++ Syntax	HRESULT get_EqualTonePower(VARIANT_BOOL* val) HRESULT put_EqualTonePower(VARIANT_BOOL val)
Interface	ISweptIMD2 IIMSpectrum2

Last modified:

14-Nov-2012 Superseded

5-May-2011 New topic

ErrorCorrection Property

Description Sets (or returns) error correction ON or OFF for the measurement.

VB Syntax *meas*.**ErrorCorrection** = *value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**boolean**)

False - Turns error correction OFF

True - Turns error correction ON

Return Type Boolean

Default See [Error Correction](#)

Examples `meas.ErrorCorrection = True 'Write`

`errcorr = meas.ErrorCorrection 'Read`

C++ Syntax HRESULT put_ErrorCorrection (VARIANT_BOOL bState)
HRESULT get_ErrorCorrection (VARIANT_BOOL *bState)

Interface IMeasurement

ErrorCorrection (Channel) Property

Description Attempts to sets error correction ON or OFF for all of the measurements on the channel. This setting may not be successful for some measurements because the Cal Set currently in place may not contain the appropriate calibration data. To read the error correction state for a measurement, use [Error Correction Property](#).

VB Syntax *chan*.**ErrorCorrection** = *value*

Variable [\(Type\)](#) - Description

chan A [Channel](#) (**object**)

value (**boolean**)

False - Turns error correction OFF

True - Turns error correction ON

Return Type Boolean

Default [About Error Correction](#)

Examples `chan.ErrorCorrection = True`

C++ Syntax HRESULT put_ErrorCorrection (VARIANT_BOOL bState)

Interface IChannel7

ErrorCorrectionIndicator Property

Description	Returns the error correction state for the measurement.
VB Syntax	<i>value</i> = <i>meas</i> . ErrorCorrectionIndicator
Variable	(Type) - Description
<i>value</i>	(Enum) Error correction state. <ul style="list-style-type: none">• 0 - naErrorCorrectionIndicator_None - No error correction• 1 - naErrorCorrectionIndicator_Master - Original error correction terms applied.• 2 - naErrorCorrectionIndicator_Interpolated - Error terms are interpolated. Learn more• 3 - naErrorCorrectionIndicator_Delta - Delta Match calibration terms. Learn more• 4 - naErrorCorrectionIndicator_Invalid Error terms are not valid.
<i>meas</i>	A Measurement (object)
Return Type	Enum as NAErrorCorrectionIndicator
Default	See Error Correction
Examples	<pre>errcorr = meas.ErrorCorrectionIndicator 'Read</pre>
C++ Syntax	HRESULT get_ErrorCorrectionIndicator (enum NAErrorCorrectionIndicator *pIndicator);
Interface	IMeasurement14

Write-only

ExtendedProperties Property

Description Provides access to the custom properties and methods of an external device.

VB Syntax Set *PSG* = *ExtDev*.**ExtendedProperties**

Variable [\(Type\)](#) - Description

PSG **(Object)** Variable to store the returned handle to an external device.

ExtDev An [ExternalDevice](#) **(object)**

Return Type Object

Default Not Applicable

Examples [See Example](#)

C++ Syntax HRESULT get_ExtendedProperties(IDispatch** ppObject);

Interface IExternalDevice

Last Modified:

27-Aug-2009 MX New topic

Write/Read

ExternalALC Property

Description Sets or returns the source of the analyzer leveling control.

VB Syntax *app.ExternalALC = value*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (**boolean**) - Choose from:

True - Leveling control supplied through the rear panel.

False - Leveling control supplied inside the analyzer

Return Type Boolean

Default False

Examples `app.ExternalALC = True 'Write`

`extALC = app.ExternalALC 'Read`

C++ Syntax HRESULT get_ExternalALC(VARIANT_BOOL *pVal)
HRESULT put_ExternalALC(VARIANT_BOOL newVal)

Interface IApplication

ExternalDeviceDeActivatePolicy Property

Description Set and return whether External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

See the [ExternalDevices](#) collection.

VB Syntax `pref.ExternalDeviceDeActivatePolicy = value`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (**Boolean**) - Choose from:

- **True** - External device are **de-activated** when the PNA is Preset or when a Instrument State is recalled.
- **False** - External devices **remain active** when the PNA is Preset or when a Instrument State is recalled.

Return Type Boolean

Default **True**

Examples

```
pref.ExternalDeviceDeActivatePolicy = 1 'Write
```

```
dDevPolicy = pref.ExternalDeviceDeActivatePolicy 'Read
```

C++ Syntax HRESULT get_ExternalDeviceDeActivatePolicy(VARIANT_BOOL * pref);

HRESULT put_ExternalDeviceDeActivatePolicy(VARIANT_BOOL pref);

Interface IPreferences10

Last Modified:

17-Sep-2009 MX New topic

ExternalTriggerConnectionBehavior Property

Description Configures the external triggering signal for the PNA and PNA-X.

- [TriggerSouce Property](#) is automatically set to External when **ExternalTriggerConnectionBehavior** is sent.
- Edge triggering is only available on some PNA models.
- For more information, see [External Triggering](#).

VB Syntax *trigsetup*.**ExternalTriggerConnectionBehavior** (*conn*) = *value*

Variable [\(Type\)](#) - Description

trigsetup A [TriggerSetup](#) (object)

conn (**enum NATriggerConnection**) Rear Panel connector to send or receive trigger signals. Choose from:

Only one of the input connectors is active at a time. When a command is sent to one, the PNA automatically makes the other INACTIVE.

0 - naTriggerConnectionAUXT Trigger IN from rear-panel AUX IO connector Pin 19 (No longer supported).

1 - naTriggerConnectionBNC1 Trigger IN

- [MEAS TRIG IN](#) on models

2 - naTriggerConnectionBNC2 Trigger OUT. Only useful in point sweep mode.

- [AUX TRIG 1 OUT](#) on models

3 - naTriggerConnectionMATH Trigger IN from rear-panel [Material Handler connector Pin 18](#)

value (**enum NAExternalTriggerBehavior**) -

0 - naTriggerInactive - Disables the specified connector.

Choose from 1 through 4 when <conn> is set to naTriggerConnection**BNC1**

1 - naTriggerInEdgeNegative - Triggers the PNA when receiving a negative going

signal

2 - **naTriggerInEdgePositive** - Triggers the PNA when receiving a positive going signal

3 - **naTriggerInLevelLow** - Triggers the PNA when receiving a low level signal

4 - **naTriggerInLevelHigh** - Triggers the PNA when receiving a High-level signal

Choose from 5 through 8 when <conn> is set to **naTriggerConnectionBNC2**.

In addition to sending this command, you must also use [TriggerOutputEnabled Property](#) to enable the BNC2 output.

5 - **naTriggerOutPulsePositiveAfter** - Sends a POSITIVE going TTL pulse at the END of each point during the sweep.

6 - **naTriggerOutPulsePositiveBefore** - Sends a POSITIVE going TTL pulse at the START of each point during the sweep.

7 - **naTriggerOutPulseNegativeAfter** - Sends a NEGATIVE going TTL pulse at the END of each point during the sweep.

8 - **naTriggerOutPulseNegativeBefore** - Sends a NEGATIVE going TTL pulse at the START of each point during the sweep.

Return Type Enum as NAExternalTriggerBehavior

Default BNC1 = **naTriggerInactive**

BNC2 = **naTriggerInactive**

When [Output is enabled](#)

BNC1 = **naTriggerInactive**

BNC2 = **naTriggerOutPulsePositiveAfter**

Examples

```
trigsetup.ExternalTriggerConnectionBehavior (naTriggerConnectionBNC1) =  
naTriggerInLevelLow 'Write
```

```
trigBehav = trigsetup.ExternalTriggerConnectionBehavior  
(naTriggerConnectionAUXT) 'Read
```

C++ Syntax HRESULT get_ExternalTriggerConnectionBehavior(tagNATriggerConnection connection,tagNAExternalTriggerBehavior *trigger);

HRESULT put_ExternalTriggerConnectionBehavior(tagNATriggerConnection connection,tagNAExternalTriggerBehavior trigger);

Interface ITriggerSetup

Last Modified:

12-Apr-2012 Removed reference to old models

12-Dec-2011 Added notes for models

25-Feb-2008 Added 'Global' note

ExternalTriggerDelay Property

Description Sets and reads the trigger delay for all measurements in the CHANNEL. This delay is only applied while in [app.Source = naTriggerSourceExternal](#) and [trigsetup.Scope = naChannelTrigger](#) . After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for all channels (Global), use [TriggerDelay Property](#).

VB Syntax *chan.ExternalTriggerDelay = value*

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

value **Double**- Trigger delay value in seconds. Range is from 0 to 107 seconds

Return Type Double

Default 0

Examples

```
chan.ExternalTriggerDelay = .003 'Write
```

```
delay = chan.ExternalTriggerDelay 'Read
```

C++ Syntax HRESULT get_ExternalTriggerDelay(double *delay);

HRESULT put_ExternalTriggerDelay(double delay)

Interface IChannel6

F1Frequency Property

Description Sets and returns the frequency of the F1 tone. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`

VB Syntax *object.F1Frequency = value*

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IMSpectrum](#) Object

value (Double) F1 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default .9995 GHz

Examples `imd.F1Frequency = 100e6 'Write`

`value = imd.F1Frequency 'Read`

C++ Syntax `HRESULT get_F1Frequency(double *pVal)`
`HRESULT put_F1Frequency(double newVal)`

Interface `ISweptIMD`
`IIMSpectrum`

Last Modified:

19-Aug-2008 MX New topic

F2Frequency Property

Description Sets and returns the frequency of the F2 tone. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`

VB Syntax *object.F2Frequency = value*

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IMSpectrum](#) Object

value (Double) F2 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 1.0005 GHz

Examples

```
imd.F2Frequency = 200e9 'Write
```

```
value = imd.F2Frequency 'Read
```

C++ Syntax HRESULT get_F2Frequency(double *pVal)
HRESULT put_F2Frequency(double newVal)

Interface ISweptIMD
IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

FailedTraces Property

Description Set and return the limit line color of failed traces or failure indicators (dots) and the word **Fail**.

VB Syntax *colors.FailedTraces = value*

Variable [\(Type\)](#) - Description

colors A [ComColors](#) (object)

value **(Long Integer)** - RGB color of the FailedTraces pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Display = 255,20,20

Print = 255,20,20

Examples

```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.FailedTraces = RGB 'Write
color = colors.FailedTraces 'Read
```

C++ Syntax HRESULT get_FailedTraces(long* pVal);

HRESULT put_FailedTraces(long newVal);

Interface IComColors

Last Modified:

7-Aug-2009 MX New topic

FastCWPointCount Property

Description Enables Fast CW sweep and sets the number of data points for the channel. [Sweep Type](#) must already be set to CWTime and FIFO must already be enabled.

See Also

[FIFO and other Antenna Features](#)

[FIFO Object](#)

[Example program](#)

[N5264A Measurement Receiver](#)

VB Syntax *chan*.FastCWPointCount = *value*

Variable (Type) - Description

chan A [Channel](#) Object

value (Long Integer) Number of data points to measure in Fast CW mode. This setting overwrites the standard number of points setting for the channel.

Set to 0 to disable Fast CW.

Return Type Long Integer

Default 0

Examples

```
chan.FastCWPointCount = 1e3 'Write
```

```
value = chan.FastCWPointCount 'Read
```

C++ Syntax HRESULT get_FastCWPointCount(long *value)

HRESULT put_FastCWPointCount(long value)

Interface IChannel16

Last Modified:

2-Feb-2011 Fixed syntax

FastMode Property

Description	Sets and returns the state of a separate IFBW setting for leveling sweeps. ON allows a higher (faster) IFBW than the measurement sweep. It also causes leveling sweeps to be noisier.
VB Syntax	<i>RxLevel</i> . FastMode (<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>srcPort</i>	(Long Integer) Source port for which to set Fast Mode for Receiver Leveling.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Boolean) Separate IFBW setting state. Choose from: True - Use separate IFBW setting. Specify IFBW using LevelingIFBW . False - Use same IFBW as the measurement sweep. Specify IFBW using IF Bandwidth .
Return Type	Variant Boolean
Default	True
Examples	<pre>rxLevel.FastMode (1) = True ' Write value = rxLevel.FastMode 2 ' Read</pre>
C++ Syntax	HRESULT get_FastMode(long port, VARIANT_BOOL* pVal); HRESULT put_FastMode(long port, VARIANT_BOOL newVal);
Interface	IRceiverLevelingConfiguration

Last Modified:

13-Feb-2009 MX New topic

FilterBW Property

Description Returns the results of the SearchBandwidth method.

VB Syntax `filtBW = meas.FilterBW`

Variable [\(Type\)](#) - [Description](#)

filtBW (single) - Variable to store bandwidth data

meas A Measurement (**object**)

Return Type Single

Default Not applicable

Examples `filterBW = meas.FilterBW 'Read`

C++ Syntax HRESULT get_FilterBW(float* bw)

Interface IMeasurement

FilterCF Property

Description Returns the Center Frequency result of the SearchBandwidth method.

VB Syntax `filtCF = meas.FilterCF`

Variable [\(Type\)](#) - Description

`filtCF` (**double**) - Variable to store bandwidth CF data

`meas` A Measurement (**object**)

Return Type Double

Default Not applicable

Examples `filtCF = meas.FilterCF 'Read`

C++ Syntax HRESULT get_FilterCF(double* centerFrequency)

Interface IMeasurement

FilterLoss Property

Description Returns the Loss value of the SearchBandwidth method.

VB Syntax *filtLoss* = *meas*.FilterLoss

Variable [\(Type\)](#) - Description

filtLoss (**single**) - Variable to store bandwidth Loss data

meas A Measurement (**object**)

Return Type Single

Default Not applicable

Examples `filterLoss = meas.FilterLoss 'Read`

C++ Syntax HRESULT get_FilterLoss(float* loss)

Interface IMeasurement

FilterQ Property

Description Returns the Q (quality factor) result of the SearchBandwidth method.

VB Syntax `filtQ = meas.FilterQ`

Variable [\(Type\)](#) - Description

`filtQ` (single) - Variable to store bandwidth Q data

`meas` A Measurement (**object**)

Return Type Single

Default Not applicable

Examples `filtQ = meas.FilterQ 'Read`

C++ Syntax HRESULT get_FilterQ(float* quality)

Interface IMeasurement

FilterErrors Property

Description Returns the error string associated with the digital filters. The return string has three fields separated by commas: "stage1 status, stage2 status, stage3 status"

Each of these fields can contain one or more of the following error codes:

- **NO ERROR**
- ***NUMBER-OF-COEFFICIENTS** - the number of coefficients is excessive for that filter-stage
- ***COEFFICIENT VALUE** - one or more coefficients are out of range for that filter-stage
- ***SUM-OF-COEFFICIENTS** - the sum of all coefficients is excessive for that filter-stage,
- ***FREQUENCY** - the frequency for Stage 1 is out of range (only applies stage1 field),
- ***PARAMETER** - one or more parameters are out of range (only applies to stage 3 field)

VB Syntax *value* = *spm4*.FilterErrors

Variable [\(Type\)](#) - Description

value Variable to store the returned errors.

spm4 A [SignalProcessingModuleFour](#) (object)

Return Type String

Default Not Applicable

Examples

```
mode = spm4.FilterErrors 'Read

'example return strings"

NO ERROR, NO ERROR, NO ERROR
indicates no errors,

*SUM-OF-COEFFICIENTS, NO ERROR, NO ERROR
indicates that the sum of all filter coefficients exceed the
maximum value for the Stage-1 filter,

*COEFFICIENT *SUM-OF-COEFFICIENTS, NO ERROR, *PARAMETER
indicates a problems with Stage 1 coefficients and a problem
with one or more of the parameters associated with the Stage 3
filter.
```

C++ Syntax HRESULT get_FilterErrors(BSTR* dspErrors);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

FilterMode Property

Description Sets and returns whether the PNA configures the 3-stage digital filter settings or they will be configured manually. When making manual settings, also send [ADCCaptureMode Property](#) which routes the IF through the 3-stage filter.

VB Syntax `spm4.FilterMode = value`

Variable (Type) - Description

spm4 A [SignalProcessingModuleFour \(object\)](#)

value (**enum as NAModes**) Filter mode. Choose from:

naAUTO PNA controls digital filter settings.

naMANUAL You control digital filter settings using other [SignalProcessingModuleFour](#) commands.

Return Type Enum

Default naAUTO

Examples

```
spm4.FilterMode = naAUTO 'Write
mode = spm4.FilterMode 'Read
```

C++ Syntax HRESULT get_FilterMode(tagNAModes* dspMode);
HRESULT put_FilterMode(tagNAModes dspMode);

Interface ISignalProcessingModuleFour

Last Modified:

24-Jan-2007 MX New topic

FirmwareMajorRevision Property

Description	Returns the major firmware revision number as an integer. For example, given a firmware revision number A.03.30, this command returns 3.
VB Syntax	<i>value</i> = <i>cap</i> . FirmwareMajorRevision
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned integer value of the firmware revision number.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<code>value = cap.FirmwareMajorRevision 'Read</code>
C++ Syntax	HRESULT get_FirmwareMajorRevision(long * majorRev);
Interface	ICapabilities

FirmwareMinorRevision Property

Description	Returns the minor firmware revision number as an integer. For example, given a firmware revision number A.03.30, this command returns 30.
VB Syntax	<i>value</i> = <i>cap</i> . FirmwareMinorRevision
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned decimal value of the firmware revision number.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<code>value = cap.FirmwareMinorRevision 'Read</code>
C++ Syntax	HRESULT get_FirmwareMinorRevision(long * minorRev);
Interface	ICapabilities

FirmwareSeries Property

Description	Returns the alpha portion of the firmware revision number. For example, given a firmware revision number A.03.30, this command returns A.
VB Syntax	<i>value</i> = <i>cap</i> . FirmwareSeries
Variable	(Type) - Description
<i>value</i>	(String) - Variable to store the returned alpha value of the firmware revision number.
<i>cap</i>	A Capabilities (object)
Return Type	String
Default	Not Applicable
Examples	<pre>value = cap.FirmwareSeries 'Read</pre>
C++ Syntax	HRESULT get_FirmwareSeries(BSTR * series);
Interface	ICapabilities

FixedDelay Property

Description Set and return the known delay through the calibration mixer.

VB Syntax *smc*.**FixedDelay** = *value*

Variable [\(Type\)](#) - Description

smc An [SMCType](#) (object)

value (Double) Known delay through the calibration mixer in seconds.

Return Type Double

Default 0 seconds

Example `SMC.FixedDelay = 12e-9` **Write**

`value =SMC.FixedDelay` **Read**

C++ Syntax HRESULT put_FixedDelay(Double Value);

HRESULT get_FixedDelay(Double* Value);

Interface SMCType5

Last Modified:

25-Mar-2010 MX New topic

FixedPhase Property

Description Write and read the fixed phase value. Must not be logarithmic sweep type.

VB Syntax *phase*.FixedPhase(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Phase value in degrees. Choose a value between -360 and 360.

Return Type Double

Default 0 degrees

Examples

```
phase.FixedPhase 1 = 15 ' Write  
value = phase.FixedPhase 2 ' Read
```

C++ Syntax

```
HRESULT get_FixedPhase(long port, double* pVal);  
  
HRESULT put_FixedPhase(long port, double newVal);
```

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

FixedRatioedPower Property

Description	Write and read the fixed power ratioed value. Must NOT be in power sweep to use this value during phase control.
VB Syntax	<i>phase</i> .FixedRatioedPower(<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>phase</i>	A PhaseControl Object
<i>srcPort</i>	(Long Integer) Source port for which to make phase control settings.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Double) Fixed power ratio value in dBc within the allowable range of the PNA.
Return Type	Double
Default	0 dBc
Examples	<pre>phase.FixedRatioedPower 1 = -1 ' Write value = phase.FixedRatioedPower 2 ' Read</pre>
C++ Syntax	<pre>HRESULT get_FixedRatioedPower(long port, double* pVal); HRESULT put_FixedRatioedPower(long port, double newVal);</pre>
Interface	IPhaseControl

8-Dec-2010 MX New topic

FixturingState Property

Description Turns all three fixturing functions (de-embedding, port matching, impedance conversion) ON or OFF for all ports on the specified channel. This does NOT affect port extensions.

VB Syntax *fixture.FixturingState* = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (boolean)

True - Turns Fixturing ON

False - Turns Fixturing OFF

Return Type Boolean

Default False

Examples `fixture.FixturingState = True 'Write`

`value = fixture.FixturingState 'Read`

C++ Syntax HRESULT get_FixturingState(VARIANT_BOOL *pVal)

HRESULT put_FixturingState(VARIANT_BOOL newVal)

Interface IFixturing

Read-only

FootSwitch Property

Description Reads the Footswitch Input (pin 20 of the AUX IO connector).

VB Syntax *value* = *AuxIO*.**Footswitch**

Variable [\(Type\)](#) - **Description**

value **(boolean)** - Variable to store the returned value

False - foot switch is released

True - footswitch is depressed

AuxIO **(object)** - A Hardware Aux I/O object

Return Type Boolean

Default True

Examples `fs = aux.Footswitch`

C++ Syntax HRESULT get_FootSwitch (VARIANT_BOOL* State);

Interface IHWAuxIO

FootswitchMode Property **Obsolete**

Description	Determines what occurs when the footswitch is pressed. For more information see the FootSwitch In pin description in the Auxiliary IO connector.
VB Syntax	<i>AuxIo.FootSwitchMode = value</i>
Variable	(Type) - Description
<i>value</i>	(enum NAFootSwitchMode)
	0 - naIgnoreFootswitch - Footswitch presses are ignored.
	1 - naSweepTrigger - Footswitch presses trigger a sweep. The PNA must be in Manual Trigger Mode.
	2 - naRecallNextState - Footswitch presses recall an instrument state. When more than one state is available, then each footswitch press recalls the next state, then starts over from the beginning. It is possible for a recalled state to override the current mode. If the recalled state is IGNore, then mode changes and additional footswitch presses are ignored.
	3 - naRunMacro - Footswitch presses load and run a macro. When more than one macro is available, then each footswitch press loads and runs the next macro, then starts over from the beginning. It is possible for a Macro to override the current mode. If the macro contains a Preset, then the mode changes to the default setting IGNore and additional footswitch presses are ignored.
<i>AuxIO</i>	(object) - A Hardware Aux I/O object
Return Type	NAFootSwitchMode
Default	0 - naIgnoreFootswitch
Examples	<code>auxIo.FootSwitchMode = naIgnoreFootSwitch 'Write</code>
C++ Syntax	HRESULT get_FootSwitchMode(NAFootSwitchMode *pFootSwitchMode) HRESULT put_FootSwitchMode(NAFootSwitchMode newFootSwitchMode)
Interface	IHWAuxIO3

ForceDeEmbedENRAdapter Property

Description Set and read the De-embedENRAdapter state. [Learn more](#).

VB Syntax `noiseCal.ForceDeEmbedENRAdapter = value`

Variable [\(Type\)](#) - Description

noiseCal A [NoiseCal](#) (object)

value (**boolean**) - ENR Adapter de-embed state.

False - Do not Force de-embedding.

True - Force de-embedding.

Return Type Boolean

Default False

Examples `noiseCal.ForceDeEmbedENRAdapter = False` **Write**
`AdapterDembed = noiseCal.ForceDeEmbedENRAdapter` **Read**

C++ Syntax HRESULT get_ForceDeEmbedENRAdapter(VARIANT_BOOL* on);
HRESULT put_ForceDeEmbedENRAdapter(VARIANT_BOOL on);

Interface INoiseCal2

Last Modified:

26-Oct-2009 MX New topic

ForceDeEmbedSensorAdapter Property

Description Set and read the state of power sensor adapter de-embedding. [Learn more](#).

VB Syntax `noiseCal.ForceDeEmbedSensorAdapter = value`

Variable [\(Type\)](#) - Description

noiseCal A [NoiseCal](#) (object)

value (**boolean**) - Power sensor adapter de-embed state.

False - Do not Force de-embedding.

True - Force de-embedding.

Return Type Boolean

Default False

Examples

```
noiseCal.ForceDeEmbedSensorAdapter = False 'Write
```

```
AdapterDembed = noiseCal.ForceDeEmbedSensorAdapter 'Read
```

C++ Syntax HRESULT get_ForceDeEmbedSensorAdapter(VARIANT_BOOL* on);
HRESULT put_ForceDeEmbedSensorAdapter(VARIANT_BOOL on);

Interface INoiseCal2

Format Property (marker)

Description Sets (or returns) the format of the marker.

VB Syntax *mark.Format = value*

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (enum `NAMarkerFormat`) - Choose from:

0 - `naMarkerFormat_LinMag`

1 - `naMarkerFormat_LogMag`

2 - `naMarkerFormat_Phase`

3 - `naMarkerFormat_Delay`

4 - `naMarkerFormat_Real`

5 - `naMarkerFormat_Imaginary`

6 - `naMarkerFormat_SWR`

7 - `naMarkerFormat_LinMagPhase`

8 - `naMarkerFormat_LogMagPhase`

9 - `naMarkerFormat_RealImaginary`

10 - `naMarkerFormat_ComplexImpedance`

11 - `naMarkerFormat_ComplexAdmittance`

12 - `naMarkerFormat_Kelvin`

13 - `naMarkerFormat_Fahrenheit`

14 - `naMarkerFormat_Celsius`

Return Type `NAMarkerFormat`

Default 1 - `naMarkerFormat_LogMag`

Examples `mark.Format = naMarkerFormat_SWR 'Write`

`fmt = mark.Format 'Read`

C++ Syntax HRESULT get_Format(tagNAMarkerFormat *pVal)
HRESULT put_Format(tagNAMarkerFormat newVal)

Interface IMarker

Last Modified:

1-Oct-2007 Added temperature formats

FormatUnit Property

Description Sets and returns the units for the specified data format. Measurements with display formats other than those specified are not affected.

VB Syntax *meas.FormatUnit (format) = value*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

format (enum **NADataFormat**) - Choose:

1 - **naDataFormat_LogMag**

value (enum **naFormatUnit**) - Choose from:

0 - naFormatUnit_dBm Units are displayed in dBm. 0 dBm = 0.001 watt

1 - naFormatUnit_dBmV Units are displayed in dBmV. 0 dBmV = 0.001 volt

Return Type Enum

Default **0 - naFormatUnit_dBm**

Examples `meas.FormatUnit(1) = naFormatUnit_dBmV 'Write`

`units = meas.FormatUnit(1) 'Read`

C++ Syntax HRESULT put_FormatUnit(tagDataFormat format, tagFormatUnit unit)

HRESULT get_FormatUnit(tagDataFormat format, tagFormatUnit* unit)

Interface IMeasurement9

26-Aug-2008 MX New topic

Frequency Property

Description Sets group delay aperture using a fixed frequency range.

VB Syntax *gdAperture.Frequency = value*

Variable [\(Type\)](#) - [Description](#)

gdAperture A [GroupDelayAperture](#) (**object**)

value (**Double**) Frequency range (in Hz) to use for the aperture setting.

Return Type Double

Default Frequency range that equates to 11 points.

This can be changed to two points with a [preference setting](#).

Examples `gdAperture.Frequency = 1e6 'Write`

`aperture = gdAperture.Frequency 'Read`

C++ Syntax HRESULT get_Frequency(double Frequency *pVal)

HRESULT put_Frequency(double Frequency newVal)

Interface IGroupDelayAperture

Last Modified:

23-Feb-2010 MX New topic

Frequency Property

Description	Sets or returns the frequency associated with a Power Sensor CalFactor Segment or Sets or returns the frequency associated with a Power Loss Segment.
VB Syntax	<i>object</i> . Frequency = <i>value</i>
Variable	(Type) - Description
<i>object</i>	One of the following objects: PowerSensorCalFactorSegment PowerSensorCalFactorSegmentPMAR PowerLossSegment PowerLossSegmentPMAR
<i>value</i>	(double) – Frequency in units of Hz. This can be any non-negative value (limited by the maximum value of double).
Return Type	Double
Default	0
Examples	<pre>seg.Frequency = 6e9 'Write freq = seg.Frequency 'Read</pre>
C++ Syntax	HRESULT put_Frequency(double newVal); HRESULT get_Frequency(double *pVal);
Interface	One of the above objects.

Last Modified:

25-Aug-2009 Added PMAR

FrequencyCenter Property

Description Sets and returns the center frequency of the main tones. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`
- `naIMDDeltaFrequencySweep`

VB Syntax `object.FrequencyCenter = value`

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IMSpectrum](#) Object

value (Double) Tone center frequency in Hz. Both the F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 1.0 GHz

Examples

```
imd.FrequencyCenter = 2e9 'Write
```

```
value = imd.FrequencyCenter 'Read
```

C++ Syntax HRESULT get_FrequencyCenter(double *pVal)
HRESULT put_FrequencyCenter(double *pVal)

Interface ISweptIMD
IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

FrequencyCenterCenter Property

Description Sets and returns the sweep center frequency when sweeping the main tones. Use with sweep type = **naIMDToneCenterFreqSweep**.

VB Syntax *imd.FrequencyCenterCenter = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Center frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 13.255 GHz

Examples

```
imd.FrequencyCenterCenter = 10e9 'Write  
value = imd.FrequencyCenterCenter 'Read
```

C++ Syntax HRESULT get_FrequencyCenterCenter(double *pVal)
HRESULT put_FrequencyCenterCenter(double newVal)

Interface ISweptIMD

Last Modified:

19-Aug-2008 MX New topic

FrequencyCenterSpan Property

Description Sets and returns the frequency span when sweeping the main tones. Use with sweep type = **naIMDToneCenterFreqSweep**.

VB Syntax *imd.FrequencyCenterSpan = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Frequency span in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 26.489 GHz

Examples

```
imd.FrequencyCenterSpan = 10e9 'Write  
value = imd.FrequencyCenterSpan 'Read
```

C++ Syntax HRESULT get_FrequencyCenterSpan(double *pVal)
HRESULT put_FrequencyCenterSpan(double newVal)

Interface ISweptIMD

Last Modified:

19-Aug-2008 MX New topic

FrequencyCenterStart Property

Description Sets and returns the start frequency when sweeping the main tones. Use with sweep type = **naIMDToneCenterFreqSweep**.

VB Syntax *imd.FrequencyCenterStart = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Start frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 10.5 MHz

Examples

```
imd.FrequencyCenterStart = 20e6 'Write  
value = imd.FrequencyCenterStart 'Read
```

C++ Syntax HRESULT get_FrequencyCenterStart(double *pVal)
HRESULT put_FrequencyCenterStart(double newVal)

Interface ISweptIMD

Last Modified:

19-Aug-2008 MX New topic

FrequencyCenterStop Property

Description Sets and returns the stop frequency when sweeping the main tones. Use with sweep type = **naIMDToneCenterFreqSweep**.

VB Syntax *imd.FrequencyCenterStop = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMD](#) Object

value (Double) Stop frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Return Type Double

Default 26.4995 MHz

Examples

```
imd.FrequencyCenterStop = 20e9 'Write  
value = imd.FrequencyCenterStop 'Read
```

C++ Syntax HRESULT get_FrequencyCenterStop(double *pVal)
HRESULT put_FrequencyCenterStop(double newVal)

Interface ISweptIMD

19-Aug-2008 MX New topic

FrequencyOffsetDivisor Property **Superseded**

Description	This method is replaced by properties on the FOMRange Object . Specifies (along with FrequencyOffsetMultiplier) the value to multiply by the stimulus. See other Frequency Offset properties
VB Syntax	<i>object</i> . FrequencyOffsetDivisor = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object) or CalSet (object) - Read-only property
<i>value</i>	(Double) - Divisor value. Range is 1 to 1000
Return Type	Double
Default	1
Examples	<pre>chan.FrequencyOffsetDivisor = 2 'Write</pre> <pre>fOffsetDiv = chan.FrequencyOffsetDivisor 'Read</pre>
C++ Syntax	HRESULT get_FrequencyOffsetDivisor(double*pval) HRESULT put_FrequencyOffsetDivisor(double newVal)
Interface	IChannel2 CalSet3

FrequencyOffsetFrequency Property **Superseded**

Description	This method is replaced by properties on the FOMRange Object . Specifies an absolute offset frequency in Hz. For mixer measurements, this would be the LO frequency. See other Frequency Offset properties.
VB Syntax	<i>object</i> . FrequencyOffsetFrequency = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object)
	or
	CalSet (object) - Read-only property
<i>value</i>	(Double) - Offset value. Range is +/- 1000 GHz. (Offsets can be positive or negative.)
Return Type	Double
Default	0 Hz
Examples	<pre>chan.FrequencyOffsetFrequency = 2 'Write</pre> <pre>fOffsetFreq = chan.FrequencyOffsetFrequency 'Read</pre>
C++ Syntax	HRESULT get_FrequencyOffsetFrequency(double*pval) HRESULT put_FrequencyOffsetFrequency(double newVal)
Interface	IChannel2 CalSet3

FrequencyOffsetMultiplier Property **Superseded**

Description	This method is replaced by properties on the FOMRange Object . Specifies (along with FrequencyOffsetDivisor) the value to multiply by the stimulus. See other Frequency Offset properties.
VB Syntax	<i>object</i> . FrequencyOffsetMultiplier = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object) or CalSet (object) - Read-only property
<i>value</i>	(Double) - Multiplier value. Range is 1 to 1000
Return Type	Double
Default	1
Examples	<pre>chan.FrequencyOffsetMultiplier = 2 'Write</pre> <pre>fOffsetMult = chan.FrequencyOffsetMultiplier 'Read</pre>
C++ Syntax	HRESULT get_FrequencyOffsetMultiplier (double*pval); HRESULT put_FrequencyOffsetMultiplier (double newVal);
Interface	IChannel2 CalSet3

Write/Read

FrequencyOffsetRangeForCalComputations Property

Description Specifies the FOM frequency range to use when performing calibration.

VB Syntax `pref.FrequencyOffsetRangeForCalComputations = value`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (Enum as [NACalFOMRange](#)) - Choose from:

0 - naCalFOMRangeAuto - All other calibration situations.

1 - naCalFOMRangePrimary - Used for calibrating at the mmWave frequencies when NOT using a test set. [Learn more.](#)

Return Type Enum

Default [naCalFOMRangeAuto](#)

Examples

```
pref.FrequencyOffsetRangeForCalComputations = naCalFOMRangePrimary 'Write  
calPref = pref.FrequencyOffsetRangeForCalComputations 'Read
```

C++ Syntax

```
HRESULT get_FrequencyOffsetRangeForCalComputations(tagNACalFOMRange *  
val);  
  
HRESULT put_FrequencyOffsetRangeForCalComputations((tagNACalFOMRange val);
```

Interface [IPreferences10](#)

Last Modified:

16-Sep-2009 MX New topic

FrequencyOffsetCWOverride Property **Superseded**

Description	This method is replaced by properties on the FOMRange Object .
	Establishes a fixed (CW) stimulus frequency while measuring the Response over a swept frequency range. For example, a fixed-frequency PNA stimulus may be applied to the RF input of a mixer whose local oscillator (LO) is being swept. Because the IF output of the mixer will be swept, the PNA receivers must also be swept.
	See other Frequency Offset properties.
VB Syntax	<i>object</i> . FrequencyOffsetCWOverride = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object)
	or
	CalSet (object) - Read-only property
<i>value</i>	(Enum as NaStates) - Choose from:
	naOFF (0) - Turns CW override OFF
	naON (1) - Turns CW override ON
Return Type	Enum
Default	0 Hz
Examples	<pre>chan.FrequencyOffsetCWOverride = 1 'Write</pre>
	<pre>fOffsetOV = chan.FrequencyOffsetCWOverride 'Read</pre>
C++ Syntax	HRESULT get_FrequencyOffsetCWOverride (tagNAStates *pstate) HRESULT put_FrequencyOffsetCWOverride (tag NAStates newState)
Interface	IChannel2 CalSet3

FrequencyOffsetState Property **Superseded**

Description	This method is replaced by properties on the FOMRange Object . Enables Frequency Offset on ALL measurements that are present on the active channel. This immediately causes the source and receiver to tune to separate frequencies. The receiver frequencies are specified with other channel and offset settings. To make the stimulus settings, use Channel Start, Stop Frequency properties. See other Frequency Offset properties. Tip: To avoid unnecessary errors, first make other frequency offset settings. Then turn Frequency Offset ON.
VB Syntax	<i>object</i> . FrequencyOffsetState = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object) or CalSet (object) - Read-only property
<i>value</i>	(Enum as NaStates) - Choose from: naOFF (0) - Turns Frequency Offset OFF naON (1) - Turns Frequency Offset ON
Return Type	Enum
Default	naOFF (0)
Examples	<pre>chan.FrequencyOffsetState = naON 'Write</pre> <pre>Foffset = chan.FrequencyOffsetState 'Read</pre>
C++ Syntax	HRESULT FrequencyOffsetState (tag NAStates *pState); HRESULT FrequencyOffsetState (tag NAStates newState)
Interface	IChannel2 CalSet3

FrequencyType Property

Description	Sets and returns the frequency range to use for receiver leveling. On the user interface, this is the "Receiver frequency is determined by:" setting.
VB Syntax	<i>RxLevel.FrequencyType(srcPort) = value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>srcPort</i>	(Long Integer) Source port for Receiver Leveling.
	<p>Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port</p>
<i>value</i>	(Enum) Frequency range. Choose from: <ul style="list-style-type: none"> naAutoFrequency (0) - always uses the frequency range that is assigned to the measurement receiver. naInputFrequency (3) - Mixer/Converter input frequency range. naOutputFrequency (4) - Mixer/Converter input frequency range. naReceiverFrequency (1) - FOM Receiver frequency range. naSourceFrequency (2) - FOM Source frequency range
Return Type	Enum
Default	naAutoFrequency (0)
Examples	<pre>rxLevel.FrequencyType (1) = naAutoFrequency ' Write value = rxLevel.FrequencyType 2 ' Read</pre>
C++ Syntax	<pre>HRESULT get_FrequencyType(long port, tagNAFrequencyType* pVal); HRESULT put_FrequencyType(long port, tagNAFrequencyType newVal);</pre>
Interface	IRxLevelingConfiguration3

Gain Property

Description Returns the Gain result of the PNOP marker search.

$\text{Pnop Gain} = \text{Pnop Out} - \text{Pnop In}$.

VB Syntax `gain = pnop.Gain`

Variable [\(Type\)](#) - Description

`gain` (**double**) - Variable to store returned value

`pnop` A [PNOP](#) (**object**)

Return Type Double

Default Not applicable

Examples `gain = pnop.Gain 'Read`

[See example program](#)

C++ Syntax HRESULT get_Gain(double* pNewVal)

Interface IPNOP

Last Modified:

19-Feb-2010 MX New topic

GainLinear Property

Description Returns the Linear Gain result of a PSat marker search.

Gain Linear = Marker 1 - Y-axis value MINUS X-axis value

VB Syntax *gainLin* = *pSat*.GainLinear

Variable [\(Type\)](#) - Description

gainLin (double) - Variable to store returned value

pSat A [PSaturation](#) (object)

Return Type Double

Default Not applicable

Examples `gainLin = pSat.GainLinear 'Read`

[See example program](#)

C++ Syntax HRESULT get_GainLinear(double* pNewVal)

Interface IPSaturation

Last Modified:

19-Feb-2010 MX New topic

GainMax Property

Description Returns the GainMax result of the PNOP or PSAT marker search.

$$\text{Gain Max} = \text{PMax Out} - \text{PMax In}$$

VB Syntax *gainMax* = *pMarker*.**GainMax**

Variable (Type) - Description

gainMax (double) - Variable to store returned value

pMarker A [PNOP](#) (object) or [PSaturation](#) (Object)

Return Type Double

Default Not applicable

Examples `gainMax = pMarker.GainMax 'Read`

[See example program](#)

C++ Syntax HRESULT get_GainMax(double* pNewVal)

Interface IPNOP or IPSaturation

Last Modified:

19-Feb-2010 MX New topic

GainSaturation Property

Description Returns the GainSaturation result of the PSAT marker search.

Gain Sat = Psat Out - Psat In

VB Syntax *GainSat* = *pSat*.**GainSaturation**

Variable [\(Type\)](#) - Description

GainSat (double) - Variable to store returned value

pSat A [PSaturation](#) (Object)

Return Type Double

Default Not applicable

Examples `GainSat = pSat.GainSaturation 'Read`

[See example program](#)

C++ Syntax HRESULT get_GainSaturation(double* pNewVal)

Interface IPSaturation

Last Modified:

22-Feb-2010 MX New topic

GeneratedCalsets Property

Description	Returns the cal set names that were produced by the cal all session.
VB Syntax	<i>csets</i> = <i>calAll</i> . GeneratedCalsets
Variable	(Type) - Description
<i>csets</i>	(Variant Array) Variable to store the returned cal set names.
<i>calAll</i>	A CalibrateAllChannels (object)
Return Type	Variant Array
Default	Not Applicable
Examples	<pre>csets = calAll.GeneratedCalsets</pre> <pre>See example program</pre>
C++ Syntax	HRESULT get_GeneratedCalsets (VARIANT*, propNames);
Interface	CalibrateAllChannels

Last modified:

28-Mar-2012 New topic

FrequencySpan Property

Description Sets or returns the frequency span of the channel.

Sets or returns the frequency span of the segment.

VB Syntax *object*.FrequencySpan = *value*

Variable [\(Type\)](#) - Description

object A Channel (**object**)

or

A Segment (**object**)

value (**double**) - Frequency span in Hertz. Choose any number between the **minimum** and **maximum** frequencies of the analyzer.

Return Type Double

Default Full frequency span of the analyzer

Examples

```
chan.FrequencySpan = 4.5e9 'sets the frequency span of a linear sweep  
for the channel object -Write
```

```
freqspan = chan.FrequencySpan 'Read
```

C++ Syntax HRESULT get_FrequencySpan(double *pVal)
HRESULT put_FrequencySpan(double newVal)

Interface IChannel
ISegment

Shape Property

Description Specifies the shape of the gate filter.

VB Syntax `gat.Shape = value`

Variable [\(Type\)](#) - Description

gat A Gating (**object**)

value (**enum** NAGateShape) - Choose from:

0 - naGateShapeMaximum

1 - naGateShapeWide

2 - naGateShapeNormal

3 - naGateShapeMinimum

Return Type NAGateShape

Default 2 - Normal

Examples `gat.Shape = naGateShapeMaximum 'Write`

`filterShape = gat.Shape 'Read`

C++ Syntax HRESULT get_Shape(tagNAGateShape *pVal)
HRESULT put_Shape(tagNAGateShape newVal)

Interface IGating

Type (gate) Property

Description	Specifies the type of gate filter used.
VB Syntax	<i>gat.Type</i> = <i>value</i>
Variable	(Type) - Description
<i>gat</i>	A Gating (object)
<i>value</i>	(enum NAGateType) - Choose from: 0 - naGateTypeBandpass - Includes (passes) the range between the start and stop times. 1 - naGateTypeNotch - Excludes (attenuates) the range between the start and stop times.
Return Type	NAGateType
Default	Bandpass
Examples	<pre>gate.Type = naGateTypeNotch 'Write</pre> <pre>filterType = gate.Type 'Read</pre>
C++ Syntax	HRESULT get_Type(tagNAGateType *pVal) HRESULT put_Type(tagNAGateType newVal)
Interface	IGating

GPIBAddress Property

Description Sets and returns the PNA GPIB address on the talker/listener bus.

VB Syntax *app.GPIBAddress (bus) = value*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

bus (Short Integer) GPIB bus. MUST be set to 0 - the talker/listener bus.

value (Short Integer) GPIB Address on the PNA. Choose a value between 0 and 30.

Return Type Short Integer

Default 16

Examples `address=app.GPIBAddress(0) 'Read`

`app.GPIBAddress(0)=16 'Write`

C++ Syntax HRESULT get_GPIBAddress(short busIndex, short* address);

HRESULT put_GPIBAddress(short busIndex,short address);

Interface IApplication8

Last Modified:

16-Mar-2011 Add talker/listener

GPIBMode Property

Description Changes the analyzer to a GPIB system controller or a talker/listener on the bus. The analyzer must be the controller if you want to use it to send commands to other instruments. The analyzer must be a talker/listener if you want to send it commands from another PC.

Note: This command has no affect in PNAs with dedicated Controller and Talker/Listener GPIB connectors.

VB Syntax *app.GPIBMode value*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (enum **NAGPIBMode**) -Choose either:
0 - naTalkerListener - the analyzer is a talker / listener
1 - naSystemController - the analyzer is the system controller

Return Type Long Integer

Default 0 - naTalkerListener

Examples

```
app.GPIBMode = naTalkerListener 'Write  
mode = app.GPIBMode 'Read
```

C++ Syntax HRESULT get_GPIBMode(tagGPIBModeEnum* eGpibMode)
HRESULT put_GPIBMode(tagGPIBModeEnum eGpibMode)

Interface IApplication

Last Modified:

10-Nov-2008 Removed link to obsolete topic.

GPIBPortCount Property

Description	Returns the number of GPIB ports that are present on the PNA rear-panel.
VB Syntax	<i>value</i> = <i>cap</i> . GPIBPortCount
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned integer value of the number of GPIB ports.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<pre>value = cap.GPIBPortCount 'Read</pre>
C++ Syntax	HRESULT get_GPIBPortCount(long * gpibPorts);
Interface	ICapabilities3

Last Modified:

23-Oct-2008 Removed 1.1 GHz description

Grid Property

Description Set and return the inner lines of all grid in all windows, and the grid frame in inactive windows for the PNA display or hardcopy print.

VB Syntax *colors*.**Grid** = *value*

Variable [\(Type\)](#) - Description

colors A [ComColors](#) (object)

value **(Long Integer)** - RGB color of the Grid pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Display = 175,175,175

Print = 0,0,0 (Black)

Examples

```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.Grid = RGB 'Write
color = colors.Grid 'Read
```

C++ Syntax HRESULT get_Grid(long* pVal);

HRESULT put_Grid(long newVal);

Interface IComColors

Last Modified:

7-Aug-2009 MX New topic

GridLineType Property

Description	Set and return whether the grid lines are displayed in solid or dotted lines for all open windows. Grid lines are returned to solid when the PNA is Preset.
VB Syntax	<i>app</i> .GridLineType = <i>value</i>
Variable	(Type) - Description
<i>app</i>	A Application Object (object)
<i>value</i>	(Enum as naLineType) - Choose from: 0 - naLineTypeSolid 1 - naLineTypeDotted
Return Type	Enum
Default	naLineTypeSolid
Examples	<pre>app.GridLineType = naLineTypeSolid 'Write grid = app.GridLineType 'Read</pre>
C++ Syntax	HRESULT get_GridLineType(tag naLineType* pVal); HRESULT put_GridLineType(tag naLineType newVal);
Interface	IApplication

Last Modified:

16-Mar-2010 MX New topic

HandshakeEnable Property

Description Turns handshake ON / OFF.

To enable handshake, the main trigger enable must ALSO be set using [Enable](#).

When ON, PNA acquisition waits indefinitely for the input line to be asserted before continuing with the acquisition.

Note: Use on PNA-X ONLY. Other models do NOT have an Aux Input.

VB Syntax `auxTrig.HandshakeEnable = state`

Variable [\(Type\)](#) - Description

`auxTrig` An [AuxTrigger](#) (object)

`state` (boolean) -

True - Handshake enabled

False - Handshake NOT enabled

Return Type Boolean

Default False

Examples `auxTrig.HandshakeEnable = True 'Write`

`value = auxTrig.HandshakeEnable 'Read`

C++ Syntax `HRESULT get_HandshakeEnable(VARIANT_BOOL * enable);`
`HRESULT put_HandshakeEnable(VARIANT_BOOL enable);`

Interface IAuxTrigger

Last Modified:

5-Sep-2008 Added Note
 14-Dec-2006 MX New topic

HasItem Property

Description	Returns a value indicating whether the specified external devices is configured.
VB Syntax	<i>value</i> = <i>extDevices</i> . HasItem (<i>name</i>)
Variable	(Type) - Description
<i>value</i>	(Boolean) Variable to store one of the following returned values. False - Item (name) is NOT present in the External Devices collection. True - Item (name) IS present in the External Devices collection.
<i>extDevices</i>	An ExternalDevices (collection)
<i>name</i>	(String) Name of External Device for which to search the collection.
Return Type	Boolean
Default	Not Applicable
Examples	<pre>has = extDevices.HasItem('mysource') 'Read</pre>
C++ Syntax	HRESULT get_HasItem(VARIANT Index, BOOL *pVal);
Interface	IExternalDevices

Last Modified:

27-Nov-2012	Fixed
31-Jul-2009	MX New topic

HighAmplitude Property

Description Sets and returns the High amplitude (voltage) of the pulse generator.

VB Syntax *extPulseGen.HighAmplitude* = *value*

Variable [\(Type\)](#) - Description

extPulseGen An [ExternalPulseGenerator](#) (object)

value (**Double**) Pulse Generator high amplitude voltage.

Return Type Double

Default 5

Examples `extPulseGen.HighAmplitude = 4 'Write`

`hi = extPulseGen.HighAmplitude 'Read`

C++ Syntax HRESULT get_HighAmplitude (double *pValue)

HRESULT put_HighAmplitude (double newVal)

Interface IExternalPulseGenerator

Last Modified:

15-Feb-2012 New topic

HighestOrderProduct Property

Description	Returns the highest order product that can be measured by SweptIMD.
VB Syntax	<i>value</i> = <i>imd</i> . HighestOrderProduct
Variable	(Type) - Description
<i>value</i>	(Long Integer) Variable in which to store the returned value.
<i>imd</i>	A SweptIMD Object
Return Type	Integer
Default	Always returns 9
Examples	<pre>value = imd.HighestOrderProduct 'Read</pre>
C++ Syntax	HRESULT get_HighestOrderProduct(long *pVal)
Interface	ISweptIMD

Last Modified:

19-Sep-2008 MX New topic

ID Property

Description	Returns the test set ID number. For GPIB testsets, the ID is equivalent to the GPIB address. For testset I/O testsets, the ID is the base address of the testset (0 for the first testset, 1 for the second, and so on).
VB Syntax	<i>value</i> = <i>tset</i> . ID
Variable	(Type) - Description
<i>value</i>	(Long) variable to store the returned information.
<i>testsets(1)</i>	A TestsetControl object.
	OR
	An E5091Testset object.
Return Type	Long Integer
Default	Not Applicable
Examples	<pre>value = testset1.ID</pre> See E5091A Example Program See External Testset Program
C++ Syntax	HRESULT get_ID(long *idNumber);
Interface	ITestsetControl IE5091Testset

Read-only

IDString Property

Description Returns the ID of the analyzer, including the Model number, Serial Number, and the Software revision number.

Note: Beginning with Rev 6.01, this command now returns the software revision with 6 digits instead of 4. For example, A.06.01.02.

VB Syntax *value* = *app*.IDString

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

value (**string**) - variable to contain the returned ID string

Return Type String

Default Not Applicable

Examples `id = app.IDString`

C++ Syntax HRESULT IDString(BSTR* IDString)

Interface IApplication

IFBandwidthOption Property

Description	Enables the IFBandwidth to be set on individual sweep segments. This property must be set True before <code>seg.IFBandwidth = value</code> is sent. Otherwise, this command will be ignored.
VB Syntax	<code>segs.IFBandwidthOption = value</code>
Variable	(Type) - Description
<i>segs</i>	A Segments collection (object)
<i>value</i>	(boolean) True - Enables variable IFBandwidth setting for segment sweep False - Disables variable IFBandwidth setting for segment sweep
Return Type	Boolean
Default	False
Examples	<pre>segs.IFBandwidthOption = True 'Write IFOption = IFBandwidthOption 'Read</pre>
C++ Syntax	HRESULT get_IFBandwidthOption(VARIANT_BOOL *pVal) HRESULT put_IFBandwidthOption(VARIANT_BOOL newVal)
Interface	ISegments

IFBandwidth Property

Description Sets or returns the IF Bandwidth of the channel.

Sets or returns the IF Bandwidth of the segment.

Returns the IF Bandwidth used in the Cal Set

VB Syntax *object*.**IFBandwidth** = *value*

Variable [\(Type\)](#) - Description

object Channel (**object**)

or

Segment (**object**)

or

CalSet (**object**) - Read-only property

value (**double**) - IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. ([Click to see the lists.](#)) If an invalid number is specified, the analyzer will round up to the closest valid number.

Return Type Double

Default Varies with PNA model.

Examples

```
chan.IFBandwidth = 3e3 'sets the IF Bandwidth of for the channel object
to 3 kHz. -Write
seg.IFBandwidth = 5 'sets the IF Bandwidth of the segment to 5 Hz. -
Write
```

```
ifbw = chan.IFBandwidth -Read
```

C++ Syntax HRESULT get_IFBandwidth(double *pVal);

HRESULT put_IFBandwidth(double newVal);

Interface IChannel
ISegment

|CalSet3

IFBW Property

Description	Sets and returns the IFBW for a Cal All calibration. Learn more about this setting.
VB Syntax	<i>calAll</i> . IFBW = <i>value</i>
Variable	(Type) - Description
<i>calAll</i>	A CalibrateAllIFBW (object)
<i>value</i>	(Double) IFBW in Hz.
Return Type	Variant
Default	1 kHz
Examples	<pre>calAll.IFBW = 10e3 'sets IFBW to 10 kHz</pre> <pre>ifbw = calAll.IFBW 'returns the ifbw setting</pre>
C++ Syntax	HRESULT get_IFBW (Double *Val) HRESULT put_IFBW (Double newVal)
Interface	ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

IFBWList Property

Description Returns a list of supported IFBW values.

VB Syntax *value* = *cap*.**IFBWList**

Variable [\(Type\)](#) - Description

value (Variant) - Variable to store the returned array of IFBW values

cap A [Capabilities](#) (Object)

Return Type Variant array

Default Not Applicable

Examples

```
'Read the supported IFBW values

Set app =
CreateObject("AgilentPNA835x.Application")

Set cap = app.Capabilities

list=cap.IFBWList

For i = 0 To UBound(list)

    msg = msg & list(i) & vbCrLf

Next

MsgBox msg
```

C++ Syntax HRESULT get_IFBWList(Variant *value);

Interface ICapabilities8

IFDenominator Property

Description Sets or returns the denominator value of the IF Fractional Multiplier.

Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *conv*.IFDenominator = *value*

Variable [\(Type\)](#) - Description

conv A [Converter](#) (object)

value (**long**) IF Denominator value.

Return Type Long

Default 1

Examples `Print mixer.IFDenominator 'prints the value of the IFDenominator`

C++ Syntax HRESULT get_IFDenominator(long *pVal)

HRESULT put_IFDenominator(long newVal)

Interface IConverter4

Last Modified:

29-Oct-2010 MX New topic

IFNumerator Property

Description Sets or returns the numerator value of the IF Fractional Multiplier.

Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *conv*.IFNumerator = *value*

Variable [\(Type\)](#) - Description

conv A [Converter](#) (object)

value (**Long**) IF Numerator value.

Return Type long

Default 1

Examples `Print mixer.IFNumerator 'prints the value of the IFNumerator`

C++ Syntax HRESULT get_IFNumerator(long *pVal)

HRESULT put_IFNumerator(long newVal)

Interface IConverter4

IFFrequency Property

Description	Sets and returns the IF frequency for ALL receiver paths being used for the specified channel. To set this frequency, IFFrequencyModeProperty must be set to OFF (Manual).
VB Syntax	<i>IfConfig</i> . IFFrequency = <i>value</i>
Variable	(Type) - Description
<i>IfConfig</i>	An IFConfiguration (object)
<i>value</i>	(double) IF Frequency. Use MaximumIFFrequency and MinimumIFFrequency to determine the range of value for this command.
Return Type	Double
Default	9 MHz
Examples	<pre>IfConfig.IFFrequency = 9.3e6</pre>
C++ Syntax	HRESULT get_IFFrequency (double *pVal); HRESULT put_IFFrequency (double pVal);
Interface	IFConfiguration3

Last Modified:

25-Aug-2010 Updated for DSP 5
18-Jun-2007 MX New topic

IFFrequencyMode Property

Description	Sets and returns method for specifying the way the IF Frequency is determined.
VB Syntax	<i>IfConfig</i> . IFFrequencyMode = <i>value</i>
Variable	(Type) - Description
<i>IfConfig</i>	An IFConfiguration (object)
<i>value</i>	(enum as NAModes) IF Frequency mode. Choose from: 0 - naAUTO The PNA determines the setting for the IF frequency. The IF frequency is based on many PNA settings, including measurement frequency. Therefore, it is NOT possible to read the IF frequency that is being used. 1 - naMANUAL (use IFFrequencyProperty to manually set frequency.
Return Type	Enum
Default	0 naAuto
Examples	<pre>IfConfig.IFFrequencyMode = naMANUAL</pre>
C++ Syntax	<pre>HRESULT get_IFFrequencyMode (tagNAModes* pdspMode); HRESULT put_IFFrequencyMode (tagNAModes* pdspMode);</pre>
Interface	IFConfiguration3

IFSideband Property

Description When two LOs are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

- This setting corresponds to the   buttons on LO1.
- Also set [OutputSideband](#) to LOW or HIGH to determine the output frequency of the mixer.
- This setting is ignored when ONE LO is used.
- If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also an [IFSideband_Property](#) on the Mixer Interface.

VB Syntax `obj.IFSideband =value`

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

value (enum as **ConverterSideBand**) - Choose from:

0 or **naLowSide** Minus (-) on the Mixer setup dialog

1 or **naHighSide** Plus (+) on the Mixer setup dialog

Return Type Enum as ConverterSideBand

Default 0 - **naLowSide**

Examples `conv.IFSideband = naLowSide`

C++ Syntax `HRESULT get_IFSideband(ConverterSideBand *pVal)`

`HRESULT put_IFSideband(ConverterSideBand newVal)`

Interface IConverter

Last Modified:

2-Oct-2008 Clarification

4-Mar-2008 Added note.

IFStartFrequency Property

Description Sets or returns the start frequency value of the mixer IF frequency.

Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *mixer*.IFStartFrequency = *value*

Variable [\(Type\)](#) - Description

mixer A [Converter](#) (object)

value **(double)** - Frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `Print mixer.IFStartFrequency 'prints the value of the IFStartFrequency`

C++ Syntax HRESULT get_IFStartFrequency(double *pVal)

HRESULT put_IFStartFrequency(double newVal)

Interface IMixer

Last Modified:

4-Mar-2008 Added note.

IFStopFrequency Property

Description Sets or returns the stop frequency value of the mixer IF frequency.

Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *mixer*.IFStopFrequency = *value*

Variable [\(Type\)](#) - Description

mixer A [Converter](#) (object)

value **(double)** - IF stop frequency in Hertz.

Return Type Double

Default Not Applicable

Examples

```
Print mixer.IFStopFrequency 'prints the value of the
IFStopFrequency
```

C++ Syntax HRESULT get_IFStopFrequency(double *pVal)

HRESULT put_IFStopFrequency(double newVal)

Interface IMixer

Last Modified:

4-Mar-2008 Added note.

ImpedanceStates Method

Description Sets the number of impedance states to use during calibrated measurements.

VB Syntax `noise.ImpedanceStates = value`

Variable [\(Type\)](#) - Description

noise A [NoiseFigure](#) (object)

value (**double**) - Impedance states. Choose between 4 and the maximum number allowed by the noise tuner device. If the specified number exceeds the capability of the device, the measurement will use the maximum number of states the device allows.

Return Type Double

Default 4

Examples

```
noise.ImpedanceStates = 10 'Write
AvgNoise = noise.ImpedanceStates 'Read
```

C++ Syntax HRESULT get_ImpedanceStates(double* pVal)
HRESULT put_ImpedanceStates(double newVal)

Interface INoiseFigure

Last Modified:

29-May-2007 MN New topic

ImpulseWidth Property

Description	Sets or returns the Impulse Width of Time Domain transform windows
VB Syntax	<i>trans</i> .ImpulseWidth = <i>value</i>
Variable	(Type) - Description
<i>trans</i>	A Transform (object)
<i>value</i>	(double) - Impulse Width in seconds. Range of settings depends on the frequency range of your analyzer.
Return Type	Double
Default	.98 / Default Span
Examples	<pre>trans.ImpulseWidth = 200e-12 'sets the Impulse width of a transform window -Write IW = trans.ImpulseWidth 'Read</pre>
C++ Syntax	HRESULT get_ImpulseWidth(double *pVal) HRESULT put_ImpulseWidth(double newVal)
Interface	ITransform

IMToneIFBandwidth Property

Description Sets and returns the IF Bandwidth for measurement of the intermodulation products.

VB Syntax `imd.IMToneIFBandwidth = value`

Variable [\(Type\)](#) - Description

`imd` A [SweptIMD](#) Object

`value` (Double) IF Bandwidth in Hz. Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

[Learn more about setting IFBW for IMD.](#)

If an invalid number is specified, the analyzer will round up to the closest valid number.

Return Type Double

Default 1 kHz

Examples

```
imd.IMToneIFBandwidth = 2e3 'Write
```

```
value = imd.IMToneIFBandwidth 'Read
```

C++ Syntax HRESULT get_IMToneIFBandwidth(double *pVal)
HRESULT put_IMToneIFBandwidth(double newVal)

Interface ISweptIMD

Last Modified:

19-Aug-2008 MX New topic

InactiveLabels Property

Description Set and return the Inactive (not selected) Window Labels for the PNA display or hardcopy print.

VB Syntax *colors.InactiveLabels = value*

Variable [\(Type\)](#) - Description

colors A [ComColors](#) (object)

value **(Long Integer)** - RGB color of the Inactive Labels pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Display = 160,160,160

Print = 0,0,0 (Black)

Examples

```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.InactiveLabels = RGB 'Write
color = colors.InactiveLabels 'Read
```

C++ Syntax HRESULT get_InactiveLabels(long* pVal);

HRESULT put_InactiveLabels(long newVal);

Interface IComColors

Last Modified:

Include2ndOrderProduct Property

Description Sets and returns whether to include the second order products in the calibration. These frequencies of these products can be far from the main tones.

VB Syntax *imd.Include2ndOrderProduct = value*

Variable [\(Type\)](#) - Description

imd A [SweptIMDCal](#) (object)

value (Boolean) Choose from:

False - Do NOT include 2nd order products

True - Include 2nd order products

Return Type Boolean

Default **False** - Do NOT include 2nd order products

Examples

```
imd.Include2ndOrderProduct = true 'Write
```

```
incl = imd.Include2ndOrderProduct 'Read
```

C++ Syntax HRESULT get_Include2ndOrderProduct(VARIANT_BOOL * Val)

HRESULT put_Include2ndOrderProduct(VARIANT_BOOL newVal)

Interface ISweptIMD

Last Modified:

9-Sep-2008 MX New topic

IncludeReverseSweep Property

Description Sets whether to include SC12 sweeps during measurements.

VB Syntax *obj.IncludeReverseSweep = bool*

Variable [\(Type\)](#) - Description

obj A [Converter](#) (object)

bool **(Boolean)** -

True - Include the SC12 (reverse) sweep.

False - Do NOT Include the SC12 (reverse) sweep.

Return Type Boolean

Default True

Examples `obj.IncludeReverseSweep = True`

C++ Syntax HRESULT get_IncludeReverseSweep(VARIANT_BOOL * val);

HRESULT put_IncludeReverseSweep(VARIANT_BOOL val);

Interface IMixer12

Last Modified:

12-Feb-2010 MX New topic

IndexState Property

Description Determines the control of Material Handler connector Pin 20.

VB Syntax *handler.IndexState* = *value*

Variable [\(Type\)](#) - Description

handler **(object)** - A [Handler I/O](#) object

value **(boolean)**

False - Pin 20 is controlled by Output Port B6

True - Pin 20 is controlled by the Index signal

Return Type Boolean

Default False

Examples

```
handler.IndexState = False 'Write  
bState = handler.IndexState 'Read
```

C++ Syntax HRESULT put_IndexState (BOOL *pVal);

HRESULT get_IndexState (BOOL newVal);

Interface IHWMaterialHandlerIO2

InputA Property - **Obsolete**

Description **This property has NO replacement and no longer works correctly. (Sept. 2004)**

Sets a Port Extension value for Receiver A

VB Syntax *portExt*.InputA = *value*

Variable [\(Type\)](#) - Description

portExt A Port Extension (**object**)

value (**double**) - Port Extension value in seconds. Choose any number between **-10** and **10**

Return Type Double

Default 0

Examples

```
portExt.InputA = 10e-6 'Write
```

```
inA = portExt.InputA 'Read
```

C++ Syntax HRESULT get_InputA(double *pVal)
HRESULT put_InputA(double newVal)

Interface IPortExtension

InputB Property - **Obsolete**

Description **This property has NO replacement and no longer works correctly. (Sept. 2004)**

Sets the Port Extension value for Receiver B

VB Syntax *portExt*.InputB = *value*

Variable [\(Type\)](#) - Description

portExt A Port Extension (**object**)

value (**double**) - Port Extension value in seconds. Choose any number between **-10** and **10**

Return Type Double

Default 0

Examples

```
portExt.InputB = 10e-6 'Write
```

```
inB = portExt.InputB 'Read
```

C++ Syntax HRESULT get_InputB(double *pVal)
HRESULT put_InputB(double newVal)

Interface IPortExtension

InputC Property **Obsolete**

Description **This property has NO replacement and no longer works correctly. (Sept. 2004)**

Sets the Port Extension value for Receiver C

VB Syntax *portExt*.InputC = *value*

Variable [\(Type\)](#) - Description

portExt A Port Extension (**object**)

value (**double**) - Port Extension value in seconds. Choose any number between **-10** and **10**

Return Type Double

Default 0

Examples

```
portExt.InputC = 10e-6 'Write
```

```
inC = portExt.InputC 'Read
```

C++ Syntax HRESULT get_InputC(double *pVal)
HRESULT put_InputC(double newVal)

Interface IPortExtension

InputDenominator Property

Description Sets or returns the denominator value of the Input Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.**InputDenominator** = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value (**Long**) - Input denominator value.

Return Type Long

Default 1

Examples

```
Print mixer.InputDenominator 'prints the value of the
InputDenominator
```

C++ Syntax HRESULT get_InputDenominator(long *pVal)

HRESULT put_InputDenominator(long newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added converter

4-Mar-2008 Added note.

InputFixedFrequency Property

Description Sets or returns the mixer fixed Input frequency value.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.InputFixedFrequency = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - Input Fixed Frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `mixer.InputFixedFrequency = 1e9`

C++ Syntax HRESULT get_InputFixedFrequency(double *pVal)

HRESULT put_InputFixedFrequency(double newVal)

Interface IMixer6

IConverter

Last Modified:

2-Feb-2009 Added converter

4-Mar-2008 Added note.

IsInputGreaterThanLO Property

Description Specifies whether to use the Input frequency that is greater than the LO or less than the LO. To learn more, see the [mixer setup dialog box help](#).

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax `obj.IsInputGreaterThanLO (LO) = bool`

Variable [\(Type\)](#) - [Description](#)

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

LO (Integer) - LO stage number

Choose from 1 (default) or 2

bool **(Boolean)** -

True - Use the Input that is Greater than the specified LO.

False - Use the Input that is Less than the specified LO.

Return Type Boolean

Default True

Examples `mixer.IsInputGreaterThanLO(1) = True`

C++ Syntax HRESULT get_IsInputGreaterThanLO(VARIANT_BOOL * val);
HRESULT put_IsInputGreaterThanLO(VARIANT_BOOL val);

Interface IMixer2
IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

InputNumerator Property

Description Sets or returns the numerator value of the Input Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.**InputNumerator** = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value (**Long**) - Input numerator value.

Return Type Long

Default 1

Examples

```
Print mixer.InputNumerator 'prints the value of the
InputNumerator
```

C++ Syntax HRESULT get_InputNumerator(long *pVal)

HRESULT put_InputNumerator(long newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added converter

4-Mar-2008 Added note.

InputPower Property

Description Sets or returns the value of the Input Power.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.**InputPower** = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - Input power in dBm.

Return Type Double

Default -15 dBm for IMixer

-20 dBm for IConverter

Examples `Print mixer.InputPower 'prints the value of the InputPower`

C++ Syntax HRESULT get_InputPower(double *pVal)

HRESULT put_InputPower(double newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added converter

4-Mar-2008 Added note.

InputRangeMode Property

Description Sets or returns the Input sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also a [InputRangeMode Property](#) on the Converter Object.

VB Syntax *obj*.InputRangeMode = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

value **(Enum as MixerRangeMode)** - Input sweep mode. Choose from:

0 - **mixSwept**

1 - **mixFixed**

Return Type Enum

Default 0 - mixSwept

Examples `mixer.InputRangeMode = mixSwept`

C++ Syntax HRESULT get_InputRangeMode(long *pVal)

HRESULT put_InputRangeMode(long newVal)

Interface IMixer6

Last Modified:

4-Mar-2008 Added note.

InputRangeMode Property

Description Sets or returns the Input sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also a [InputRangeMode](#) on the Mixer Interface.

VB Syntax *obj*.InputRangeMode = *value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

value **(Enum as NARangeMode)** - Input sweep mode. Choose from:

0 - **naSwept**

1 - **naFixed**

Return Type Enum

Default 0 - naSwept

Examples `conv.InputRangeMode = naSwept`

C++ Syntax HRESULT get_InputRangeMode(long LO, enum *pVal)

HRESULT put_InputRangeMode(long LO, enum newVal)

Interface IConverter

InputStartFrequency Property

Description Sets and returns the start frequency value of the mixer Input frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.InputStartFrequency = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value (**double**) - Input start frequency in Hertz.

Return Type Double

Default Start frequency of the PNA

Examples `mixer.InputStartFrequency = Start_Freq`

C++ Syntax HRESULT get_InputStartFrequency(double *pVal)

HRESULT put_InputStartFrequency(double newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added converter

4-Mar-2008 Added note.

InputStartPower Property

Description Sets and returns the Start Power value of the mixer Input Power.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.**InputStartPower** = *value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

value **(double)** - Input start Power in dBm.

Return Type Double

Default Start Power of the PNA

Examples `mixer.InputStartPower = 0`

C++ Syntax HRESULT get_InputStartPower(double *pVal)

HRESULT put_InputStartPower(double newVal)

Interface IConverter

Last Modified:

2-Feb-2009 New topic

InputStopFrequency Property

Description Sets and returns the stop frequency value of the mixer Input frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.InputStopFrequency = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value (**double**) - Input stop frequency in Hertz.

Return Type Double

Default Stop frequency of the PNA

Examples `mixer.InputStopFrequency = Stop_Freq`

C++ Syntax HRESULT get_InputStopFrequency(double *pVal)

HRESULT put_InputStopFrequency(double newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

InputStopPower Property

Description Sets and returns the Stop Power value of the mixer Input Power.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.**InputStopPower** = *value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

value **(double)** - Input Stop Power in dBm.

Return Type Double

Default Stop Power of the PNA

Examples `mixer.InputStopPower = 0`

C++ Syntax HRESULT get_InputStopPower(double *pVal)

HRESULT put_InputStopPower(double newVal)

Interface IConverter

Last Modified:

2-Feb-2009 New topic

InternalTestsetPortCount Property

Description	Returns the number of PNA test ports. This does not include the ports on an external test set .
VB Syntax	<i>value</i> = <i>cap</i> . InternalTestsetPortCount
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned number of PNA test ports.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<code>value = cap.InternalTestsetPortCount 'Read</code>
C++ Syntax	HRESULT get_InternalTestsetPortCount(long *numPorts);
Interface	ICapabilities

Interpolate Correction Property

Description Turns ON and OFF correction interpolation which calculates new error terms when stimulus values change after calibration.

When this property is ON and error correction is being applied, the calibration subsystem attempts to interpolate the error terms whenever the stimulus parameters are changed.

When this property is OFF under the same circumstances, error correction is turned OFF.

VB Syntax `meas.InterpolateCorrection = value`

Variable [\(Type\)](#) - Description

meas A [Measurement \(object\)](#)

value (**boolean**) - Choose from:

True - Turns correction interpolation ON

False - Turns correction interpolation OFF

Return Type Boolean

Default True

Examples

```
meas.InterpolateCorrection = False
calInterpolate = InterpolateCorrection 'Read
```

C++ Syntax HRESULT get_InterpolateCorrection(boolean *pVal)
HRESULT put_InterpolateCorrection(boolean newVal)

Interface IMeasurement

Interpolated Property

Description Turns marker Interpolation ON and OFF. Marker interpolation enables X-axis resolution beyond the discrete data values. The analyzer will calculate the x and y-axis data values between discrete data points. Use `meas.Interpolate` to change interpolation of **all** markers in a measurement. This command will override the measurement setting.

VB Syntax `mark.Interpolated = value`

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (boolean)

False - Turns interpolation OFF

True - Turns interpolation ON

Return Type Boolean

Default True

Examples

```
mark.Interpolated = True 'Write
```

```
interpolate = mark.Interpolated 'Read
```

C++ Syntax HRESULT get_Interpolated(VARIANT_BOOL *pVal)
HRESULT put_Interpolated(VARIANT_BOOL newVal)

Interface IMarker

InterpolateNormalization Property **Superseded**

Description **Note:** This property is replaced by [DoReceiverPowerCal Method](#).

Turns ON and OFF normalization interpolation which calculates new divisor data when stimulus values change after normalization.

When this property is ON and normalization is being applied, the Normalization algorithm attempts to interpolate the divisor data whenever the stimulus parameters are changed.

When this property is OFF under the same circumstances, normalization is turned OFF.

Normalization is currently supported only on measurements of unratiod power for the purpose of performing a receiver power calibration.

VB Syntax *meas*.InterpolateNormalization = *value*

Variable [\(Type\)](#) - Description

meas **(object)** - A Measurement object

value **(boolean)**

False – Turns normalization interpolation OFF

True – Turns normalization interpolation ON

Return Type Boolean

Default False -OFF

Examples `meas.InterpolateNormalization = False` 'Write

`normalized = meas.InterpolateNormalization` 'Read

C++ Syntax HRESULT put_InterpolateNormalization(VARIANT_BOOL bState);

HRESULT get_InterpolateNormalization(VARIANT_BOOL *bState);

Interface IMeasurement

Interrupt Property

Description	Reads the boolean that represents the state of the Interrupt In line (pin 13) on the external test set connector.
VB Syntax	<i>value</i> = <i>ExtIO</i> . Interrupt
Variable	(Type) - Description
<i>value</i>	(boolean) - Variable to store the returned data
<i>ExtIO</i>	(object) - An ExternalTestSetIO object
Return Type	Boolean
	False - indicates the line is being held at a TTL High
	True - indicates the line is being held at a TTL Low
Default	Not Applicable
Examples	<code>value = ExtIO.Interrupt</code>
C++ Syntax	HRESULT get_Interrupt(VARIANT_BOOL* bValue);
Interface	IHWExternalTestSetIO

Invert Property

Description Sets whether to invert the polarity of the pulse.

VB Syntax *pulse*.**Invert** (*n*) = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (**object**)

n (**Integer**) Pulse generator number. Choose from 0 to 4.

Or use [PulseGeneratorID](#) to refer to an external pulse generator.

0 is the generator that pulses the ADC.

value **True** - Invert the pulse generator polarity. This causes the pulse ON time to be active low and OFF be active high.

False - Do NOT Invert the pulse generator polarity.

Return Type Boolean

Default False

Examples

```
pulse.Invert(1) = True 'Write
```

```
value = pulse.Invert(4) 'Read
```

C++ Syntax

```
HRESULT get_Invert(VARIANT_BOOL *pVal);
```

```
HRESULT put_Invert(VARIANT_BOOL newVal);
```

Interface IPulseGenerator3

Last Modified:

16-Feb-2012 Edit for Ext PG

8-Oct-2010 MX New topic

IOConfiguration Property

Description Sets and returns the method of communication and address for the external device.

VB Syntax *extDevices.IOConfiguration = value*

Variable [\(Type\)](#) - Description

extDevices An [ExternalDevice](#) (object)

value (String) Configuration path. Any valid VISA resource shown in the IO Configuration field of the [External Devices dialog](#), enclosed in quotes.

Do NOT use the ID string of a PMAR USB power sensor as the resource string. The ID string is returned by the [USBPowerMeterCatalog Property](#)

Return Type String

Default " " Empty String

Examples

```
extDevices.IOConfiguration =  
"TCPIP::141.121.76.239::inst0::INSTR" Write  
  
value = extDevices.IOConfiguration 'Read  
  
See example program to configure PMAR device  
  
See example program to configure External Source
```

C++ Syntax HRESULT get_IOConfiguration(BSTR* value);
HRESULT put_IOConfiguration(BSTR newVal);

Interface IExternalDevices

Last Modified:

31-Jul-2009 MX New topic

IOEnable Property

Description Sets and returns whether an external device is enabled for IO communication with the PNA.

When disabled (False), the PNA will NOT attempt to connect to the external device regardless of the instrument state ([Active](#)).property. Therefore, no errors will be produced if the device is not connected.

This command is useful for debugging and testing states when the external device is not connected. This command is unnecessary in ordinary operation (when the device is connected).

VB Syntax `extDevices.IOEnable = value`

Variable [\(Type\)](#) - Description

extDevices An [ExternalDevice](#) (object)

value (Boolean) Choose from:

True - Device is available for IO communication.

False - Device is NOT available for IO communication.

Return Type Boolean

Default True

Examples

```
extDevices.IOEnable = True 'Write
```

```
bool = extDevices.IOEnable 'Read
```

See example program to configure [PMAR device](#)

See example program to configure [External Source](#)

C++ Syntax HRESULT get_IOEnable(VARIANT_BOOL* value);

HRESULT put_IOEnable(VARIANT_BOOL newVal);

Interface IExternalDevices

IsContinuous Property

Description	Returns whether or not a channel is in continuous mode. To set the channel to continuous mode, use Continuous Method .
VB Syntax	<i>value</i> = <i>chan</i> . IsContinuous
Variable	(Type) - Description
<i>value</i>	(boolean) - Choose either: False - Channel trigger is NOT set to continuous. True - Channel trigger IS set to continuous.
<i>chan</i>	Channel (object)
Return Type	Boolean
Default	Not Applicable
Examples	<pre>trig = chan.IsContinuous 'Read</pre>
C++ Syntax	HRESULT get_IsContinuous (VARIANT_BOOL *bContinuous);
Interface	IChannel4

Last Modified:

13-Nov-2013 Fixed Channel rev.

IsDevicePresent Property

Description	Returns whether the named device is present on the bus for which it is configured.
VB Syntax	<i>value</i> = <i>extDevices</i> . IsDevicePresent (<i>devName</i>)
Variable	(Type) - Description
<i>value</i>	(Boolean) Variable to store the returned value: <ul style="list-style-type: none">• False - The device is not in the collection or the device fails to respond and times out when communication is attempted.• True - The device responds when communication is attempted.
<i>extDevices</i>	An ExternalDevices (collection)
<i>devName</i>	(String) Name of the device with which you want to communicate.
Return Type	Boolean
Default	Not Applicable
Examples	<pre>present = extDevices.IsDevicePresent("MyPowerMeter") 'Read</pre>
C++ Syntax	HRESULT get_IsDevicePresent(VARIANT_BOOL *present);
Interface	IExternalDevices2

Last Modified:

19-Jul-2011 New topic

IsECALModuleFoundEx Property

Description	This property replaces IsECALModuleFound Property . Returns true or false depending on whether communication was established between the PNA and the specified ECal module.
VB Syntax	<i>modFound</i> = <i>cal</i> . IsECALModuleFoundEx (<i>module</i>)
Variable	(Type) - Description
<i>modFound</i>	(boolean) - Variable to store the returned test result. True - The PNA identified the presence of the specified ECal module. False - The PNA did NOT identify the presence of the specified ECal module.
<i>cal</i>	(object) - A Calibrator object
<i>module</i>	(long integer) ECal module. Choose from modules 1 through 8 Use GetECALModuleInfoEx to return the model and serial number of each module.
Return Type	Boolean
Default	Not applicable
Examples	<pre>Set cal = pna.ActiveChannel.Calibrator moduleFound = cal.IsECALModuleFoundEx(1)</pre>
C++ Syntax	HRESULT get_IsECALModuleFoundEx(long moduleNumber, VARIANT_BOOL *bModuleFound);
Interface	ICalibrator4

IsFrequencyOffsetPresent Property

Description	Returns a value indicating the presence of Frequency Offset Option 080 in the remote PNA.
VB Syntax	<i>value</i> = <i>cap</i> . IsFrequencyOffsetPresent
Variable	(Type) - Description
<i>value</i>	(Boolean) - Variable to store the returned value True - Frequency Offset Option 080 is present False - Frequency Offset Option 080 is not present
<i>cap</i>	A Capabilities (object)
Return Type	Boolean
Default	Not Applicable
Examples	<pre>value = cap.isFrequencyOffsetPresent(1) 'Read</pre>
C++ Syntax	HRESULT get_IsFrequencyOffsetPresent(VARIANT_BOOL * present);
Interface	ICapabilities

IsHold Property

Description	Returns whether or not a channel is in hold mode. To set the channel to hold mode, use Hold Method .
VB Syntax	<i>value</i> = <i>chan</i> . IsHold
Variable	(Type) - Description
<i>value</i>	(boolean) - Choose either: False - Channel trigger is NOT set to hold. True - Channel trigger IS set to hold.
<i>chan</i>	Channel (object)
Return Type	Boolean
Default	Not Applicable
Examples	<pre>trig = chan.IsHold 'Read</pre>
C++ Syntax	HRESULT get_IsHold (VARIANT_BOOL *bHold);
Interface	IChannel3

IsMarkerOn Property

Description Returns whether or not a marker was used for the specified tuning sweep.

VB Syntax *value* = *embedLODiag*.**IsMarkerOn** (*n*)

Variable [\(Type\)](#) - [Description](#)

value **(Boolean)** Variable to store the returned data.

embedLODiag An [EmbeddedLODiagnostic](#) (**object**)

n Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Return Type **(String)**

Default Not Applicable

Examples `data= embedLO.IsMarkerOn 3 'read`

C++ Syntax HRESULT IsMarkerOn(long sweep, VARIANT_BOOL* markerOn);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

IsolationIncrementAveraging Property

Description Value by which to increment (increase) the channel's averaging factor during measurement of isolation in an ECal calibration.

Note: If <value> is greater than 1 and the channel currently has averaging turned OFF, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to <value>.

VB Syntax `cal.IsolationIncrementAveraging = value`

Variable [\(Type\) - Description](#)

cal A [Calibrator](#) (object)

value **(Long)** Incremental Averaging factor. The maximum averaging factor is 65536 (2¹⁶).

Return Type Long Integer

Default 8

Examples

```
oCal.IsolationAveragingIncrement = 16 'Write  
avgIncr = oCal.IsolationAveragingIncrement ' Read
```

C++ Syntax

```
HRESULT get_IsolationAveragingIncrement(long *pVal);  
HRESULT put_IsolationAveragingIncrement(long newVal);
```

Interface ICalibrator7

Last Modified:

16-Apr-2007 MX New topic

IsOn Property

Description Sets and returns the ON |OFF state of Embedded LO.

VB Syntax *obj.IsOn = value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Boolean**)

False - Turns Embedded LO OFF

True - Turns Embedded LO ON

Return Type (**Boolean**)

Default False (OFF)

Examples

```
embedLO.IsOn = True 'write
```

```
data= embedLO.IsOn 'read
```

C++ Syntax HRESULT get_IsOn(VARIANT_BOOL* IsOn);

HRESULT put_IsOn(VARIANT_BOOL IsOn);

Interface IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object

18-Apr-2007 MX New topic

IsReceiverStepAttenuatorPresent Property

Description	Returns a value indicating the presence of Receiver step attenuators in the remote PNA.
VB Syntax	<i>value</i> = <i>cap</i> . IsReceiverStepAttenuatorPresent (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Boolean) - Variable to store the returned value. True - Receiver step attenuators are present. False - Receiver step attenuators are not present.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - port number to query for step attenuators
Return Type	Boolean
Default	Not Applicable
Examples	<pre>value = cap.IsReceiverStepAttenuatorPresent(1) 'Read</pre>
C++ Syntax	HRESULT get_IsReceiverStepAttenuatorPresent(long portNumber, VARIANT_BOOL * present);
Interface	ICapabilities

IsReferenceBypassSwitchPresent Property

Description	Returns a value indicating the presence of a Reference Bypass Switch in the remote PNA.
VB Syntax	<i>value</i> = <i>cap</i> .IsReferenceBypassSwitchPresent (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Boolean) - Variable to store the returned value. True - Reference Bypass Switch is present. False - Reference Bypass Switch is not present.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - port number to query for reference bypass switch
Return Type	Boolean
Default	Not Applicable
Examples	<pre>value = cap.IsReferenceBypassSwitchPresent(1) 'Read</pre>
C++ Syntax	HRESULT get_IsReferenceBypassSwitchPresent(long portNumber, VARIANT_BOOL * present);
Interface	ICapabilities

Read-only

IsSParameter Property

Description	Returns true if measurement represents an S-Parameter
VB Syntax	<i>value</i> = <i>meas</i> . IsSparameter
Variable	(Type) - Description
<i>meas</i>	A Measurement (object)
<i>value</i>	(Boolean)
	True - measurement is an S-Parameter
	False - measurement is NOT an S-Parameter
Return Type	Boolean
Default	True
Examples	<pre>print app.IsSparameter</pre>
C++ Syntax	HRESULT IsSparameter([out, retval] VARIANT_BOOL * bVal);
Interface	IMeasurement2

Item Property

Description Add or change a name-value pair in the Cal Set, or read the value associated with a name.

After editing, [Save](#) the CalSet to the PNA.

About Name-Value pairs

A Cal Set name-value pair is a general purpose data structure that maps a name to a value. This property allows you to associate a name with a value. Then, using this same property, you can read the value using the name.

For example, one of the items added by the PNA firmware to every Cal Set is named 'Created By'. The value attached to this item is the name of the PNA App that created the Cal Set. When an SMC cal is performed, you can query the Cal Set for the 'Create By' item, and it will return 'Scalar Mixer/Converter'. The same query on an NFX channel returns 'Noise Figure Converters'.

Warning - Do NOT change the name or value of any Items that you did NOT create. Otherwise, the PNA firmware may behave unpredictably.

See Also

[EnumerateItems Method](#)

[RemoveItem Method](#)

VB Syntax *CalSet.Item (name) = value*

Variable [\(Type\)](#) - Description

CalSet **(object)** - A [Cal Set](#) object

name **(String)** - Name of the name-value pair.

value **(Variant)** - Can be an integer, float, double, string, or a single-dimensioned array of integer, float, double, string.

Return Type Variant

Default Not Applicable

Example

```
' Create the pna object
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
```

```

' Get a handle to the calsets collection
Dim calsets
Set calsets = pna.GetCalManager.calsets
' Get a handle to the cal set to be edited
Dim MyCalSet
Set MyCalSet = calsets.Item("CalSet_1")
' Add a name-value pair(item) to MyCalSet
MyCalSet.Item("MyItem")=15
' Save the edited Cal Set to the PNA
MyCalSet.Save
' Loop thru the name-value pairs in the Cal Set
Dim CSetItems
CSetItems = MyCalSet.EnumerateItems
for i=lbound(CSetItems) to Ubound(CSetItems)
    ' List the item names in MyCalSet
    Dim name
    name = CSetItems(i)
    wscript.echo name
    ' List the value for each item name
    Dim value
    value = myCalSet.Item(name)
    wscript.echo value
Next
' Delete the new name-value pair
MyCalSet.RemoveItem("MyItem")

```

[C++ Syntax](#) HRESULT get_Item(BSTR name, VARIANT *value);
 HRESULT put_Item(BSTR name, VARIANT value);

Interface ICalSet6

Items Property

Description	Returns a list of configured external devices in the collection.
VB Syntax	<code>array = extDevices.Items</code>
Variable	(Type) - Description
<i>value</i>	(array) Variable to store the returned values. Each item in the array is in the format (name:driver), where: <ul style="list-style-type: none">• name = name of the external device• driver = See a list of supported drivers.
<i>extDevices</i>	An ExternalDevices (collection)
Return Type	Variant Array
Default	Not Applicable
Examples	<code>array = extDevices.Items 'Read</code>
C++ Syntax	<code>HRESULT get_Items(VARIANT* array);</code>
Interface	IExternalDevices

Last Modified:

31-Jul-2009 MX New topic

IterationNumber Property

Description	Sets and returns the maximum leveling sweep iterations to be used in order to achieve the tolerance setting.
VB Syntax	<i>RxLevel</i> . IterationNumber (<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>srcPort</i>	(Long Integer) Source port for which to set the IterationNumber for Receiver Leveling.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Long Integer) Max iterations. Choose a value between 1 and 25.
Return Type	(Long Integer)
Default	5
Examples	<pre>rxLevel.IterationNumber (1) = 10 ' Write value = rxLevel.IterationNumber 2 ' Read</pre>
C++ Syntax	<pre>HRESULT get_IterationNumber(long port, long* pVal); HRESULT put_IterationNumber(long port, long newVal);</pre>
Interface	IRceiverLevelingConfiguration

IterationsTolerance Property

Description This command, along with [MaximumIterationsPerPoint Property](#) deal with ADJUSTMENTS made to the source power.

Sets the maximum desired deviation from the sum of the [test port power](#) and the [offset](#) value. Power readings will continue to be made, and source power adjusted, until a reading is within this tolerance value or the [max number of readings](#) has been met. The last value to be read is the valid reading for that data point.

The following two commands allow for settling of power READINGS.

[ReadingsPerPoint Property](#)

[ReadingsTolerance Property](#)

VB Syntax *pwrCal.IterationsTolerance = value*

Variable [\(Type\)](#) - Description

pwrCal **(object)** - A [SourcePowerCalibrator](#) (object)

value **(Double)** – Tolerance value in dBm. Choose any number between 0 and 5

Return Type Double

Default .05 dB

Examples

```
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.IterationsTolerance = .1 'Write
ReadTol = powerCalibrator.IterationsTolerance 'Read
```

C++ Syntax HRESULT get_IterationsTolerance(double *pVal);

HRESULT put_IterationsTolerance(double newVal);

Interface ISourcePowerCalibrator3

17-Apr-2007 Clarified verbage

KaiserBeta Property

Description Sets or returns the Kaiser Beta of Time Domain transform windows

VB Syntax *trans*.KaiserBeta = *value*

Variable [\(Type\)](#) - Description

trans A Transform (**object**)

value (**single**) - Kaiser Beta. Choose any number between **0** and **13**.

Return Type Single

Default 0

Examples `trans.KaiserBeta = 6 'sets the Kaiser Beta of a transform window`
`-Write`

`KB = trans.KaiserBeta 'Read`

C++ Syntax HRESULT get_KaiserBeta(float *pVal)
HRESULT put_KaiserBeta(float newVal)

Interface ITransform

L0 Property

Description Sets and Returns the L0 (L-zero) value (the first inductance value) for the calibration standard.

To set the other inductance values, use [L1](#), [L2](#), [L3](#).

VB Syntax `calstd.L0 = value`

Variable [\(Type\)](#) - [Description](#)

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for L0 in femtohenries(1E-15)

Return Type Single

Default Not Applicable

Examples `calstd.L0 = 15 'Write the value of L0 = 15 femtohenries`

`Induct0 = calstd.L0 'Read the value of L0`

C++ Syntax HRESULT get_L0(float *pVal)
HRESULT put_L0(float newVal)

Interface ICalStandard

L1 Property

Description Sets and Returns the L1 value (the second inductance value) for the calibration standard.

To set the other inductance values, use [L0](#), [L2](#), [L3](#).

VB Syntax `calstd.L1 = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for L1.

Return Type Single

Default Not Applicable

Examples

```
calstd.L1 = 15 'Write the value of L1
```

```
Induct1 = calstd.L1 'Read the value of L1
```

C++ Syntax HRESULT get_L1(float *pVal)
HRESULT put_L1(float newVal)

Interface ICalStandard

L2 Property

Description Sets and Returns the L2 value (the third inductance value) for the calibration standard.

To set the other inductance values, use [L0](#), [L1](#), [L3](#).

VB Syntax `calstd.L2 = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for L2.

Return Type Single

Default Not Applicable

Examples

```
calstd.L2 = 15 'Write the value of L2.
```

```
Induct2 = calstd.L2 'Read the value of L2
```

C++ Syntax HRESULT get_L2(float *pVal)
HRESULT put_L2(float newVal)

Interface ICalStandard

L3 Property

Description Sets and Returns the L3 value (the third inductance value) for the calibration standard.

To set the other inductance values, use [L0](#), [L1](#), [L2](#).

VB Syntax `calstd.L3 = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for L3.

Return Type Single

Default Not Applicable

Examples `calstd.L3 = 15 'Write the value of L3.`

`Induct3 = calstd.L3 'Read the value of L3`

C++ Syntax HRESULT get_L3(float *pVal)
HRESULT put_L3(float newVal)

Interface ICalStandard

Label Property

Description Sets and Returns the label for the calibration standard. The label is used to prompt the user to connect the specified standard.

VB Syntax *calstd.Label* = *value*

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**string**) - between 1 and 12 characters long. Cannot begin with a numeric.

Return Type String

Default Not Applicable

Examples `calstd.Label = "Short" 'Write`

`stdLabel = calstd.Label 'Read`

C++ Syntax HRESULT get_Label(BSTR *pVal)
HRESULT put_Label(BSTR newVal)

Interface ICalStandard

Label Property

Description	Sets or gets the display label for a given channel/testset combination. The label appears in a status bar at the bottom of the PNA display when the ShowProperties property is set to TRUE.
VB Syntax	<i>tset</i> . Label (<i>chNum</i>) = <i>value</i>
Variable	(Type) - Description
<i>tset</i>	A TestsetControl object. Obtained from the ExternalTestsets collection.
<i>chNum</i>	(Integer) Channel number of the measurement.
<i>value</i>	(String) The text of the label.
Return Type	String
Default	None
Examples	<pre>'The following sets the label for channel 5 corresponding to a given testset object.'</pre> <pre>testset1.Label(5) = 'High-power output'</pre> See External Testset Program
C++ Syntax	HRESULT get_Label(long channelNum, BSTR *pLabel); HRESULT put_Label(long channelNum, BSTR label);
Interface	ITestsetControl

LANConfiguration Property

Description	Returns information about the current status of the PNA's computer networking configuration. This is the same set of information that is returned in an NA_IPConfiguration data structure by the GetIPConfigurationStruct method.
VB Syntax	<i>value</i> = <i>app</i> .LANConfiguration
Variable	(Type) - Description
<i>value</i>	(String) Variable to contain the PNA's LAN configuration string
<i>app</i>	An Application (object)
Return Type	Comma-delimited string
Default	Not Applicable
Examples	<pre>networkConfigInfo = app.LANConfiguration</pre>
C++ Syntax	HRESULT get_LANConfiguration (BSTR * pStrConfig);
Interface	IApplication13

Last Modified:

2-Jun-2008 MX New topic

LastCalPassedTolerance Property

Description	Returns the pass / fail status of the tolerance limits of the target power from the most recent source power cal.
VB Syntax	<i>value</i> = <i>pwrCal</i> . LastCalPassedTolerance
Variable	(Type) - Description
<i>pwrCal</i>	(object) – A SourcePowerCalibrator (object)
<i>value</i>	(boolean) - False – Source power cal did NOT achieve the specified tolerance limits. True – Source power cal DID achieve the specified tolerance limits.
Return Type	Boolean
Default	Not Applicable
Examples	<pre>status = powerCal.LastCalPassedTolerance 'Read</pre>
C++ Syntax	HRESULT get_LastCalPassedTolerance(VARIANT_BOOL *bState);
Interface	ISourcePowerCalibrator7

Last Modified:

17-Mar-2010 MX New topic

LastLevelingAsSPC Property

Description Sets and returns the state of **Use Last Result for Source Power Cal**. When Leveling Mode is switched back to Internal, this feature turns Source Power Cal correction ON using the latest receiver leveling correction data.

VB Syntax *RxLevel.LastLevelingAsSPC(srcPort) = value*

Variable [\(Type\)](#) - **Description**

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port being used for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Boolean) . Choose from:

True - When Leveling Mode is switched back to Internal, Source Power Cal correction is turned ON using the latest receiver leveling correction data.

False - When Leveling Mode is switched back to Internal, Source Power Cal correction is NOT turned ON.

Return Type Variant Boolean

Default False

Examples

```
rxLevel.LastLevelingAsSPC (1) = True ' Write
value = rxLevel.LastLevelingAsSPC 2 ' Read
```

C++ Syntax

```
HRESULT get_LastLevelingAsSPC(long port, VARIANT_BOOL* pVal);
HRESULT put_LastLevelingAsSPC(long port, VARIANT_BOOL newVal);
```

Interface IReceiverLevelingConfiguration2

Last Modified:

16-Sep-2010 MX New topic

LastModified Property

Description Returns the time stamp of the last modification to this Cal Set.

The time is returned in the local time zone setting of the PNA.

VB Syntax *value* = *Object*.**LastModified**

Variable [\(Type\)](#) - Description

object Channel (**object**)

or

CalSet (**object**) - Read-only property

value (**Variant**) – Variable to store the time stamp.

Return Type Variant

Default Not Applicable

Examples `date = CalSet.LastModified 'Read`

C++ Syntax HRESULT get_LastModified(VARIANT* datetime)

Interface ICalSet3

Last Modified:

13-May-2013 Removed GMT note
25-Apr-2007 Added GMT note

LevelingIFBW Property

Description Sets and returns the IFBW to be used for leveling sweeps. Enable separate IFBW for leveling sweeps using [FastMode Property](#).

VB Syntax *RxLevel.LevelingIFBW(srcPort) = value*

Variable [\(Type\)](#) - [Description](#)

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port for which to set the LevelingIFBW for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) IFBW for leveling sweeps in Hz. The list of valid IF Bandwidths is different depending on the PNA model. [See list](#). If an invalid number is specified, the PNA will round up to the closest valid number.

Return Type (Double)

Default 100 kHz

Examples

```
rxLevel.LevelingIFBW (1) = 1e3 ' Write
value = rxLevel.LevelingIFBW 2 ' Read
```

C++ Syntax

```
HRESULT get_LevelingIFBW(long port, double* pVal);
HRESULT put_LevelingIFBW(long port, double newVal);
```

Interface IReceiverLevelingConfiguration

Limit Property

Description Sets and returns the power limit for the specified port.

VB Syntax *gpl.Limit (port) = value*

Variable [\(Type\)](#) - Description

gpl A [GlobalPowerLimit](#) (**object**)

port (**Long**) Port number for which power limit value is to be set.

value (**Double**) Power limit value. Choose a value between -27 dBm (approximately) and the max settable power for the PNA.

Return Type Double

Default 100 dBm for all ports

Examples `gpl.Limit(1) = 0 'Write`

`Limit = gpl.Limit(2) 'Read`

C++ Syntax HRESULT get_Limit(long port, double *pVal)
HRESULT put_Limit(long port, double newVal)

Interface IGlobalPowerLimit

Last Modified:

10-Aug-2009 MX New topic

LimitFrequency Property

Description	Enable or disable the use of the power meter min and max frequencies.
VB Syntax	<i>pwrSensor.LimitFrequency = value</i>
Variable	(Type) - Description
<i>pwrSensor</i>	A PowerSensorAsReceiver (Object)
<i>value</i>	(Boolean) - State of min and max frequency use. Choose from: False - Min and max frequencies disabled. True - Min and max frequencies enabled.
Return Type	Boolean
Default	False
Examples	<pre>pwrSensor.LimitFrequency = False 'Write</pre> <pre>limit = pwrSensor.LimitFrequency 'Read</pre>
C++ Syntax	HRESULT put_LimitFrequency(VARIANT_BOOL newVal); HRESULT get_LimitFrequency(VARIANT_BOOL* pVal);
Interface	IPowerSensorAsReceiver

Last Modified:

25-Aug-9 MX New topic

LimitTestFailed Property

Description Returns the results of limit testing for the measurement.

VB Syntax *testFailed* = *meas*.**LimitTestFailed**

Variable [\(Type\)](#) - [Description](#)

testFailed (**boolean**) Variable to store the returned value

False - Limit Test Passed

True - Limit Test Failed

meas A Measurement (**object**)

Return Type Boolean

Default False returned if there is no testing in progress.

Examples

```
Dim testRes As Boolean
testRes = meas.LimitTestFailed
MsgBox (testRes)
```

C++ Syntax HRESULT get_LimitTestFailed(VARIANT_BOOL* trueIfFailed)

Interface IMeasurement

EndStimulus Property

Description When constructing a limit line, specifies the stimulus value for the end of the segment.

VB Syntax *limtseg*.EndStimulus = *value*

Variable [\(Type\)](#) - Description

limtseg A LimitSegment (**object**)

value (**double**) - End Stimulus X-axis value. No units

Return Type Double

Default 0

Examples

```
Set limtseg = meas.LimitTest(1)
limtseg.EndStimulus = 8e9 'Write
```

```
EndStim = limtseg.EndStimulus 'Read
```

C++ Syntax HRESULT get_EndStimulus(double *pVal)
HRESULT put_EndStimulus(double newVal)

Interface ILimitSegment

EndResponse Property

Description When constructing a limit line, specifies the amplitude value at the end of the limit segment.

VB Syntax `limtseg.EndResponse = value`

Variable [\(Type\)](#) - Description

limts A LimitSegment (**object**)

value (**double**) - Y-axis value of the End Response limit. No units

Return Type Double

Default 0

Examples

```
Set limtseg = meas.LimitTest(1)
limtseg.EndResponse = 10 'Write
EndResp = limtseg.EndResponse 'Read
```

C++ Syntax HRESULT get_EndResponse(double *pVal)
HRESULT put_EndResponse(double newVal)

Interface ILimitSegment

Type (limit) Property

Description Specifies the Limit Line type.

VB Syntax `limit(index).Type = value`

Variable [\(Type\)](#) - Description

limit A LimitSegment (**object**)

index (**variant**) - Limit line number in the LimitTest collection

value (**enum NALimitSegmentType**) - Limit Line type. Choose from:

0 - naLimitSegmentType_OFF - turns limit line OFF

1 - naLimitSegmentType_Maximum - limit line fails with a data point ABOVE the line

2 - naLimitSegmentType_Minimum - limit line fails with a data point BELOW the line

Return Type Long Integer

Default 0 - OFF

Examples

```
Set limits = meas.LimitTest
limits.Type = naLimitSegmentType_Maximum 'Write
limitType = limits.Type 'Read
```

C++ Syntax HRESULT put_Type(tagNALimitSegmentType *pVal)
HRESULT get_Type(tagNALimitSegmentType newVal)

Interface ILimitSegment

LineDisplay Property

Description Turns the display of limit lines ON or OFF. To turn limit TESTING On and OFF, use [State Property](#).

Note: Trace data must be ON to view limit lines

VB Syntax *limitst.LineDisplay = state*

Variable [\(Type\)](#) - Description

limitst A LimitTest (**object**)

state (**boolean**)

False - Turns the display of limit lines OFF

True - Turns the display of limit lines ON

Return Type Long Integer

Default **True**

Examples `Limtttest.LineDisplay = true 'Write`

`lineDsp = Limtttest.LineDisplay 'Read`

C++ Syntax HRESULT get_LineDisplay(VARIANT_BOOL *pVal)
HRESULT put_LineDisplay(VARIANT_BOOL newVal)

Interface ILimitTest

ListData Property

Description Sets and returns the DC stimulus values per point from the specified DC source.

This setting overrides the Start and Stop DC settings for the channel. Only the values that are set with this command can be read by this command. The read command does NOT read the values that are set using the Start and Stop settings.

VB Syntax *DCStim.ListData(name,port) = values*

Variable [\(Type\)](#) - Description

DCStim A [DCStimulus](#) (object)

name,port (String) Name of the DC source and source port.

Use Source Property to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

value (Variant) DC stimulus value array. The size of the array must equal the sweep point number.

Return Type Variant array

Default Not Applicable

Examples

```
'The following shows how to set a DC value for each data point
dim data(2)
data(0) = 1
data(1) = 2
data(2) = 1
DC.ListData("A01") = data
'Read
varData = dc.ListData("A01")
for i=0 to 2
msgbox (varData (i))
next
```

C++ Syntax HRESULT get_ListData(BSTR name, VARIANT * pValue);
HRESULT put_ListData(BSTR name, VARIANT newValue);

Interface IExternalDCSource

Last modified:

14-Nov-2012 New topic

LoadCharFromFile Property

Description	Sets and returns whether a Mixer characterization file is to be loaded. Specify and load the filename with CharFileName Property
VB Syntax	<i>VMC.LoadCharFromFile = bool</i>
Variable	(Type) - Description
<i>VMC</i>	VMCType (object)
<i>bool</i>	(Boolean)
	True - Load from file
	False - Perform mixer characterization
Return Type	Boolean
Default	False
Examples	<code>value = VMC.LoadCharFromFile</code>
C++ Syntax	HRESULT put_LoadCharFromFile(VARIANT_BOOL bLoadCharFromFile); HRESULT get_LoadCharFromFile(VARIANT_BOOL *bLoadCharFromFile);
Interface	VMCType

LoadImpedance Property

Description Sets and returns the load impedance of the pulse generator.

VB Syntax *extPulseGen*.**LoadImpedance** = *value*

Variable [\(Type\)](#) - [Description](#)

extPulseGen An [ExternalPulseGenerator](#) (**object**)

value (**Double**) Pulse generator load impedance.

Return Type Double

Default **50**

Examples `extPulseGen.LoadImpedance = 50` 'Write

`load = extPulseGen.LoadImpedance` 'Read

C++ Syntax HRESULT get_LoadImpedance (double *pValue)

HRESULT put_LoadImpedance (double newVal)

Interface IExternalPulseGenerator

Last Modified:

15-Feb-2012 New topic

LoadPort Property

Description Returns the load port number associated with an S-parameter reflection measurement. If the measurement is not a reflection S-parameter, the number returned by this property will have no meaning.

VB Syntax `loadPort = meas.LoadPort`

Variable [\(Type\)](#) - **Description**

`loadPort` **(long integer)** - The reflection measurement's load port number.

`meas` A Measurement **(object)**

Return Type Long Integer

Default Not Applicable

Examples

```
Set meas = pna.ActiveMeasurement
loadPort = meas.LoadPort
```

C++ Syntax HRESULT get_LoadPort(long *pPortNumber);

Interface IMeasurement

LocalLockoutState Property

Description	Prevents use of the mouse, keyboard, and front panel while your program is running. Use of these controls while this property is set TRUE causes an error message on the PNA display. To prevent these messages, see About Error Messages .
VB Syntax	<i>app.LocalLockoutState = bool</i>
Variable	(Type) - Description
<i>app</i>	An Application (object)
<i>bool</i>	(boolean) -Choose either: False - User Interface is NOT locked out. True - User Interface IS locked out.
Return Type	Boolean
Default	False
Examples	<pre>app.LocalLockoutState = True 'Write block = app.LocalLockoutState 'Read</pre>
C++ Syntax	HRESULT get_LocalLockoutState(VARIANT_BOOL *State); HRESULT put_LocalLockoutState(VARIANT_BOOL *State);
Interface	IApplication4

Locator Property

Description Specifies the location, address, or ID string of the power meter / sensor that is used during a source power calibration.

Use [Path Property](#) to specify the type of interface.

VB Syntax `pwrMtrInterface.Locator = value`

Variable (Type) - Description

`pwrMtrInterface` **(object)** - A [PowerMeterInterface](#) (object)

`value` **(string)** Location of the power meter / sensor, depending on the type of interface ([Path Property](#))

- For **naGPIB**, address of the power meter. Choose any integer between 0 and 30.
- For **naUSB**, the ID string of the power sensor. Use [USBPowerMeterCatalog Property](#) to see a list of ID strings of connected power sensors.
- For **naLAN**, the hostname or IP address of the power meter.
- For **naANY**, any VISA resource string or a VISA alias.

Return Type String

Default Not applicable

Examples `pwrMeterInterface.Locator = "13" 'GPIB address`

```
pwrMeterInterface.Locator = "Agilent
Technologies,U2000A,MY12345678" 'USB ID string
```

```
pwrMeterInterface.Locator = "mymeter.agilent.com" 'LAN
```

```
pwrMeterInterface.Locator =
"TCPIP0::mymeter.agilent.com::5025::SOCKET" ' Any
```

C++ Syntax `HRESULT put_Locator(BSTR pValue);`

`HRESULT get_Locator(BSTR* pValue);`

Locator IPowerMeterInterface

24-Jan-2012 Updated with 'Any'
29-Sep-2008 Removed Rev from Example
24-Jul-2007 MX New topic

Lock Property

Description Enables or disables the ability to change the power limit values through the user interface.

VB Syntax `gpl.Lock = state`

Variable [\(Type\)](#) - Description

gpl A [GlobalPowerLimit](#) (**object**)

state (**boolean**)

False - Disables the ability to change the power limit values from the user interface.

True - Enables the ability to change the power limit values from the user interface.

Return Type Boolean

Default False

Examples `gpl.Lock = True 'Write`

`UIILock = gpl.Lock 'Read`

C++ Syntax HRESULT get_Lock(BOOL *pVal)
HRESULT put_Lock(BOOL newVal)

Interface IGlobalPowerLimit

Last Modified:

5-Aug-2009 MX New topic

LODeltaFound Property

Description Returns the LO frequency delta from the specified tuning sweep.

VB Syntax *value* = *embedLODiag*.**LODeltaFound** (*n*)

Variable [\(Type\)](#) - **Description**

value **(Double)** Variable to store the returned data.

embedLODiag An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.LODeltaFound 3 'read`

C++ Syntax HRESULT LODeltaFound(long sweep, double* deltaLO);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

LODenominator Property

Description	Sets or returns the denominator value of the LO Fractional Multiplier. If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.
VB Syntax	<i>obj</i> .LODenominator (<i>n</i>) = <i>value</i>
Variable	(Type) - Description
<i>obj</i>	A Mixer Interface pointer to the Measurement (object) Or A Converter Object
<i>value</i>	(Long) - LO denominator value
<i>n</i>	(Long) - LO stage number Choose from 1 or 2
Return Type	Long
Default	1
Examples	<pre>Print mixer.LODenominator(1) 'prints the value of the first LODenominator</pre>
C++ Syntax	HRESULT get_LODenominator(long *pVal) HRESULT put_LODenominator(long newVal)
Interface	IMixer IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

LOFixedFrequency Property

Description Sets or returns the LO frequency value.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj.LOFixedFrequency (n) = value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - LO Frequency in Hertz.

n **(Long)** - LO stage number

Choose from 1 or 2

Return Type Double

Default 0 Hz

Examples

```
Print mixer.LOFixedFrequency(1) 'prints the value of the first
LO fixed frequency
```

C++ Syntax HRESULT get_LOFixedFrequency(double *pVal)

HRESULT put_LOFixedFrequency(double newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

LOFrequencyDelta Property

Description	Sets and returns LO Frequency Delta. There is usually no need to set this value. Read this value to determine the difference between the LO Frequency that is stated in the Mixer dialog box and the last measured LO Frequency.
VB Syntax	<i>obj</i> . LOFrequencyDelta = <i>value</i>
Variable	(Type) - Description
<i>obj</i>	An EmbeddedLO (object) or A ConverterEmbeddedLO (object)
<i>value</i>	(Double) LO Frequency delta in Hertz.
Return Type	(Double)
Default	Not Applicable
Examples	<pre>embedLO.LOFrequencyDelta = 0 'write value = embedLO.LOFrequencyDelta 'read</pre>
C++ Syntax	HRESULT get_LOFrequencyDelta(double* val); HRESULT put_LOFrequencyDelta(double val);
Interface	IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object
18-Apr-2007 MX New topic

LogMagnitudeOffset Property **Superseded**

Description **Note:** This property is replaced by [DoReceiverPowerCal Method](#).

For Receiver Calibration - Sets or returns the value to offset the normalized unratiod power measurement data. The unratiod power measurement is effectively calibrated to the power level specified by the value of LogMagnitudeOffset as soon as the [Normalization property](#) is set to ON after calling the [DataToDivisor](#) method.

To offset the data trace magnitude a specified value, use [MagnitudeOffset Property](#)

VB Syntax *meas*.LogMagnitudeOffset = *value*

Variable [\(Type\)](#) - Description

meas **(object)** - A [Measurement](#) object

value **(double)** - Offset value in dBm.

Return Type Double

Default 0

Examples

```
meas.LogMagnitudeOffset = -10 'Write (-10 dBm)
calpower = meas.LogMagnitudeOffset 'Read
meas.DataToDivisor 'Store meas data as measurement divisor
meas.Normalize = 1 'Measurement is now calibrated to -10 dBm
```

C++ Syntax HRESULT put_LogMagnitudeOffset(double newVal);

HRESULT get_LogMagnitudeOffset(double *pVal);

Interface IMeasurement

LOName Property

Description Sets or returns the name of the PNA internal source or external source to use as the LO in an FCA measurement.

VB Syntax *obj.LOName (n) =value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

n **(Long)** - LO stage number

Choose from 1 or 2

value **(string)** - LO Source name. Use [SourcePortNames Property](#) to return a list of valid source ports. An external source must be configured and selected to be valid. [Learn more about external source configuration.](#)

Note: If the port is defined by a string name, such as an external source or one of the Source 2 outputs on the 2-port, 2-source PNA-x model, then you must use [cap.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

Return Type String

Default "Not controlled"

Examples `mixer.LOName(1) = "MySource"`

C++ Syntax HRESULT get_LOName(string *pVal)

HRESULT put_LOName(string newVal)

Interface MIXer

IConverter

Last Modified:

13-Jan-2012	Fixed SPNames link
2-Feb-2009	Added Converter
24-Apr-2008	Added string names note
23-Jul-2007	Updated for external source config.

LONumerator Property

Description Sets or returns the numerator value of the LO Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj.LONumerator* (*n*) = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(Long)** - LO denominator value

n **(Long)** - LO stage number

Choose from 1 or 2

Return Type Long

Default 1

Examples

```
Print mixer.LONumerator(1) 'prints the value of the
first LO Numerator
```

C++ Syntax HRESULT get_LONumerator(long *pVal)

HRESULT put_LONumerator(long newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

LOPower Property

Description	Sets or returns the value of LO Power.
VB Syntax	<i>obj.LOPower</i> (<i>n</i>) = <i>value</i>
Variable	(Type) - Description
<i>obj</i>	A Mixer Interface pointer to the Measurement (object)
	Or
	A Converter Object
<i>n</i>	(Long) - LO stage number
	Choose from 1 or 2
<i>value</i>	(double) - LO Power in dBm.
Return Type	Double
Default	-10dBm
Examples	<pre>Print mixer.LOPower(1) 'prints the value of the LO Power</pre>
C++ Syntax	HRESULT get_LOPower(double *pVal) HRESULT put_LOPower(double newVal)
Interface	IMixer IConverter

Last Modified:

2-Feb-2009 added converter

LORangeMode Property

Description Sets or returns the LO sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also a [LORangeMode](#) on the Converter Object.

VB Syntax *obj.LORangeMode* (*n*) = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

n **(Long)** - LO stage number.

Choose from 1 or 2

value **(Enum as MixerRangeMode)** - LO sweep mode. Choose from:

0 - **mixSwept**

1 - **mixFixed**

Return Type Enum

Default 0 - mixSwept

Examples `mixer.LORangeMode(1)=mixSwept`

C++ Syntax HRESULT get_LORangeMode(long LO, enum *pVal)

HRESULT put_LORangeMode(long LO, enum newVal)

Interface IMixer3

Last Modified:

4-Mar-2008 Added note.

LORangeMode Property

Description Sets or returns the LO sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also a [LORangeMode](#) on the Mixer Interface

VB Syntax *obj.LORangeMode* (*n*) = *value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

n **(Long)** - LO stage number.

Choose from 1 or 2

value **(Enum as NARangeMode)** - LO sweep mode. Choose from:

0 - **naSwept**

1 - **naFixed**

Return Type Enum

Default 0 - **naSwept**

Examples `mixer.LORangeMode(1)=naSwept`

C++ Syntax HRESULT get_LORangeMode(long LO, enum *pVal)

HRESULT put_LORangeMode(long LO, enum newVal)

Interface IConverter

Last Modified:

18-Feb-2011 New topic

Loss Property

Description	Sets and Returns the insertion loss for the calibration standard.
VB Syntax	<i>calstd.loss</i> = <i>value</i>
Variable	(Type) - Description
<i>calstd</i>	A CalStandard (object). Use calKit. GetCalStandard to get a handle to the standard.
<i>value</i>	(single) - Insertion loss in Gohms / sec. (Giga Ohms per second of electrical delay)
Return Type	Single
Default	Not Applicable
Examples	<pre>calstd.loss = 3.5 'Write 3.5 Gohms of loss</pre> <pre>stdLoss = calstd.loss 'Read the value of Loss</pre>
C++ Syntax	HRESULT get_Loss(float *pVal) HRESULT put_Loss(float newVal)
Interface	ICalStandard

Loss (Power Segment) Property

Description	Sets or returns the loss value associated with a PowerLossSegment.
VB Syntax	<i>lossSeg</i> . Loss = <i>value</i>
Variable	(Type) - Description
<i>lossSeg</i>	A PowerLossSegment (object)
	A PowerLossSegmentPMAR (object)
<i>value</i>	(double) – Loss value in dB. Loss is entered as a POSITIVE number.
Return Type	Double
Default	0
Examples	<pre>lossSeg.Loss = 0.5 'Write lossVal = lossSeg.Loss 'Read</pre>
C++ Syntax	HRESULT put_Loss(Double newVal); HRESULT get_Loss(Double *pVal);
Interface	IPowerLossSegment IPowerLossSegmentPMAR

Last Modified:

27-Aug-2009	Added PMAR (9.0)
2-Jun-2008	Clarified negative value for loss

LOStage Property

Description Sets or returns the number of LO stages present in the mixer.

VB Syntax *obj.LOStage = value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value (**Long**) - Number of LO stages. Choose from **1** or **2**

Return Type Long

Default 1

Examples `mixer.LOStage = 1 'sets the LO Stage value to 1`

C++ Syntax HRESULT get_LOStage(long *pVal)

HRESULT put_LOStage(long newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added converter

LOStartFrequency Property

Description Sets or returns the LO start frequency value. This command can only be used with SMC (not VMC) measurements.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj.LOStartFrequency (n) = value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - LO Start Frequency in Hertz.

n **(Long)** - LO stage number

Choose from 1 or 2

Return Type Double

Default Not Applicable

Examples

```
Print mixer.LOStartFrequency(1) 'prints the value of the first
LO start frequency
```

C++ Syntax HRESULT get_LOStartFrequency(long id, double *pVal)

HRESULT put_LOStartFrequency(long id, double newVal)

Interface IMixer3

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

LOStartPower Property

Description Sets or returns the Start value of a LO Power sweep.. Also set [indx.SweepType](#) to naIMDLPowerSweep.

VB Syntax *obj.LOStartPower (n) = value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

n **(Long)** - LO stage number. Choose 1

value **(double)** - LO start power in dBm.

Return Type Double

Default -20 dBm

Examples `convtr.LOStartPower(1) = -5 'Sets the LO Power sweep start value`

`start = convtr.LOStartPower(1) 'Reads the start value`

C++ Syntax HRESULT get_LOStartPower(long LOStage, double *pVal)

HRESULT put_LOStartPower(long LOStage, double newVal)

Interface IConverter

Last Modified:

27-Mar-2009 MX New topic

LOStopFrequency Property

Description Sets or returns the LO stop frequency value. This command can only be used with SMC (not VMC) measurements.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj.LOStopFrequency (n) = value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - LO Stop Frequency in Hertz.

n **(Long)** - LO stage number

Choose from 1 or 2

Return Type Double

Default Not Applicable

Examples

```
Print mixer.LOStopFrequency(1) 'prints the value of the first LO stop frequency
```

C++ Syntax HRESULT get_LOStopFrequency(long id, double *pVal)

HRESULT put_LOStopFrequency(long id,double newVal)

Interface IMixer3

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

LOStopPower Property

Description Sets or returns the Stop value of a LO Power sweep. Also set [imdx.SweepType](#) to naIMDLPowerSweep.

VB Syntax *obj.LOStopPower (n) = value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

n **(Long)** - LO stage number. Choose 1

value **(double)** - LO Stop power in dBm.

Return Type Double

Default -10 dBm

Examples `convtr.LOStopPower(1) = -5 'Sets the LO Power sweep Stop value`

`Stop = convtr.LOStopPower(1) 'Reads the Stop value`

C++ Syntax HRESULT get_LOStopPower(long LOStage, double *pVal)

HRESULT put_LOStopPower(long LOStage, double newVal)

Interface IConverter

Last Modified:

27-Mar-2009 MX New topic

LowAmplitude Property

Description Sets and returns the Low amplitude (voltage) of the pulse generator.

VB Syntax *extPulseGen.LowAmplitude* = *value*

Variable [\(Type\)](#) - [Description](#)

extPulseGen An [ExternalPulseGenerator](#) (**object**)

value (**Double**) Pulse Generator low amplitude voltage.

Return Type Double

Default 0

Examples `extPulseGen.LowAmplitude = 4 'Write`

`lo = extPulseGen.LowAmplitude 'Read`

C++ Syntax HRESULT get_LowAmplitude (double *pValue)

HRESULT put_LowAmplitude (double newVal)

Interface IExternalPulseGenerator

Last Modified:

15-Feb-2012 New topic

LXIDeviceIDState Property

Description Opens and closes the [LAN Status dialog](#) with the LAN Status Indicator showing IDENTIFY.

The PNA supports this capability to satisfy a requirement of the LAN eXtensions for Instrumentation (LXI) standard. Changing the value of this property is the same operation that occurs when clicking the Toggle LXI Identification button on the Welcome web page presented by the PNA web server.

VB Syntax `app.LXIDeviceIDState = bool`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

bool (boolean) Choose from:

True - Displays the [LAN Status dialog](#) with the Status Indicator showing IDENTIFY.

False -

- If the dialog had been opened by this property, then the LAN Status dialog is closed.
- If the dialog was opened manually, then it will stay open.

Return Type Boolean

Default False

Examples

```
app.LXIDeviceIDState = True 'Write
```

```
value = app.LXIDeviceIDState 'Read
```

C++ Syntax HRESULT get_LXIDeviceIDState(VARIANT_BOOL* pState);

HRESULT put_LXIDeviceIDState(VARIANT_BOOL state);

Interface IApplication14

Last Modified:

2-Jun-2008 MX New topic

MagnitudeOffset Property

Description Offsets the data trace magnitude by the specified value.

To offset the data trace magnitude to a slope value that changes with frequency, use [MagnitudeSlopeOffset Property](#).

To implement a Receiver Cal offset, use [LogMagnitudeOffset property](#).

VB Syntax *meas.MagnitudeOffset* = *value*

Variable [\(Type\)](#) - Description

meas **(object)** - A [Measurement](#) object

value **(double)** - Offset value in dB.

Return Type Double

Default 0

Examples

```
meas.MagnitudeOffset = 4 'Write
```

```
offs = meas.MagnitudeOffset 'Read
```

C++ Syntax HRESULT put_MagnitudeOffset(double newVal);

HRESULT get_MagnitudeOffset(double *pVal);

Interface IMeasurement4

MagnitudeSlopeOffset Property

Description Offsets the data trace magnitude to a value that changes linearly with frequency. The offset slope begins at 0 Hz.

To offset the entire data trace magnitude by a specified value, use [MagnitudeOffset Property](#).

VB Syntax *meas.MagnitudeSlopeOffset = value*

Variable [\(Type\)](#) - Description

meas **(object)** - A [Measurement](#) object

value **(double)** - Offset slope value in dB / 1GHz.

Return Type Double

Default 0

Examples

```
meas.MagnitudeSlopeOffset = 4 'Writes a slope offset of 4dB/1GHz.  
offs = meas.MagnitudeSlopeOffset 'Read
```

C++ Syntax HRESULT put_MagnitudeSlopeOffset(double newVal);

HRESULT get_MagnitudeSlopeOffset(double *pVal);

Interface IMeasurement4

MainToneIFBandwidth Property

Description Sets and returns the IF Bandwidth for measurement of the Main tones.

VB Syntax `imd.MainToneIFBandwidth = value`

Variable [\(Type\)](#) - Description

`imd` A [SweptIMD](#) Object

`value` (Double) IF Bandwidth in Hz. Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

[Learn more about setting IFBW for IMD.](#)

If an invalid number is specified, the analyzer will round up to the closest valid number.

Return Type Double

Default 1 kHz

Examples

```
imd.MainToneIFBandwidth = 2e3 'Write
```

```
value = imd.MainToneIFBandwidth 'Read
```

C++ Syntax HRESULT get_MainToneIFBandwidth(double *pVal)
HRESULT put_MainToneIFBandwidth(double newVal)

Interface ISweptIMD

MarkerAnnotation Property

Description Returns the Y-axis marker value from the specified tuning sweep. Use [IsMarkerOn](#) to confirm if a marker was used for the tuning sweep.

VB Syntax *value* = *embedLO*.MarkerAnnotation (*n*)

Variable [\(Type\)](#) - Description

value **(String)** Variable to store the returned data.

embedLO An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.MarkerAnnotation 3 'read`

C++ Syntax HRESULT MarkerAnnotation(long sweep, BSTR* annotation);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

MarkerFormat Property

Description Sets the format of all the markers in the measurement. To override this setting for an individual marker, use [mark.Format](#)

VB Syntax `meas.MarkerFormat = value`

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**enum NAMarkerFormat**) - Choose from:

0 - naMarkerFormat_LinMag

1 - naMarkerFormat_LogMag

2 - naMarkerFormat_Phase

3 - naMarkerFormat_Delay

4 - naMarkerFormat_Real

5 - naMarkerFormat_Imaginary

6 - naMarkerFormat_SWR

7 - naMarkerFormat_LinMagPhase

8 - naMarkerFormat_LogMagPhase

9 - naMarkerFormat_RealImaginary

10 - naMarkerFormat_ComplexImpedance

11 - naMarkerFormat_ComplexAdmittance

12 - naMarkerFormat_Kelvin

13 - naMarkerFormat_Fahrenheit

14 - naMarkerFormat_Centigrade

Return Type Not Applicable

Default 1 - naMarkerFormat_LogMag

Examples `meas.MarkerFormat = naMarkerFormat_SWR 'Write`

[C++ Syntax](#) HRESULT put_MarkerFormat(tagNAMarkerFormat NewFormat)

[Interface](#) IMeasurement

Last Modified:

17-Nov-2010	Removed Read capability
1-Oct-2007	Added temperature formats

InterpolateMarkers Method

Description Turns **All** Marker Interpolation ON and OFF for the measurement. Marker interpolation enables X-axis resolution between the discrete data values. The analyzer will calculate the x and y-axis data values between discrete data points. To override this property for individual markers, use the [Interpolated](#) property.

VB Syntax *meas*.Interpolate = *value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**boolean**)

False - Turns interpolation OFF for all markers in the measurement

True - Turns interpolation ON for all markers in the measurement

Return Type Boolean

Default True (ON)

Examples `meas.Interpolate = 1`

C++ Syntax HRESULT InterpolateMarkers(VARIANT_BOOL bNewVal)

Interface IMeasurement

Number Property

Description	Returns the number of the marker.
VB Syntax	<i>marknum</i> = <i>mark</i> . Number
Variable	(Type) - Description
<i>marknum</i>	(long) - Variable to store marker number
<i>mark</i>	A Marker (object)
Return Type	Long Integer
Default	Not applicable
Examples	<pre>marknum = mark.Number 'Read</pre>
C++ Syntax	HRESULT get_Number(long *pVal)
Interface	IMarker

MarkerPosition Property

Description Returns the X-axis marker position from the specified tuning sweep.

VB Syntax *value* = *embedLO*.**MarkerPosition** (*n*)

Variable [\(Type\)](#) - Description

value **(Double)** Variable to store the returned data.

embedLO *Diag* An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.MarkerPosition 3 'read`

C++ Syntax HRESULT MarkerPosition(long sweep, double *position);

Interface IEmbeddedLODiagnostic

MarkerReadout Property

Description	Enables or disables the readout of markers in the window. To show the marker on the screen use ShowMarkerReadout Method.
VB Syntax	<i>win</i> . MarkerReadout = <i>state</i>
Variable	(Type) - Description
<i>win</i>	A NAWindow (object)
<i>state</i>	(boolean) True - enables marker readout False - disables marker readout
Return Type	Boolean
Default	True
Examples	<pre>win.MarkerReadout = True 'Write</pre> <pre>State = app.ActiveNAWindow.MarkerReadout 'Read</pre>
C++ Syntax	HRESULT get_MarkerReadout(VARIANT_BOOL *pVal) HRESULT put_MarkerReadout(VARIANT_BOOL newVal)
Interface	INAWindow

MarkerReadoutResponsePlaces Property

Description	For the Y-axis (response), sets the number digits to display after the decimal point in marker readouts.
VB Syntax	<i>win.MarkerReadoutResponsePlaces = value</i>
Variable	(Type) - Description
<i>win</i>	A NAWindow (object)
<i>value</i>	(Long Integer) Number of digits to display. Choose a value between 1 and 4.
Return Type	Long Integer
Default	2
Examples	<pre>win.MarkerReadoutResponsePlaces = 3 'Write</pre> <pre>value = app.ActiveNAWindow.MarkerReadoutResponsePlaces 'Read</pre>
C++ Syntax	HRESULT get_MarkerReadoutResponsePlaces(long *pVal) HRESULT put_MarkerReadoutResponsePlaces(long newVal)
Interface	INAWindow3

Last Modified:

5-Aug-2010 MX New topic

MarkerReadoutSize Property

Description	Specifies the size of font used when displaying Marker Readout in the selected window.
VB Syntax	<i>win</i> . MarkerReadoutSize = <i>value</i>
Variable	(Type) - Description
<i>win</i>	A NAWindow (object)
<i>value</i>	(enum NAFontSize)
	0 - naDefault - marker readout appears in default font size
	1 - naLarge - marker readout appears in large font size
Return Type	Long Integer
Default	naDefault
Examples	<pre>win.MarkerReadoutSize = naDefault 'write default size for marker readout</pre>
	<pre>Dim Size As NAFontSize Size = app.ActiveNAWindow.MarkerReadoutSize 'Read</pre>
C++ Syntax	HRESULT get_MarkerReadoutSize(tagNAFontSize *pVal) HRESULT put_MarkerReadoutSize(tagNAFontSize newVal)
Interface	INAWindow

MarkerReadoutsPerTrace Property

Description Sets the number of marker readouts to display per trace. Display up to 20 marker readouts per window.

VB Syntax `win.MarkerReadoutsPerTrace = value`

Variable [\(Type\)](#) - Description

win A [NAWindow](#) (object)

value **(Long Integer)** Number of marker readouts to display. Choose a value between 1 and 10.

Return Type Long Integer

Default 5

Examples `win.MarkerReadoutsPerTrace = 3 'Write`

`value = app.ActiveNAWindow.MarkerReadoutsPerTrace 'Read`

C++ Syntax HRESULT get_MarkerReadoutsPerTrace(long *pVal)

HRESULT put_MarkerReadoutsPerTrace(long newVal)

Interface INAWindow3

Last Modified:

5-Aug-2010 MX New topic

MarkerReadoutStimulusPlaces Property

Description	For the X-axis (stimulus), sets the number digits to display after the decimal point in marker readouts.
VB Syntax	<i>win.MarkerReadoutStimulusPlaces = value</i>
Variable	(Type) - Description
<i>win</i>	A NAWindow (object)
<i>value</i>	(Long Integer) Number of digits to display. Choose a value between 2 and 6.
Return Type	Long Integer
Default	3
Examples	<pre>win.MarkerReadoutStimulusPlaces = 2 'Write</pre> <pre>value = app.ActiveNAWindow.MarkerReadoutStimulusPlaces 'Read</pre>
C++ Syntax	HRESULT get_MarkerReadoutStimulusPlaces(long *pVal) HRESULT put_MarkerReadoutStimulusPlaces(long newVal)
Interface	INAWindow3

Last Modified:

5-Aug-2010 MX New topic

MarkerReadoutXPosition Property

Description Sets the X-axis position of marker readouts. Readouts are right-justified at the specified position.

VB Syntax `win.MarkerReadoutXPosition = value`

Variable [\(Type\)](#) - Description

win A [NAWindow](#) (object)

value **(Double)** X-axis position. Choose a value between 1 (far left) and 10 (far right).

Return Type Double

Default 10

Examples `win.MarkerReadoutXPosition = 3 'Write`

`value = app.ActiveNAWindow.MarkerReadoutXPosition 'Read`

C++ Syntax HRESULT get_MarkerReadoutXPosition(double *pVal)

HRESULT put_MarkerReadoutXPosition(double newVal)

Interface INAWindow3

Last Modified:

5-Aug-2010 MX New topic

MarkerReadoutYPosition Property

Description	Sets the Y-axis position of marker readouts. Readouts are right-justified at the specified position.
VB Syntax	<i>win</i> . MarkerReadoutYPosition = <i>value</i>
Variable	(Type) - Description
<i>win</i>	A NAWindow (object)
<i>value</i>	(Double) Y-axis position. Choose a value between 1 (bottom) and 10 (top).
Return Type	Double
Default	10
Examples	<pre>win.MarkerReadoutYPosition = 3 'Write</pre> <pre>value = app.ActiveNAWindow.MarkerReadoutYPosition 'Read</pre>
C++ Syntax	HRESULT get_MarkerReadoutYPosition(double *pVal) HRESULT put_MarkerReadoutYPosition(double newVal)
Interface	INAWindow3

Last Modified:

5-Aug-2010 MX New topic

Markers Property

Description Set and return the color of data trace markers for nth trace in a window.

VB Syntax `trace(n).Markers = value`

Variable [\(Type\) - Description](#)

`trace(n)` One of the 8 [ComTraceColors](#) objects

`value` **(Long Integer)** - RGB color of the Markers pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Varies for each trace.

Examples

```
R = 10
G = 10
B = 10
RGB = 10+(10*2^8)+(10*2^16)
trace1.Markers = RGB 'Write
color = trace1.Markers 'Read
```

C++ Syntax HRESULT get_Markers(long* pVal);

HRESULT put_Markers(long newVal);

Interface IComTraceColors

Last Modified:

7-Aug-2009 MX New topic

MarkerState Property

Description Sets or returns the ON / OFF state of the specified marker.

VB Syntax `meas.MarkerState (n) = state`

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

n (Long Integer) Marker number to turn on or off.

state (boolean) -
True - turns the specified marker ON
False - turns the specified marker OFF

Return Type Boolean

Default False

Examples `meas.MarkerState(1) = True`

`reference = meas.MarkerState(2)`

C++ Syntax HRESULT get_MarkerState(long markerNum, VARIANT_BOOL bState)
HRESULT put_MarkerState(long markerNum, VARIANT_BOOL* bState)

Interface IMeasurement3

MarkerSymbol Property

Description Sets the symbol to display for marker position.

VB Syntax `win.MarkerSymbol = value`

Variable [\(Type\)](#) - Description

win A [NAWindow](#) (object)

value (Enum as naMarkerSymbol) Choose from:

0 - naMarkerSymbolTriangle

1 - naMarkerSymbolFlag

2 - naMarkerSymbolLine

[See pictures of symbols](#)

Return Type Enum

Default 0 - naMarkerSymbolTriangle

Examples

```
win.MarkerSymbol = naMarkerSymbolLine  
'Write
```

```
value = app.ActiveNAWindow.MarkerSymbol  
'Read
```

C++ Syntax HRESULT get_MarkerSymbol(double *pVal)

HRESULT put_MarkerSymbol(double newVal)

Interface INAWindow3

Last Modified:

5-Aug-2010 MX New topic

MasterFrequency Property

Description Sets the pulse repetition frequency (PRF) for ALL internal pulse generators.

This setting is equal to 1/period which is set with [MasterPeriod Property](#)

Note: On the [Pulse Setup dialog](#), this command is a "Basic" setting, intended to be used with the 'Auto' selections set to ON.

VB Syntax *pulse*.**MasterFrequency** = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseMeasurementControl](#) (**object**)

value (**Double**) PRF in Hz.

Return Type Double

Default 1 kHz

Examples `pulse.MasterFrequency = 1e4 'Write`
`value = pulse.MasterFrequency 'Read`

C++ Syntax HRESULT get_MasterFrequency(double* value);
HRESULT put_MasterFrequency(double value);

Interface IPulseMeasurementControl2

Last modified:

11-May-2011 New topic

MasterMode Property

Description Sets and returns the Master (On/Off) setting of the external pulse generator. this setting allows the external pulse generator to set the master clock frequency for the other pulse generators.

VB Syntax `extPulseGen.MasterMode = value`

Variable [\(Type\)](#) - **Description**

extPulseGen An [ExternalPulseGenerator](#) (**object**)

value (**Boolean**) Master setting. Choose from:

True - Use the external pulse generator becomes the master clock frequency.

False - Use the internal pulse generator as the master clock frequency.

Return Type Boolean

Default False

Examples

```
extPulseGen.MasterMode = True 'Write
```

```
master = extPulseGen.MasterMode 'Read
```

C++ Syntax HRESULT get_MasterMode (VARIANT BOOL *pValue)

HRESULT put_MasterMode (VARIANT BOOL newVal)

Interface IExternalPulseGenerator2

Last Modified:

15-Feb-2012 New topic

MasterPeriod Property

Description Sets the period for ALL internal pulse generators.

This setting is equal to 1/PRF which is set with [MasterFrequency Property](#).

Note: On the [Pulse Setup dialog](#), this command is a 'Basic setting, which is intended to be used with the 'Auto' selections set to ON.

VB Syntax *pulse*.**MasterPeriod** = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseMeasurementControl Object](#) (**object**)

value (**Double**) Period in seconds.

Return Type Double

Default 1 msec

Examples
`pulse.MasterPeriod = 1e-4 'Write`
`value = pulse.MasterPeriod 'Read`

C++ Syntax HRESULT get_MasterPeriod(double* MasterPeriod);
HRESULT put_MasterPeriod(double MasterPeriod);

Interface IPulseMeasurementControl2

Last modified:

9-May-2011 New topic

MasterWidth Property

Description Sets the pulse width for ALL internal pulse generators.

Note: On the [Pulse Setup dialog](#), this command is a 'Basic setting, which is intended to be used with the 'Auto' selections set to ON.

VB Syntax `pulse.MasterWidth = value`

Variable [\(Type\)](#) - Description

pulse A [PulseMeasurementControl Object](#) (**object**)

value (**Double**) Pulse width in seconds.

Return Type Double

Default 100 microseconds

Examples `pulse.MasterWidth = 1e-3 'Write`

`value = pulse.MasterWidth 'Read`

C++ Syntax HRESULT get_MasterWidth(double* MasterWidth);

HRESULT put_MasterWidth(double MasterWidth);

Interface IPulseMeasurementControl2

Last modified:

9-May-2011 New topic

Type (Marker) Property

Description Sets and reads the marker type.

VB Syntax *mark.Type = value*

Variable [\(Type\)](#) - Description

chan A [Marker](#) (object)

value (enum `NAMarkerType`) - Marker Type. Choose from:

0 - `naMarkerType_Normal` - the X-axis value for a normal marker will always be determined by the measurement data of the marker.

1 - `naMarkerType_Fixed` - retains and keeps its x-axis value at the time the marker type is set.

Return Type Long Integer

Default `naMarkerType_Normal`

Examples `mark.Type = naMarkerType_Normal 'Write`

`MrkType = mark.Type 'Read`

C++ Syntax `HRESULT get_Type(tagNAMarkerType *pVal)`
`HRESULT put_Type(tagNAMarkerType newVal)`

Interface `IMarker`

Stimulus Property

Description Sets and reads the X-Axis value of the marker. If the marker is a delta marker, the value will be relative to the reference marker.

VB Syntax *mark.Stimulus = value*

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (**double**) - X-Axis value. Choose any number within the full span of the channel or User Range (if set).

Return Type Double

Default First activated Marker turns ON in the middle of the X-axis range. Subsequent markers turn ON at the position of the most recently active marker.

Examples `mark.Stimulus = 3e9 'Write`

`XVal = mark.Stimulus 'Read`

C++ Syntax HRESULT get_Stimulus(double *pVal)
HRESULT put_Stimulus(double newVal)

Interface IMarker

Value Property

Description Reads the Y-axis value of the marker. If the marker is a delta marker, the value will be relative to the reference marker.

You cannot set the Y-axis value of a marker. The marker remains at the position at the time you set [marker.Type](#).

Note: To accurately read the marker Y-axis value with [trace smoothing](#) applied, the requested format must match the [displayed format](#). Otherwise, the returned value is un-smoothed data. For example, to read the smoothed marker value when measuring group delay, both the display format and the marker format must be set to (Group) Delay.

VB Syntax *YValue* = *mark.Value* (*format*)

Variable [\(Type\)](#) - **Description**

YValue A variable to store the Y-axis value

mark A [Marker](#) (**object**)

format (**enum NAMarkerFormat**) - The format in which to return the marker's Y-axis value. The number in parenthesis following the format is the number of values that are returned in a variant array. Choose from:

0 - naMarkerFormat_**LinMag** (1)

1 - naMarkerFormat_**LogMag** (1)

2 - naMarkerFormat_**Phase** (1)

3 - naMarkerFormat_**Delay** (1)

4 - naMarkerFormat_**Real** (1)

5 - naMarkerFormat_**Imaginary** (1)

6 - naMarkerFormat_**SWR** (1)

7 - naMarkerFormat_**LinMagPhase** (2)

8 - naMarkerFormat_**LogMagPhase** (2)

9 - naMarkerFormat_**RealImaginary** (2)

10 - naMarkerFormat_**ComplexImpedance** (3)

11 - naMarkerFormat_ **ComplexAdmittance** (3)

12 - naMarkerFormat_ **Kelvin** (1)

13 - naMarkerFormat_ **Fahrenheit** (1)

14 - naMarkerFormat_ **Celsius** (1)

Return Type Variant - The (parens) in the previous list of formats indicates the number of values that are returned in a variant array

Default Not applicable

Examples

```
YVal = mark.Value(0) 'Read  
'or  
YVal = mark.Value(naMarkerFormat_LinMag)
```

C++ Syntax HRESULT get_Value(tagNAMarkerFormat format, VARIANT *pVal)

Interface IMarker

Read/Write

MatchCorrectPower Property

Description Turns match-correction ON or OFF. Use this command AFTER performing a Guided Power Cal. [Learn more.](#)

VB Syntax *corrMethods.MatchCorrectPower = value*

Variable [\(Type\) - Description](#)

corrMethods [CorrectionMethods](#) (object)

value **(Boolean)**

True Turns match-correction ON

False Turns match-correction OFF

Return Type **Boolean**

Default True

Example `corrMethods.MatchCorrectPower = True`

C++ Syntax HRESULT get_MatchCorrectPower(VARIANT_BOOL* val);

HRESULT put_MatchCorrectPower(VARIANT_BOOL newVal);

Interface ICorrectionMethods

10-Sep-2010 MX New topic

MaximumFrequency Property

Description Sets and Returns the maximum frequency for the calibration standard.

VB Syntax *calstd.MaximumFrequency = value*

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**double**) - Maximum frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `calstd.MaximumFrequency = 9e9 'Write`

`maxFrequency = calstd.MaximumFrequency 'Read`

C++ Syntax HRESULT get_MaximumFrequency(double *pVal)
HRESULT put_MaximumFrequency(double newVal)

Interface ICalStandard

MaximumFrequency Property

Description Returns the maximum frequency of the remote PNA.

VB Syntax *value* = *cap*.MaximumFrequency

Variable [\(Type\)](#) - Description

value (Double) - Variable to store the returned maximum frequency of the PNA.

cap A [Capabilities](#) (object)

Return Type Double

Default Not Applicable

Examples `value = cap.MaximumFrequency 'Read`

C++ Syntax HRESULT get_MaximumFrequency(&frequencyMax);

Interface ICapabilities

MaximumFrequency Property

Description Set and returns the maximum usable frequency specified for the power sensor.

VB Syntax *pwrSensor*.**MaximumFrequency** = *value*

Variable [\(Type\)](#) - Description

pwrSensor A [PowerSensor](#) (Object) or

a [PowerSensorAsReceiver](#) (Object)

value (**double**) -Frequency in Hertz.

Return Type Double

Default Device dependent

Examples `pwrSensor.MaximumFrequency = 6e9 'Write`

`MaxFreq = pwrSensor.MaximumFrequency 'Read`

C++ Syntax HRESULT put_MaximumFrequency(double newVal);

HRESULT get_MaximumFrequency(double *pVal);

Interface IPowerSensor

IPowerSensorPMAR

MaximumIFFrequency Property

Description	Returns the Maximum allowed value for the IFFrequency Property
VB Syntax	<i>value</i> = <i>IfConfig</i> . MaximumIFFrequency
Variable	(Type) - Description
<i>value</i>	(double) Variable to store the returned maximum allowed frequency that can be applied to the IFFrequency Property .
<i>IfConfig</i>	IFConfiguration (object)
Return Type	Double
Default	Not Applicable
Examples	<pre>val = App.ActiveChannel.IFConfiguration.MaximumIFFrequency 'Read</pre>
C++ Syntax	HRESULT get_ MaximumIFFrequency (double * pMaxFreq);
Interface	IIFConfiguration3

Last Modified:

18-Jun-2007 MX New topic

MaximumIterationsPerPoint Property

Description This command, along with [IterationsTolerance Property](#) deal with ADJUSTMENTS made to the source power.

Sets the maximum number of readings to take at each data point for iterating the source power. Power readings will continue to be made, and source power adjusted, until a reading is within the [IterationsTolerance](#) value or this max number of readings has been met. The last value to be read is the valid reading for that data point.

The following two commands allow for settling of power READINGS.

[ReadingsPerPoint Property](#)

[ReadingsTolerance Property](#)

VB Syntax `pwrCal.MaximumIterationsPerPoint = value`

Variable [\(Type\)](#) - Description

`pwrCal` **(object)** - A [SourcePowerCalibrator](#) (object)

`value` **(Long)** – Maximum number of readings. Choose any number between 1 and 100.

Return Type Long Integer

Default 5

Examples

```
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.MaximumIterationsPerPoint = 5 'Write
MaxReads = powerCalibrator.MaximumIterationsPerPoint 'Read
```

C++ Syntax HRESULT get_MaximumIterationsPerPoint(long *pVal);

HRESULT put_MaximumIterationsPerPoint(long newVal);

Interface ISourcePowerCalibrator3

17-Apr-2007 Clarified verbage

MaximumNumberOfChannels Property

Description	Returns the maximum possible number of channels that can be used in the PNA.
VB Syntax	<i>value</i> = <i>cap</i> .MaximumNumberOfChannels
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned maximum value for number of channels.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<pre>value = cap.MaximumNumberOfChannels 'Read</pre>
C++ Syntax	HRESULT get_MaximumNumberOfChannels(long * maximumNumberOfChans);
Interface	ICapabilities2

MaximumNumberOfTracesPerWindow Property

Description	Returns the maximum possible number of traces that can reside in any window.
VB Syntax	<i>value</i> = <i>cap</i> . MaximumNumberOfTracesPerWindow
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned maximum value for number of traces.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<pre>value = cap.MaximumNumberOfTracesPerWindow 'Read</pre>
C++ Syntax	HRESULT get_MaximumNumberOfTracesPerWindow(long * maximumNumberOfTraces);
Interface	ICapabilities2

MaximumNumberOfWindows Property

Description	Returns the maximum possible number of windows that can be present on the PNA screen.
VB Syntax	<i>value</i> = <i>cap</i> .MaximumNumberOfWindows
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned maximum value for number of windows.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<pre>value = cap.MaximumNumberOfWindows 'Read</pre>
C++ Syntax	HRESULT get_MaximumNumberOfWindows(long * maximumNumberOfWindows);
Interface	ICapabilities2

MaximumNumberOfPoints Property

Description	Returns the maximum possible number of data points.
VB Syntax	<i>value</i> = <i>obj</i> . MaximumNumberOfPoints
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned maximum value for number of points.
<i>cap</i>	A Capabilities (object)
	or
	A GainCompression (object)
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.MaximumNumberOfPoints 'Read</pre>
C++ Syntax	HRESULT get_MaximumNumberOfPoints(double * maximumNumberOfPoints);
Interface	ICapabilities IGainCompression

MaximumPowerCompression

MaximumReceiverStepAttenuator Property

Description	Returns the maximum amount of receiver attenuation.
VB Syntax	<i>value</i> = <i>cap</i> . MaximumReceiverStepAttenuator (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned value of maximum receiver attenuation.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - port number to query for step attenuators
Return Type	Double
Default	Not Applicable
Examples	<code>value = cap.MaximumReceiverStepAttenuator 'Read</code>
C++ Syntax	HRESULT get_MaximumReceiverStepAttenuator(long portNumber, double * attenuation);
Interface	ICapabilities

MaximumSourceALCPower Property

Description	Returns a value indicating the maximum amount of source ALC power.
VB Syntax	<i>value</i> = <i>cap</i> .MaximumSourceALCPower (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned value for the maximum amount of source ALC power.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - source number to query for maximum ALC power
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.MaximumSourceALCPower 'Read</pre>
C++ Syntax	HRESULT get_MaximumSourceALCPower(long sourceNum, double * power);
Interface	ICapabilities

MaximumSourceStepAttenuator Property

Description	Returns a value for the maximum amount of source attenuation.
VB Syntax	<i>value</i> = <i>cap</i> .MaximumSourceStepAttenuator (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned value for the maximum amount of source attenuation.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - port number to query for the maximum amount of source attenuation
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.MaximumSourceStepAttenuator 2 'Read</pre>
C++ Syntax	HRESULT get_MaximumSourceStepAttenuator(long portNumber, double * attenuation);
Interface	ICapabilities

Last Modified:

19-Sep-2007 Added port arg to ex.

MaxPreciseTuningIterations Property

Description Sets and returns the maximum number of tuning iterations to achieve the precise tolerance.

VB Syntax *obj*.MaxPreciseTuningIterations = *value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Long**) Maximum number of tuning iterations.

Return Type (**Long**)

Default 5

Examples

```
embedLO.MaxPreciseTuningIterations = 3 'write
```

```
value = embedLO.MaxPreciseTuningIterations 'read
```

C++ Syntax HRESULT get_MaxPreciseTuningIterations long* iter);

HRESULT put_MaxPreciseTuningIterations long iter);

Interface IEmbeddedLO

MaxProduct Property

Description Sets and returns the maximum intermod product frequencies to be calibrated.

VB Syntax `imd.MaxProduct = value`

Variable [\(Type\)](#) - Description

imd A [SweptIMDCal](#) (object)

value Maximum IM products to calibrate. Choose from:

2 - second order products

3 - third order products

5 - fifth order products

7 - seventh order products

9 - ninth order products

Return Type Long Integer

Default 3

Examples

```
imd.MaxProduct = 7 'Write
```

```
mprod = imd.MaxProduct 'Read
```

C++ Syntax HRESULT get_MaxProduct(long * Val)

HRESULT put_MaxProduct(long newVal)

Interface ISweptIMD

Mean Property

Description	Returns the mean value of the measurement . To retrieve all 3 statistics value at the same time, use meas.GetTraceStatistics
VB Syntax	<code>average = meas.Mean</code>
Variable	(Type) - Description
<code>average</code>	(single) - Variable to store mean value
<code>meas</code>	A Measurement (object)
Return Type	Single
Default	Not applicable
Examples	<pre>Dim average as Single average = meas.Mean 'Read</pre>
C++ Syntax	HRESULT get_Mean(float* mean)
Interface	IMeasurement

Measurement Property

Description	Returns the measurement handle of the trace object. Learn the difference between a Trace and a Measurement .
VB Syntax	<i>myMeas</i> = <i>trace</i> . Measurement
Variable	(Type) - Description
<i>myMeas</i>	(Object) Variable to store the returned Measurement object.
<i>trace</i>	A Trace (object)
Return Type	Object
Default	Not Applicable
Examples	<code>myMeas = myTrace.Measurement</code>
C++ Syntax	HRESULT get_Measurement(IMeasurement** ppMeas);
Interface	ITrace2

Last modified:

2-May-2011 New topic

MeasurementClassProperties Property

Description Provides access to the [MeasurementClassProperties](#) Object.

VB Syntax *handle* = *cap*.**MeasurementClassProperties** (*measClass*)

Variable [\(Type\)](#) - Description

handle (Variant) - Variable to store the returned object.

cap A [Capabilities](#) (**object**)

measClass (String) Name of the measurement class to be accessed.

Use [AvailableMeasurementClasses Property](#) to return a list of measurement classes installed on the PNA.

Return Type Object

Default Not Applicable

Examples

```
'Access the MeasurmentClassProperties Object
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
Set measProps = cap.MeasurmentClassProperties("SweptIMD")
```

C++ Syntax HRESULT put_MeasurementClassProperties(IMeasurementClassProperties *handle);

Interface ICapabilities8

Last Modified:

24-May-2011 MX New topic

MeasurementClass Property

Description	Returns the measurement class name from the channel. Use CreateCustomMeasurementEx to create a measurement from a class other than standard S-Parameters.
VB Syntax	<i>class</i> = <i>chan</i> . MeasurementClass
Variable	(Type) - Description
	<i>class</i> (string) - Variable to store the returned measurement class name.
	<i>chan</i> Channel (object)
Return Type	String
Default	Not Applicable
Examples	<pre>class = chan.MeasurementClass 'Read For a standard S-Parameter channel, returns... "Standard"</pre>
C++ Syntax	HRESULT get_MeasurementClass();
Interface	IChannel15

Last Modified:

6-Oct-2008 Corrected IChannel
12-May-2008 MX New topic

Medium Property

Description Sets and Returns the media type of the calibration standard.

VB Syntax `calstd.Medium = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**enum** NACalStandardMedium) - Medium of the transmission line of the standard.

Choose from:

0 - naCoax - Coaxial Cable

1 - naWaveGuide

Return Type Long Integer

Default Not Applicable

Examples

```
calstd.Medium = naCoax 'Write
```

```
stdMedium = calstd.Medium 'Read
```

C++ Syntax

```
HRESULT get_Medium(tagNACalStandardMedium *pVal)
```

```
HRESULT put_Medium(tagNACalStandardMedium newVal)
```

Interface ICalStandard

Memory Property

Description Set and return the memory trace color for nth trace in a window.

VB Syntax `trace(n).Memory = value`

Variable [\(Type\) - Description](#)

`trace(n)` One of the 8 [ComTraceColors](#) objects

`value` **(Long Integer)** - RGB color of the Memory pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Varies for each trace.

Examples

```
R = 10
G = 10
B = 10
RGB = 10+(10*2^8)+(10*2^16)
trace1.Memory = RGB 'Write
color = trace1.Memory 'Read
```

C++ Syntax HRESULT get_Memory(long* pVal);

HRESULT put_Memory(long newVal);

Interface IComTraceColors

Last Modified:

7-Aug-2009 MX New topic

MemoryMarkers Property

Description Set and return the color of memory trace markers for nth trace in a window.

VB Syntax `trace(n).MemoryMarkers = value`

Variable [\(Type\)](#) - Description

`trace(n)` One of the 8 [ComTraceColors](#) objects

`value` **(Long Integer)** - RGB color of the MemoryMarkers pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the [Display Colors dialog](#), click **Change Color**, then **Define Custom Color**.

Return Type Long

Default Varies for each trace.

Examples

```
R = 10
G = 10
B = 10
RGB = 10+(10*2^8)+(10*2^16)
trace1.MemoryMarkers = RGB 'Write
color = trace1.MemoryMarkers 'Read
```

C++ Syntax HRESULT get_MemoryMarkers(long* pVal);

HRESULT put_MemoryMarkers(long newVal);

Interface IComTraceColors

MessageText Property

Description	Returns text for the specified eventID
VB Syntax	<i>app</i> . MessageText , <i>eventID</i> , <i>message</i>
Variable	(Type) - Description
<i>app</i>	An Application (object)
<i>eventID</i>	(enum naEventID) Choose from the list in Working with the Analyzer's Events
<i>message</i>	(string) - variable to store the returned message
Return Type	String
Default	Not Applicable
Examples	<code>RFNA.MessageText naEventID_ARRANGE_WINDOW_EXCEED_CAPACITY, message</code>
C++ Syntax	HRESULT get_MessageText(tagNAEventID msgID, BSTR* message)
Interface	IApplication

MinimumFrequency Property

Description Sets and Returns the minimum frequency for the calibration standard.

VB Syntax *calstd.MinimumFrequency = value*

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**double**) -Minimum frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `calstd.MinimumFrequency = 300e3 'Write`

`minFrequency = calstd.MinimumFrequency 'Read`

C++ Syntax HRESULT get_MinimumFrequency(double *pVal)
HRESULT put_MinimumFrequency(double newVal)

Interface ICalStandard

MinimumFrequency Property

Description Returns the minimum frequency of the remote PNA.

VB Syntax *value* = *cap*.**MinimumFrequency**

Variable [\(Type\)](#) - Description

value (Double) - Variable to store the returned minimum frequency of the PNA.

cap A [Capabilities](#) (object)

Return Type Double

Default Not Applicable

Examples `value = cap.MinimumFrequency 'Read`

C++ Syntax HRESULT get_MinimumFrequency(double *pVal)

Interface ICapabilities

MinimumFrequency Property

Description Sets and returns the minimum usable frequency specified for the power sensor.

VB Syntax *pwrSensor*.**MinimumFrequency** = *value*

Variable [\(Type\)](#) - Description

pwrSensor A [PowerSensor](#) (Object) or

A [PowerSensorAsReceiver](#) (Object)

value (**double**) -Frequency in Hertz.

Return Type Double

Default Device dependent

Examples `pwrSensor.MinimumFrequency = 300e3 'Write`

`MinFreq = pwrSensor).MinimumFrequency 'Read`

C++ Syntax HRESULT put_MinimumFrequency(double newVal);

HRESULT get_MinimumFrequency(double *pVal);

Interface IPowerSensor

IPowerSensorPMAR

Last Modified:

25-Aug-2009 Added PMAR

MinimumIFFrequency Property

Description	Returns the minimum allowed value for the IFFrequency Property
VB Syntax	<i>value</i> = <i>IfConfig</i> . MinimumIFFrequency
Variable	(Type) - Description
<i>value</i>	(double) Variable to store the returned minimum allowed frequency that can be applied to the IFFrequency Property .
<i>IfConfig</i>	IFConfiguration (object)
Return Type	Double
Default	Not Applicable
Examples	<code>val = App.ActiveChannel.IFConfiguration.MinimumIFFrequency</code> 'Read
C++ Syntax	HRESULT get_MinimumIFFrequency(double * pMinFreq);
Interface	IIFConfiguration3

Last Modified:

18-Jun-2007 MX New topic

MinimumNumberOfPoints Property

Description	Returns the minimum possible number of data points for a data trace.
VB Syntax	<i>value</i> = <i>cap</i> . MinimumNumberOfPoints
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned minimum value for number of points.
<i>cap</i>	A Capabilities (object)
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.MinimumNumberOfPoints 'Read</pre>
C++ Syntax	HRESULT get_MinimumNumberOfPoints(double * minimumNumberOfPoints);
Interface	ICapabilities

Last Modified:

24-Oct-2013	Changed return type
3-Dec-2007	MX New topic

MinimumReceiverStepAttenuator Property

Description	Returns a value indicating the minimum amount of receiver attenuation.
VB Syntax	<i>value</i> = <i>cap</i> . MinimumReceiverStepAttenuator (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned minimum value of receiver attenuation.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - port number to query for minimum value of receiver attenuation
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.MinimumReceiverStepAttenuator 'Read</pre>
C++ Syntax	<pre>HRESULTget_MinimumReceiverStepAttenuator(long portNumber, double * attenuation);</pre>
Interface	ICapabilities

MinimumSourceALCPower Property

Description	Returns a value indicating the minimum amount of source ALC power.
VB Syntax	<i>value</i> = <i>cap</i> . MinimumSourceALCPower (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned minimum value of source ALC power.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - source number to query for the minimum value of source ALC power
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.MinimumSourceALCPower 'Read</pre>
C++ Syntax	HRESULT get_MinimumSourceALCPower(long sourceNum, double * power);
Interface	ICapabilities

MixerCharacterizationFile Property

Description Set the filename of the S2P file used to characterize the calibration mixer

VB Syntax *smc.MixerCharacterizationFile* = *value*

Variable [\(Type\)](#) - Description

smc An [SMCType](#) (object)

value (String) Full path, file name, and extension of the mixer characterization file.

Return Type String

Default Not applicable

Example

```
SMC.MixerCharacterizationFile = "C:/Program  
Files/Agilent/Network Analyzer/Documents/default.S2P"
```

C++ Syntax HRESULT put_MixerCharacterizationFile(BSTR Value);

Interface SMCType5

Last Modified:

25-Mar-2010 MX New topic

Mode Property

Description	Sets the type of transform.
VB Syntax	<i>trans</i> .Mode = <i>value</i>
Variable	(Type) - Description
<i>trans</i>	A Transform (object)
<i>value</i>	(enum NATransformMode) - Choose from: 0 - naTransformBandpassImpulse 1 - naTransformLowpassImpulse 2 - naTransformLowpassStep
Return Type	NATransformMode
Default	0 - naTransformBandpassImpulse
Examples	<pre>trans.Mode = naTransformLowpassStep 'Write</pre> <pre>transmode = trans.Mode 'Read</pre>
C++ Syntax	HRESULT get_Mode(tagNATransformMode *pVal) HRESULT put_Mode(tagNATransformMode newVal)
Interface	ITransform

Mode Property

Description Sets and returns the stimulus mode for balanced measurements.

VB Syntax *balStim.Mode* = *value*

Variable [\(Type\)](#) - Description

balStim A [BalancedStimulus](#) (object)

value (Enum **NABALSTIMulus**) - Stimulus Mode. True modes are applicable only with [Opt 460 - iTMSA](#). When a True-Mode is selected, the Balanced port powers are automatically uncoupled.

Choose from:

0 - **naSEStim**: Single-Ended stimulus

1 - **naTMStim**: True-Mode stimulus

2 - **naFTMStim**: Forward only True-Mode stimulus

3 - **naRTMStim**: Reversed only True-Mode stimulus

Return Type Enum

Default 0 - **naSEStim**: Single-Ended stimulus

Examples

```
balStim.Mode = naTMStim 'Write
```

```
variable = balStim.Mode 'Read
```

[See an example iTMSA program](#)

C++ Syntax HRESULT get_Mode(tagNABALSTIMulus *eVal);

HRESULT put_Mode(tagNABALSTIMulus eVal);

Interface IBalancedStimulus

Move Property

Type topic text here.

Multiplier Property

Description Sets and returns the multiplier value to be used when coupling this range to the primary range. Learn more about multiplier value.

This setting is valid only if this range is [coupled](#) to the primary range.

VB Syntax `FOMRange.Multiplier = value`

Variable [\(Type\)](#) - Description

object An [FOMRange](#) (**object**)

value **(Double)** - Multiplier value.-(Unitless)

Return Type Double

Default 1

Examples `fomRange.Multiplier = 2 'Write`

`Mult = fomRange.Multiplier 'Read`

C++ Syntax HRESULT get_Multiplier(double *pVal)
HRESULT put_Multiplier(double pVal)

Interface IFOMRange

Name Property

Description Sets or returns the Name of the Cal Set.

VB Syntax *CalSet.Name* = *value*

Variable [\(Type\)](#) - Description

CalSet **(object)** - A [Cal Set](#) object

value **(string)** - Name of the Cal Set.

Return Type String

Default Not Applicable

Examples

```
Dim pna
set
pna=CreateObject("AgilentPNA835x.Application")

Dim calsets
set calsets=pna.getcalmanager.calsets

Dim c
for each c in calsets
wscript.echo c.name
'Changes the name of CalSet_1
if c.name="CalSet_1" then c.name="New"
next
```

C++ Syntax HRESULT get_Name(BSTR *name)

HRESULT put_Name(BSTR name);

Interface ICalSet4

Name (CalKit) Property

Description	Sets and Returns a name for the selected calibration kit.
VB Syntax	<i>calKit</i> .Name = <i>value</i>
Variable	(Type) - Description
<i>calKit</i>	A CalKit (object).
<i>value</i>	(string) -Calibration Kit name. Any string name, can include numerics, period, and spaces; any length (although the dialog box display is limited to about 30 characters).
Return Type	String
Default	Not Applicable
Examples	<pre>calKit.Name = "MyCalKit" 'Write KitName = calKit.Name 'Read</pre>
C++ Syntax	HRESULT get_Name(BSTR *pVal) HRESULT put_Name(BSTR newVal)
Interface	ICalKit

Name (PathConfig) Property

Description Returns the name of the current configuration only if NO individual element settings had been changed since selecting or storing a configuration. When element settings change, the path configuration name is cleared.

VB Syntax *name* = *pathConfig*.Name

Variable [\(Type\)](#) - Description

name **(String)** Variable to store the returned configuration name.

pathConfig A [PathConfiguration](#) **(object)**

Return Type String

Default 'default' - name of the default factory configuration

Examples `name=pathConf.Name`

C++ Syntax HRESULT get_Name(BSTR* ppName)

Interface IPathConfiguration

Last Modified:

14-Dec-2006 MX New topic

Name Property

Description Returns the name of the current element object

VB Syntax *name* = *pathElement*.Name

Variable [\(Type\)](#) - Description

name **(String)** Variable to store the returned element name.

pathElement A [PathElement](#) **(object)**

Return Type String

Default Not Applicable

Examples `name=pathElement.Name`

C++ Syntax HRESULT get_Name(BSTR* ppName)

Interface IPathElement

Last Modified:

15-Dec-2006 MX New topic

Name (ExternalDevice) Property

Description Sets and returns the name of the External Device.

VB Syntax *extDev*.Name = *value*

Variable [\(Type\)](#) - Description

extDev A [ExternalDevice Object](#) (object).

value (string) - External Device name. Any string name limited to alpha-numeric characters.

Return Type String

Default Device<n>

Examples

```
extDev.Name = "MySource" 'Write
extDevName = extDev.Name 'Read

See example program to configure PMAR device
See example program to configure External Source
```

C++ Syntax HRESULT get_Name(BSTR *pVal)

HRESULT put_Name(BSTR newVal)

Interface IExternalDevice

Last Modified:

31-Jul-2009 MX New topic

Name Property

Description Returns the name of this FOM range object.

VB Syntax *value* = *FOMRange*.Name

Variable [\(Type\)](#) - Description

value **(string)** - Variable to store the returned range name.

FOMRange An [FOMRange](#) **(object)**

Return Type String

Default Not Applicable

Examples `rname = fomRange.Name 'Read`

C++ Syntax HRESULT get_Name(BSTR *pRName)

Interface IFOMRange

Last Modified:

8-Mar-2007 Major Modifications

Name (Measurement) Property

Description Sets (or returns) the Name of the measurement. Measurement names must be unique among the set of measurements. Measurement names cannot be an empty string.

Note: This is the same name as trace.Name; when one changes, the other changes.

VB Syntax `meas.Name = value`

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**string**) - A user defined name of the measurement

Return Type String

Default "CH1_S11_1" - name of the default measurement

Examples

```
meas.Name = "Filter BPass" 'Write
```

```
MName = meas.Name 'Read
```

C++ Syntax HRESULT get_Name(BSTR *pVal)
HRESULT put_Name(BSTR newVal)

Interface IMeasurement

Name Property

Description	Sets and returns the name of the Power Sensor (object) to be used as part of a Guided Power Calibration.
VB Syntax	<i>pSensor</i> .Name = <i>value</i>
Variable	(Type) - Description
<i>pSensor</i>	A GuidedCalibrationPowerSensor (object)
<i>value</i>	(string) - Name of the power sensor. The power sensor must be already configured as a PMAR device using this name. Learn how to remotely configure a PMAR device.
Return Type	String
Default	Not Applicable
Examples	<pre>Sensor.Name = "26GHzSesnsor" 'write</pre> <pre>value = pSensor.Name 'Read</pre> <p>See example program</p>
C++ Syntax	HRESULT get_Name(BSTR *pPsensorName) HRESULT put_Name(BSTR pPsensorName)
Interface	IGuidedCalibrationPowerSensor

Last Modified:

8-Feb-2011 New topic

Name (trace) Property

Description Sets or returns the name of the Trace. Use the trace name to identify the trace and refer to the trace in the collection.

Note: This is the same name as `meas.Name`; when one changes, the other changes.

VB Syntax `trac.Name = value`

Variable [\(Type\)](#) - Description

`trac` A Trace (**object**)

`value` (**String**) Trace name

Return Type String

Default "CH1_S11_1" - name of the default measurement

Examples `trace.Name = "myTrace" 'Write`

`traceName = Name.Trace 'Read`

C++ Syntax HRESULT put_Name(BSTR name)
HRESULT get_Name(BSTR *name)

Interface ITrace

NetworkFilename Property

Description	Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement.
VB Syntax	<i>object</i> .NetworkFilename(<i>n</i>) = <i>filename</i>
Variable	(Type) - Description
<i>object</i>	SMCType (object) or VMCType (object)
<i>n</i>	(Integer) Apply network to input or output of mixer. Choose from: 1 - Input of mixer 2 - Output of mixer
<i>filename</i>	(String) Filename of the S2P used for embedding or de-embedding. Use the full path name, file name, and .S2P suffix, enclosed in quotes.
Return Type	String
Default	Not Applicable
Examples	<pre>VMC.Filename(2) = "c:\users\public\network analyzer\documents\WaveguideAdapt.S2P"</pre>
C++ Syntax	HRESULT put_NetworkFilename(short networkNum, BSTR filename); HRESULT get_NetworkFilename(short networkNum, BSTR *filename);
Interface	SMCType2 VMCType2

Last Modified:

29-Feb-2008 Several edits

NetworkMode Property

Description	Allows you to embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement.
VB Syntax	<i>object</i> .NetworkMode(<i>n</i>) = <i>value</i>
Variable	(Type) - Description
<i>object</i>	SMCType (object) or VMCType (object)
<i>n</i>	(Integer) Apply network to input or output of mixer. Choose from: 1 - Input of mixer 2 - Output of mixer
<i>value</i>	(Enum as ENetworkMode) Choose from: NO_NETWORK Do nothing with effects of S2P file EMBED_NETWORK - Add effects of S2P file from the measurement results. DEEMBED_NETWORK - Remove effects of S2P file from the measurement results.
Return Type	Enum
Default	NO_NETWORK
Examples	<pre>VMC.NetworkMode = EMBED_NETWORK</pre>
C++ Syntax	HRESULT put_NetworkMode(short networkNum, enum ENetworkMode networkMode); HRESULT get_NetworkMode(short networkNum, enum ENetworkMode *networkMode);
Interface	SMCType2 VMCType2

NetworkPortMapA Property

Description Read the port mapping of “in A” port for a 4-port SNP file to be embedded.

Use [NetworkPortMap Method](#) to set the port map for all four ports.

VB Syntax `value = fixture.NetworkPortMapA (network)`

Variable (Type) - Description

value (Long) Variable to store the returned value.

fixture A [Fixturing \(object\)](#)

network (Integer) Network position. Choose from **1** or **2**.

Default 1

Examples `value = fixture.NetworkPortMapA(1)`

C++ Syntax HRESULT get_NetworkPortMapA(short* Net);

Interface IFixturing6

NoiseAverageFactor Property

Description Sets and reads the averaging of the noise receiver.

VB Syntax *noise*.NoiseAverageFactor = *value*

Variable [\(Type\)](#) - Description

noise A [NoiseFigure](#) (object)

value (**long integer**) - Averaging value. Choose a number between 1 and 99.

Return Type Long Integer

Default 1

Examples `noise.NoiseAverageFactor = 10 'Write`

`AvgNoise = noise.NoiseAverageFactor 'Read`

C++ Syntax HRESULT get_NoiseAverageFactor(long* pVal)

HRESULT put_NoiseAverageFactor(long newVal)

Interface INoiseFigure

Last Modified:

NoiseAverageState Property

Description	Turns Noise Averaging ON and OFF.
VB Syntax	<i>noise</i> .NoiseAverageState = <i>value</i>
Variable	(Type) - Description
<i>noise</i>	A NoiseFigure (object)
<i>value</i>	(boolean) - Averaging state.
	False - Turns Noise Averaging OFF
	True - Turns Noise Averaging ON
Return Type	Boolean
Default	False
Examples	<pre>noise.NoiseAverageState = OFF 'Write</pre>
	<pre>NoiseAvgState = noise.NoiseAverageState 'Read</pre>
C++ Syntax	HRESULT get_NoiseAverageState(VARIANT_BOOL* on); HRESULT put_NoiseAverageState(VARIANT_BOOL on);
Interface	INoiseFigure

Last Modified:

NoiseBandwidth Property

Description Set the bandwidth of the noise receiver.

VB Syntax `noise.NoiseBandwidth = value`

Variable [\(Type\)](#) - Description

noise A [NoiseFigure](#) (object)

value (**double**) Bandwidth value.

For [NoiseReceiver](#) = **naNoiseReceiver** (Opt 029) choose from: 800 KHz, 2 MHz, 4 MHz, 8 MHz, or 24 MHz or the numerical equivalent, such as 8e6 and so forth. **NOTE:** The [Receiver Characterization Method](#) = "Power Meter" is NOT allowed when the Noise Bandwidth is 8 MHz or 24 MHz.

For NoiseReceiver = **naStandardReceiver** (Opt 028) choose from: 720 kHz or 1.2 MHz

If the value does not match one of these, it is rounded up to the next valid bandwidth value.

Return Type Double

Default 4 MHz for **naNoiseReceiver**

1.2 MHz for **naStandardReceiver**

Examples `noise.NoiseBandwidth = 2E6 'Write`

`NoiseBW = noise.NoiseBandwidth 'Read`

C++ Syntax `HRESULT get_NoiseBandwidth(double *pVal);`

`HRESULT put_NoiseBandwidth(double newVal);`

Interface INoiseFigure

NoiseReceiverSweepTime Property

Description Returns the APPROXIMATE time the channel will take to make one noise receiver sweep given the current setup. This, along with the sweep time for a standard receiver measurement and the following calculations, can tell you how long a “single” sweep would take so that you can set an appropriate "timeout" in your program.

Use [Sweep Time Property](#) to perform the standard sweep time query, shown as **SSwpTime** below.

To calculate the total sweep time:

Noise Figure on amplifiers (Vector Correction ON):

- $2 * \text{SSwpTime} + X * \text{NoiseReceiverSweepTime}$
- Where X = the number of noise receiver impedance state sweeps. (Default is 4).

Noise Figure on converters (NFX) correction on - increased number of sweeps due to extra mixer sweeps and source pulling:

- $4 * \text{SSwpTime} + X * \text{NoiseReceiverSweepTime}$ (without source pulling)
- $8 * \text{SSwpTime} + X * \text{NoiseReceiverSweepTime}$ (with source pulling)
- Where X = the number of noise receiver impedance state sweeps. (Default is 4).

Note: The number of sweeps to perform a noise measurement is annotated at the bottom of the Noise Figure screen.

VB Syntax $\text{swpTime} = \text{NF.NoiseReceiverSweepTime}$

Variable [\(Type\)](#) - **Description**

swpTime Variable to store the returned sweep time value (in seconds).

NF A [NoiseFigure](#) (**object**)

Return Type Double

Default Not Applicable

Examples $\text{swpTime} = \text{NF.NoiseReceiverSweepTime}()$

C++ Syntax HRESULT get_NoiseReceiverSweepTime (Double* SwpTime);

Interface INoiseFigure3

Last Modified:

28-Oct-2009 MX New topic

NoiseGain Property

Description Sets and reads the gain state of the noise receiver. This setting is NOT used when [NoiseReceiver](#) = naStandardReceiver (Opt 028)

VB Syntax `noise.NoiseGain = value`

Variable [\(Type\)](#) - Description

noise A [NoiseFigure](#) (**object**)

value (**long integer**) - Gain value. Choose from:

0 Low Gain select if the gain of your DUT is relatively high (>35 dB).

15 Medium Gain select if the gain of your DUT is about average (20 dB to 45 dB).

30 High Gain ..select if the gain of your DUT is relatively low (<30 dB).

If the value does not match one of these, it is rounded up to the next legal value.

[Learn more about Noise Receiver Gain setting.](#)

Return Type Long Integer

Default 30

Examples

```
noise.NoiseGain = 30 'Write
```

```
GainNoise = noise.NoiseGain 'Read
```

C++ Syntax HRESULT get_NoiseGain(long* pVal)

HRESULT put_NoiseGain(long newVal)

Interface INoiseFigure

NoiseSourceCalKitType Property

Description Set and read the Cal Kit that will be used for the Noise Source adapter.

An adapter is always necessary to connect a 346C Noise Source to the PNA port 2. Select a Cal Kit that is the same type and gender as the noise source connector.

If the Noise Source mates directly to PNA port 2, then set this type to "None".

VB Syntax `noise.NoiseSourceCalKitType = value`

Variable [\(Type\)](#) - Description

noise A [NoiseCal](#) (**object**)

value (**string**) Cal Kit type. To read possible cal kit strings for the adapter:

1. Change the port connector type to that of the noise source using: [ConnectorType](#)
2. Then read the possible cal kit strings for that port using: [CompatibleCalKits](#)

Return Type String

Default Not applicable

Examples

```
noise.NoiseSourceCalKitType = "N4691-60004 ECAL" 'Write
calkit = noise.NoiseSourceCalKitType 'Read
```

C++ Syntax HRESULT get_NoiseSourceCalKitType(BSTR* pValue)
HRESULT put_NoiseSourceCalKitType(BSTR pNewValue)

Interface INoiseCal

Last Modified:

29-May-2007 MN New topic

NoiseSourceCold Property

Description Sets and returns the temperature of the noise source connector.

VB Syntax *noise.NoiseSourceCold* = *value*

Variable [\(Type\)](#) - Description

noise A [NoiseCal](#) (object)

value (**double**) Noise source temperature in Kelvin.

Return Type Double

Default Not Applicable

Examples `noise.NoiseSourceCold = 295 'Write`

`temp = noise.NoiseSourceCold 'Read`

C++ Syntax HRESULT get_NoiseSourceCold(double* pTemp)

HRESULT put_NoiseSourceCold(double pNewTemp)

Interface INoiseCal

Last Modified:

21-Jun-2007 MX New topic

NoiseSourceConnectorType Property

Description Set and read the Noise Source connector type and gender.

The Agilent 346C has an "APC 3.5 male" connector.

VB Syntax *noise.NoiseSourceConnectorType* = *value*

Variable [\(Type\)](#) - Description

noise A [NoiseCal](#) (object)

value (**string**) Connector type. Use [ValidConnectorType](#) to return a list of valid connector types.

Return Type String

Default Not applicable

Examples

```
noise.NoiseSourceConnectorType = "APC 3.5 male" 'Write  
connector = noise.NoiseSourceConnectorType 'Read
```

C++ Syntax HRESULT get_NoiseSourceConnectorType(BSTR* pConnectorType)
HRESULT put_NoiseSourceConnectorType(BSTR pConnectorType)

Interface INoiseCal

Last Modified:

29-May-2007 MN New topic

NoiseSourceState Property

Description Sets and reads the noise source ([28V](#)) ON and OFF.

VB Syntax `app.NoiseSourceState = state`

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

state (**boolean**)

False (0) - Turns Noise Source OFF

True (1) - Turns Noise Source ON

Return Type Boolean

Default For PNA models with a Noise Figure option (028/029/H29), the 28V line is ON at application start and after a preset. The ON/OFF state is also available from a PNA softkey menu.

For PNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF at application start and it's state is not affected by a preset. The ON/OFF state is NOT available from a PNA softkey menu.

Examples `app.NoiseSourceState = True 'Write`

`coupl = app.NoiseSourceState 'Read`

C++ Syntax HRESULT put_NoiseSourceState(VARIANT_BOOL bState)
HRESULT get_NoiseSourceState(VARIANT_BOOL *bState)

Interface IApplication13

Last Modified:

3-Nov-2010 Available for PNA models without a NF option.

29-May-2007 MN New topic

NoiseTuner Property

Description Sets and returns the noise tuner identifier, which is an ECal model and serial number string.

VB Syntax `noise.NoiseTuner = value`

Variable [\(Type\)](#) - Description

noise A [NoiseFigure](#) (**object**)

value (**string**) Noise Tuner. Return the connected ECal identifiers by sending GetCalKitTypeString and passing the module number.

Return Type String

Default Not Applicable

Examples

```
noise.NoiseTuner = "N4691-60004 ECal 02822" 'Write
noiseT = noise.NoiseTuner 'Read
```

C++ Syntax HRESULT get_NoiseTuner(BSTR* pValue)
HRESULT put_NoiseTuner(BSTR pNewValue)

Interface INoiseFigure

Last Modified:

18-Jun-2007 MN New topic

NoiseTunerIn Property

Description	Sets and returns the port identifier of the ECal noise tuner that is connected to the PNA Source.
VB Syntax	<i>noise.NoiseTunerIn = value</i>
Variable	(Type) - Description
<i>noise</i>	A NoiseFigure (object)
<i>value</i>	(string) Noise Tuner port identifier that is connected to the PNA source, as it is labeled on the ECal module. For example, for 2-port ECal modules, choose either "A" or "B".
Return Type	String
Default	Not Applicable
Examples	<pre>noise.NoiseTunerIn = "A" 'Write EcalPort = noise.NoiseTunerIn 'Read</pre>
C++ Syntax	HRESULT get_NoiseTunerIn(BSTR* pValue) HRESULT put_NoiseTunerIn(BSTR pNewValue)
Interface	INoiseFigure

Last Modified:

29-May-2007 MN New topic

NoiseTunerOut Property

Description Sets and returns the port identifier of the ECal noise tuner that is connected to the DUT.

VB Syntax `noise.NoiseTunerOut = value`

Variable [\(Type\) - Description](#)

noise A [NoiseFigure](#) (object)

value (**string**) Noise Tuner port identifier that is connected to the DUT, as it is labeled on the ECal module. For example, for 2-port ECal modules, choose either "A" or "B".

Return Type String

Default Not Applicable

Examples

```
noise.NoiseTunerOut = "A" 'Write
EcalPort = noise.NoiseTunerOut 'Read
```

C++ Syntax HRESULT get_NoiseTunerOut(BSTR* pValue)
HRESULT put_NoiseTunerOut(BSTR pNewValue)

Interface INoiseFigure

29-May-2007 MN New topic

NominalIncidentPowerState Property

Description	Toggles the Nominal Incident Power setting ON and OFF. This setting is ONLY to be used with SMC measurements, not VMC. Learn more about Nominal Incident Power.
VB Syntax	<i>mixer</i> . NominalIncidentPowerState = <i>bool</i>
Variable	(Type) - Description
<i>mixer</i>	A Mixer (object)
<i>bool</i>	(boolean) - Nominal Incident Power State. Choose from: 1 -(True) Turn nominal incident power ON 0 -(False) Turn nominal incident power OFF
Return Type	Boolean
Default	0 -(False)
Examples	<pre>mixer.NominalIncidentPowerState = True 'sets NominalIncidentPowerState to ON</pre>
C++ Syntax	HRESULT get_NominalIncidentPowerState(VARIANT_BOOL *pVal) HRESULT put_NominalIncidentPowerState(VARIANT_BOOL val);
Interface	IMixer4

NormalizePoint Property

Description	Sets and returns the sweep data point around which to perform broadband and precise tuning.
VB Syntax	<i>obj</i> . NormalizePoint = <i>value</i>
Variable	(Type) - Description
<i>obj</i>	An EmbeddedLO (object) or A ConverterEmbeddedLO (object)
<i>value</i>	(Long) Mixer Sweep data point. Choose a data point number between 1 and the max number of data points in the sweep that has the least amount of expected noise.
Return Type	(Long)
Default	Center point in the sweep span
Examples	<pre>embedLO.NormalizePoint = 101 'write</pre> <pre>value = embedLO.NormalizePoint 'read</pre>
C++ Syntax	HRESULT get_NormalizePoint(long *point); HRESULT put_NormalizePoint(long point);
Interface	IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object

18-Apr-2007 MX New topic

NormalizePoint Property

Description Sets or returns the data point used for normalizing the phase measurement.

VB Syntax *obj.NormalizePoint = value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

A [Converter](#) (Object)

value **(Long)** - Normalization data point. Choose a data point number between 1 and the max number of data points in the sweep that has the least amount of expected noise.

Return Type Long Integer

Default Center point in the sweep

Examples `mixer.NormalizePoint = 101`

C++ Syntax HRESULT get_NormalizePoint(Long * val);

HRESULT put_NormalizePoint(Long val);

Interface IMixer13

Last Modified:

25-Mar-2010 MX New topic

Number (Measurement) Property

Description Returns the Number of the measurement. Measurement numbers are assigned internally.

Note: Measurement numbers are NOT the same as their number in the Measurements collection. Measurement number is used to identify the measurement associated with an event.

This property is used to identify measurements when events occur through the [OnMeasurementEvent](#) callback. For example:

```
OnMeasurementEvent (naEventId_MSG_LIMIT_FAILED, 3)
```

VB Syntax `measNum = meas.Number`

Variable [\(Type\)](#) - Description

`measNum` **(long)** - variable to store the measurement number

`meas` A Measurement **(object)**

Return Type Long Integer

Default "1" - number of the default measurement

Examples `measNum = meas.Number`

C++ Syntax HRESULT get_Number(long *MeasurementNumber)

Interface IMeasurement

Number Property

Description	Returns the number of the Auxiliary Trigger connector pair currently being used with the instance of the AuxTrigger object. Set the trigger pair with the AuxTrig object.
VB Syntax	<i>value</i> = <i>auxTrig</i> . Number
Variable	(Type) - Description
<i>auxTrig</i>	An AuxTrigger (object)
<i>value</i>	(Long Integer) - Connector pair. PNA-X returns 1 or 2. All other models that do not have the Aux trigger connector returns 1.
Return Type	Single
Default	Not Applicable
Exaamples	<code>value = auxTrig.Number 'Read the value</code>
C++ Syntax	HRESULT get_Number(long *auxID);
Interface	IAuxTrigger

Last Modified:

7-Apr-2009	Updated to "all other models.."

NumberOfFrequencyPoints Property

Description Set and read the number of frequency points for a Gain Compression channel. Applies to all acquisition modes.

VB Syntax `gca.NumberOfFrequencyPoints = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**integer**) - Frequency points. Do not exceed the max number of points. [Learn more.](#)

Return Type Integer

Default 201

Examples `gca.NumberOfFrequencyPoints = 101 'Write`

`freqPts = gca.NumberOfFrequencyPoints 'Read`

C++ Syntax HRESULT get_NumberOfFrequencyPoints(int* pVal)

HRESULT put_NumberOfFrequencyPoints(int newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

NumberOfPoints Property

Description Sets or returns the Number of Points of the channel.

Sets or returns the Number of Points of the segment.

See Also

- [Measurement2 Interface](#) to learn how this method differs from [meas.NumberofPoints](#)
- [Gain Compression Number of Points](#).
- [Swept IMD limitations](#)

VB Syntax *object*.NumberOfPoints = *value*

Variable [\(Type\)](#) - Description

object Channel (**object**)

or

CalSet (**object**) - Read-only property

value (**long**) - Number of Points.

For channel, choose any number from **1** to the [PNA max number of points](#).

For segment, the total number of points in all segments cannot exceed the PNA maximum. A segment can have as few as 1 point.

Return Type Long Integer

Default 201 for channel

21 for segment

Examples

```
chan.NumberOfPoints = 201 'sets the number of points for all  
measurements in the channel. -Write
```

```
numofpts = chan.NumberOfPoints 'Read
```

C++ Syntax HRESULT get_NumberOfPoints(long *pVal)
HRESULT put_NumberOfPoints(long newVal)

Interface IChannel
ISegment
|CalSet3

Last Modified:

5-Aug-2008	Fixed bad link
21-Jun-2007	Increased max

Read-only

NumberOfPoints Property

Description	Returns the number of data points of the measurement. To understand how this property is useful, see IMeasurement2 Interface .
VB Syntax	<i>value</i> = <i>meas</i> . NumberOfPoints
Variable	(Type) - Description
<i>value</i>	(Long) - variable to store the returned value
<i>meas</i>	A Measurement (object)
Return Type	Long Integer
Default	Not Applicable
Examples	<pre>Print meas.NumberOfPoints 'prints the number of data points</pre>
C++ Syntax	HRESULT get_NumberOfPoints(long *pVal);
Interface	IMeasurement2

Read-only

NumberOfPorts Property

Description Returns the number of hardware source ports on the PNA.

VB Syntax *value* = *app*.NumberOfPorts

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (long integer) - variable to contain the returned value

Return Type (long integer)

Default Not Applicable

Examples `iNumPorts = app.NumberOfPorts`

C++ Syntax HRESULT NumberOfPorts(long* NumPorts)

Interface IApplication

NumberOfPorts Property

Description	Returns the number of ports on the specified testset. Returns 0 if no test set is connected.
VB Syntax	<i>value</i> = <i>tset</i> . NumberOfPorts
Variable	(Type) - Description
<i>value</i>	(Long) variable to store the returned information.
<i>tset</i>	A TestsetControl object.
	OR
	An E5091Testset object.
Return Type	Long Integer
Default	Not Applicable
Examples	<pre>value = testset1.NumberOfPorts</pre> See E5091A Example Program See External Testset Program
C++ Syntax	HRESULT get_NumberOfPorts(long *numberOfPorts);
Interface	ITestsetControl IE5091Testset

NumberOfPowerPoints Property

Description Set and read the number of data points in each power sweep. Applies ONLY to 2D [acquisition modes](#).

VB Syntax `gca.NumberOfPowerPoints = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**integer**) - Power points. Do not exceed the max number of points.

For 2D sweeps, total = frequency x power. Max = 20,001

For Smart sweep, total = frequency. Max = 10,000.

Return Type Integer

Default 26

Examples

```
gca.NumberOfPowerPoints = 31 'Write
```

```
pwrPts = gca.NumberOfPowerPoints 'Read
```

C++ Syntax HRESULT get_NumberOfPowerPoints(int* pVal)
HRESULT put_NumberOfPowerPoints(int newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

NumberOfSweeps Property

Description Returns the number of tuning sweeps used for the latest embedded LO measurement.

VB Syntax *value* = *embedLODiag*.NumberOfSweeps

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned data.

embedLODiag An [EmbeddedLODiagnostic](#) **(object)**

Return Type **(Long)**

Default Not Applicable

Examples `data= embedLODiag.NumberOfSweeps 'read`

C++ Syntax HRESULT get_NumberOfSweeps(long * numSweeps);

Interface IEmbeddedLODiagnostic

Last Modified:

12-Apr-2007 MX New topic

Offset Property

Description	Sets and returns the offset value to be used when coupling this range to the primary range. This setting is valid only if the specified range is coupled to the primary range.
VB Syntax	<i>FOMRange</i> . Offset = <i>value</i>
Variable	(Type) - Description
<i>object</i>	An FOMRange (object)
<i>value</i>	(Double) - Offset value.-(Unitless)
Return Type	Double
Default	0
Examples	<pre>fomRange.Offset = 1e9 'Write</pre> <pre>Offs = fomRange.Offset 'Read</pre>
C++ Syntax	HRESULT get_Offset(double *pVal) HRESULT put_Offset(double pVal)
Interface	IFOMRange

Last Modified:

8-Mar-2007 Modified links.

OffsetReceiverAttenuator Property

Description Set and return whether to offset the reference receiver by the amount of receiver attenuation. [Learn more.](#)

This setting remains until changed or until the hard drive is changed or reformatted.

VB Syntax `pref.OffsetReceiverAttenuator = value`

Variable (Type) - Description

pref A [Preferences](#) (object)

value (Boolean) - Choose from:

False Do NOT offset the test port receivers.

True Offset the test port receivers.

Return Type Boolean

Default **True** PNA-X models

False E836xB and PNA-L models

Examples

```
pref.OffsetReceiverAttenuator = 1 'Write
```

```
Rcvroffset = pref.OffsetReceiverAttenuator 'Read
```

C++ Syntax HRESULT get_OffsetReceiverAttenuator(VARIANT_BOOL * val);

HRESULT put_OffsetReceiverAttenuator(VARIANT_BOOL val);

Interface IPreferences6

Last Modified:

14-Jan-2007 MX New topic

OffsetSourceAttenuator Property

Description Set and return whether to mathematically offset the reference receivers by the amount of source attenuation. [Learn more.](#)

This setting remains until changed or until the hard drive is changed or reformatted.

VB Syntax `pref.OffsetSourceAttenuator = value`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value **(Boolean)** - Choose from:

False Do NOT offset the reference receivers.

True Offset the reference receivers.

Return Type Boolean

Default **True** PNA-X models

False E836xB and PNA-L models

Examples

```
pref.OffsetSourceAttenuator = 1 'Write
```

```
Rcvroffset = pref.OffsetSourceAttenuator 'Read
```

C++ Syntax HRESULT get_OffsetSourceAttenuator(VARIANT_BOOL * val);

HRESULT put_OffsetSourceAttenuator(VARIANT_BOOL val);

Interface IPreferences6

14-Jan-2007 MX New topic

OmitIsolation Property - Superseded

Description	This command is replaced with SetIsolationPaths and GetIsolationPaths . Sets and returns whether Isolation portion of the calibration will be performed or not.
VB Syntax	<i>obj.OmitIsolation</i> = <i>bool</i>
Variable	(Type) - Description
	<i>obj</i> SMCType (object)
	or
	VMCType (object)
	<i>bool</i> (Boolean)
	True - Isolation is NOT performed
	False - Isolation is performed
Return Type	Boolean
Default	True
Examples	<pre>value = SMC.OmitIsolation</pre>
C++ Syntax	HRESULT put_OmitIsolation (VARIANT_BOOL bState) HRESULT get_OmitIsolation (VARIANT_BOOL *bState)
Interface	SMCType VMCType

OneMarkerReadoutPerTrace Property - Superseded

Description Either show marker readout of only the active trace or all of the traces simultaneously.

Note: This method is replaced by [MarkerReadoutsPerTrace Property](#)

VB Syntax `win.OneReadoutPerTrace = state`

Variable [\(Type\)](#) - Description

win A [NAWindow](#) (object)

value **(boolean)**

True - Shows the readout of only the active marker for each trace.

False - Shows up to 5 marker readouts per trace, up to 20 total readouts.

Return Type Boolean

Default False

Examples

```
win.OneMarkerReadoutPerTrace = True 'Write
```

```
State = app.ActiveNAWindow.OneMarkerReadoutPerTrace 'Read
```

C++ Syntax HRESULT get_OneMarkerReadoutPerTrace(VARIANT_BOOL *pVal)

HRESULT put_OneMarkerReadoutPerTrace(VARIANT_BOOL newVal)

Interface INAWindow

Options Property

Description Returns a string identifying the analyzer option configuration.

VB Syntax *value* = *app.Options*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (string) - variable to contain the returned string

Return Type String

Default Not Applicable

Examples `availOptions = app.Options`

C++ Syntax HRESULT Options(BSTR* OptionString)

Interface IApplication

OrientECALModule Property

Description Specifies if the PNA should perform orientation of the ECal module during calibration. Orientation is a technique by which the PNA automatically determines which ports of the module are connected to which ports of the PNA. Orientation begins to fail at very low power levels or if there is much attenuation in the path between the PNA and the ECal module.

Note: For guided calibrations where Orient is OFF and the same ECal module is used in more than one Connection Step, you are not allowed to specify how the ECal module is connected. Instead, the PNA determines the orientation. The PNA does not verify that you made the connection properly.

This setting remains until the PNA is restarted or this command is sent again.

This command, and [ECALPortMapEx](#), can be used to perform ECal using the [Guided Calibration](#) interface.

VB Syntax `cal.OrientECALModule = value`

Variable [\(Type\)](#) - **Description**

cal A [Calibrator](#) (object)

value (boolean)

False – [DoECAL1PortEX](#) and [DoECAL2PortEx](#) methods will use the value of the [ECALPortMapEx](#) property to determine the port connections.

True - [DoECAL1PortEX](#) and [DoECAL2PortEx](#) methods will use auto Orientation technique to determine port connections.

Return Type Boolean

Default True

Examples Dim cal As Calibrator

Dim bOrient As Boolean

Set cal = PNAapp.ActiveChannel.Calibrator

cal.OrientECALModule = False 'Write

bOrient = cal.OrientECALModule 'Read

C++ Syntax HRESULT put_OrientECALModule(VARIANT_BOOL bOrient);
HRESULT get_OrientECALModule(VARIANT_BOOL *bOrient);
Interface ICalibrator3

Last Modified:

7-May-2007 Added note about Guided Cal.

OutputChannel Property

Description Sets and returns the output channel of the pulse generator.

VB Syntax *extPulseGen*.**OutputChannel** = *value*

Variable [\(Type\)](#) - [Description](#)

extPulseGen An [ExternalPulseGenerator](#) (**object**)

value (**Long**) Pulse Generator output port. Choose from 1 or 2.

Return Type Long Integer

Default 1

Examples

```
extPulseGen.OutputChannel = 2 'Write
port = extPulseGen.OutputChannel 'Read
```

C++ Syntax HRESULT get_OutputChannel (long *pValue)
HRESULT put_OutputChannel (long newVal)

Interface IExternalPulseGenerator

Last Modified:

15-Feb-2012 New topic

OutputFixedFrequency Property

Description Sets or returns the mixer output fixed frequency value.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.OutputFixedFrequency = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value (**double**) - Output Fixed Frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `Print mixer.OutputFixedFrequency 'prints the output fixed frequency value of the mixer.`

C++ Syntax HRESULT get_OutputFixedFrequency(double *pVal)

HRESULT put_OutputFixedFrequency(double newVal)

Interface IMixer3

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

OutputPort Property

Description Switches an input to one of the valid outputs on the specified E5091A. The following are valid input/output combinations. If a combination other than these are sent, an “invalid argument” error will occur.

Input	Valid Outputs
1	A
	T1- If Port 2 already is connected to T1, then Port 2 will be switched to T2.)
2	T1 - If Port 1 already is connected to T1, then Port 1 will be switched to A.
	T2
3	R1+
	R2+
	R3+ If option 007 (7port), R2 is selected.
4	R1-
	R2-
	R3- If option 007 (7port), R2 is selected.

Note: Do not confuse the similar Testset.[OutputPorts Property](#), which sets or gets the port mapping for ALL ports.

VB Syntax *testsets(1).OutputPort (chNum,input) = output*

Variable [\(Type\)](#) - Description

testsets(1) An item from [Testsets](#) (collection)

Learn how to [identify a testset in the collection.](#)

chNum (**Long**) Channel number of the measurement.

input (**Long**) Testset Input port. Choose from 1|2|3|4.

output (Enum as NAE5091OutputPort) Output port to switch to specified Input.
Choose from:

0 or **naE5091PortA** - Port A

1 or **naE5091PortT1** - Port T1

2 or **naE5091PortT2** - Port T2

3 or **naE5091PortR1** - Port R1

4 or **naE5091PortR2** - Port R2

5 or **naE5091PortR3** - Port R3

Return Type Enum

Default Not Applicable

Examples [See Example Program](#)

C++ Syntax HRESULT get_OutputPort(long channelNum, long inputPort,
E5091OutputPort *outPort);
HRESULT put_OutputPort(long channelNum, long inputPort,
E5091OutputPort outPort);

Interface IE5091Testsets

OutputPorts (Cal Set) Property

Description	Returns the port mapping for the Cal Set.
VB Syntax	<i>portMap</i> = <i>calset</i> . OutputPorts
Variable	(Type) - Description
<i>portMap</i>	(String) Variable to store the returned string. The returned values are the physical ports. The POSITION of the returned values corresponds to the logical ports. For example, with an N44xx test set, if the returned string is "PNA 1,TS 2,PNA 2, TS 4" this means: <ul style="list-style-type: none">• PNA 1 is assigned to logical port 1• TS 2 is assigned to logical port 2• PNA 2 is assigned to logical port 3• TS 4 is assigned to logical port 4
<i>calset</i>	A Cal Set object.
Return Type	String
Default	Depends on the test set.
Example	<pre>portMap = calset.OutputPorts</pre>
C++ Syntax	HRESULT get_OutputPorts(BSTR *mapping);
Interface	ICalset5

Last modified:

9/18/06 MQ Added for multiport

OutputPorts Property

Description Sets or gets the port mappings for ALL ports. An “invalid argument” error will occur if you attempt to set an illegal port combination.

Refer to your testset documentation for valid port combinations.

Note: Do not confuse the similar E5091 [OutputPort Property](#), which sets or gets the port mapping for a single port.

VB Syntax *tset*.**OutputPorts**(*chNum*) = *portList*

Variable [\(Type\) - Description](#)

tset A [TestsetControl](#) object.

chNum **(Long)** Channel number of the measurement.

portList **(String)** A comma-separated list of port mappings. Spaces are ignored at the beginning and end of this text, and before or after commas. Space characters in other locations are not ignored.

Return Type String

Default Not Applicable

Examples [See External Testset Program](#)

C++ Syntax HRESULT get_OutputPorts(long channelNum, BSTR *outPorts);
HRESULT put_OutputPorts(long channelNum, BSTR outPorts);

Interface ITestsetControl

OutputRangeMode Property

Description Sets or returns the Output sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also a [OutputRangeMode Property](#) on the Converter Object.

VB Syntax *obj*.OutputRangeMode = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

value **(Enum as MixerRangeMode)** - Output sweep mode. Choose from:

0 - **mixSwept**

1 - **mixFixed**

Return Type Enum

Default 0 - mixSwept

Examples `mixer.OutputRangeMode = mixSwept`

C++ Syntax HRESULT get_OutputRangeMode(long *pVal)

HRESULT put_OutputRangeMode(long newVal)

Interface IMixer6

Last Modified:

4-Mar-2008 Added note.

OutputRangeMode Property

Description Sets or returns the Output sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also a [OutputRangeMode](#) Property on the Mixer Interface.

VB Syntax *obj*.OutputRangeMode = *value*

Variable [\(Type\)](#) - Description

obj A [Converter Object](#)

value (**Enum as NARangeMode**) - Output sweep mode. Choose from:

0 - **naSwept**

1 - **naFixed**

Return Type Enum

Default 0 - **naSwept**

Examples `conv.OutputRangeMode = naSwept`

C++ Syntax HRESULT get_OutputRangeMode(long *pVal)

HRESULT put_OutputRangeMode(long newVal)

Interface IConverter

Last Modified:

18-Feb-2011 New topic

OutputSideband Property

Description Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input (+ or -) LO1 = Output frequency.
- When two LO's are used: IF (+ or -) LO2 = Output frequency. See Also: [IFSideband Property](#)

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.**OutputSideband** = *value*

Variable [\(Type\) - Description](#)

obj A [Converter Object](#)

value (**enum as ConverterSideBand**) - Choose from:

0 - or **naLowSide** Minus (-) on the Mixer setup dialog

1 - or **naHighSide** Plus (+) on the Mixer setup dialog

Return Type Enum as ConverterSideBand

Default naLowSide

Examples

```
Print converter.OutputSideband 'prints the value of the
OutputSideband
```

C++ Syntax HRESULT get_OutputSideband(ConverterSideBand *pVal)

HRESULT put_OutputSideband(ConverterSideBand newVal)

Interface IConverter

Last Modified:

26-Mar-2009 New topic

OutputSideband Property

Description Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input + or - LO1 = Output frequency
- When two LOs are used: IF1 + or - LO2 = Output frequency

Use [IFSideband_Property](#) when two LOs are used to determine the IF1 frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

Note: There is also an [OutputSideband_Property](#) on the Converter Object.

VB Syntax *mixer*.**OutputSideband** = *value*

Variable [\(Type\)](#) - Description

mixer A [Mixer](#) (object)

value (**FCASideBand**) -

Choose from:

0 - LOW Minus (-) on the Mixer setup dialog

1 - HIGH Plus (+) on the Mixer setup dialog

Return Type Enum as FCASideBand

Default LOW

Examples `Print mixer.OutputSideband` 'prints the value of the `OutputSideband`

C++ Syntax HRESULT get_OutputSideband(FCASideBand *pVal)

HRESULT put_OutputSideband(FCASideBand newVal)

Interface IMixer

Last Modified:

2-Oct-2008 Clarified 1 vs 2 LOs

4-Mar-2008 Added note.

OutputStartFrequency Property

Description Sets or returns the mixer output start frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.OutputStartFrequency = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - Output Start Frequency in Hertz.

Return Type Double

Default Not Applicable

Examples

```
Print mixer.OutputStartFrequency 'prints the value of the
OutputStartFrequency
```

C++ Syntax HRESULT get_OutputStartFrequency(double *pVal)

HRESULT put_OutputStartFrequency(double newVal)

Interface IMixer

IConverter

Last Modified:

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

OutputStopFrequency Property

Description Sets or returns the mixer Output Stop frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

VB Syntax *obj*.OutputStopFrequency = *value*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

Or

A [Converter Object](#)

value **(double)** - Output stop frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `Print mixer.OutputStopFrequency 'prints the value of the OutputStopFrequency`

C++ Syntax HRESULT get_OutputStopFrequency(double *pVal)

HRESULT put_OutputStopFrequency(double newVal)

Interface IMixer

IConverter

2-Feb-2009 Added Converter

4-Mar-2008 Added note.

Read-only

Parameter Property

Description	Returns the measurement Parameter. To change the parameter, use <code>meas.ChangeParameter</code>
VB Syntax	<code>measPar = meas.Parameter</code>
Variable	(Type) - Description
<code>measPar</code>	(string) - Variable to store Parameter string
<code>meas</code>	A Measurement (object)
Return Type	String
Default	Not applicable
Examples	<code>measPar = meas.Parameter 'Read</code>
C++ Syntax	<code>HRESULT get_Parameter(BSTR *pVal)</code>
Interface	IMeasurement

Parameter (Embedded LO) Property

Description Returns the name of the parameter of the specified tuning sweep.

VB Syntax *value* = *embedLO*.**Parameter** (*n*)

Variable [\(Type\)](#) - Description

value **(String)** Variable to store the returned data.

embedLO *Diag* An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.Parameter 3 'read`

C++ Syntax HRESULT Parameter(long sweep, BSTR * param);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

Read-only

Parent Property

Description Returns a handle to the parent object of the collection object being referred to in the statement. The parent property allows the user to traverse from an object back up the object hierarchy.

VB Syntax *collection*.Parent

Variable [\(Type\)](#) - Description

collection

- [CalFactorSegments collection](#)
- [CalFactorSegmentsPMAR Collection](#)
- [Channels collection](#)
- [E5091Testset Collection](#)
- [ECalModules Collection](#)
- [ExternalDevices Collection](#)
- [ExternalTestsets Collection](#)
- [Measurements collection](#)
- [NaWindows collection](#)
- [PowerLossSegments collection](#)
- [PowerLossSegmentsPMAR_Collection](#)
- [PowerSensors collection](#)
- [Segments collection](#)
- [Traces collection](#)
- [PathConfigurationManager](#)
- [PowerMeterInterfaces Collection](#)

Return Type Object

Default Not Applicable

Examples `parentobj = chans.Parent 'returns a handle to the parent object (Application) of the chans collection. -Read`

C++ Syntax HRESULT get_Parent(IApplication* *pApplication); //IChannels, IChannel, IMeasurements, INAWindows, and IExternalDevices

HRESULT get_Parent(IChannel* *pChannel); //ITraces

HRESULT get_Parent(INAWindow* *pWindow); //ISegments

HRESULT get_Parent(IPowerSensor* *pSensor);
//ICalFactorSegments(PMAR)

HRESULT get_Parent(ISourcePowerCalibrator* *pCalibrator);
//IPowerSensors, IPowerLossSegments, and IPowerMeterInterfaces

Interface All listed above

Last Modified:

31-Jul-2009 Added ExternalDevices (9.0)

5-Mar-2009 Added PowerMeterInterfaces

PassFailLogic Property

Description Sets and reads the logic of the PassFail line on the [HANDLER IO connector](#) (pin 33). [Learn more about Global Pass/Fail.](#)

Note: This line is connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.

VB Syntax *object*.**PassFailLogic** = *value*

Variable [\(Type\)](#) - **Description**

object **(object)** - An Aux I/O or Handler I/O object

value **(enum as NARearPanelIOLogic)** Choose from:

0 - naPositiveLogic - Causes the PassFail line to have positive logic (high = pass, low = fail).

1 - naNegativeLogic - Causes the PassFail line to have negative logic (high = fail, low = pass).

Return Type Long Integer

Default naPositiveLogic

Examples

```
aux.PassFailLogic = naNegativeLogic 'Write
Text1.Text = aux.PassFailLogic 'Read
```

C++ Syntax

```
HRESULT put_PassFailLogic ( tagNARearPanelIOLogic Mode );
```

```
HRESULT get_PassFailLogic ( tagNARearPanelIOLogic* Mode );
```

Interface

```
IHWAuxIO
```

```
IHWMaterialHandlerIO
```

PassFailMode Property

Description	Sets and reads the mode of the PassFail line on the HANDLER IO connector (pin 33). Learn more about Global Pass/Fail.
VB Syntax	<i>object</i> . PassFailMode = <i>value</i>
Variable	(Type) - Description
<i>object</i>	(object) - An Aux I/O or Handler I/O object
<i>value</i>	(enum as NAPassFailMode) . Choose from: 0 - naDefaultPassNoWaitMode - the line stays in PASS state. When a device fails, then the line goes to fail IMMEDIATELY. 1 - naDefaultPassWaitMode - the line stays in PASS state. When a device fails, then the line goes to fail after the Sweep End line is asserted. 2 - naDefaultFailWaitMode - the line stays in FAIL state. When a device passes, then the line goes to PASS state after the Sweep End line is asserted.
Return Type	Long Integer
Default	0 - naDefaultPassNoWaitMode
Examples	<pre>HWAuxIO.PassFailMode = naDefaultPassNoWaitMode 'Write mode = HWAuxIO.PassFailMode 'Read</pre>
C++ Syntax	<pre>HRESULT put_PassFailMode (tagNAPassFailMode Mode); HRESULT get_PassFailMode (tagNAPassFailMode* Mode);</pre>
Interface	IHWAuxIO IHWMaterialHandlerIO

PassFailPolicy Property

Description	Sets the policy used to determine how global pass/fail is computed. Learn more about Global Pass/Fail.
VB Syntax	<i>object</i> . PassFailPolicy = <i>value</i>
Variable	(Type) - Description
<i>object</i>	(object) - An Aux I/O or Handler I/O object
<i>value</i>	(enum as NAPassFailPolicy) Choose from: 0 - naPolicyAllTests - - Pass/Fail Status returns PASS if all tests on all measurements pass. 1 - naPolicyAllMeas - Pass/Fail Status returns PASS if all measurements have associated tests, and all tests pass. FAIL is returned if even one measurement has no associated limit test. Only those measurements which are not in HOLD mode contribute to the pass/fail result.
Return Type	Long Integer
Default	naPolicyAllTests
Examples	<pre>matHndler.PassFailPolicy = naPolicyAllTests 'Write</pre> <pre>policy = aux.PassFailPolicy 'Read</pre>
C++ Syntax	HRESULT put_PassFailPolicy (tagNAPassFailPolicy Policy); HRESULT get_PassFailPolicy (tagNARearPanelIOLogic* Policy);
Interface	IHWAuxIO4 IHWMaterialHandlerIO2

PassFailScope Property

Description	Sets and reads the Scope of the PassFail line on the HANDLER IO connector (pin 33). Learn more about Global Pass/Fail.
VB Syntax	<i>object</i> . PassFailScope = <i>value</i>
Variable	(Type) - Description
<i>object</i>	(object) - An Aux I/O or Handler IO object
<i>value</i>	(enum NAPassFailScope) Choose from: 0 - naChannelScope - The PassFail line returns to its default state before sweeps on the next channel start. (A channel measurement may require several sweeps.) 1 - naGlobalScope - The PassFail line returns to its default state before the sweeps for the next triggerable channel start. The default state of the PassFail line before a measurement occurs and after a failure occurs is set by the PassFailMode property.
Return Type	enum NAPassFailScope
Default	1 - naGlobalScope
Examples	<pre>HWAuxIO.PassFailScope = naGlobalScope 'Write</pre> <pre>scope = HWAuxIO.PassFailScope 'Read</pre>
C++ Syntax	<pre>HRESULT put_PassFailScope (tagNAPassFailScope Scope);</pre> <pre>HRESULT get_PassFailScope (tagNAPassFailScope* Scope);</pre>
Interface	IHWAuxIO IHWMaterialHandlerIO

PassFailStatus Property

Description Returns the most recent pass/fail status value. Use this command as follows:

1. Set the PNA [trigger scope](#) to GLOBAL
2. Set the PNA [trigger source](#) to MANUAL or EXTERNAL.
3. Configure and enable [Limit Testing](#)
4. Trigger the PNA.
5. Use the `*OPC?` (with [SCPIStringParser object](#)) to determine when the sweep is complete.
6. Use the **PassFailStatus** property to obtain the global pass/fail result.

[Learn more about Global Pass/Fail.](#)

VB Syntax `var = object.PassFailStatus`

Variable [\(Type\)](#) - **Description**

`var` (enum as `NAPassFailStatus`) Variable to store returned status. One of the following will be returned:

0 - naStatusFail - all measurements not in HOLD mode have been swept, and one or more limit tests failed according to the specified [Pass/Fail policy](#).

1 - naStatusPass - all measurements not in HOLD mode have been swept, and all associated limit tests have passed.

2 - naStatusNone - status cannot be determined because measurements are in progress.

object **(object)** - An [Aux I/O](#) or [Handler I/O](#) object

Return Type Long Integer

Default Not Applicable

Examples `status = aux.PassFailStatus 'Read`

C++ Syntax `HRESULT get_PassFailPolicy (tagNAPassFailStatus* status);`

Interface `IHWAuxIO4`

`IHWMaterialHandlerIO2`

Path Property

Description Specifies an interface to use for the power meter / sensor during a source power calibration.

VB Syntax *pwrMtrInterface*.**Path** = *value*

Variable [\(Type\)](#) - Description

pwrMtrInterface **(object)** - A [PowerMeterInterface](#) (object)

value **(enum as NACommunicationPath)** Choose from:

0 - naGPIB - GPIB interface

1 - naUSB - USB interface

2 - naLAN - LAN interface

3 - naAny - Any VISA resource string or a visa alias

Return Type Enum

Default naGPIB

Examples [See example](#)

C++ Syntax HRESULT put_Path(tagNACommunicationPath pNewVal);

HRESULT get_Path(tagNACommunicationPath *pVal);

Interface IPowerMeterInterface

Last Modified:

24-Jan-2012 Added naAny

2-Aug-2007 MX New topic

PathCalMethod Property

Description **Note:** This command replaces [ThruCalMethod](#).

(Read-Write) Specifies the calibration method for each port pair.

Note: Sending this command will overwrite the PNAs SmartCal determinations for the most accurate cal method for your connector settings and Cal Kits. Send this command ONLY if you have a deliberate reason for overwriting the SmartCal logic. You can send the query form of this command to learn the cal method determined by SmartCal.

See [Thru Pairs Sequence](#) to learn how to send this and other Thru commands.

After sending this command, send the query form to be sure that the command was accepted. If not, then the chosen Cal method is not compatible with the specified Thru method. For example, if the specified Thru method is Unknown Thru, an attempt to set Enhanced Response Cal should be rejected.

See an example of a [4-port guided calibration using COM](#).

VB Syntax `guidedCal.PathCalMethod (port1, port2) = "caltype1[,caltype2]"`

Variable [\(Type\) - Description](#)

`guidedCal` [GuidedCalibration](#) (object)

`port1` First port of the pair to be calibrated.

`port2` Second port of the pair to be calibrated.

`"caltype1[,caltype2]"` (String) Cal types for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

caltype1 Cal type for the pair if caltype2 is not specified. Otherwise, Cal type for port 1. Choose from:

- "TRL"
- "SOLT"
- "QSOLTN"
- "EnhRespN"

For the last two arguments, replace N with the port to be used as the source port, which MUST be one of the port pair.

[caltype2] Optional argument. Use only when performing an adapter removal cal on the pair. This argument specifies the Cal Type on the second port; *caltype1* then specifies the Cal Type of the first port.

Choose from the same arguments as *caltype1*.

Return Type **String** - Returns comma-separated cal types.

Default The most accurate cal method for the current cal.

Example `guidedCal.PathCalMethod(2,3) = "TRL" 'Write trl for port pair`

```
guidedCal.PathCalMethod(1,4) = "TRL,SOLT" 'Write adapter  
removal cal, consisting of trl on port 1 and solt on port 4
```

```
calmethod = guided.PathCalMethod(1,4) 'Read previous example,  
returns: "TRL,SOLT"
```

C++ Syntax HRESULT get_PathCalMethod(long firstport, long secondport, BSTR *calMethod);

HRESULT put_PathCalMethod(long firstport, long secondport, BSTR calMethod);

Interface IGuidedCalibration3

PathConfigurationElement Property

Description	Allows you to set and return the Path Configuration settings for a Cal All calibration. Learn more about this setting.
VB Syntax	<i>calAll</i> . PathConfigurationElement (<i>element</i>). value = <i>setting</i>
Variable	(Type) - Description
<i>calAll</i>	A CalibrateAllChannels (object)
<i>element</i>	(String) Path configuration element to be set. See a list of configurable RF Path elements.
	Is this also for IF Path configuration elements?
<i>setting</i>	(String) Path configuration element setting.
Return Type	String
Default	Default settings vary with each element.
Examples	<pre>CalAll.PathConfigurationElement("Port1NoiseTuner").value = "Internal"</pre> <pre>'returns the PathConfigurationElement setting value = CalAll.PathConfigurationElement("Port1NoiseTuner").value</pre>
C++ Syntax	HRESULT put_PathConfigurationElement(BSTR name, IPathElement** pElement);
Interface	ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

PathThruMethod Property

Description **Note:** This command replaces [ThruCalMethod](#).

(Read-Write) Specifies the calibration THRU method for each port pair.

Note: Sending this command will overwrite the PNAs SmartCal determination for the thru method. Send this command **ONLY** if you have a deliberate reason for overwriting the SmartCal logic. You can send the query form of this command to learn the THRU method determined by SmartCal.

See [Thru Pairs Sequence](#) to learn how to send this and other Thru commands.

See an example of a [4-port guided calibration using COM](#).

VB Syntax `guidedCal.PathThruMethod (port1, port2) = "ThruType1[,ThruType2]"`

Variable [\(Type\) - Description](#)

`guidedCal` [GuidedCalibration](#) (object)

`port1` First port of the pair to be calibrated.

`port2` Second port of the pair to be calibrated.

`"ThruType1[,ThruType2]"` (String) Thru methods for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

thruType1 Calibration thru method for the pair if thruType2 is not specified. Otherwise, thru method for port 1.

Choose from:

- **“Defined Thru”** Measures a Thru for which there is a stored definition in the Cal Kit.
- **“Zero Thru”** Measures a Zero length Thru, also known as Flush-Thru.
- **“Undefined Thru”** A thru type for which there is NOT a stored definition in the Cal Kit. Also known as Unknown Thru. Valid **ONLY** for SOLT [cal type](#).
- **“Undefined Thru using a Defined Thru”** (ECal modules ONLY) Measures the internal Thru as an Unknown Thru.

ThruType2 (String) Optional argument. Use ONLY when Adapter Removal Cal is specified for the pair using [PathCalMethod](#). When specifying ThruType2, this is the only valid argument: "**Defined Thru, Defined Thru**"

Return Type **String** - Returns comma-separated ThruTypes.

Always returns two parts:

If the second part of the string is empty, adapter removal is NOT being performed.

If the string is "Defined Thru, Defined Thru", adapter removal IS being performed.

Default The most accurate THRU method for the current cal.

Example

```
guidedCal.PathThruMethod(2,3) = "Zero Thru" 'Write for port pair
```

```
guidedCal.PathThruMethod(1,4) = "Defined Thru, Defined Thru" 'Write for adapter removal cal.
```

```
calmethod = guided.PathThruMethod(1,4) 'Read previous example, return: "Defined Thru, Defined Thru"
```

C++ Syntax HRESULT get_PathThruMethod(long firstport, long secondport, BSTR *thruMethod);

HRESULT put_PathThruMethod(long firstport, long secondport, BSTR thruMethod);

Interface IGuidedCalibration3

PeakExcursion Property

Description Sets and reads the peak excursion value for the specified marker. The Excursion value determines what is considered a "peak".

VB Syntax *mark*.PeakExcursion = *value*

Variable [\(Type\)](#) - Description

mark A [Marker](#) (**object**)

value (**single**) - Peak Excursion. Choose any number between **-500** and **500**

Return Type Single

Default 3

Examples

```
mark.PeakExcursion = 1 'Write
```

```
PkExcur = mark.PeakExcursion 'Read
```

C++ Syntax HRESULT get_PeakExcursion(float *pVal)
HRESULT put_PeakExcursion(float newVal)

Interface IMarker

PeakThreshold Property

Description Sets peak threshold for the specified marker. If a peak (using the criteria set with [PeakExcursion](#)) is below this reference value, it will not be considered when searching for peaks.

VB Syntax `mark.PeakThreshold = value`

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (single) - Peak Threshold. Choose any number between: -500 and 500

Return Type Single

Default -100db

Examples `mark.PeakThreshold = 1 'Write`

`PkThresh = mark.PeakThreshold 'Read`

C++ Syntax HRESULT get_PeakThreshold(float *pVal)
HRESULT put_PeakThreshold(float newVal)

Interface IMarker

PeakToPeak Property

Description	Returns the Peak to Peak value of the measurement. To retrieve all 3 statistics value at the same time, use meas.GetTraceStatistics
VB Syntax	<code>pp = meas.PeakToPeak</code>
Variable	(Type) - Description
<i>pp</i>	(single) - Variable to store peak-to-peak value
<i>meas</i>	A Measurement (object)
Return Type	Single
Default	Not applicable
Examples	<code>pp = meas.PeakToPeak</code> 'Read
C++ Syntax	<code>HRESULT get_PeakToPeak(float* pp)</code>
Interface	IMeasurement

Percent Property

Description Sets group delay aperture using a percent of the channel frequency span.

VB Syntax `gdAperture.Percent = value`

Variable [\(Type\)](#) - Description

gdAperture A [GroupDelayAperture](#) (object)

value **(Double)** Percent of frequency span to use for the aperture setting. Choose between the equivalent of 2 points and 100 percent of the channel frequency span.

Return Type Double

Default Percent range that equates to 11 points.

This can be changed to two points with a [preference setting](#).

Examples

```
gdAperture.Percent = 25 'Write
```

```
aperture = gdAperture.Percent 'Read
```

C++ Syntax HRESULT get_Percent(double Percent *pVal)

HRESULT put_Percent(double Percent newVal)

Interface IGroupDelayAperture

PerformPowerCalibration Property

Description	Enables Guided Power Cal and sets the source port to be calibrated.
VB Syntax	<i>guidedCal</i> . PerformPowerCalibration (<i>port</i>) = <i>value</i>
Variable	(Type) - Description
<i>guidedCal</i>	GuidedCalibration (object)
<i>port</i>	(Long integer) Source port to be calibrated. ONLY one port may be calibrated with a Guided Power Cal.
<i>value</i>	(Boolean) True Perform a Guided Power Calibration. False Do NOT perform a Guided Power Calibration
Return Type	Boolean
Default	False
Example	<pre>guided.PerformPowerCalibration(1) = True</pre> See example program
C++ Syntax	HRESULT get_PerformPowerCalibration(long port, VARIANT_BOOL* val); HRESULT put_PerformPowerCalibration(long port, VARIANT_BOOL newVal);
Interface	IGuidedCalibration7

Last Modified:

9-Sep-2010 MX New topic

Period Property

Description Sets the pulse-period (1/PRF) for ALL PNA-X internal pulse generators.

The resolution of the period is 16.667nS.

VB Syntax *pulse*.**Period** = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (object)

value (**Double**) Pulse period in seconds. Choose a value from about 33ns to about 70 seconds.

Return Type Double

Default 1e-3 sec

Examples

```
pulse.Period = 1ms 'Write
```

```
value = pulse.Period 'Read
```

C++ Syntax HRESULT get_Period(double* period);

HRESULT put_Period(double period);

Interface IPulseGenerator

Last Modified:

1-Jan-2007 MX New topic

PhaseOffset Property

Description Sets the Phase Offset for the active channel.

VB Syntax *meas*.PhaseOffset = *value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**double**) - PhaseOffset in degrees. Choose any number between: **-360** and **+360**

Return Type Double

Default 0

Examples

```
meas.PhaseOffset = 25 'Write
```

```
poffset = meas.PhaseOffset 'Read
```

C++ Syntax HRESULT get_PhaseOffset(double *pVal)
HRESULT put_PhaseOffset(double newVal)

Interface IMeasurement

PhaseAsFixture Property

Description	Sets and reads the state of phase offset as a fixture with True Mode balanced measurements. Learn more about iTMSA phase and power offset.
VB Syntax	<i>balStim.PhaseAsFixture = value</i>
Variable	(Type) - Description
<i>balStim</i>	A BalancedStimulus (object)
<i>value</i>	(Boolean) State of phase offset as a fixture. False Offset is applied but is NOT included as a fixture in the output calculations. True Offset is applied and included as a fixture in the output calculations.
Return Type	Boolean
Default	False
Examples	<pre>balStim.PhaseAsFixture = False 'Write</pre> <pre>var = balStim.PhaseAsFixture 'Read</pre>
C++ Syntax	HRESULT get_PhaseAsFixture (VARIANT_BOOL *bVal) HRESULT put_PhaseAsFixture (VARIANT_BOOL bVal)
Interface	IBalancedStimulus

Last Modified:

27-May-2008 MX New topic

PhaseControlMode Property

Description Write and read the Phase Control mode for the specified port.

VB Syntax *phase*.PhaseControlMode(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Enum as NPhaseControlMode) Choose from:

0 - naPhaseControlOff Do NOT control the phase of <port>.

1 - naPhaseControlParameter Control the phase of <port>.

2 - naPhaseControlReference (READ-only) - reference port for a 'controlled' (parameter) Port.

3 - naPhaseControlOpenLoop Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.

Return Type Enum

Default **0 - naPhaseControlOff**

Examples

```
phase.PhaseControlMode 1 = naPhaseControlParameter ' Write  
value = phase.PhaseControlMode 2 ' Read
```

C++ Syntax HRESULT get_PhaseControlMode(long port, enum NPhaseControlMode* pVal);

HRESULT put_PhaseControlMode(long port, enum NPhaseControlMode newVal);

Interface IPhaseControl

Last Modified:

26-Jun-2012 Changed enum 2

8-Dec-2010 MX New topic

PhaseCorrectionData Property

Description Write and read an array of phase offsets. Each phase offset is summed with each phase point to get new target value. The PNA attempts to set phase for each target value. The number of phase offset values must be the same as the number of data points.

VB Syntax `phase.PhaseCorrectionData(srcPort) = value`

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Long values) Phase offset data array.

Return Type Long data array

Default Not Applicable

Examples

```
phase.PhaseCorrectionData 1 = 10,11,12 ' Write 3 phase offset values
value = phase.PhaseCorrectionData 2 ' Read
```

C++ Syntax HRESULT get_PhaseCorrectionData(long port, long* pVals);

HRESULT put_PhaseCorrectionData(long port, long newVals);

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

PhaseCorrectionEnabled Property

Description	Write and read whether to use the phase correction offset array. Use PhaseCorrectionData to write or read the offset data.
VB Syntax	<i>phase</i> .PhaseCorrectionEnabled(<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>phase</i>	A PhaseControl Object
<i>srcPort</i>	(Long Integer) Source port for which to make phase control settings.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Boolean) Phase correction array state.
	True – Apply phase correction offset array.
	False – Do NOT apply phase correction offset array.
Return Type	Boolean
Default	False
Examples	<pre>phase.PhaseCorrectionEnabled 1 = True ' Write value = phase.PhaseCorrectionEnabled 2 ' Read</pre>
C++ Syntax	HRESULT get_PhaseCorrectionEnabled(long port, VARIANT_BOOL* pVal); HRESULT put_PhaseCorrectionEnabled(long port, VARIANT_BOOL newVal);
Interface	IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

PhaseIterationNumber Property

Description	Write and read the maximum number of background phase sweeps to perform.
VB Syntax	<i>phase</i> .PhaseIterationNumber(<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>phase</i>	A PhaseControl Object
<i>srcPort</i>	(Long Integer) Source port for which to make phase control settings.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Double) Number of background sweep iterations. Choose a value between 1 and 25.
Return Type	Double
Default	5
Examples	<pre>phase.PhaseIterationNumber 1 = 15 ' Write value = phase.PhaseIterationNumber 2 ' Read</pre>
C++ Syntax	HRESULT get_PhaseIterationNumber(long port, double* pVal); HRESULT put_PhaseIterationNumber(long port, double newVal);
Interface	IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

PhaseParameter Property

Description Write and read the ratioed receivers (parameter) and paired port to use for phase control.

VB Syntax *phase.PhaseParameter(srcPort) = value*

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (String) Ratioed parameter. Choose any two PNA physical receivers. Use either standard receiver notation ("R/R3") or [logical receiver notation](#) ("a1/a3"). Separate the two receiver names by a forward slash '/'. For example: "a1/a3".

Return Type String

Default "a1/b1"

Examples

```
phase.PhaseParameter 1 = "a1/a3" ' Write
value = phase.PhaseParameter 2 ' Read
```

C++ Syntax HRESULT get_PhaseParameter(long port, BSTR* pVal);

HRESULT put_PhaseParameter(long port, BSTR newVal);

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

PhaseParameterModes Property

Description Returns the available phase control modes for the specified port. Use [PhaseControlMode](#) to set the Phase Control mode.

VB Syntax `phase.PhaseParameterModes(srcPort) = value`

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (String) Choose from:

"Off" - Turn phase control OFF

"Openloop" - Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.

"Parameter" - Sets and controls the phase of the signal at <port>.

"Reference" - Reference port for a controlled (parameter) port. Use [PhaseReferencePort](#) to set the reference port.

Return Type String

Default "Off"

Example `value = phase.PhaseParameterModes 2 ' Read`

C++ Syntax HRESULT get_PhaseParameterModes(long port, BSTR* pVal);

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

PhaseReference Property

Description	Sets and returns the Phase Reference ID to be used for the Phase Reference calibration. Use GetConnectedPhaseReferences to read the phase references currently connected to the PNA USB.
VB Syntax	<i>phasRef</i> . PhaseReference = <i>value</i>
Variable	(Type) - Description
<i>phasRef</i>	A PhaseReferenceCalibration Object
<i>value</i>	(String) Phase Reference ID name.
Return Type	String
Default	Not Applicable
Examples	<pre>phase.PhaseReference = "MYPRT0001"</pre> See example program
C++ Syntax	HRESULT get_PhaseReference(BSTR PhaseReference* pVals); HRESULT put_PhaseReference(BSTR PhaseReference newVals);
Interface	IPhaseReferenceCalibration

Last Modified:

3-Apr-2012 MX New topic

PhaseReferencePort Property

Description Sets and returns the reference port for the Phase Control measurement.

VB Syntax *phase*.PhaseReferencePort(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Long Integer) Reference port number. ONLY specific ports are available to be a reference for each source port. [Learn more](#).

Return Type Long Integer

Default Depends on the controlled port.

Examples

```
phase.PhaseReferencePort 1 = 3 ' Write
value = phase.PhaseReferencePort 2 ' Read
```

C++ Syntax

```
HRESULT get_PhaseReferencePort(long port, long* pVal);
HRESULT put_PhaseReferencePort(long port, long newVal);
```

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

PhaseSwpAsFixture Property

Description	Sets and reads the state of phase offset as a fixture with True Mode balanced measurements.
VB Syntax	<i>balStim.PhaseAsFixture</i> = <i>value</i>
Variable	(Type) - Description
<i>balStim</i>	A BalancedStimulus (object)
<i>value</i>	(Boolean) State of phase offset as a fixture. False Offset is applied but is NOT included as a fixture in the output calculations. True Offset is applied and included as a fixture in the output calculations.
Return Type	Boolean
Default	False
Examples	<pre>balStim.PhaseAsFixture = False 'Write</pre> <pre>var = balStim.PhaseAsFixture 'Read</pre>
C++ Syntax	HRESULT get_PhaseAsFixture (VARIANT_BOOL *bVal) HRESULT put_PhaseAsFixture (VARIANT_BOOL bVal)
Interface	IBalancedStimulus2

Last Modified:

3-Mar-2009 MX New topic (A.08.50)

PhaseSwpState Property

Description	Sets and reads the state of phase sweep. Sweep type must be set to CWTime.
VB Syntax	<i>balStim.PhaseSwpState</i> = <i>value</i>
Variable	(Type) - Description
<i>balStim</i>	A BalancedStimulus (object)
<i>value</i>	(Boolean) State of phase sweep. False Phase sweep disabled. True Phase sweep enabled.
Return Type	Boolean
Default	False
Examples	<pre>balStim.PhaseSwpState = False 'Write</pre> <pre>var = balStim.PhaseSwpState 'Read</pre>
C++ Syntax	HRESULT get_PhaseSwpState (VARIANT_BOOL *bVal) HRESULT put_PhaseSwpState (VARIANT_BOOL bVal)
Interface	IBalancedStimulus2

Last Modified:

3-Mar-2009 MX New topic (A.08.50)

PhaseTolerance Property

Description Write and read the tolerance value to be used for background phase sweeps.

VB Syntax *phase*.PhaseTolerance(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Tolerance for background sweeps in degrees. Choose a value between 1 and 5.

Return Type Double

Default 5 degrees

Examples

```
phase.PhaseTolerance 1 = 3 ' Write  
value = phase.PhaseTolerance 2 ' Read
```

C++ Syntax HRESULT get_PhaseTolerance(long port, double* pVal);

HRESULT put_PhaseTolerance(long port, double newVal);

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

Pin Property

Description Returns the Pin result of a PNOP or PSAT marker search.

PNOP In = Marker 4 X-axis value

PSAT In = Marker 2 X-axis value

VB Syntax *pIn* = *pMark*.**Pin**

Variable [\(Type\)](#) - Description

pIn (**double**) - Variable to store returned value

pMark A [PNOP](#) (object) or [PSaturation](#) (object)

Return Type Double

Default Not applicable

Examples `pIn = pMark.Pin 'Read`

[See example program](#)

C++ Syntax HRESULT get_Pin(double* pNewVal)

Interface IPNOP or IPSaturation

Last Modified:

19-Feb-2010 MX New topic

PinOffset Property

Description Sets and returns the PinOffset value used to calculate various PNOP parameters.

Also set [BackOff Property](#).

A sweep must be executed (single or continuous) and [SearchPowerNormalOperatingPoint Method](#) must be sent before reading marker results.

To turn off the PNOP markers, either turn them off individually or [DeleteAllMarkers](#).

To search a [User Range](#) with the PNOP search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

VB Syntax *pnop.PinOffset = value*

Variable [\(Type\)](#) - Description

pnop A [PNOP](#) (object)

value (**double**) - PinOffset value in dB. Choose any number between: **-500** and **500**

Return Type Double

Default 0 dB

Examples `pinOffs = pnop.PinOffset 'Read`

[See example program](#)

C++ Syntax HRESULT put_PinOffset(double newVal);

HRESULT get_PinOffset(double* pNewVal)

Interface IPNOP

PMaxBackOff Property

Description Sets and returns the backoff value used to calculate various PSAT parameters.

A sweep must be executed (single or continuous) and [SearchPowerSaturation Method](#) must be sent before reading marker results.

To turn off the PSAT markers, either turn them off individually or [DeleteAllMarkers](#).

To search a [User Range](#) with the PSAT search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

VB Syntax *pSat.PMaxBackOff = value*

Variable [\(Type\) - Description](#)

pSat A [PSaturation \(object\)](#)

value **(double)** - Backoff value in dB. Choose any number between:-**500** and **500**

Return Type Double

Default 0 dB

Examples `backoff = pSat.PMaxBackOff 'Read`

[See example program](#)

C++ Syntax HRESULT put_PMaxBackOff(double newVal);

HRESULT get_PMaxBackOff(double* pNewVal)

Interface IPSaturation

Last Modified:

22-Feb-2010 MX New topic

PMaxIn Property

Description Returns the PMaxIn result of a PNOP and PSAT marker search.

PMax In = Marker 3 X-axis value

VB Syntax *pMaxIn* = *pMark*.**PMaxIn**

Variable [\(Type\)](#) - [Description](#)

pMaxIn (**double**) - Variable to store returned value

pMark A [PNOP](#) (object) or [PSaturation](#) (object)

Return Type Double

Default Not applicable

Examples `pMaxIn = pMark.PMaxIn 'Read`

[See example program](#)

C++ Syntax HRESULT get_PMaxIn(double* pNewVal)

Interface IPNOP or IPSAT

Last Modified:

19-Feb-2010 MX New topic

PMaxOut Property

Description Returns the PMaxOut result of the PNOP and PSAT marker search.

PMaxOut = Marker 3 Y-axis value

VB Syntax *pMaxOut* = *pMark*.**PMaxOut**

Variable (Type) - Description

pMaxOut (**double**) - Variable to store returned value

pMark A [PNOP](#) (object) or [PSaturation](#) (object)

Return Type Double

Default Not applicable

Examples `pMaxOut = pMark.PMaxOut 'Read`

[See example program](#)

C++ Syntax HRESULT get_PMaxOut(double* pNewVal)

Interface IPNOP or IPSaturation

Last Modified:

19-Feb-2010 MX New topic

PointAveragingState Property

Description Turns point averaging ON or OFF for all measurements on the channel.

VB Syntax *chan*.**PointAveragingState** = *state*

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

state (**Enum**)

False - Turns point averaging OFF

True - Turns point averaging ON

Return Type Boolean

Default False

Examples `chan.PointAveragingState = True 'Write`

`averg = chan.PointAveragingState 'Read`

C++ Syntax HRESULT get_PointAveragingState(BOOL *pVal)
HRESULT put_PointAveragingState(BOOL newVal)

Interface IChannel16

Last Modified:

7-Oct-2008 MX New topic

PointDwell Property

Description Sets and returns the "Dwell Before/After Point" value for an external DC Device which can be configured as either a DC Meter or a DC Source.

VB Syntax `extDC.PointDwell = value`

Variable [\(Type\)](#) - Description

`extDC` An [ExternalDCDevice](#) (**object**)

`value` (**Double**)

For DC Meter, the dwell time (in seconds) before making a data point measurement.

For DC Source, the dwell time (in seconds) after making a data point setting.

Return Type Double

Default 3 milliseconds

Examples

```
extDC.PointDwell = 10e-3 'Write
dwell = extDC.PointDwell 'Read
```

C++ Syntax HRESULT get_PointDwell (double *pValue)

HRESULT put_PointDwell (double newVal)

Interface IExternalDCDevice

Last Modified:

15-Feb-2012 New topic

Points Property

Description Sets group delay aperture using a fixed number of data points.

VB Syntax `gdAperture.Points = value`

Variable [\(Type\)](#) - [Description](#)

gdAperture A [GroupDelayAperture](#) (**object**)

value (**Double**) Number of data points to use for the aperture setting. Choose between two points and the number of points in the channel.

Return Type Double

Default Points range that equates to 11 points.

This can be changed to two points with a [preference setting](#).

Examples `gdAperture.Points = 25 'Write`

`aperture = gdAperture.Points 'Read`

C++ Syntax HRESULT get_Points(double Points *pVal)

HRESULT put_Points(double Points newVal)

Interface IGroupDelayAperture

Last Modified:

23-Feb-2010 MX New topic

PointSweepState Property

Description Turns point sweep ON or OFF for all measurements on the channel. Point sweep measures both the forward and reverse parameters at each frequency point before stepping to the next frequency. The display trace is updated after the forward and reverse parameters are measured at that frequency point.

VB Syntax *chan*.**PointSweepState** = *state*

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

state (boolean)

False - Turns point sweep OFF

True - Turns point sweep ON

Return Type Boolean

Default False

Examples `chan.PointSweepState = True 'Write`

`averg = chan.PointSweepState 'Read`

C++ Syntax HRESULT get_PointSweepState(VARIANT_BOOL *pVal)
HRESULT put_PointSweepState(VARIANT_BOOL newVal)

Interface IChannel16

Last Modified:

3-Nov-2008 MX New topic

Port1 Property **Superseded**

Description	This command is replaced by PortDelay property . Sets a Port Extension value for Port 1
VB Syntax	<i>portExt</i> .Port1 = <i>value</i>
Variable	(Type) - Description
<i>portExt</i>	A Port Extension (object)
<i>value</i>	(double) - Port Extension value in seconds. Choose any number between -10 and 10
Return Type	Double
Default	0
Examples	<pre>portExt.Port1 = 10e-6 'Write prt1 = portExt.Port1 'Read</pre>
C++ Syntax	HRESULT get_Port1(double *pVal) HRESULT put_Port1(double newVal)
Interface	IPortExtension

Port2 Property **Superseded**

Description	This command is replaced by PortDelay property . Sets a Port Extension value for Port 2
VB Syntax	<i>portExt</i> .Port2 = <i>value</i>
Variable	(Type) - Description
<i>portExt</i>	A Port Extension (object)
<i>value</i>	(double) - Port Extension value in seconds. Choose any number between -10 and 10
Return Type	Double
Default	0
Examples	<pre>portExt.Port2 = 10e-6 'Write</pre> <pre>prt2 = portExt.Port2 'Read</pre>
C++ Syntax	HRESULT get_Port2(double *pVal) HRESULT put_Port2(double newVal)
Interface	IPortExtension

Port3 Property **Superseded**

Description	This command is replaced by PortDelay property .
	Sets a Port Extension value for Port 3
VB Syntax	<i>portExt</i> .Port3 = <i>value</i>
Variable	(Type) - Description
<i>portExt</i>	A Port Extension (object)
<i>value</i>	(double) - Port Extension value in seconds. Choose any number between -10 and 10
Return Type	Double
Default	0
Examples	<pre>portExt.Port3 = 10e-6 'Write</pre> <pre>prt3 = portExt.Port3 'Read</pre>
C++ Syntax	HRESULT get_Port3(double *pVal) HRESULT put_Port3(double newVal)
Interface	IPortExtension

Port1NoiseTunerSwitchPresetsToExternal Property

Description Sets the default setting for the Noise Tuner switch. [Learn more.](#)

This property returns an error on PNA models with a built-in Noise tuner.

VB Syntax `pref.Port1NoiseTunerSwitchPresetsToExternal = bool`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

bool (**Boolean**) - Choose from:

False - Sets the default (preset) to INTERNAL

True - Sets the default (preset) to EXTERNAL

Return Type Boolean

Default True

Examples

```
pref.Port1NoiseTunerSwitchPresetsToExternal = False 'Write
```

```
prefer = pref.Port1NoiseTunerSwitchPresetsToExternal 'Read
```

C++ Syntax

```
HRESULT put_Port1NoiseTunerSwitchPresetsToExternal( VARIANT_BOOL bValue)
```

```
HRESULT get_Port1NoiseTunerSwitchPresetsToExternal( VARIANT_BOOL  
*bValue)
```

Interface IPreferences8

Last Modified:

1-Feb-2008 MX New topic

Port2PdeembedCktModel Property

Description Select whether or not to load a 2-port De-embedding circuit model for the specified port number. Circuit model is applied when both "USER" is selected and the filename is specified. To set the filename, use [strPort2Pdeembed_S2PFile Property](#)

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.Port2PdeembedCktModel(port) = value`

Variable [\(Type\) - Description](#)

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive circuit model.

value (**Enum as NAFixturing2PdeembedCkt**)

0 **naFix2PD_USER** load a 2-port De-embedding circuit model

1 **naFix2PD_NONE** no model

Return Type Long Integer

Default naFix2PD_NONE

Examples

```
fixture.Port2PdeembedCktModel(2) = naFix2PD_USER 'Write
value = fixture.Port2PdeembedCktModel(1) 'Read
```

C++ Syntax HRESULT get_Port2PdeembedCktModel(short port tagNAFixturing2PdeembedCkt *pVal)
 HRESULT put_Port2PdeembedCktModel(short port tagNAFixturing2PdeembedCkt newVal)

Interface IFixturing

Port2PdeembedState Property

Description	Turns de-embedding ON or OFF for all ports on the channel.
VB Syntax	<i>fixture</i> .Port2PdeembedState = <i>value</i>
Variable	(Type) - Description
<i>fixture</i>	A Fixturing (object)
<i>value</i>	(Boolean)
	False - Turns De-embedding OFF
	True - Turns De-embedding ON
Return Type	Boolean
Default	False
Examples	<pre>fixture.Port2PdeembedState = False 'Write</pre> <pre>value = fixture.Port2PdeembedState 'Read</pre>
C++ Syntax	HRESULT get_Port2PdeembedState(VARIANT_BOOL *pVal) HRESULT put_Port2PdeembedState(VARIANT_BOOL newVal)
Interface	IFixturing

PortArbzImag Property

Description Sets and returns the Imaginary portion of the impedance value for the specified single-ended port. Use [PortArbzReal](#) to set the real value. Or use [PortArbzZ0](#) to set both values together.

VB Syntax *fixture.PortArbzImag(portNum) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum (**Integer**) Single-ended port number to receive impedance value.

value (**Double**) Real Impedance value. Choose a value between -1E18 and 1E18

Return Type Double

Default 0

Examples `fixture.PortArbzImag(2) = 75 'Write`

`value = fixture.PortArbzImag(1) 'Read`

C++ Syntax HRESULT get_PortArbzImag(short portNum, double *pVal)
HRESULT put_PortArbzImag(short portNum, double newVal)

Interface IFixturing3

PortArbzReal Property

Description Sets and returns the Real portion of the impedance value for the specified single-ended port. Use [PortArbzImag](#) to set the imaginary value. Or use [PortArbzZO](#) to set both values together.

VB Syntax *fixture.PortArbzReal(portNum) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum (**Integer**) Single-ended port number to receive impedance value.

value (**Double**) Real Impedance value. Choose a value between 0 to 1E7

Return Type Double

Default 50

Examples `fixture.PortArbzReal(2) = 75 'Write`
`value = fixture.PortArbzReal(1) 'Read`

C++ Syntax HRESULT get_PortArbzReal(short portNum, double *pVal)
HRESULT put_PortArbzReal(short portNum, double newVal)

Interface IFixturing3

PortArbzState Property

Description Turns Port Impedance ON or OFF for all ports on the channel.

VB Syntax *fixture*.PortArbzState = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (**Boolean**)

False - Turns Port Impedance OFF

True - Turns Port Impedance ON

Return Type Boolean

Default False

Examples `fixture.PortArbzState = False 'Write`

`value = fixture.PortArbzState 'Read`

C++ Syntax HRESULT get_PortArbzState(VARIANT_BOOL *pVal)
HRESULT put_PortArbzState(VARIANT_BOOL newVal)

Interface IFixturing

PortArbzZ0 Property

Description Sets and returns the Real portion of the impedance value for the specified single-ended port. The imaginary portion is automatically set to 0.0.

To set both values separately, use [PortArbzReal](#) and [PortArbzImag](#).

VB Syntax `fixture.PortArbzZ0(portNum) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

portNum (**Integer**) Single-ended port number to receive impedance value.

value (**Double**) Impedance value. Choose a value between 0 to 1E7

Return Type Double

Default 50

Examples `fixture.PortArbzZ0(2) = 75 'Write`

`value = fixture.PortArbzZ0(1) 'Read`

C++ Syntax HRESULT get_PortArbzZ0(short portNum, double *pVal)
HRESULT put_PortArbzZ0(short portNum, double newVal)

Interface IFixturing3

PortCatalog Property

Description	Returns a comma-separated list of the Output port selections that are available for a given logical input port. Read the number of input ports for the test set using NumberOfPorts Property .
VB Syntax	<i>value</i> = <i>tset</i> . PortCatalog (<i>logPort</i>)
Variable	(Type) - Description
<i>value</i>	(String) Variable to store the returned information.
<i>tset</i>	A TestsetControl object.
<i>logPort</i>	(Long) Logical Input port number for which to return valid output ports.
Return Type	String
Default	Not Applicable
Examples	<pre>value = testset1.PortCatalog 2</pre> See External Testset Program
C++ Syntax	HRESULT get_PortCatalog(long inputPort, BSTR *outPort);
Interface	ITestsetControl

Last Modified:

18-Jan-2007 Fixed argument

PortCLogic Property

Description Sets and reads the logic mode of Port C on the Handler IO connector.

VB Syntax *AuxIO.PortCLogic = value*

Variable [\(Type\)](#) - Description

AuxIO **(object)** - A Hardware Aux I/O object

value **(Enum as NaRearPanelIOLogic)** - Choose from:

0 - naPositiveLogic - The associated data line goes **HIGH** when writing a 1 to a PortC bit.

1 - naNegativeLogic - The associated data line goes **LOW** when writing a 1 to a PortC bit.

When Port C is in Output/Write mode, a change in logic causes the output lines to change state immediately. For example, Low levels change to High levels.

When Port C is in Input/Read mode, a change in logic will not cause the lines to change, but data read from Port C will reflect the change in logic.

Return Type Enum

Default 1 - naNegativeLogic

Examples

```
auxIO.PortCLogic = value 'Write
value = auxIo.PortCLogic 'Read
```

C++ Syntax

```
HRESULT put_PortCLogic ( tagNARearPanelIOLogic Mode );
```

```
HRESULT get_PortCLogic ( tagNARearPanelIOLogic* Mode );
```

Interface

```
IHWAuxIO
```

PortCMode Property

Description	Sets and reads whether Port C is setup for writing or reading data on the Handler IO connector.
VB Syntax	<i>AuxIO.PortCMode = value</i>
Variable	(Type) - Description
<i>AuxIO</i>	(object) - A Hardware Aux I/O object
<i>value</i>	(enum as NaPortMode) - Choose from: 0 - naInput - set the port for reading 1 - naOutput - set the port for writing
Return Type	Enum as NaPortMode
Default	1 - naInput
Examples	<pre>auxIo.get_PortCMode = naInput 'Write</pre> <pre>value = auxIo.get_PortCMode 'Read</pre>
C++ Syntax	<pre>HRESULT get_PortCMode(tagNAPortMode* pMode);</pre> <pre>HRESULT put_PortCMode(tagNAPortMode pMode);</pre>
Interface	IHWAuxIO

PortCoupleToSystemMedia Property

Description Sets and returns the state of coupling with the system Media type.

VB Syntax *fixture*.PortCoupleToSystemMedia (*port*)= *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) Object

port (Integer) Port Number that will receive the coupling change.

value (Boolean) Coupling state. Choose from:

- **True** - Media type is coupled with the system setting.
- **False** - Media type is NOT coupled with the system setting.

Return Type Boolean

Default True

Examples

```
fixture.PortCoupleToSystemMedia(2)= True
```

```
bool = fixture.PortCoupleToSystemMedia(1)
```

C++ Syntax

```
HRESULT get_PortCoupleToSystemMedia(short portNum, VARIANT_BOOL *pVal);
```

```
HRESULT put_PortCoupleToSystemMedia(short portNum, VARIANT_BOOL  
newVal);
```

Interface IFixturing4

Last Modified:

6-Feb-2009 MX New topic

PortCoupleToSystemVelocity Property

Description Sets and returns the state of coupling with the system Velocity Factor.

VB Syntax *fixture*.PortCoupleToSystemVelocity (*port*)= *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) Object

port (Integer) Port Number that will receive the coupling change.

value (Boolean) Coupling state. Choose from:

- **True** - Velocity Factor is coupled with the system setting.
- **False** - Velocity Factor is NOT coupled with the system setting.

Return Type Boolean

Default True

Examples `fixture.PortCoupleToSystemVelocity(2)= True`

`bool = fixture.PortCoupleToSystemVelocity(1)`

C++ Syntax HRESULT get_PortCoupleToSystemVelocity(short portNum, VARIANT_BOOL *pVal);

HRESULT put_PortCoupleToSystemVelocity(short portNum, VARIANT_BOOL newVal);

Interface IFixturing4

PortDelay Property

Description Sets and returns the Port Extensions Delay value for the specified port number.

Note: This command affects ALL measurements on the channel.

This command replaces [Port 1](#) [Port 2](#) [Port_3](#) Properties.

VB Syntax `fixture.PortDelay(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive delay value.

value **(Double)** Delay value in seconds. Choose a value between -1E18 and 1E18.

Return Type Double

Default 0

Examples `fixture.PortDelay(2) = .002 'Write`

`value = fixture.PortDelay(1) 'Read`

C++ Syntax HRESULT get_PortDelay(short port double *pVal)
HRESULT put_PortDelay(short port double newVal)

Interface IFixturing

PortDescription Property

Description For each port of the ECal module that is going to be characterized, sets and reads the description of the adapters, cable, or fixture to be included in the user characterization. This description is stored with the characterization in the ECal module.

Set this description before sending [Initialize](#) or the default (empty string) will be used.

VB Syntax `userChar.PortDescription (port)= value`

Variable [\(Type\)](#) - Description

userChar An [ECalUserCharacterizer](#) Object

port (Enum) ECal port for which description is to be set. Choose from:

1 or **naECalPort_A**

2 or **naECalPort_B**

3 or **naECalPort_C**

4 or **naECalPort_D**

value (String) Descriptive text, limited to 24 characters maximum.

Return Type String

Default "" (Empty String)

Examples

```
userChar.PortDescription (naECalPort_C)= "3.5 mm adapter, SN  
00001"
```

C++ Syntax HRESULT get_PortDescription(NAECalPort port, *BSTR description);

HRESULT put_PortDescription(NAECalPort port, BSTR description);

Interface IECalUserCharacterizer

Last Modified:

2-Nov-2008 New topic (8.33)

PortDistance Property

Description Sets and returns the port extension delay in physical length (distance).

VB Syntax *fixture*.**PortDistance** (*port*)= *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) Object

port (Integer) Port Number that will receive the delay setting.

value (Double) Physical length in distance. First specify units with [PortDistanceUnit](#).

Return Type Double

Default 0

Examples `fixture.PortDistance(2)= .01 'Write`

`value = fixture.PortDistance(2) 'Read`

C++ Syntax HRESULT get_PortDistance(short portNum, double *pVal);

HRESULT put_PortDistance(short portNum, double newVal);

Interface IFixturing4

Last Modified:

6-Feb-2009 MX New topic

PortDistanceUnit Property

Description Sets and returns the units for specifying port extension delay in physical length (distance).

VB Syntax *fixture*.PortDistanceUnit = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) Object

value (enum naDistanceUnit) Choose from:

0 – naDistanceUnit_Meter

1 – naDistanceUnit_Feet

2 – naDistanceUnit_Inch

Return Type Enum

Default naDistanceUnit_Meter

Examples `fixture.PortDistanceUnit(2) = naDistanceUnit_Meter 'Write`

`value = fixture.PortDistanceUnit(2) 'Read`

C++ Syntax HRESULT get_PortDistanceUnit(short portNum, tagNADistanceUnit*
*pVal);

HRESULT put_PortDistanceUnit(short portNum, tagNADistanceUnit
newVal);

Interface IFixturing4

Last Modified:

6-Feb-2009 MX New topic

PortExtState Property

Description Turns Port Extension ON or OFF for all ports on the channel.

VB Syntax *fixture*.PortExtState = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (**Boolean**)

False - Turns Port Extensions OFF

True - Turns Port Extensions ON

Return Type Boolean

Default False

Examples `fixture.PortExtState = 0 'Write`

`value = fixture.PortExtState 'Read`

C++ Syntax HRESULT get_PortExtState(VARIANT_BOOL *pVal)
HRESULT put_PortExtState(VARIANT_BOOL newVal)

Interface IFixturing

PortExtUse1 Property

Description Sets and returns the Use1 ON/OFF state for the use of the [PortLoss1](#) and [PortFreq1](#) values for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture.PortExtUse1(port) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive Use1 ON / OFF state.

value (**Boolean**)

False - Turns Use1 OFF

True - Turns Use1 ON

Return Type Boolean

Default False

Examples `fixture.PortExtUse1(2) = False 'Write`

`value = fixture.PortExtUse1(1) 'Read`

C++ Syntax HRESULT get_PortExtUse1(short port VARIANT_BOOL *pVal)
HRESULT put_PortExtUse1(short port VARIANT_BOOL newVal)

Interface IFixturing

PortExtUse2 Property

Description Sets and returns the Use2 ON/OFF state for the use of the [PortLoss2](#) and [PortFreq2](#) values for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture.PortExtUse2(port) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive Use2 ON / OFF state.

value **(Boolean)**

False - Turns Use1 OFF

True - Turns Use1 ON

Return Type Boolean

Default False

Examples `fixture.PortExtUse2(2) = False 'Write`

`value = fixture.PortExtUse2(1) 'Read`

C++ Syntax HRESULT get_PortExtUse2(short port VARIANT_BOOL *pVal)
HRESULT put_PortExtUse2(short port VARIANT_BOOL newVal)

Interface IFixturing

PortFreq1 Property

Description Sets and returns Frequency1 value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortFreq1(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive extrapolated loss.

value (Double) Frequency1 value. Choose a frequency within the frequency span of the PNA.

Return Type Double

Default 1 GHz

Examples

```
fixture.PortFreq1(2) = naFix2PD_USER 'Write
```

```
value = fixture.PortFreq1(1) 'Read
```

C++ Syntax HRESULT get_PortFreq1(short port double *pVal)
HRESULT put_PortFreq1(short port double newVal)

Interface IFixturing

PortFreq2 Property

Description Sets and returns Frequency2 value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortFreq2(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive extrapolated loss.

value (**Double**) Frequency2 value. Choose a frequency within the frequency span of the PNA.

Return Type Double

Default 1 GHz

Examples `fixture.PortFreq2(2) = 10E9 'Write`

`value = fixture.PortFreq2(1) 'Read`

C++ Syntax HRESULT get_PortFreq2(short port double *pVal)
HRESULT put_PortFreq2(short port double newVal)

Interface IFixturing

PortLabel Property

Description Sets and returns the label on the calibration kit Port for the calibration wizard.

VB Syntax `calKit.PortLabel (portNum) = value`

Variable [\(Type\)](#) - Description

calKit A CalKit (**object**)

portNum (**long integer**) - number of the port to be labeled. Choose either **1** or **2**

value (**string**) - Label that is visible in the calibration wizard.

Return Type String

Default Depends on the Cal Kit.

Examples `calKit.PortLabel = "MyCalKit" 'Write`

`kitLabel = calKit.PortLabel 'Read`

C++ Syntax HRESULT get_PortLabel(long port, BSTR *pVal)
HRESULT put_PortLabel(long port, BSTR newVal)

Interface ICalKit

PortLogic Property

Description	Sets and returns the logic mode of data ports A-H on the HandlerIO connector. Port C of the Handler IO is connected internally to the Port C of the Aux IO connector. Therefore, it will have the same logic mode.
VB Syntax	<i>handler</i> . PortLogic = <i>value</i>
Variable	(Type) - Description
<i>handler</i>	(object) - A HandlerI/O object
<i>value</i>	(enum as NaRearPanelIOLogic) - Choose from: 0 - naPositiveLogic - When a value of one is written, the associated line goes High 1 - naNegativeLogic - When a value of one is written, the associated line goes Low For ports that are in output (write) mode, a change in logic causes the output lines to change state immediately. For example, Low levels change immediately to High levels. For ports that are in input (read) mode (C,D,E only), a change in logic will be reflected when data is read from that port. For example, if a line read 0, the next read after a logic change will read 1.
Return Type	Long Integer
Default	1 - naNegativeLogic
Examples	<pre>handler.PortLogic = value 'Write value = handler.PortLogic 'Read</pre>
C++ Syntax	<pre>HRESULT put_PortLogic(tagNARearPanelIOLogic Mode); HRESULT get_PortLogic(tagNARearPanelIOLogic* Mode);</pre>
Interface	IHWMaterialHandlerIO

PortLoss1 Property

Description Sets and returns the Loss1 value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture*.PortLoss1(*port*) = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive Loss value

value **(Double)** Loss1 value in dB. Choose a value between -90 and 90.

Return Type Double

Default 0

Examples

```
fixture.PortLoss1(2) = .002 'Write
```

```
value = fixture.PortLoss1(1) 'Read
```

C++ Syntax HRESULT get_PortLoss1(short port double *pVal)
HRESULT put_PortLoss1(short port double newVal)

Interface IFixturing

PortLoss2 Property

Description Sets and returns the Loss2 value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture*.PortLoss2(*port*) = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive Loss value

value **(Double)** Loss2 value in dB. Choose a value between -90 and 90.

Return Type Double

Default 0

Examples `fixture.PortLoss2(2) = .002 'Write`

`value = fixture.PortLoss2(1) 'Read`

C++ Syntax HRESULT get_PortLoss2(short port double *pVal)
HRESULT put_PortLoss2(short port double newVal)

Interface IFixturing

PortLossDC Property

Description Sets and returns the Loss value at DC for the specified port number.

[Learn about Loss compensation values.](#)

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture.PortLossDC(port) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive Loss value at DC.

value **(Double)** Loss value in ohms. Choose a value between -90 and 90

Return Type Double

Default 0

Examples

```
fixture.PortLossDC(2) = .002 'Write
```

```
value = fixture.PortLossDC(1) 'Read
```

C++ Syntax HRESULT get_PortLossDC(short port double *pVal)
HRESULT put_PortLossDC(short port double newVal)

Interface IFixturing

PortMatching_C Property

Description Sets and returns the Capacitance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortMatching_C(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive capacitance value

value **(Double)** Capacitance value in farads. Choose a value between -1E18 to 1E18.

Return Type Double

Default 0

Examples

```
fixture.PortMatching_C(2) = .00002 'Write
```

```
value = fixture.PortMatching_C(1) 'Read
```

C++ Syntax HRESULT get_PortMatching_C(short port double *pVal)
HRESULT put_PortMatching_C(short port double newVal)

Interface IFixturing

PortMatching_G Property

Description Sets and returns the Conductance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortMatching_G(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive conductance value.

value **(Double)** Conductance value in siemens. Choose a value between -1E18 and 1E18.

Return Type Double

Default 0

Examples `fixture.PortMatching_G = .002 'Write`

`value = fixture.PortMatching_G 'Read`

C++ Syntax HRESULT get_PortMatching_G(short port double *pVal)
HRESULT put_PortMatching_G(short port double newVal)

Interface IFixturing

PortMatching_L Property

Description Sets and returns the Inductance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortMatching_L(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive inductance value

value **(Double)** Inductance value in henries. Choose a value between -1E18 and 1E18.

Return Type Double

Default 0

Examples

```
fixture.PortMatching_L = .002 'Write  
value = fixture.PortMatching_L 'Read
```

C++ Syntax HRESULT get_PortMatching_L(short port double *pVal)
HRESULT put_PortMatching_L(short port double newVal)

Interface IFixturing

PortMatching_R Property

Description Sets and returns the Resistance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortMatching_R(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive resistance value.

value **(Double)** Resistance value in ohms. Choose a value between -1E18 and 1E18.

Return Type Double

Default 0

Examples

```
fixture.PortMatching_R = .1 'Write
value = fixture.PortMatching_R 'Read
```

C++ Syntax HRESULT get_PortMatching_R(short port double *pVal)
HRESULT put_PortMatching_R(short port double newVal)

Interface IFixturing

PortMatchingCktModel Property

Description Sets and returns the Port Matching circuit model for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortMatchingCktModel(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive circuit model.

value (**Enum as NAFixturingPortMatchCkt**) Circuit model. Choose from

0 **naFixPMC_SLPC** Series L - Parallel C

1 **naFixPMC_PCSL** Parallel C - Series L

2 **naFixPMC_PLSC** Parallel L - Series C

3 **naFixPMC_SCPL** Series C - Parallel L

4 **naFixPMC_PLPC** Parallel L - Parallel C

5 **naFixPMC_USER** Load S2P file - also set filename to load with [strPortMatch_S2PFile Property](#)

6 **naFixPMC_NONE** No circuit model

Return Type Long Integer

Default **naFixPMC_NONE**

Examples `fixture.PortMatchingCktModel(2) = naFixPMC_PLSC 'Write`

`value = fixture.PortMatchingCktModel(1) 'Read`

C++ Syntax HRESULT get_PortMatchingCktModel(short port tagNAFixturingPortMatchCkt *pVal)
 HRESULT put_PortMatchingCktModel(short port tagNAFixturingPortMatchCkt newVal)

Interface IFixturing

PortMatchingState Property

Description Sets and returns the Port Matching State on the channel.

VB Syntax *fixture*.PortMatchingState = *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

value (boolean)

True - Turns Port Matching ON

False - Turns Port Matching OFF

Return Type Boolean

Default False

Examples `fixture.PortMatchingState = True 'Write`

`value = fixture.PortMatchingState 'Read`

C++ Syntax HRESULT get_PortMatchingState(VARIANT_BOOL *pVal)
HRESULT put_PortMatchingState(VARIANT_BOOL newVal)

Interface IFixturing

PortMedium Property

Description Sets and returns the media type of the added fixture or transmission line.

VB Syntax *fixture*.**PortMedium** (*port*)= *value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) Object

port (Integer) Port Number for which media type is being set.

value (enum NACalStandardMedium) - Medium of the transmission line of the standard. Choose from:

0 - naCoax - Coaxial Cable

1 - naWaveGuide - Waveguide

Return Type Enum

Default **0 - naCoax**

Examples `fixture.PortMedium(2)= naCoax 'Write`

`value = fixture.PortMedium(2) 'Read`

C++ Syntax HRESULT get_PortMedium(short portNum, tagNACalStandardMedium* pVal);

HRESULT put_PortMedium(short portNum, tagNACalStandardMedium newVal);

Interface IFixturing4

6-Feb-2009 MX New topic

PortMode Property

Description	Sets and returns whether Port C or Port D is used for writing or reading data on the Handler IO connector. The Handler IO Port C is connected internally to the Port C of the Aux IO connector. Therefore, the Aux IO connector will have the same input/output mode.
VB Syntax	<i>handler</i> . PortMode (<i>port</i>) = <i>value</i>
Variable	(Type) - Description
<i>handler</i>	(object) - A Handler I/O object
<i>port</i>	(enum as NAMatHandlerPort) Port to be changed. Choose from: 2 - naPortC 3- naPortD
<i>value</i>	(enum as NaPortMode) - Choose from: 0 - naInput - set the port for reading 1 - naOutput - set the port for writing
Return Type	Long Integer
Default	1 - naInput
Examples	<pre>handler.PortMode(naPortC) = naInput 'Write value = handler.PortMode(naPortD) 'Read</pre>
C++ Syntax	<pre>HRESULT put_PortMode (tagNAMatHandlerPort Port, tagNAPortMode Mode); HRESULT get_PortMode (tagNAMatHandlerPort Port, tagNAPortMode* Mode);</pre>
Interface	IHWMaterialHandlerIO

PortsNeedingDeltaMatch Property

Description Returns the port numbers for which delta match correction is required. 0 (zero) is returned if the Cal does NOT require Delta Match correction for one of the following reasons:

- The Cal does NOT involve Unknown Thru or TRL. You specify this using [ThruCalMethod Property](#).
- The Cal DOES involve Unknown Thru or TRL, but the delta match data can be calculated by the Unknown Thru or TRL Cal. [Learn how this is possible](#). However, you can force the Cal to use the Delta Match data from a Cal Set.

VB Syntax *value* = *guided*.PortsNeedingDeltaMatch

Variable [\(Type\)](#) - Description

value (Variant) Variable to store the returned list of port numbers.

guided [GuidedCalibration](#) (object)

Return Type Variant

Default Not Applicable

Examples

```
Dim ports As Variant
ports = guided.PortsNeedingDeltaMatch
```

C++ Syntax HRESULT get_PortsNeedingDeltaMatch (VARIANT* portList);

Interface IGuidedCalibration2

PortVelocityFactor Property

Description Sets and returns the Port Extensions Velocity Factor value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax `fixture.PortVelocityFactor(port) = value`

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port **(Integer)** Port number to receive velocity factor value.

value **(Double)** Velocity Factor value. Choose a number between: 0 and 10
(.66 polyethylene dielectric; .7 PTFE dielectric)

Return Type Double

Default 1

Examples

```
fixture.PortVelocityFactor(2) = .6 'Write
```

```
value = fixture.PortVelocityFactor(1) 'Read
```

C++ Syntax HRESULT get_PortVelocityFactor(short port double *pVal)
HRESULT put_PortVelocityFactor(short port double newVal)

Interface IFixturing4

Last Modified:

12-Feb-2009 MX New topic

PortWGCutoffFreqProperty

Description Sets and returns the cutoff (minimum) frequency of the added waveguide fixture or transmission line.

VB Syntax *fixture.PortWGCutoffFreq(port)= value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) Object

port (Integer) Port Number for which media type is being set.

value (Double) Cutoff frequency in Hz.

This value is ignored when [PortMedium Property](#) is set to **COAX** for the same port.

Return Type Double

Default System Media Cutoff Frequency

Examples `fixture.PortWGCutoffFreq(2)= 1e9 'Write`

`value = fixture.PortWGCutoffFreq(2) 'Read`

C++ Syntax HRESULT get_PortWGCutoffFreq(short portNum, double *pVal);

HRESULT put_PortWGCutoffFreq(short portNum, double newVal);

Interface IFixturing4

Last Modified:

6-Feb-2009 MX New topic

POut Property

Description Returns the POut result of the PNOP or PSAT marker search.

PSAT Out = Marker 2 Y-axis value

PNOPOut = Marker 4 Y-axis value

VB Syntax *pOut* = *pMark*.**POut**

Variable [\(Type\)](#) - [Description](#)

pOut (**double**) - Variable to store returned value

pMark A [PNOP](#) (Object) or [PSaturation](#) (Object)

Return Type Double

Default Not applicable

Examples `pOut = pMark.POut 'Read`

[See example program](#)

C++ Syntax HRESULT get_POut(double* pNewVal)

Interface IPNOP or IPSaturation

Last Modified:

19-Feb-2010 MX New topic

PowerSlope Property

Description Sets or returns the Power Slope value. Power Slope function increases or decreases the output power over frequency. Units are db/GHz. For example: PowerSlope = 2 will increase the power 2db/1GHZ.

VB Syntax *object*.PowerSlope = *value*

Variable [\(Type\)](#) - Description

object [Channel](#) (**object**)

or

[CalSet](#) (**object**) - Read-only property

value (**double**) - Power Slope. Choose any number between -2 and 2.
No slope = 0

Return Type Double

Default 0

Examples

```
chan.PowerSlope = 2 'Write
```

```
pwrslp = chan.PowerSlope 'Read
```

C++ Syntax HRESULT get_PowerSlope(double *pVal)
HRESULT put_PowerSlope(double newVal)

Interface IChannel
|CalSet3

PowerAcquisitionDevice Property

Description Returns the power sensor channel (A or B) that is currently selected for use at a specific frequency.

If [UsePowerSensorFrequencyLimits](#) is set to False, this property will return the sensor channel last used for a source power calibration. This setting corresponds to the **Use this sensor only** checkbox in the [Power Sensor Settings](#) dialog.

When performing an SMC calibration, use [SetPowerAcquisitionDevice Method](#) to set the power sensor channel.

VB Syntax *sensor* = *pwrCal*.PowerAcquisitionDevice(*dFreq*)

Variable [\(Type\)](#) - Description

sensor (**enum NPowerAcquisitionDevice**) The currently selected sensor channel for the specified frequency. Choose from:

0 – naPowerSensor_A

1 – naPowerSensor_B

pwrCal A SourcePowerCalibrator (object)

dFreq (double) Frequency (Hz) for the power reading of interest.

Return Type enum NPowerAcquisitionDevice

Default Not Applicable

Examples `selectedSensor = pwrCal.PowerAcquisitionDevice(1.E9) 'Write`

C++ Syntax HRESULT get_PowerAcquisitionDevice(double dFreq, tagNPowerAcquisitionDevice* enumAcqDevice);

Interface ISourcePowerCalibrator2

PowerAsFixture Property

Description Sets and reads the state of power offset as a fixture with True Mode balanced measurements. [Learn more about iTMSA power and power offset.](#)

VB Syntax *balStim.PowerAsFixture = value*

Variable [\(Type\)](#) - Description

balStim A [BalancedStimulus](#) (object)

value (**Boolean**) State of power offset as a fixture.

False Offset is applied but is NOT included as a fixture in the output calculations.

True Offset is applied and included as a fixture in the output calculations.

Return Type Boolean

Default False

Examples

```
balStim.PowerAsFixture = False 'Write
```

```
var = balStim.PowerAsFixture 'Read
```

C++ Syntax HRESULT get_PowerAsFixture (VARIANT_BOOL *bVal)

HRESULT put_PowerAsFixture (VARIANT_BOOL bVal)

Interface IBalancedStimulus

Last Modified:

27-May-2008 MX New topic

PowerCalibrationLevel Property

Description Set and read the power level at which to perform the source cal during an Enhanced Power Cal or during the power cal portion of some Noise Figure Cals.

VB Syntax *object*.PowerCalibrationLevel (*port*) = *value*

Variable [\(Type\)](#) - Description

object A [GuidedCalibration](#) (Object)

port **(Long)** PNA Port number to connect the power sensor.

value **(Double)** - Power level in dB. Choose a value from +30 to (-30).

Return Type Double

Default 0

Examples

```
cal.PowerCalibrationLevel(1) = -5 'Write
```

```
pLevel = nfx.PowerCalibrationLevel(1) 'Read
```

[See enhanced power cal example](#)

C++ Syntax HRESULT get_PowerCalibrationLevel(long port, double* pVal)
HRESULT put_PowerCalibrationLevel(long port, double* pVal)

Interface IGuidedCalibration6

Last Modified:

4-Oct-2010 Added enhanced power cal

12-Oct-2009 MX New topic

PowerCalibrationPowerLevel Property

Description Set and read the power level at which to perform the source cal during an Guided Power Cal or during an NFX Cal.

When used with [Guided Power Cal](#), first enable a power cal using [PerformPowerCalibration Property](#).

VB Syntax *object.PowerCalibrationPowerLevel* (*port*) = *value*

Variable [\(Type\)](#) - Description

object A [GuidedCalibration](#) (Object)

port (**Long**) PNA Port number to connect the power sensor.

value (**Double**) - Power level in dB. Choose a value from +30 to (-30).

Return Type Double

Default 0

Examples `cal.PowerCalibrationPowerLevel(1) = -5 'Write`

`pLevel = nfx.PowerCalibrationPowerLevel(1) 'Read`

C++ Syntax HRESULT get_PowerCalibrationPowerLevel(long port, double* pVal)

HRESULT put_PowerCalibrationPowerLevel(long port, double* pVal)

Interface IGuidedCalibration6

Last Modified:

12-Oct-2009 MX New topic

PowerLevel Property

Description Set and read the power level at which to perform the Source Power Cal portion of a Gain Compression Calibration or a SweptIMD Cal.

VB Syntax *object*.**PowerLevel** = *value*

Variable [\(Type\)](#) - Description

object A [GainCompressionCal](#) (**object**)

A [SweptIMDCal](#) (**object**)

value (**Double**) - Power level in dB. Choose a value from +30 to (-30). [Learn about choosing a power level.](#)

Return Type Double

Default 0

Examples

```
gca.PowerLevel = -5 'Write
pLevel = imd.PowerLevel 'Read
```

C++ Syntax HRESULT get_PowerLevel(double* pVal)
HRESULT put_PowerLevel(double newVal)

Interface IGainCompressionCal
ISweptIMDCal

Last Modified:

9-Sep-2008 Added IMD
11-Apr-2008 MX New topic

PowerLevel (Cal All) Property

Description Sets and returns the power level at which a Cal All calibration is to be performed.

VB Syntax `calAll.PowerLevel (port) = value`

Variable [\(Type\)](#) - Description

`calAll` A [CalibrateAllChannels](#) (object)

`port` (Long) Source port number.

`value` (Double) Power level at which the calibration is to be performed.

Return Type Double

Default ??

Examples

```
calAll.PowerLevel = 0 'Power Level of cal
```

```
value = calAll.PowerLevel 'returns the power level of the cal
```

C++ Syntax HRESULT get_PowerLevel (long port, double val);

HRESULT put_PowerLevel long port, double* newVal);

Interface ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

PowerMax Property

Description Sets and returns the maximum power level for Safe Mode.

VB Syntax *RxLevel.PowerMax(srcPort) = value*

Variable [\(Type\)](#) - Description

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port for which to set the max power for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Maximum power level in dB.

Return Type (Double)

Default + 30

Examples

```
rxLevel.PowerMax (1) = 25 ' Write
value = rxLevel.PowerMax 2 ' Read
```

C++ Syntax

```

PowerMaxIn

PowerMaxOut

PowerMeterChannel Property

Description	Identifies which channel of the power meter the power sensor is connected to.
VB Syntax	<i>chan</i> = <i>powerSensor</i> . PowerMeterChannel
Variable	(Type) - Description
<i>chan</i>	(enum NAPowerAcquisitionDevice) – Power meter channel identifier for sensor. Choose from: 0 – naPowerSensor_A 1 – naPowerSensor_B
<i>pwrSensor</i>	A PowerSensor (Object) or A PowerSensorAsReceiver (Object)
Return Type	NAPowerAcquisitionDevice
Default	Not Applicable
Examples	<pre>meterChannel = pwrSensor.PowerMeterChannel</pre>
C++ Syntax	HRESULT PowerMeterChannel(tagNAPowerAcquisitionDevice *pSensor);
Interface	IPowerSensor IPowerSensorAsReceiver

Last Modified:

25-Aug-2009 Added PMAR

PowerMeterGPIBAddress Property **Superseded**

Description This command is replaced with [PowerMeterInterface Object](#).

Specifies the GPIB address of the power meter that will be referenced by the SourcePowerCalibrator object.

When performing a source power cal, the PNA will search VISA interfaces that are configured in the Agilent IO Libraries on the PNA.

VB Syntax *powerCalibrator*.**PowerMeterGPIBAddress** = *value*

Variable [\(Type\)](#) - Description

powerCalibrator **(object)** - A SourcePowerCalibrator (object)

value **(long integer)** – Power meter GPIB address. Choose any number between 0 and 30.

Return Type Long integer

Default 13

Examples

```
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.PowerMeterGPIBAddress = 13 'Write
pwrMtrAddress = powerCalibrator.PowerMeterGPIBAddress 'Read
```

C++ Syntax HRESULT put_PowerMeterGPIBAddress(long newVal);

HRESULT get_PowerMeterGPIBAddress(long *pVal);

Interface ISourcePowerCalibrator

Last Modified:

9-Jul-2007 Superseded

PowerMin Property

Description Sets and returns the minimum power level for Safe Mode.

VB Syntax *RxLevel*.**PowerMin**(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port for which to set the min power for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Minimum power level in dB.

Return Type (Double)

Default -95 dB

Examples

```
rxLevel.PowerMin (1) = -50 ' Write  
value = rxLevel.PowerMin 2 ' Read
```

C++ Syntax

```
HRESULT get_PowerMin(long port, double* pVal);
```

```
HRESULT put_PowerMin(long port, double newVal);
```

Interface IReceiverLevelingConfiguration

Last Modified:

13-Feb-2009 MX New topic

PowerOffset Property

Description Sets and returns the power level offset value.

VB Syntax *RxLevel*.**PowerOffset**(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port for which to set the offset power for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Power level Offset in dB.

Return Type (Double)

Default 0 dB

Examples

```
rxLevel.PowerOffset (1) = 10 ' Write  
value = rxLevel.PowerOffset 2 ' Read
```

C++ Syntax

```
HRESULT get_PowerOffset(long port, double* pVal);
```

```
HRESULT put_PowerOffset(long port, double newVal);
```

Interface IReceiverLevelingConfiguration

Last Modified:

13-Feb-2009 MX New topic

PowerOffset (Cal All) Property

Description	Sets and returns the power offset value for a Cal All calibration. Power Offset provides a method of compensating port power for added attenuation or amplification in the source path. The result is that power at the specified port reflects the added components.
VB Syntax	<i>calAll</i> . PowerOffset (<i>port</i>) = <i>value</i>
Variable	(Type) - Description
<i>calAll</i>	A CalibrateAllChannels (object)
<i>port</i>	(Long) Source port number.
<i>value</i>	(Double) Power offset value in dB for a Cal All calibration. <ul style="list-style-type: none">• For amplification, use positive offset.• For attenuation, use negative offset.
Return Type	Double
Default	0 (zero dB)
Examples	<pre>calAll.PowerOffset = 0 'Power Level of cal</pre> <pre>value = calAll.PowerOffset 'returns the power offset of the cal</pre>
C++ Syntax	HRESULT get_PowerOffset (long port, double val); HRESULT put_PowerOffset long port, double* newVal);
Interface	CalibrateAllChannels

Last modified:

PowerOnDuringRetraceMode Property

Description For single-band frequency or segment sweeps ONLY, specify whether to turn RF power ON or OFF during a retrace.

This setting remains until changed using this command, or until the hard drive is changed or reformatted.

VB Syntax *pref.PowerOnDuringRetraceMode = value*

Variable [\(Type\)](#) - Description

pref A [Preferences \(object\)](#)

value **(Enum)** - Choose from:

0 - **naRetracePowerMode_Auto** Power is left ON during retrace of single-band frequency or segment sweeps ONLY.

1 - **naRetracePowerMode_OFF** Power is turned OFF during retrace of single-band frequency or segment sweeps ONLY.

Return Type Enum

Default 0 - naRetracePowerMode_Auto

Examples

```
pref.PowerOnDuringRetraceMode = naPowerSweepRetraceMode_Start 'Write
psMode = pref.naPowerOnDuringRetraceMode_Start 'Read
```

C++ Syntax HRESULT get_PowerOnDuringRetraceMode (tagNARetracePowerMode* preference);
 HRESULT put_PowerOnDuringRetraceMode (tagNARetracePowerMode val)

Interface IPreferences4

PowerSlopeState Property

Description Turns point slope ON or OFF for all measurements on the channel. Use [PowerSlope](#) to set the slope value.

VB Syntax `chan.PowerSlopeState = state`

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

state (boolean)

False - Turns power slope OFF

True - Turns point slope ON

Return Type Boolean

Default False

Examples `chan.PowerSlopeState = True 'Write`

`state = chan.PowerSlopeState 'Read`

C++ Syntax HRESULT get_PowerSlopeState(VARIANT_BOOL *pVal)

HRESULT put_PowerSlopeState(VARIANT_BOOL newVal)

Interface IChannel18

Last Modified:

1-Apr-2011 New topic

PowerStep Property

Description Sets and returns the safe mode power step value.

VB Syntax *RxLevel.PowerStep(srcPort) = value*

Variable [\(Type\)](#) - Description

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port for which to set the power step for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Power step in dB.

Return Type (Double)

Default 1 dB

Examples

```
rxLevel.PowerStep (1) = 2 ' Write  
value = rxLevel.PowerStep 2 ' Read
```

C++ Syntax

```
HRESULT get_PowerStep(long port, double* pVal);
```

```
HRESULT put_PowerStep(long port, double newVal);
```

PreciseTuningTolerance Property

Description Sets and returns the tuning tolerance for precise tuning.

VB Syntax *obj.PreciseTuningTolerance = value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Double**) Tuning tolerance in Hz.

Return Type (**Double**)

Default 1 Hz

Examples

```
embedLO.PreciseTuningTolerance = .5 'write
```

```
value = embedLO.PreciseTuningTolerance 'read
```

C++ Syntax HRESULT get_PreciseTuningTolerance(double* tolerance);

HRESULT put_PreciseTuningTolerance(double tolerance);

Interface IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object

18-Apr-2007 MX New topic

PreferInternalTriggerOnChannelSingle Property

Description Set and read the preference for the [chan.Single](#) trigger behavior. This setting persists until changed.

These preferences are important when performing a Guided calibration, as the PNA uses the **chan.Single** trigger command to measure standards.

- set `PreferInternalTriggerOnChannelSingle = False` to use an External trigger sweep to measure a cal standard.
- set `PreferInternalTriggerOnChannelSingle = True` to use an External sweep for the measurement, but rely on the PNA to send Internal trigger signals for calibrating.

To set this preference for an **Unguided** Calibration, use [PreferInternalTriggerOnUnguidedCal Property](#)

The **chan.Single** trigger command NEVER respects the Trigger Source = Manual setting. It always switches to Internal for one trigger, then back to Manual, regardless of this preference command.

VB Syntax `pref.PreferInternalTriggerOnChannelSingle = bool`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

bool (**Boolean**) - Choose from:

0 - False - the Single trigger property does respect the **Trigger Source = External** setting. For example, if [Trigger source = External](#), the single trigger method will wait for the External trigger signal and then allow only one sweep.

1 - True - the Single trigger command does NOT respect the **Trigger Source = External** setting. For example, when the Single method is sent, the PNA immediately switches to Internal sweep, responds to one trigger signal, then switches back to External.

Return Type Boolean

Default 0 - False

Examples

```
pref.PreferInternalTriggerOnChannelSingle = False 'Write
prefer = pref.PreferInternalTriggerOnChannelSingle 'Read
```

C++ Syntax HRESULT put_PreferInternalTriggerOnChannelSingle(VARIANT_BOOL bprefSingle)

HRESULT get_PreferInternalTriggerOnChannelSingle(VARIANT_BOOL
*bprefSingle)

Interface IPreferences2

PreferInternalTriggerOnUnguidedCal Property

Description Set and read the preference for the trigger behavior when performing an Unguided calibration.

VB Syntax `pref.PreferInternalTriggerOnUnguidedCal = bool`

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

bool (**Boolean**) - Choose from:

0 - False - The trigger behavior during an Unguided calibration DOES respect the setting of the [Trigger source](#) command. For example, during an Unguided Cal, when Trigger source = External, the PNA will wait for the External trigger signal and then allow only one sweep.

1 - True -The trigger behavior during an Unguided calibration does NOT respect the **Trigger Source = External** setting. For example, during an Unguided Cal, when Trigger source = External, the PNA immediately switches to Internal sweep, measures the standard with one trigger signal, then switches back to External trigger.

Note: When Trigger Source = Manual during a calibration, the PNA ALWAYS switches to Internal for one trigger to measure a standard, then back to Manual, regardless of this preference command.

Return Type Boolean

Default 0 - False

Examples

```
pref.PreferInternalTriggerOnUnguidedCal = False 'Write
```

```
prefer = pref.PreferInternalTriggerOnUnguidedCal 'Read
```

C++ Syntax HRESULT put_PreferInternalTriggerOnUnguidedCal(VARIANT_BOOL
bprefUnguided)

HRESULT get_PreferInternalTriggerOnUnguidedCal(VARIANT_BOOL
*bprefUnguided)

Interface IPreferences2

PresetPowerState Property

Description Set and return the Preset Power ON/OFF state.

VB Syntax *pref.PresetPowerState* = *value*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (Enum as NAPowerStates) - Choose from:

naPowerON (0) - Instrument Preset always turns RF power ON.

naPowerAUTO (1):

- When the current power setting is OFF, leave power OFF at Preset.
- When the current power setting is ON, turn power ON at Preset.

Return Type enum

Default naPowerON (0)

Examples

```
pref.PresetPowerState = naPowerON 'Write
```

```
pwrState = pref.PresetPowerState 'Read
```

C++ Syntax HRESULT get_PresetPowerState(tagNAPowerStates* pVal);
HRESULT put_PresetPowerState(tagNAPowerStates pVal);

PropertyNames Property

Description	Returns the unique, settable properties for the current cal all session. See a list of valid properties and values for each measurement class.
VB Syntax	<i>props</i> = <i>calAll</i> . PropertyNames
Variable	(Type) - Description
<i>props</i>	(Variant Array) Variable to store the returned property names that can be set.
<i>calAll</i>	A CalibrateAllChannels (object)
Return Type	Variant Array
Default	Not Applicable
Examples	<pre>props = calAll.PropertyNames</pre>
C++ Syntax	HRESULT get_PropertyNames (VARIANT*, propName);
Interface	CalibrateAllChannels

Last modified:

10-Feb-2014 Added link to props/values

PropertyValue Property

Description Sets and returns the property value for a specific property name.

[See a list of valid properties and values for each measurement class.](#)

Use [PropertyValues](#) to query a list of valid values.

VB Syntax `calAll.PropertyValue (propName) = value`

Variable [\(Type\)](#) - **Description**

`calAll` A [CalibrateAllChannels](#) (**object**)

`propName` (String) Property name for which value is to be set or returned.

`value` (String) Property value.

Return Type String

Default Not Applicable

Examples `calAll.PropertyValue ("Noise Cal Method") = "Scalar"`

C++ Syntax `HRESULT get_PropertyValue (BSTR propName, BSTR* propValue);`

`HRESULT put_PropertyValue (BSTR propName, BSTR propValue);`

Interface CalibrateAllChannels

PulseGeneratorID Property

Description	Returns the ID of the specified External Pulse Generator name. Use this ID number when setting properties on the PulseGenerator Object . Use PulseGeneratorNames to read the names of the internal and configured external pulse generators.
VB Syntax	<i>value</i> = <i>chan</i> . PulseGeneratorID (<i>name</i>)
Variable	(Type) - Description
<i>value</i>	(Long Integer) - Variable to store the returned ID.
<i>chan</i>	A Channel (object)
<i>name</i>	Name of the pulse generator. Use PulseGeneratorNames to read the names of configured pulse generators.
Return Type	Long Integer
Default	Not Applicable
Example	<pre>id = chan.PulseGeneratorID "My81110"</pre>
C++ Syntax	HRESULT get_PulseGeneratorID(long* count, BSTR name)
Interface	IChannel23

Last modified:

16-Feb-2012 New topic

PulseGeneratorNames Property

Description Returns the string names of internal and configured external pulse generators.

VB Syntax *names* = *chan*.**PulseGeneratorNames**

Variable [\(Type\)](#) - Description

names Variant array to store the returned string names.

chan A [Channel](#) (**object**)

Return Type Variant Array of string names

Default Not applicable

Example `names = extPulseGen.PulseGeneratorNames 'Read`

C++ Syntax HRESULT get_PulseGeneratorNames (VARIANT *pNames)

Interface IChannel

Last Modified:

15-Feb-2012 New topic

PulseMeasMode Property

Description Sets the pulse measurement state for the channel.

VB Syntax *pulseMeas.PulseMeasMode* = *value*

Variable [\(Type\)](#) - Description

pulseMeas A [PulseMeasurementControl](#) (object)

value (Enum as NAPulseMeasurementMode) Choose from:

(0) **naPulseMeasurementOff** - Turn OFF pulse measurements.

(1) **naPulseStandardMeasurement** - Turn ON standard pulse measurements.

(2) **naPulseProfileMeasurement** - Turn ON pulse profile measurements.

Return Type Enum

Default (0) **naPulseMeasurementOff**

Examples

```
pulse.PulseMeasMode = naPulseProfileMeasurement 'Write  
value = pulse.PulseMeasMode 'Read
```

C++ Syntax HRESULT get_PulseMeasMode(tagNAPulseMeasurementMode* pVal);
HRESULT put_PulseMeasMode(tagNAPulseMeasurementMode newVal);

Interface IPulseMeasurementControl

RangeCount Property

Description	Returns the number of ranges that are available in the PNA. To see the range names, query the Name property of each range in the FOM collection.
VB Syntax	<i>value</i> = FOM.RangeCount
Variable	(Type) - Description
<i>object</i>	An FOM (collection object)
<i>value</i>	(long) - Variable to store the returned number of ranges.
Return Type	Long Integer
Default	Not Applicable
Examples	<pre>NumRanges = fom.RangeCount 'Read</pre>
C++ Syntax	HRESULT get_RangeCount(long *count)
Interface	IFOM

Last Modified:

8-Mar-2007 Added link to Name property

rangeNumber Property

Description	Returns the index number of the range within the FOM collection .
VB Syntax	<i>value</i> = <i>FOMRange</i> .rangeNumber
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned range number.
<i>object</i>	An FOMRange (object)
Return Type	Long
Default	Not Applicable
Examples	<pre>num = fomRange.rangeNumber 'Read</pre>
C++ Syntax	HRESULT get_rangeNumber(long *pVal)
Interface	IFOMRange

RatioedPowerCorrectionData Property

Description Write and read an array of ratioed power offsets. This allows the setting of arbitrary impedance, which is used for active load applications. The number of offset values must be the same as the number of data points. Use [RatioedPowerCorrectionEnabled](#) to use the offset values.

VB Syntax `phase.RatioedPowerCorrectionData(srcPort) = value`

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Long values) Ratioed amplitude offset data array.

Return Type Long data array

Default Not Applicable

Examples

```
phase.RatioedPowerCorrectionData 1 = .1,.2,.3 ' Write 3 power
offset values
value = phase.RatioedPowerCorrectionData 2 ' Read
```

C++ Syntax HRESULT get_RatioedPowerCorrectionData(long port, long* pVals);

HRESULT put_RatioedPowerCorrectionData(long port, long newVals);

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

RatioedPowerCorrectionEnabled Property

Description Write and read whether to use the ratioed power offset array. Use [RatioedPowerCorrectionData Property](#) to write or read the offset data.

VB Syntax `phase.RatioedPowerCorrectionEnabled(srcPort) = value`

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Boolean) Ratioed power offset array state.

True – Apply offset array.

False – Do NOT apply offset array.

Return Type Boolean

Default False

Examples

```
phase.RatioedPowerCorrectionEnabled 1 = True ' Write  
value = phase.RatioedPowerCorrectionEnabled 2 ' Read
```

C++ Syntax

```
HRESULT get_RatioedPowerCorrectionEnabled(long port,  
VARIANT_BOOL* pVal);
```

```
HRESULT put_RatioedPowerCorrectionEnabled(long port,  
VARIANT_BOOL newVal);
```

Interface IPhaseControl

RcvCharMethod Property

Description Set and read the method used to characterize the noise receivers.

VB Syntax *noise*.**RcvCharMethod** = *value*

Variable [\(Type\)](#) - Description

noise A [NoiseCal](#) (object)

value (**string**) Receiver characterization method. NOT case-sensitive. Choose from:

- **"NoiseSource"** - Use a noise source. This selection is NOT allowed when a standard PNA receiver is used as the noise receiver. ([noise.NoiseReceiver](#) = naStandardReceiver).
- **"PowerMeter"** - Use a power meter.

NOTE: The Power Meter selection is **NOT** allowed when the Noise Bandwidth is **8 MHz** or **24 MHz**.

Return Type String

Default "NoiseSource"

Examples

```
noise.RcvCharMethod = "PowerMeter" 'Write  
receiverMethod = noise.RcvCharMethod 'Read
```

C++ Syntax HRESULT get_RcvCharMethod(BSTR* pValue)
HRESULT put_RcvCharMethod(BSTR pNewValue)

Interface INoiseCal3

Last Modified:

9-Jun-2011 MN New topic

R1InputPath Property

Description All PNA models (except the N523xA models) have a switch in the test set that allows access to the port 1 reference receiver through the front panel Reference 1 connectors. This command throws that switch between the internal path to the receiver, or through the external connectors.

See other [Frequency Offset](#) properties.

VB Syntax `chan.R1InputPath = value`

Variable [\(Type\) - Description](#)

chan A [Channel](#) (object)

value **(Enum as naInputPath)** - Choose from: naPathInternal -

(0) - internal path to the reference receiver naPathExternal

(1) - path through external connectors

Return Type Enum

Default naPathInternal - (0)

Examples `chan.R1InputPath = naPathInternal 'Write`

`Inpath = chan.R1InputPath 'Read`

C++ Syntax `HRESULT get_R1InputPath (tag NAInputPath *pPath);`

`HRESULT put_R1InputPath (tag NAInputPath newPath);`

Interface IChannel2

Last Modified:

30-Apr-2009 Added PNA-X models

ReadingsPerPoint Property

Description This command, along with [ReadingsTolerance](#), allows for settling of the power sensor READINGS.

Specifies the maximum number of power readings that are taken at each stimulus point to allow for power meter settling. Each reading is averaged with the previous readings at that stimulus point. When this average meets the [ReadingsTolerance](#) value or this number of readings has been made, the average is returned as the valid reading.

VB Syntax *pwrSensor*.**ReadingsPerPoint** = *value*

Variable [\(Type\)](#) - **Description**

pwrCal A [SourcePowerCalibrator](#) (Object) or

A [PowerSensorAsReceiver](#) (Object)

value **(long integer)** – Number of power readings. Choose any number between 3 and 100.

Return Type Long Integer

Default 3

Examples

```
pwrSensor.ReadingsPerPoint = 3 'Write  
numReadings = pwrSensor.ReadingsPerPoint 'Read
```

C++ Syntax HRESULT put_ReadingsPerPoint(long newVal);

HRESULT get_ReadingsPerPoint(long *pVal);

Interface ISourcePowerCalibrator

IPowerSensorAsReceiver

Last Modified:

25-Aug-2009 Added PMAR

17-Apr-2007 Clarified verbage

ReadingsTolerance Property

Description This command, along with [ReadingsPerPoint Property](#) allows for settling of the power sensor READINGS.

Each power reading is averaged with the previous readings at each stimulus point. When the average meets this tolerance value or the maximum [ReadingsPerPoint](#) has been made, the average is returned as the valid reading.

VB Syntax *pwrSens.ReadingsTolerance = value*

Variable [\(Type\) - Description](#)

pwrCal A [SourcePowerCalibrator](#) (Object) or

A [PowerSensorAsReceiver](#) (Object)

value **(Double)** – Power meter settling tolerance value in dB. Choose any number between 0 and 5.

Return Type Double

Default .05 dB

Examples

```
pwrSens.ReadingsTolerance = .1 'Write
ReadTol = pwrSensor.ReadingsTolerance 'Read
```

C++ Syntax HRESULT get_ReadingsTolerance(double *pVal);
HRESULT put_ReadingsTolerance(double newVal);

Interface ISourcePowerCalibrator3
IPowerSensorAsReceiver

Last Modified:

25-Aug-2009 Added PMAR
17-Apr-2007 Clarified verbage

ReadyForTriggerPolarity Property

Description Specifies the polarity of Ready for Trigger output.

All existing Ready for Trigger outputs for PNA-X and PNA-L models are configured simultaneously with this command. [See Capabilities Summary.](#)

The Ready for Trigger polarity can NOT be configured for E836x models.

VB Syntax *trigsetup*.**ReadyForTriggerPolarity** = *value*

Variable [\(Type\)](#) - **Description**

trigsetup A [TriggerSetup](#) (**object**)

value (Enum as NAlevel)

Choose from:

0 - naLow - Outputs a TTL low when the PNA is ready for trigger.

1 - naHigh - Outputs a TTL high when the PNA is ready for trigger.

Return Type Enum

Default **0** - naLow

Examples `trigsetup.ReadyForTriggerPolarity = naLow 'Write`

`pol = trigsetup.ReadyForTriggerPolarity 'Read`

C++ Syntax HRESULT get_ReadyForTriggerPolarity(tagNAlevel *pVal);

HRESULT put_ReadyForTriggerPolarity(tagNAlevel newVal);

Interface ITriggerSetup3

Last Modified:

14-Mar-2008 MX New topic

ReadyForTriggerState Property

Description Determines the control of Material Handler connector Pin 21.

VB Syntax *handler.ReadyForTriggerState = value*

Variable [\(Type\)](#) - Description

handler **(object)** - A [Handler I/O](#) object

value **(boolean)**

False - Pin 21 is controlled by Output Port B7

True - Pin 21 is controlled by the Ready for Trigger signal

Return Type Boolean

Default False

Examples `handler.ReadyForTriggerState = False 'Write
bState = handler.ReadyForTriggerState 'Read`

C++ Syntax HRESULT put_ReadyForTriggerState (BOOL *pVal);

HRESULT get_ReadyForTriggerState (BOOL newVal);

Interface IHWMaterialHandlerIO2

RecallSoftkeysMostRecent Property

Description Set and return whether to list files for recall on softkeys by most-recently used or alphabetically.

VB Syntax *pref.RecallSoftkeysMostRecent = value*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (**object**)

value (Boolean) – Choose from:

True – Recall softkeys show most recently-used files.

False – Recall softkeys show alphabetically-ordered files.

Return Type Boolean

Default False

Examples

```
pref.RecallSoftkeysMostRecent = False 'Write
```

```
recallPref = pref.RecallSoftkeysMostRecent 'Read
```

C++ Syntax HRESULT get_RecallSoftkeysMostRecent(VARIANT_BOOL * pVal);
HRESULT put_RecallSoftkeysMostRecent(VARIANT_BOOL pVal);

Interface IPreferences13

Last Modified:

ReceiverAttenuator Property

Description	Sets or returns the value of the specified receiver attenuator control.
VB Syntax	<i>object</i> . ReceiverAttenuator (<i>rec</i>) = <i>value</i>
Variable	(Type) - Description
<i>object</i>	Channel (object)
	or
	CalSet (object) - Read-only property
<i>rec</i>	(long integer) - Receiver with attenuator control to be changed. Choose from any of the available receivers in your PNA
	1 - Receiver A
	2 - Receiver B
	Receiver attenuation can not be set using logical receiver notation .
<i>value</i>	(double) - Attenuator value in dB. Choose any Long Integer between 0 and 35 in 5dB steps: If an invalid value is entered, the analyzer will select the next lower valid value. For example, if 19.9 is entered the analyzer will select 15 dB attenuation.
Return Type	Double
Default	0 db
Examples	<pre>chan.ReceiverAttenuator(1) = 5 'Write</pre> <pre>attn = chan.ReceiverAttenuator(2) 'Read</pre>
C++ Syntax	HRESULT get_ReceiverAttenuator(long lport, double *pVal) HRESULT put_ReceiverAttenuator(long lport, double newVal)
Interface	IChannel CalSet3

ReceiverAttenuator (Cal All) Property

Description	Sets and returns the Receiver Attenuator setting for a Cal All calibration.
VB Syntax	<i>calAll</i> . ReceiverAttenuator (<i>port</i>) = <i>value</i>
Variable	(Type) - Description
<i>calAll</i>	A CalibrateAllChannels (object)
<i>port</i>	(Long) Receiver port number.
<i>value</i>	(Double) Attenuation value in dB for a Cal All calibration. Choose a valid value for the PNA model. See valid settings .
Return Type	Double
Default	0 (zero dB)
Examples	<pre>calAll.ReceiverAttenuator = 0 'Set value</pre> <pre>value = calAll.ReceiverAttenuator 'Return value</pre>
C++ Syntax	HRESULT get_ReceiverAttenuator (long port, double val); HRESULT put_ReceiverAttenuator long port, double* newVal);
Interface	ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

ReceiverCount Property

Description	Returns the number of receivers in the remote PNA. The returned number includes both test port receivers and reference receivers. See the number of reference receivers in your PNA.
VB Syntax	<i>value</i> = <i>cap</i> . ReceiverCount
Variable	(Type) - Description
<i>value</i>	(Long) - Variable to store the returned number of receivers.
<i>cap</i>	A Capabilities (object)
Return Type	Long
Default	Not Applicable
Examples	<pre>value = cap.ReceiverCount 'Read</pre>
C++ Syntax	HRESULT get_ReceiverCount(long * receiverCount);
Interface	ICapabilities

ReceiverRatio Property

Description	Sets and returns the receiver ratio pair to be used with Receiver Leveling. To perform receiver leveling with a ratioed receiver, use ReceiverRatio Property .
VB Syntax	<i>RxLevel.ReceiverRatio(srcPort) = value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>srcPort</i>	(Long Integer) Source port for which to set the receiver for Receiver Leveling. Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(String) Receiver to use for the leveling sweeps. (Not case sensitive). Choose any receiver in your PNA. see the block diagram of your PNA, located at the bottom of all Specs documents . Receivers can also be referred to using logical receiver notation. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more .
Return Type	String
Default	Not applicable
Examples	<pre>rxLevel.ReceiverRatio (1) = "R1" ' Write</pre> <pre>rxLevel.ReceiverRatio (1) = "b2" ' Write</pre> <pre>value = rxLevel.ReceiverRatio 2 ' Read</pre>
C++ Syntax	<pre>HRESULT get_ReceiverRatio(long port, BSTR* pVal);</pre> <pre>HRESULT put_ReceiverRatio(long port, BSTR newVal);</pre>
Interface	IRceiverLevelingConfiguration

Last Modified:

22-Dec-2010 Added link to ratioed rec.
13-Feb-2009 MX New topic

ReceiverStepAttenuatorStepSize Property

Description Returns a value indicating the step size of the attenuator.

VB Syntax *value* = *cap*.**ReceiverStepAttenuatorStepSize** (*n*)

Variable [\(Type\)](#) - Description

value **(Double)** - Variable to store the returned value of the attenuator step size.

cap A [Capabilities](#) **(object)**

n **(Long)** - port number to query for the value of the attenuator step size.

Return Type Double

Default Not Applicable

Examples `value = cap.ReceiverStepAttenuatorStepSize(1) 'Read`

C++ Syntax HRESULT get_ReceiverStepAttenuatorStepSize(long portNumber, double * stepSize);

Interface ICapabilities

ReceiverTemperature Property

Description	Returns the current temperature on the PNA receiver board.
VB Syntax	<i>value</i> = <i>cap</i> . ReceiverTemperature (<i>unit</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned temperature value.
<i>cap</i>	A Capabilities (object)
<i>unit</i>	(Enum as NATempScale) - Units in which temperature is returned. Choose from: <ul style="list-style-type: none">• 0 - naTempScale_Fahrenheit• 1 - naTempScale_Celsius
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.ReceiverTemperature naTempScale_Celsius 'Read</pre>
C++ Syntax	HRESULT get_ReceiverTemperature(NATempScale val, long temperature);
Interface	ICapabilities9

Read-only

ReceivePort Property

Description Returns the receiver (response) port number of measurement. To understand how this property is useful, see [IMeasurement2 Interface](#).

Note: Returning a receiver port is only supported for S-Parameter measurements. If the measurement is not an S-Parameter, then E_NA_BAD_PARAMETER is returned.

VB Syntax *value* = *meas*.**ReceivePort**

Variable [\(Type\)](#) - Description

value **(Long)** - Variable to store the returned value

meas A [Measurement](#) **(object)**

Return Type Long Integer

Default Not Applicable

Examples `rp = meas.ReceivePort`

C++ Syntax HRESULT ReceivePort(Long* rcvPort);

Interface IMeasurement2

RedTraceOnFail Property

Description Set and return whether to display limit line failures as red trace segments or red data points (dots).

VB Syntax *pref.RedTraceOnFail = bool*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (**object**)

bool (**Boolean**) - Choose from:

False - Display failures as red data points (dots).

True - Display failures as red trace segments. (Red Trace On Fail).

Return Type Boolean

Default False

Examples `pref.RedTraceOnFail = False 'Write`

`prefer = pref.RedTraceOnFail 'Read`

C++ Syntax HRESULT put_RedTraceOnFail(VARIANT_BOOL bValue)

HRESULT get_RedTraceOnFail(VARIANT_BOOL *bValue)

Interface IPreferences10

Last Modified:

11-Aug-2009 MX New topic

ReduceIFBandwidth Property

Description Sets or returns the state of the [Reduced IF Bandwidth at Low Frequencies](#) setting.

VB Syntax `chan.ReduceIFBandwidth = state`

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

state (boolean)

False - Turns Reduce IFBW **OFF**

True - Turns Reduce IFBW **ON**

Return Type Boolean

Default True

Examples `chan.ReduceIFBandwidth = False 'Write`

`reduce = chan.ReduceIFBandwidth 'Read`

C++ Syntax HRESULT get_ReduceIFBandwidth(BOOL *pVal)
HRESULT put_ReduceIFBandwidth(BOOL newVal)

Interface IChannel5

Last Modified:

16-Aug-2007 Corrected Interface number

ReferenceCalFactor Property

Description	Sets and returns the Cal Factor (%) for the 50 MHz reference signal associated with this power sensor. Use this property only if the power sensor does not contain cal factors in EPROM (for example, HP/Agilent 848x sensors).
VB Syntax	<i>pwrSensor</i> . ReferenceCalFactor = <i>value</i>
Variable	(Type) - Description
<i>pwrSensor</i>	A PowerSensor (Object)
	A PowerSensorAsReceiver (Object)
<i>value</i>	(double) – Cal factor in units of percent. This can be any value between 1 and 150.
Return Type	Double
Default	100
Examples	<pre>pwrSensor.ReferenceCalFactor = 98 'R</pre> <pre>RefFact = pwrSensor.ReferenceCalFactor 'Read</pre>
C++ Syntax	HRESULT put_ReferenceCalFactor(double newVal); HRESULT get_ReferenceCalFactor(double *pVal);
Interface	IPowerSensor IPowerSensorAsReceiver

Last Modified:

25-Aug-2009 Added PMAR

ReferenceMarkerState Property

Description Turn ON or OFF the reference marker.

VB Syntax *meas*.**ReferenceMarkerState** = *state*

Variable [\(Type\)](#) - Description

app A Measurement (**object**)

state (boolean) -

True - turns the reference marker ON

False - turns the reference marker OFF

Return Type Boolean

Default **False**

Examples `meas.ReferenceMarkerState = True`

`reference = meas.ReferenceMarkerState`

C++ Syntax HRESULT get_ReferenceMarkerState(VARIANT_BOOL bState)
HRESULT put_ReferenceMarkerState(VARIANT_BOOL* bState)

Interface IMeasurement

ReferenceReceiver Property

Description	Sets and returns the receiver to be used with Receiver Leveling. To perform receiver leveling with a ratioed receiver, use ReceiverRatio Property .
VB Syntax	<i>RxLevel</i> . ReferenceReceiver (<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>srcPort</i>	(Long Integer) Source port for which to set the receiver for Receiver Leveling. Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(String) Receiver to use for the leveling sweeps. (Not case sensitive). Choose any receiver in your PNA. see the block diagram of your PNA, located at the bottom of all Specs documents . Receivers can also be referred to using logical receiver notation. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more .
Return Type	String
Default	Not applicable
Examples	<pre>rxLevel.ReferenceReceiver (1) = "R1" ' Write</pre> <pre>rxLevel.ReferenceReceiver (1) = "b2" ' Write</pre> <pre>value = rxLevel.ReferenceReceiver 2 ' Read</pre>
C++ Syntax	HRESULT get_ReferenceReceiver(long port, BSTR* pVal); HRESULT put_ReferenceReceiver(long port, BSTR newVal);
Interface	IRceiverLevelingConfiguration

Last Modified:

22-Dec-2010 Added link to ratioed rec.
13-Feb-2009 MX New topic

ReferenceValue Property

Description	Sets or returns the value of the Y-axis Reference Level of the active trace.
VB Syntax	<i>trce</i> .ReferenceValue = <i>value</i>
Variable	(Type) - Description
<i>trce</i>	A Trace (object)
<i>value</i>	(double) - Reference Value. Units and range depend on the current data format.
Return Type	Double
Default	Not applicable
Examples	<pre>meas.ReferenceValue = 0 'Write</pre> <pre>rlev = meas.ReferenceValue 'Read</pre>
C++ Syntax	HRESULT get_ReferenceValue(double *pVal) HRESULT put_ReferenceValue(double newVal)
Interface	ITrace

ReferencePosition Property

Description Sets or returns the Reference Position of the active trace.

VB Syntax *trce*.ReferencePosition = *value*

Variable [\(Type\)](#) - Description

trce A Trace (**object**)

value (**double**) - Reference position on the screen measured in horizontal graticules from the bottom of the screen. Choose from any number between: **0** and **10**.

Return Type Double

Default 0

Examples `meas.ReferencePosition = 5 'Middle of the screen -Write`

`rpos = meas.ReferencePosition -Read`

C++ Syntax HRESULT get_ReferencePosition(double *pVal)
HRESULT put_ReferencePosition(double newVal)

Interface ITrace

RemoteCalStoragePreference Property

Description Specifies the default manner in which calibrations performed using COM or SCPI are to be stored.

Cal data is always stored to the channel's Cal Register regardless of this setting.

This setting survives instrument preset and reboot. It remains until changed by another invocation of this property.

VB Syntax `pref.RemoteCalStoragePreference = value`

Variable [\(Type\)](#) - [Description](#)

cal A [Preferences](#) (object)

value **(Enum)** - Choose from:

0 - naPreferCalRegister - Cal is saved ONLY to the channel's Cal Register.

1 - naPreferNewUserCalSet - Cal is automatically saved to a new User Cal Set file when performing a calibration using COM. The Cal Set name is automatically generated. This corresponds to pre-6.0 behavior. Use the [Name](#) property to change the name after the cal is complete.

2 - naPreferReuseCurrentCalSet - The cal is saved to the Cal Set is that is currently selected on the specific channel. This could be the channel's Cal Register. If the channel does not yet have a selected Cal Set, the cal will be saved to a new User Cal Set with an automatically-generated name.

Return Type Enum

Default 0 - naPreferCalRegister

Examples

```
pref.RemoteCalStoragePreference = naPreferNewUserCalSet 'Write
calStorageMode = pref.RemoteCalStoragePreference ' Read
```

C++ Syntax HRESULT get_RemoteCalStoragePreference(enum NARemoteCalStoragePreference* preference);

HRESULT put_RemoteCalStoragePreference(enum NARemoteCalStoragePreference val);

Interface IPreferences7

16-Apr-2007 MX New topic

ReportReceiverOverload Property

Description Set and return whether to display receiver overload warnings.

VB Syntax *pref*.**ReportReceiverOverload** = *value*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (**Boolean**) - Choose from:

True Display overload warnings.

False Do NOT display overload warnings.

Return Type Boolean

Default True

Examples `pref.ReportReceiverOverload = True 'Write`

`value = pref.ReportReceiverOverload 'Read`

C++ Syntax HRESULT get_ReportReceiverOverload (VARIANT_BOOL PowerSweepRetraceMode* preference);
HRESULT put_ReportReceiverOverload (VARIANT_BOOL PowerSweepRetraceMode val)

Interface IPreferences12

Last Modified:

ResBWList Property

Description Returns a list of Res BW values that are supported by the IM Spectrum apps.

VB Syntax *value* = *cap*.ResBWList

Variable [\(Type\)](#) - Description

value (Variant) - Variable to store the returned array of Res BW values

cap A [Capabilities](#) (Object)

Return Type Variant array

Default Not Applicable

Examples `'Read the supported IFBW values`

```
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
list=cap.ResBWList
For i = 0 To UBound(list)
    msg = msg & list(i) & vbCrLf
Next
MsgBox msg
```

C++ Syntax HRESULT get_ResBWList(Variant *value);

Interface ICapabilities8

Last Modified:

23-May-2011 MX New topic

ResolutionBW Property

Description Sets and returns the Resolution Bandwidth for the IM Spectrum measurement.

VB Syntax *ims.ResolutionBW = value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Double) Resolution BW in Hz. Choose from:

60k | 100k | 150k | 300k, 600k | 1.0M | 3.0M

If an invalid number is specified, the PNA will round up to the closest valid number.

Return Type Double

Default 600 kHz

Examples `ims.ResolutionBW = 150e3 'Write`

`value = ims.ResolutionBW 'Read`

C++ Syntax HRESULT get_ResolutionBW(double *pVal)
HRESULT put_ResolutionBW(double newVal)

Interface IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

Reverse2PortAdapter Property

Description Set and read whether or not to reverse ports on a 2-port fixture or adapter to be de-embedded.

VB Syntax *fixture.Reverse2PortAdapter (port) = bool*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port PNA port number for which SNP file is to be de-embedded.

bool **True** - Reverse ports.

False - Do NOT reverse ports.

Return Type Boolean

Default False

Examples `fixture.Reverse2PortAdapter = True`

`value = fixture.Reverse2PortAdapter 'Read`

C++ Syntax HRESULT get_Reverse2PortAdapter(short portNum, VARIANT_BOOL *pRev);

HRESULT put_Reverse2PortAdapter(short portNum, VARIANT_BOOL bRev);

Interface IFixturing6

Last Modified:

16-Nov-2010 MX New topic

ReverseLinearPowerLevel Property

Description Set and read the reverse power level to the DUT. This is applied to the DUT output port when making reverse measurements like S22.

VB Syntax `gca.ReverseLinearPowerLevel = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**double**) Reverse power level in dBm. Choose a value from +30 to (-30).

Return Type Double

Default -5

Examples

```
gca.ReverseLinearPowerLevel = -10 'Write
```

```
LinPwr = gca.ReverseLinearPowerLevel 'Read
```

C++ Syntax HRESULT get_ReverseLinearPowerLevel(double* pVal)

HRESULT put_ReverseLinearPowerLevel(double newVal)

Interface IGainCompression

Last Modified:

21-Nov-2007 MX New topic

RFOffOnReceiverOverload Property

Description Set and return whether to turn source power OFF when a receiver is overloaded.

VB Syntax *pref*.**RFOffOnReceiverOverload** = *value*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (**Boolean**) - Choose from:

True Turn OFF source power to ALL ports when a receiver is overloaded.

False Power remains ON when a receiver is overloaded.

Return Type Boolean

Default False

Examples `pref.RFOffOnReceiverOverload = True` 'Write

`value = pref.RFOffOnReceiverOverload` 'Read

C++ Syntax HRESULT get_RFOffOnReceiverOverload (VARIANT_BOOL* preference);
HRESULT put_RFOffOnReceiverOverload (VARIANT_BOOL val)

Interface IPreferences12

Last Modified:

30-Aug-2010 MX New topic

RoleDevice Property

Description	This command replaces AssignSourceToRole Method and GetSourceByRole Method . Set and return the source to be used in the specified role. For example, use this command to set a source name to be used as the RF2 tone for a Swept IMD channel.
VB Syntax	<i>chan.RoleDevice(role) = source</i>
Variable	(Type) - Description
<i>chan</i>	A Channel (object)
<i>role</i>	(String) Role of the source. Not context-sensitive. Use DefinedRoles to read the valid roles for the channel.
<i>source</i>	(String) Source name to be used in the specified role. Use extDevices.Items to read a list of configured sources.
Return Type	String
Default	Not Applicable
Examples	<pre>chan.RoleDevice("RF2") = "MyEsg" 'Write source = chan.RoleDevice("RF2") 'Read</pre>
C++ Syntax	<pre>HRESULT get_RoleDevice(BSTR role BSTR *source); HRESULT put_RoleDevice(BSTR role BSTR source);</pre>
Interface	IChannel22

Last modified:

12-Mar-2014 New topic

SafeMode Property

Description	Sets and returns the state of Safe Mode.
VB Syntax	<i>RxLevel</i> . SafeMode (<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>value</i>	(Boolean) Choose from: True - Safe mode ON False - Safe mode OFF
<i>srcPort</i>	(Long Integer) Source port for which to set the Safe Mode state for Receiver Leveling. Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
Return Type	Variant Boolean
Default	False
Examples	<pre>rxLevel.SafeMode (1) = True ' Write value = rxLevel.SafeMode 2 ' Read</pre>
C++ Syntax	HRESULT get_SafeMode(long port, VARIANT_BOOL* pLevelingSafeMode); HRESULT put_SafeMode(long port, VARIANT_BOOL LevelingSafeMode);
Interface	IRceiverLevelingConfiguration

SafeSweepCoarsePowerAdjustment Property

Description Set and read the Safe Sweep COARSE power adjustment.

VB Syntax `gca.SafeSweepCoarsePowerAdjustment = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Double**) Coarse power adjustment setting in dBm. Choose a value from +30 to (-30).

Return Type Double

Default 3.0

Examples

```
gca.SafeSweepCoarsePowerAdjustment = 2.0 'Write
```

```
SSCourse = gca.SafeSweepCoarsePowerAdjustment 'Read
```

C++ Syntax HRESULT get_SafeSweepCoarsePowerAdjustment(double* value)
HRESULT put_SafeSweepCoarsePowerAdjustment(double value)

Interface IGainCompression

Last Modified:

1-Dec-2007 MX New topic

SafeSweepEnable Property

Description Set and read the (ON | OFF) state of Safe Sweep mode.

VB Syntax `gca.SafeSweepEnable = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Boolean**) Safe Sweep state. Choose from:

False - Disable Safe Sweep

True - Enable Safe Sweep

Return Type Boolean

Default False

Examples `gca.SafeSweepEnable = True 'Write`

`SSEnable = gca.SafeSweepEnable 'Read`

C++ Syntax HRESULT get_SafeSweepEnable(VARIANT_BOOL* value)

HRESULT put_SafeSweepEnable(VARIANT_BOOL value)

Interface IGainCompression

Last Modified:

1-Dec-2007 MX New topic

SafeSweepFinePowerAdjustment Property

Description Set and read the Safe Sweep FINE power adjustment.

VB Syntax `gca.SafeSweepFinePowerAdjustment = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value **(Double)** Fine power adjustment setting in dBm. Choose a value from +30 to (-30).

Return Type Double

Default 1.0

Examples `gca.SafeSweepFinePowerAdjustment = 0.1 'Write`

`ssfine = gca.SafeSweepFinePowerAdjustment 'Read`

C++ Syntax HRESULT get_SafeSweepFinePowerAdjustment(double* value)

HRESULT put_SafeSweepFinePowerAdjustment(double value)

Interface IGainCompression

Last Modified:

1-Dec-2007 MX New topic

SafeSweepFineThreshold Property

Description Set and read the compression level at which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment.

VB Syntax `gca.SafeSweepFineThreshold = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Double**) Threshold setting in dBm. Choose a value from +30 to (-30).

Return Type Double

Default 0.5 dBm

Examples `gca.SafeSweepFineThreshold = 0.1` **Write**

`SSThresh = gca.SafeSweepFineThreshold` **Read**

C++ Syntax HRESULT get_SafeSweepFineThreshold(double* value)

HRESULT put_SafeSweepFineThreshold(double value)

Interface IGainCompression

Last Modified:

1-Dec-2007 MX New topic

SafeSweepMaximumLimit Property

Description When the PNA port that is connected to the DUT Output measures the specified value, the input power to the DUT is no longer incremented at that frequency.

VB Syntax `gca.SafeSweepMaximumLimit = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Double**) Maximum power level in dBm. Choose a value from -100 to +100.

Return Type Double

Default 100

Examples `gca.SafeSweepMaximumLimit = 23 'Write`

`maxPwr = gca.SafeSweepMaximumLimit 'Read`

C++ Syntax HRESULT get_SafeSweepMaximumLimit(double* value)

HRESULT put_SafeSweepMaximumLimit(double value)

Interface IGainCompression

Last Modified:

16-Mar-2010 MX New topic

SaturationLevel Property

Description Set and read the deviation dB from the maximum Pout. This is the point of saturation.

This value is used for [Compression Method](#): Compression from Saturation.

VB Syntax `gca.SaturationLevel = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value **(Double)** - Saturation level in dB. Choose a value greater than 0.01 dB.

Return Type Double

Default .1 dB

Examples

```
gca.SaturationLevel = .5 'Write
```

```
satLevel = gca.SaturationLevel 'Read
```

C++ Syntax HRESULT get_SaturationLevel(double* pVal)

HRESULT put_SaturationLevel(double newVal)

Interface IGainCompression3

Last Modified:

3-Sep-2009 MX New topic

SB_BalPortNegative Property

Description With a Single-ended - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT's Balanced Port.

Use [SetSBPorts Method](#) to set the port mapping for a Single-Ended - Balanced topology.

VB Syntax *var* = *balTopology*.**SB_BalPortNegative**

Variable [\(Type\)](#) - Description

var (Long Integer) Variable to store the returned value.

balTopology A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.SB_BalPortNegative` 'Read

C++ Syntax HRESULT get_SB_BalPortNegative(long *bVal)

Interface IBalancedTopology

Last modified:

Unknown New topic

SB_BalPortPositive Property

Description With a Single-ended - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's Balanced Port.

Use [SetSBPorts Method](#) to set the port mapping for a Single-Ended - Balanced topology.

VB Syntax `var = balTopology.SB_BalPortPositive`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTop.SB_BalPortPositive 'Read`

C++ Syntax HRESULT get_SB_BalPortPositive(long *bVal)

Interface IBalancedTopology

SB_SEPort Property

Description With a Single-ended - Balanced topology, returns the PNA port number that is connected to the DUT's Single-ended port.

Use [SetSBPorts Method](#) to set the port mapping for a Single-Ended - Balanced topology.

VB Syntax `var = balTopology.SB_SEPort`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTopology.SB_SEPort 'Read`

C++ Syntax HRESULT get_SB_SEPort(long *bVal)

Interface IBalancedTopology

SBalMeasurement Property

Description Sets and returns the measurement for the Single-Ended - Balanced topology.

VB Syntax *balMeas.SBalMeasurement* = *value*

Variable [\(Type\)](#) - [Description](#)

balMeas A [BalancedMeasurement](#) (object)

value **(String)** - Single-ended - Balanced Measurement parameter. Not case-sensitive. Choose from:

Sss11	Ssd12	Ssc12
Sds21	Sdd22	Sdc22
Scs21	Scd22	Sc22
Imb	CMRR1	CMRR2
	(Sds21/Scs21)	(Ssd12/Ssc12)

Return Type Sss11

Default Not Applicable

Examples `balMeas.SBalMeasurement = "Ssd12" 'Write`

`variable = balMeas.SBalMeasurement 'Read`

C++ Syntax HRESULT get_SBalMeasurement(BSTR *pVal)

HRESULT put_SBalMeasurement(BSTR newVal)

Interface IBalancedMeasurement

ScaleCouplingMethod Property

Description	Sets and returns the method of scale coupling.
VB Syntax	<i>win</i> . ScaleCouplingMethod = <i>value</i>
Variable	(Type) - Description
<i>win</i>	An NAWindow (object)
	Any window object can be used to set this global property.
<i>value</i>	(enum NAScaleCouplingMethod)
	0 – naScaleCouplingOff - Scale Coupling is Off
	1 – naScaleCouplingWindow - Traces within selected windows share scaling
	2 – naScaleCouplingAll - Scaling is shared among traces in all selected windows
	Select windows using ScaleCouplingState Property
Return Type	Enum
Default	0 – naScaleCouplingOff
Examples	<pre>win.ScaleCouplingMethod = naScaleCouplingWindow 'Write</pre>
	<pre>method = app.ActiveNAWindow.ScaleCouplingMethod 'Read</pre>
C++ Syntax	HRESULT get_ScaleCouplingMethod(tagNAScaleCouplingMethod* couplingMethod);
	HRESULT put_ScaleCouplingMethod(tagNAScaleCouplingMethod couplingMethod);
Interface	INAWindow2

ScaleCouplingState Property

Description Enables and disables scale coupling for the window.
Use [ScaleCouplingMethod](#) to select the coupling method.

VB Syntax *win*.ScaleCouplingState = *bool*

Variable [\(Type\)](#) - Description

win An [NAWindow](#) (object) .

bool **(Boolean)**

False - NO scale coupling for this window.

True - Scale coupling enabled for this window.

Return Type Boolean

Default True

Examples

```
win.ScaleCouplingState = false 'Write
```

```
coupled = app.ActiveNAWindow.ScaleCouplingState  
'Read
```

C++ Syntax HRESULT get_ScaleCouplingState(VARIANT_BOOL
*pVal);

HRESULT put_ScaleCouplingState(VARIANT_BOOL
newVal)

Interface INAWindow2

Last Modified:

6-Aug-2009 MX New topic

Scope Property

Description Sets or returns the scope of a trigger signal. This determines whether a trigger signal affects a single channel or all channels in the PNA.

Note: [Trigger Modes](#) Point and EverySweep require that Trigger.Scope be set to naChannelTrigger.

VB Syntax `trigsetup.Scope = value`

Variable [\(Type\) - Description](#)

`trigsetup` A [TriggerSetup](#) (object)

`value` (enum **NATriggerType**) - Trigger type. Choose from:

0 - naGlobalTrigger - a trigger signal is applied to all triggerable channels

1 - naChannelTrigger - a trigger signal is applied to the current channel. The next trigger signal will be applied to the next channel; not necessarily the next channel in numeric sequence (1-2-3-4 and so forth).

Return Type Long Integer

Default naGlobalTrigger

Examples

```
trigsetup.Scope = naGlobalTrigger 'Write
trigtyp = trigsetup.Scope 'Read
```

C++ Syntax HRESULT get_Scope(tagNATriggerType *pTrigger)
HRESULT put_Scope(tagNATriggerType trigger)

Interface ITriggerSetup

Last Modified:

6-Nov-2007 Updated for new sweep mode

SearchFunction Property

Description Emulates the Tracking function in the marker search dialog box. The value you choose for SearchFunction will determine the type of search that takes place when the [Tracking](#) property is set true.

The tracking function finds the selected search function every sweep. In effect, turning Tracking ON is the same as executing one of the "Search..." methods (such as SearchMin, SearchMax) for every sweep.

VB Syntax *mark*.**SearchFunction** = *value*

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (enum **NAMarkerFunction**) - search function. Choose from:

0 - naMarkerFunction_None

1 - naMarkerFunction_Min

2 - naMarkerFunction_Max

3 - naMarkerFunction_Target

4 - naMarkerFunction_NextPeak

5 - naMarkerFunction_PeakRight

6 - naMarkerFunction_PeakLeft

7 - naMarkerFunction_Compression

Return Type Long Integer

Default 0 - naMarkerFunction_None

Examples `mark.SearchFunction = naMarkerFunction_Target 'When this marker is set to track, it will track the Target value.`

`searchfunction = mark.SearchFunction 'Read`

C++ Syntax HRESULT get_SearchFunction(tagNAMarkerFunction *pVal)
HRESULT put_SearchFunction(tagNAMarkerFunction newVal)

Interface IMarker

SearchFailures Property

Description Returns a comma-separated list of the frequency indexes that were out of tolerance for SMART Sweep mode, or at the power limit for 2D Sweep mode. Zero (0) is the first frequency data point.

Must be Single triggered. Invalid results occur if the GCA channel is continuously sweeping.

VB Syntax *value* = *gca*.**SearchFailures**

Variable [\(Type\)](#) - [Description](#)

value **(Double)** Variable to store the returned data.

gca A [GainCompression](#) **(object)**

Return Type Returns a comma-separated list of frequency indexes.

Default Not applicable

Examples `SFA = gca.SearchFailures 'Read`

C++ Syntax HRESULT get_SearchFailures(VARIANT* value)

Interface IGainCompression

Last Modified:

11-Dec-2007 MX New topic

SearchSummary Property

Description Returns the status of a compression search.

This command can be used to indicate when a GCA search is complete.

Note: The returned value reflects the current state of the GCA compression search which can vary when in continuous sweep. This command is intended to be used with [chan.Single](#) (trigger).

VB Syntax *value* = *gca*.**SearchSummary**

Variable [\(Type\)](#) - Description

value **(Enum)** Variable to store the returned value.

- **0 - naSearchNotDone** - Acquisition is still in process.
- **1 - naSearchSucceeded** - Acquisition is complete and compression value found for all frequency points.
- **2 - naSearchFailed** - Acquisition is complete and unable to find the compression value at one or more frequency points.

gca A [GainCompression](#) **(object)**

Return Type Enum

Default Not Applicable

Examples `sum = gca.SearchSummary 'Read'`

C++ Syntax HRESULT get_SearchSummary(enum naGCASearchSummary* value)

Interface IGainCompression

Last Modified:

10-Jun-2009 MX New topic

SecurityLevel Property

Description Controls the display of frequency information on the PNA screen and printouts.

VB Syntax `app.SecurityLevel value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (enum `NASecurityLevel`) -Choose from:

0 - naNoSecurity ALL frequency information is displayed.

1 - naLowSecurity NO frequency information is displayed. Frequency information can be redisplayed using the Security Setting dialog box or this command.

2 - naHighSecurity LOW setting plus [GPIB console](#) is disabled. Frequency information can be redisplayed ONLY by performing a Preset, recalling an instrument state with None or Low security settings, or using this command.

3 - naExtraSecurity HIGH setting plus:

- [ASCII data saving](#) is disabled. Same method to redisplay frequency information as HIGH setting.
- [Mixer setup files](#) (*.mxr) can NOT be saved.

Return Type Long Integer

Default 0 - None

Examples

```
app.SecurityLevel = naLowSecurity 'Write
level = app.SecurityLevel 'Read
```

C++ Syntax `HRESULT get_NASecurityLevel(tagNASecurityLevel *level);`
`HRESULT put_NASecurityLevel(tagNASecurityLevel level);`

Interface `IApplication4`

Last Modified:

17-Jul-2007 Add Extra level

SegmentNumber Property

Description	Returns the number of the current segment, PowerSensorCalFactorSegment or PowerLossSegment object.
VB Syntax	<i>seg</i> .SegmentNumber
Variable	(Type) - Description
	<i>seg</i> Any of the following objects:
	A Segment (Object)
	A PowerSensorCalFactorSegment (Object)
	A PowerSensorCalFactorSegmentPMAR Object (Object)
	A PowerLossSegment (Object)
	A PowerLossSegmentPMAR (Object)
Return Type	Long Integer
Default	Not Applicable
Examples	<code>segNum = seg.SegmentNumber</code> 'returns the segment number -Read
C++ Syntax	HRESULT get_SegmentNumber(long *pVal)
Interface	ISegment IPowerSensorCalFactorSegment IPowerSensorCalFactorSegmentPMAR IPowerLossSegment IPowerLossSegmentPMAR

Last Modified:

27-Aug-2009 Added PMAR (9.0)

SegmentCount Property

Description	Returns the number of segments on the Applied mixer .
VB Syntax	<i>value</i> = <i>conv</i> . SegmentCount
Variable	(Type) - Description
<i>value</i>	(Long integer) Variable in which to store the returned segment count.
<i>conv</i>	A Converter Object
Return Type	Long integer
Default	1 Segment is created on new converter objects.
Examples	<pre>count=mxr.SegmentCount</pre> See example program
C++ Syntax	HRESULT get_SegmentCount(long *value);
Interface	IConverter5

Last Modified:

26-Oct-2010 New command (A.09.33)

SegmentFixedFrequency Property

Description	Set and read the CW Frequency for mixer segments. The specified SegmentRangeMode must be set to Fixed. Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentFixedFrequency (<i>index</i> , <i>range</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which fixed frequency is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>range</i>	(Enum as ConverterFrequencyRange) Range for which fixed frequency is being set. Choose from: 0 - naInputFrequencies - set input frequency 1 - naOutputFrequencies - set output frequency 2 - naLO1Frequencies - set LO1 frequency 3 - naLO2Frequencies - set LO2 frequency 4 - naIFFrequencies - set IF frequency
<i>value</i>	(Double) CW Frequency. Choose a value within the frequency range of the PNA.
Return Type	Double
Default	Center frequency of the PNA
Examples	<pre>mxr.SegmentFixedFrequency(1,0)=1e9 'sets the input frequency to 1 GHz</pre> See example program
C++ Syntax	HRESULT get_SegmentFixedFrequency(long index, tagConverterFrequencyRange range, double *value); HRESULT put_SegmentFixedFrequency(long index, tagConverterFrequencyRange value, double value);

Interface IConverter5

Last Modified:

26-Oct-2010 New command (A.09.33)

SegmentFixedPower Property

Description	Set and read the fixed power level for the mixer segment.
VB Syntax	<i>conv</i> . SegmentFixedPower (<i>index</i> , <i>range</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which power is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>range</i>	(Enum as ConverterFrequencyRange) Range for which power is being set. Choose from: <ul style="list-style-type: none"> 0 - naInputFrequencies - set input power 1 - naOutputFrequencies - set output power 2 - naLO1Frequencies - set LO1 power 3 - naLO2Frequencies - set LO2 power 4 - naIFFrequencies - set IF power
<i>value</i>	(Double) Power level in dBm. Choose a value within the power/attenuation range of the PNA.
Return Type	Double
Default	
Examples	<pre>mxr.SegmentFixedPower(1,0)=0 'sets the input power level to 0 dBm</pre> See example program
C++ Syntax	HRESULT get_SegmentFixedPower(long index, tagConverterFrequencyRange range, double *value); HRESULT put_SegmentFixedPower(long index, tagConverterFrequencyRange value, double value);
Interface	IConverter5

26-Oct-2010 New command (A.09.33)

SegmentIFBandwidth Property

Description	Sets and returns the IF Bandwidth for the sweep segment. Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentIFBandwidth (<i>index</i> , <i>value</i>)
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which IF Bandwidth is to be set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>value</i>	(Long integer) IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. See the lists . If an invalid number is specified, the analyzer will round up to the closest valid number.
Return Type	Long integer
Default	100 kHz
Examples	<pre>mxr.SegmentIFBandwidth(1,3)=10e3 'Sets IFBW to 10 kHz</pre> See example program
C++ Syntax	HRESULT get_SegmentIFBandwidth(long index, long * val); HRESULT put_SegmentIFBandwidth(long index, long val);
Interface	IConverter5

Last Modified:

26-Oct-2010 New command (A.09.33)

SegmentIsInputGreaterThanLO Property

Description Set and read whether to use the Input frequency that is greater than the LO or less than the LO.

Send [Apply](#) before sending a query (read). [Learn more](#).

VB Syntax *conv*.**SegmentIsInputGreaterThanLO**(*index*,*range*) = *value*

Variable [\(Type\)](#) - Description

conv A [Converter Object](#)

index (Long integer) Segment which is being set. Choose a segment between 1 and the current segment count. Use [SegmentCount Property](#) to read the current count in the [Applied Mixer](#).

range (Enum as ConverterFrequencyRange) Range for which value is being set. Choose from:

0 - naInputFrequencies - set input power

1 - naOutputFrequencies - set output power

2 - naLO1Frequencies - set LO1 power

3 - naLO2Frequencies - set LO2 power

4 - naIFFrequencies - set IF power

value (**Boolean**) -Choose from the following:

True - Use the Input that is Greater than the specified LO.

False - Use the Input that is Less than the specified LO.

Return Type Boolean

Default True

Examples

```
mxr.SegmentIsInputGreaterThanLO(1,2=1 'sets segment 1, LO1 to  
Input greater
```

[See example program](#)

C++ Syntax HRESULT get_SegmentIsInputGreaterThanLO(long index,
tagConverterFrequencyRange range, VARIANT_BOOL *value);

HRESULT put_SegmentIsInputGreaterThanLO(long index,

tagConverterFrequencyRange value, VARIANT_BOOL value);

Interface IConverter5

SegmentMixingMode Property

Description	Set and read whether the mixing mode (high side or low side) for the mixer segment. Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentMixingMode (<i>index</i> , <i>range</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which mixing mode being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>range</i>	(Enum as ConverterFrequencyRange) Range for which mixing mode is being set. Choose from: 1 - naOutputFrequencies - sets output frequencies for 1-stage or 2-stage mixers. 4 - naIFFrequencies - sets IF frequencies for the first LO in 2-stage mixers.
<i>value</i>	(Enum as ConverterSideBand) Choose from: 0 - naLowSide Input minus LO 1 - naHighSide Input plus LO
Return Type	Enum as ConverterSideBand
Default	0 - naLowSide
Examples	<pre>mxr.SegmentMixingMode(1,1)=1 'sets segment 1 output frequencies to Highside mixing.</pre> See example program
C++ Syntax	HRESULT get_SegmentMixingMode(long index, tagConverterFrequencyRange range, tagConverterSideBand *value); HRESULT put_SegmentMixingMode(long index, tagConverterFrequencyRange value, tagConverterSideBand value);
Interface	ICConverter5

26-Oct-2010 New command (A.09.33)

SegmentPoints Property

Description	Sets and returns the number of data points to be measured in the sweep segment. Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentPoints (<i>index</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which points is to be set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>value</i>	(Long integer) - Choose a value between 1 and the maximum number of data points allowed in the PNA . This is also the total number of points allowed for ALL segments.
Return Type	Long integer
Default	21
Examples	<pre>mxr.SegmentPoints(1)=3 'Sets 3 points for segment 1.</pre> See example program
C++ Syntax	HRESULT get_SegmentPoints(long index, long * val); HRESULT put_SegmentPoints(long index, long val);
Interface	IConverter5

SegmentRangeMode Property

Description	Sets or returns the segment sweep mode (Swept or Fixed) for the specified range (Input/LO/Output). Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentRangeMode (<i>index</i> , <i>range</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which mixing mode being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>range</i>	(Enum as ConverterFrequencyRange) Range for which sweep mode is being set. Choose from: 0 - naInputFrequencies - set input sweep mode. 1 - naOutputFrequencies - set output sweep mode. 2 - naLO1Frequencies - set LO1 sweep mode. 3 - naLO2Frequencies - set LO2 sweep mode. 4 - naIFFrequencies - set IF sweep mode.
<i>value</i>	(Enum as NARangeMode) Choose from: 0 - naSwept Range is swept 1 - naFixed Range is fixed.
Return Type	Enum as NARangeMode
Default	Input and Output - naSwept LO (1 and 2) - naFixed
Examples	<pre>mxr.SegmentRangeMode(1,1)=0 'sets segment 1 output range to swept.</pre> See example program
C++ Syntax	HRESULT get_SegmentRangeMode(long index, tagConverterFrequencyRange range, tagNARangeMode *value);

```
HRESULT put_SegmentRangeMode(long index,  
tagConverterFrequencyRange value, tagNARangeMode value);
```

Interface IConverter5

SegmentStartFrequency Property

Description	Set and read the start frequency for the mixer segment. The specified SegmentRangeMode must be set to Swept. Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentStartFrequency (<i>index</i> , <i>range</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which start frequency is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>range</i>	(Enum as ConverterFrequencyRange) Range for which start frequency is being set. Choose from: 0 - naInputFrequencies - set input frequency 1 - naOutputFrequencies - set output frequency 2 - naLO1Frequencies - set LO1 frequency 3 - naLO2Frequencies - set LO2 frequency 4 - naIFFrequencies - set IF frequency
<i>value</i>	(Double) Start frequency. Choose a value within the frequency range of the PNA.
Return Type	Double
Default	Start frequency of the PNA
Examples	<pre>mxr.SegmentStartFrequency(1,0)=1e9 'sets the input start frequency to 1 GHz</pre> See example program
C++ Syntax	HRESULT get_SegmentStartFrequency(long index, tagConverterFrequencyRange range, double *value); HRESULT put_SegmentStartFrequency(long index, tagConverterFrequencyRange value, double value);

SegmentState Property

Description Sets and returns the ON|OFF state of a sweep segment. Off segments are not included in a segment sweep.

Send [Apply](#) before sending a query (read). [Learn more](#).

VB Syntax *conv*.**SegmentState**(*index*) =*state*

Variable [\(Type\)](#) - Description

conv A [Converter Object](#)

index (Long integer) Segment to set ON or OFF. Choose a segment between 1 and the current segment count. Use [SegmentCount Property](#) to read the current count in the [Applied Mixer](#).

state (**Boolean**) - Choose from:

True - Segment ON

False - Segment OFF

Return Type Boolean

Default ON when added.

Examples

```
mxr.SegmentState(1)=False 'Turns segment 1 OFF.
```

[See example program](#)

C++ Syntax HRESULT get_SegmentState(long index, VARIANT_BOOL * val);

HRESULT put_SegmentState(long index, VARIANT_BOOL val);

Interface IConverter5

SegmentStopFrequency Property

Description	Set and read the Stop frequency for the mixer segment. The specified SegmentRangeMode must be set to Swept. Send Apply before sending a query (read). Learn more .
VB Syntax	<i>conv</i> . SegmentStopFrequency (<i>index</i> , <i>range</i>) = <i>value</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Segment for which Stop frequency is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>range</i>	(Enum as ConverterFrequencyRange) Range for which Stop frequency is being set. Choose from: 0 - naInputFrequencies - set input frequency 1 - naOutputFrequencies - set output frequency 2 - naLO1Frequencies - set LO1 frequency 3 - naLO2Frequencies - set LO2 frequency 4 - naIFFrequencies - set IF frequency
<i>value</i>	(Double) Stop frequency. Choose a value within the frequency range of the PNA.
Return Type	Double
Default	Stop frequency of the PNA
Examples	<pre>mxr.SegmentStopFrequency(1,0)=1e9 'sets the input Stop frequency to 1 GHz</pre> See example program
C++ Syntax	HRESULT get_SegmentStopFrequency(long index, tagConverterFrequencyRange range, double *value); HRESULT put_SegmentStopFrequency(long index, tagConverterFrequencyRange value, double value);
Interface	IConverter5

26-Oct-2010 New command (A.09.33)

SelectPort Property

Description Sets and returns a port mapping for a single port. If this command creates a conflict with an existing port, the PNA will resolve the conflict.

Note: This command is currently not supported for the Z5623AK44.

VB Syntax *tset.SelectPort(chNum, portNum) = portValue*

Variable [\(Type\) - Description](#)

tset A [TestsetControl](#) object.

chNum **(Long)** Channel number of the measurement.

portNum **(Long)** Physical port number to map.

portValue **(Long)** **Logical** port value to assign

Return Type Long

Default Not Applicable

Examples [See External Testset Program](#)

C++ Syntax HRESULT get_SelectPort(long channelNum, long PortNum long *outPort);
HRESULT put_SelectPort(long channelNum, long PortNum long outPort);

Interface ITestsetControl

SensorIndex Property

Description	For dual sensor power meters, sets and returns the power sensor channel (1 or 2) to be used.
VB Syntax	<i>pwrSensor</i> . SensorIndex = <i>value</i>
Variable	(Type) - Description
<i>pwrSensor</i>	A PowerSensorAsReceiver (Object)
<i>value</i>	(Long) - Power Meter channel. Choose from: 1 - Sensor A 2 - Sensor B
Return Type	Long
Default	1
Examples	<pre>pwrSensor.SensorIndex = False 'Write</pre> <pre>sensor = pwrSensor.SensorIndex 'Read</pre>
C++ Syntax	HRESULT put_SensorIndex(long newVal); HRESULT get_SensorIndex(long* pVal);
Interface	IPowerSensorAsReceiver

Last Modified:

25-Aug-2009 MX New topic

SeparatePowerCal Property

Description Specifies whether to use a Thru standard or to use two power sensor connections during the power cal of an SMC calibration. [Learn more.](#)

This command must be sent immediately after the Initialize command, but before all other calibration properties.

VB Syntax *smc*.**SeparatePowerCal** = *bool*

Variable [\(Type\)](#) - Description

smc An [SMCType](#) (object)

bool (Boolean)

True - Do NOT use a Thru, but instead perform separate power cals on Input and Output reference planes.

False - Perform Cal with Thru standard.

Return Type Boolean

Default False

Example

```
FCAppLib.ISMCType4 SMC =  
(FCAppLib.ISMCType4)CalMgr.CreateCustomCal("SMC");  
SMC.Initialize(chan, true);  
if (separatePowerCalIsDesired)  
SMC.SeparatePowerCal = true;
```

C++ Syntax HRESULT put_SeparatePowerCal(VARIANT_BOOL bValue);
HRESULT get_SeparatePowerCal(VARIANT_BOOL *bValue);

Interface SMCType4

Last Modified:

16-Sep-2009 MX New topic

ShowStatistics Property

Description Displays and hides the measurement (Trace) statistics (peak-to-peak, mean, standard deviation) on the screen. To display measurement statistics for a narrower band of the X-axis, use [StatisticsRange](#).

The analyzer will display either measurement statistics or Filter Bandwidth statistics; not both.

VB Syntax *meas*.**ShowStatistics** = *value*

Variable [\(Type\)](#) - **Description**

meas A Measurement (**object**)

value (**boolean**) - Boolean value:

True - Show statistics

False - Hide statistics

Return Type Boolean

Default **False**

Examples `meas.ShowStatistics = True`

C++ Syntax HRESULT put_ShowStatistics(VARIANT_BOOL bState)

Interface IMeasurement

Last modified:

12-Dec-2013 Removed Read

ShowProperties Property

Description	<p>Turns ON and OFF the display of the test set control status bar. This status bar indicates the test set that is being controlled and the current port mappings.</p> <p>This setting is turned ON and OFF automatically when the test set is enabled or disabled.</p>
VB Syntax	<i>tset</i> . ShowProperties = <i>value</i>
Variable	(Type) - Description
<i>tset</i>	A TestsetControl object.
	OR
	An E5091Testset object.
<i>value</i>	(Boolean)
	True - Turns display of testset properties ON.
	False - Turns display of testset properties OFF.
Return Type	Boolean
Default	False (True when test set control is enabled.)
Examples	See E5091A Example Program
	See External Testset Program
C++ Syntax	HRESULT get_ShowProperties(VARIANT_BOOL *state); HRESULT put_ShowProperties(VARIANT_BOOL state);
Interface	IE5091Testsets ITestsetControl

SICL Property

Description Allows you to control the PNA via SICL (standard instrument control library). In this mode, the analyzer can receive SCPI commands from the LAN interface or from a program residing on the PNA itself. This command performs the same function as the [SICL / GPIB](#) dialog box - **SICL Enabled** checkbox. [See Configuring the analyzer for SICL/VISA.](#)

When **SICL** is enabled, the PNA VXI-11.2 interface is enabled, and if the PNA hard disk image is new enough to have the VXI-11.3 interface, it also enables that. [Learn more about LXI / VXI.](#)

With this method you can augment a test program written using SICL that resides on the PNA so that it will run unattended. An automation script can be written to start the PNA, enable SICL (using the SICL property), and then start the SICL based program.

VB Syntax *app.SICL value*

Variable [\(Type\)](#) - **Description**

app An [Application](#) (**object**)

value (**Boolean**) Choose from:

True - enable SICL

False - disable SICL

Return Type Boolean

Default False

Examples

```
Dim Pna as AgilentPNA835x.Application
Dim siclState as Boolean
Set Pna = CreateObject("AgilentPNA835x.Application")
Pna.SICL = true           'write

siclState = Pna.SICL     'Read
```

C++ Syntax HRESULT get_SICL(VARIANT_BOOL *pVal)

HRESULT put_SICL(VARIANT_BOOL newVal)

Interface IApplication5

SICLAddress Property

Description Sets and returns the PNA SICL address. This is the address used for SICL over LAN.

VB Syntax *app.SICLAddress = value*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (Integer) SICL Address of the PNA. Choose a value between 0 and 30.

Return Type Short Integer

Default 16

Examples `address=app.SICLAddress 'Read`

`app.SICLAddress=16 'Write`

C++ Syntax HRESULT get_SICLAddress(short busIndex, short* address);

HRESULT put_SICLAddress(short busIndex,short address);

Interface IApplication8

Simultaneous2PortAcquisition Property

Description Specifies whether a 2-port calibration will be done with a single set of standards (one port at a time) or with two sets of standards (simultaneously).

The [AcquireCalStandard2](#) command uses the same standard index for each calibration class. To specify the calibration standard gender for each port, you must first ensure that the order of calibration class accurately reflects the configuration of your DUT. For example, for a DUT with a male connector on port 1 and a female connector on port 2, order the devices within the S11 classes (A, B, and C) such that the MALE standards are first in the list. Then order the S22 classes specifying the FEMALE standards as the first in the list.

VB Syntax *cal*.**Simultaneous2PortAcquisition** = *state*

Variable [\(Type\)](#) - Description

cal A Calibrator (**object**)

state (**boolean**) - Choose from:

True - measures 2 ports simultaneously

False - measures 1 port at a time

Return Type Boolean

Default True

Examples `cal.Simultaneous2PortAcquisition = True`

C++ Syntax HRESULT put_Simultaneous2PortAcquisition(VARIANT_BOOL
bTwoSetsOfStandards)

HRESULT Simultaneous2PortAcquisition(VARIANT_BOOL
*bTwoSetsOfStandards)

Interface ICalibrator

Last modified:

9/12/06 Modified for cross-browser

SmartSweepMaximumIterations Property

Description Set and read the maximum permitted number of iterations which SMART Sweep may utilize to find the desired compression level, to within the specified tolerance.

VB Syntax `gca.SmartSweepMaximumIterations = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**integer**) - Maximum number of iterations. Choose a value between 1 and 50.

Return Type Integer

Default 20

Examples

```
gca.SmartSweepMaximumIterations = 10 'Write
```

```
iters = gca.SmartSweepMaximumIterations 'Read
```

C++ Syntax HRESULT get_SmartSweepMaximumIterations(int* pVal)

HRESULT put_SmartSweepMaximumIterations(int newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

SmartSweepSettlingTime Property

Description Set and read the amount of time SMART Sweep will dwell at the first point where the input power changes by the Backoff or X level.

[Learn more.](#)

VB Syntax `gca.SmartSweepSettlingTime = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**double**) - Settling time in seconds. Choose any positive value.

Return Type Double

Default 0

Examples `gca.SmartSweepSettlingTime = .01 'Write`

```
sTime = gca.SmartSweepSettlingTime 'Read
```

C++ Syntax HRESULT get_SmartSweepSettlingTime(double* pVal)

HRESULT put_SmartSweepSettlingTime(double newVal)

Interface IGainCompression

Last Modified:

21-Nov-2007 MX New topic

SmartSweepShowIterations Property

Description Set and read whether to show intermediate results for each iteration in SMART sweep.

VB Syntax `gca.SmartSweepShowIterations = value`

Variable [\(Type\)](#) - Description

gca A [GainCompression](#) (object)

value (**Boolean**) Choose from:

True Compression traces are updated after each iteration.

False Compression traces are updated after ALL iterations are complete.

Return Type Boolean

Default False

Examples `gca.SmartSweepShowIterations = True 'Write`

`SShow = gca.SmartSweepShowIterations 'Read`

C++ Syntax HRESULT get_SmartSweepShowIterations(VARIANT_BOOL *pVal)

HRESULT put_SmartSweepShowIterations(VARIANT_BOOL newVal)

Interface IGainCompression

Last Modified:

21-Nov-2007 MX New topic

SmartSweepTolerance Property

Description Set and read the acceptable range SMART Sweep will allow for the measured compression level.

VB Syntax `gca.SmartSweepTolerance = value`

Variable [\(Type\)](#) - Description

`gca` A [GainCompression](#) (object)

`value` (**double**) - Tolerance level in dB. Choose a value between .01 and 10

Return Type Double

Default .05

Examples `gca.SmartSweepTolerance = .01 'Write`

`tol = gca.SmartSweepTolerance 'Read`

C++ Syntax HRESULT get_SmartSweepTolerance(double* pVal)

HRESULT put_SmartSweepTolerance(double newVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

SmoothingAperture Property

Description Specifies or returns the amount of smoothing as a ratio of the number of data points in the measurement trace.

There is no COM command for specifying smoothing by number of aperture points.

VB Syntax *meas.SmoothingAperture = value*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

value (**double**) - Smoothing Aperture. A ratio of (aperture points / trace points). Choose any number between **.01** and **.25**.

Return Type Double

Default .25

Examples

```
meas.SmoothingAperture = .10 'Write
saperture = meas.SmoothingAperture 'Read
```

C++ Syntax HRESULT get_SmoothingAperture(double *pVal)
HRESULT put_SmoothingAperture(double newVal)

Interface IMeasurement

Last modified:

Oct. 25, 2006 Fixed formula for smoothing

Smoothing Property

Description	Turns ON and OFF data smoothing.
VB Syntax	<i>meas.Smoothing</i> = <i>state</i>
Variable	(Type) - Description
<i>meas</i>	A Measurement (object)
<i>state</i>	(boolean) True - Turns smoothing ON False - Turns smoothing OFF
Return Type	Boolean
Default	False
Examples	<pre>meas.Smoothing = False 'Write</pre> <pre>smooth = meas.Smoothing 'Read</pre>
C++ Syntax	HRESULT get_Smoothing(VARIANT_BOOL *pVal) HRESULT put_Smoothing(VARIANT_BOOL newVal)
Interface	IMeasurement

SnPFormat Property

Description Specifies the format of .SnP files.

Use either app.[Save](#) (saves data to file) or meas.[Get SnpDataWithSpecifiedPorts](#) (reads data into variant array).

VB Syntax *pref.SnPFormat = value*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (**string**) - Format of the .S1P, .S2P, .S3P, .S4P data. Choose from:

"MA" - Linear Magnitude / degrees

"DB" - Log Mag / degrees

"RI" - Real / Imaginary

"Auto" - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.

Return Type String

Default "Auto"

Examples

```
pref.SnPFormat = "MA" 'Write
```

```
format = pref.SnPFormat 'Read
```

C++ Syntax HRESULT get_SnPFormat(BSTR *Format)
HRESULT put_SnPFormat(BSTR Format)

Interface IPreferences

Last Modified:

13-Jun-2011 Updated list to get method

SoftwareGateState Property

Description When set to OFF, the improved software gating sensitivity is turned OFF and all data outside the measurement band is zeroed. This setting is used for troubleshooting purposes. There is NO user-interface control for this setting.

VB Syntax *pulseMeas*.**SoftwareGateState** = *bool*

Variable [\(Type\)](#) - **Description**

pulseMeas A [PulseMeasurementControl](#) (**object**)

bool **True** - Turn ON software gating.

False - Turn OFF software gating.

Return Type Boolean

Default True

Examples

```
pulse.SoftwareGateState = True 'Write  
value = pulse.SoftwareGateState 'Read
```

C++ Syntax HRESULT get_SoftwareGateState(VARIANT_BOOL *pVal);
HRESULT put_SoftwareGateState(VARIANT_BOOL newVal);

Interface IPulseMeasurementControl2

SoundOnFail Property

Description Turns ON or OFF the audio indicator for limit failures.

VB Syntax *limitst*.SoundOnFail = *state*

Variable [\(Type\)](#) - Description

limitst A LimitTest (**object**)

state (**boolean**)

False - Turns the sound OFF

True - Turns the sound ON

Return Type Long Integer

Default **True**

Examples `Limttest.SoundOnFail = False 'Write`

`sound = Limttest.SoundOnFail 'Read`

C++ Syntax HRESULT get_SoundOnFail(VARIANT_BOOL *pVal)
HRESULT put_SoundOnFail(VARIANT_BOOL newVal)

Interface ILimitTest

Source Property

Description Sets or returns the source of triggering on the PNA and PNA-X.

VB Syntax *trigSetup.Source = value*

Variable [\(Type\)](#) - Description

trigSetup A [TriggerSetup](#) (object)

value (enum **NATriggerSource**) - Choose from:

0 - naTriggerSourceInternal - free run

1 - naTriggerSourceManual - manual trigger source; use app.[ManualTrigger](#) to send a trigger signal.

2 - naTriggerSourceExternal - a trigger signal is generated when a signal is sensed on the appropriate external trigger input connector. Use [ExternalTriggerConnectionBehavior](#) to configure the characteristics of the external trigger signal.

This setting has implications on Calibration. [Learn more.](#)

Return Type Long Integer

Default naTriggerSourceInternal

Examples

```
trigSetup.Source = naTriggerSourceInternal 'Write
```

```
trigsource = trigSetup.Source 'Read
```

C++ Syntax HRESULT get_Source(tagNATriggerSource *pTrigger);
HRESULT put_Source(tagNATriggerSource trigger);

Interface ITriggerSetup

SourceAttenuator (Cal All) Property

Description	Sets and returns the Source Attenuator setting for a Cal All calibration.
VB Syntax	<i>calAll.SourceAttenuator (port) = value</i>
Variable	(Type) - Description
<i>calAll</i>	A CalibrateAllSourceAttenuator (object)
<i>port</i>	(Long) Source port number.
<i>value</i>	(Double) Attenuation value in dB for a Cal All calibration. Choose a valid value for the PNA model. See valid settings .
Return Type	Double
Default	0 (zero dB)
Examples	<pre>calAll.SourceAttenuator = 0 'Set value</pre> <pre>value = calAll.SourceAttenuator 'Return value</pre>
C++ Syntax	HRESULT get_SourceAttenuator (long port, double val); HRESULT put_SourceAttenuator long port, double* newVal);
Interface	ICalibrateAll

Last modified:

4-Jan-2012 New topic

SourceAttenuator Property

Description Sets and returns the Source Attenuator setting for the Phase Reference calibration.

Note: This setting MUST match the source attenuator setting at the mixer input port for subsequent SMC+Phase measurements.

VB Syntax *phasRef.SourceAttenuator* = *value*

Variable [\(Type\)](#) - [Description](#)

phasRef A [PhaseReferenceCalibration](#) Object

value Attenuation value in dB. Choose a valid value for the PNA model. [See valid settings](#).

Return Type Double

Default 10 dB

Examples `phase.SourceAttenuator = 0`

[See example program](#)

C++ Syntax HRESULT get_SourceAttenuator(Double* pVals);

HRESULT put_SourceAttenuator(Double pVals);

Interface IPhaseReferenceCalibration

Last Modified:

SourceCount Property

Description Returns the number of sources in the remote PNA.

VB Syntax *value* = *cap*.**SourceCount**

Variable [\(Type\)](#) - Description

value (Long) - Variable to store the returned number of sources.

cap A [Capabilities](#) (**object**)

Return Type Long

Default Not Applicable

Examples `value = cap.SourceCount 'Read`

C++ Syntax HRESULT get_SourceCount(long * sourceCount);

Interface ICapabilities

SourceImpedance Property

Description Sets and returns the source impedance of the pulse generator.

VB Syntax *extPulseGen.SourceImpedance = value*

Variable [\(Type\)](#) - [Description](#)

extPulseGen An [ExternalPulseGenerator](#) (**object**)

value (**Double**) Pulse generator source impedance.

Return Type Double

Default **50**

Examples

```
extPulseGen.SourceImpedance = 50 'Write
```

```
srcImp = extPulseGen.SourceImpedance 'Read
```

C++ Syntax HRESULT get_SourceImpedance (double *pValue)

HRESULT put_SourceImpedance (double newVal)

Interface IExternalPulseGenerator

Read-only

SourcePort Property

Description	Returns the source port of measurement. To understand how this property is useful, see IMeasurement2 Interface .
VB Syntax	<i>value</i> = <i>meas</i> . SourcePort
Variable	(Type) - Description
<i>meas</i>	A Measurement (object)
<i>value</i>	(Long) - Variable to store the returned value
Return Type	Long Integer
Default	Not Applicable
Examples	<pre>sp = meas.SourcePort</pre>
C++ Syntax	HRESULT SourcePort([out, retval] Long* srcPort);
Interface	IMeasurement2

SourcePortCount Property

Description Returns the number of ports that can output a signal.

To learn more, see [Remotely Specifying a Source Port](#).

VB Syntax *value* = *object*.**SourcePortCount**

Variable [\(Type\)](#) - Description

value (Long) - Variable to store the returned integer value of the number of source ports.

object A [Channel](#) (**object**)- always more complete than capabilities object.

A [Capabilities](#) (**object**) - use when a channel is not available, or to find the common ports across all channels.

Return Type Long

Default Not Applicable

Examples `value = chan.SourcePortCount 'Read`

C++ Syntax HRESULT get_SourcePortCount(long * count);

Interface IChannel13
ICapabilities4

Last Modified:

23-May-2008 Added channel object

14-Jan-2007 MX New topic

SourcePortMode Property

Description Sets the state of the PNA source for the specified port.

VB Syntax *chan.SourcePortMode (sourcePort) = value*

Variable [\(Type\)](#) - Description

chan **(object)** - A [Channel](#) object

sourcePort **(long integer)** - The source port for which to make this setting.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

value **(enum)** - State of the source. Choose from:

0 - naSourcePortAuto Port power is turned on when required for a measurement.

1 - naSourcePortOn Port power is always ON, regardless of the measurement.

2 - naSourcePortOff Port power is always OFF, regardless of the measurement.

Return Type Enum

Default 0 - naSourcePortAuto

Examples

```
chan.SourcePortMode(1) = naSourcePortOn 'Write
state = chan.SourcePortMode(4) 'Read
```

C++ Syntax HRESULT get_SourcePortMode(long sourcePort, enum NASourcePortMode*);
HRESULT put_SourcePortMode(long sourcePort, enum NASourcePortMode);

Interface IChannel9

Last modified:

10-Mar-2011 Removed ON/OFF restrictions
24-Apr-2008 Added note for strings
30-Apr-2007 Edited for src strings
10/18/06 MQQ New topic

SourcePortNames Property

Description Returns the string names of ports that can output a signal.

The following is a list of string names for the PNA-X. Your PNA will NOT have all of these ports. Use [GetPortNumber Method](#) to return the correct port number for the specified port name.

- "Port 1"
- "Port 2"
- "Port 3"
- "Port 4"
- "Src2 Out1"
- "Src2 Out2"
- "Port 1 Src2"

For [iTMSA \(Opt 460\)](#)

- "Bal Port 1"
- "Bal Port 2"
- "SE Port1"
- "SE Port 2"

This command also lists the [External Sources](#) that are currently configured and selected.

To learn more, see [Remotely Specifying a Source Port](#).

VB Syntax *value* = *object*.**SourcePortNames**

Variable [\(Type\)](#) - **Description**

value (Variant array) - Variable to store the returned integer value of the number of source ports.

object A [Channel](#) (**object**) - always more complete than capabilities object.

A [Capabilities](#) (**object**) - use when a channel is not available, or to find the common ports across all channels.

Return Type Variant array of string names.

Default Not Applicable

Examples `value = chan.SourcePortNames 'Read`

C++ Syntax HRESULT get_SourcePortNames(VARIANT *names) ;

Interface IChannel13

ICapabilities4

Last Modified:

3-Mar-2009	Added SE Port 2
23-May-2008	Added iTMSA sources and channel object
23-Jul-2007	Clarification
14-Jan-2007	MX New topic

SourcePowerCalPowerOffset Property

Description Sets or returns a power level offset from the PNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT.

Cal power is the sum of the test port power setting and this offset value. Following the calibration, the PNA power readouts are adjusted to the cal power.

This property performs the same function as the power offset argument on [SetCalInfoEx Method](#), except that this property can read the offset value.

VB Syntax `chan.SourcePowerCalPowerOffset (sourcePort) = value`

Variable [\(Type\)](#) - Description

chan **(object)** - A [Channel](#) object

sourcePort **(long integer)** - The source port for which to set this power offset value.

value **(double)** - Gain or loss value in dB. Choose a value between -200 and 200.

Return Type Double

Default 0 dB

Examples

```
chan.SourcePowerCalPowerOffset(1) = 10 'Write  
offset = chan.SourcePowerCalPowerOffset(2) 'Read
```

C++ Syntax HRESULT get_SourcePowerCalPowerOffset(long sourcePort, double *pVal);

HRESULT put_SourcePowerCalPowerOffset(long sourcePort, double newVal);

Interface IChannel4

Last Modified:

1-May-2007 Modified link to EX method.

SourcePowerCorrection Property

Description Sets source power correction ON or OFF for a specific source port on this channel, or returns the current ON or OFF state of correction for that source port.

VB Syntax `chan.SourcePowerCorrection (srcPort) = value`

Variable [\(Type\) - Description](#)

chan **(object)** – A Channel object

srcPort **(long integer)** – Source port for which to set or return the ON or OFF state of source power correction.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

value **(boolean)**

False – Turns source power correction OFF for the source port.

True – Turns source power correction ON for the source port.

Return Type Boolean

Default False - Source power correction will turn correction ON

Examples

```
chan.SourcePowerCorrection(1) = False 'Write
calOnPort2 = chan.SourcePowerCorrection(2) 'Read
```

C++ Syntax `HRESULT put_SourcePowerCorrection(VARIANT_BOOL bState);`
`HRESULT get_SourcePowerCorrection(VARIANT_BOOL *bState);`

Interface IChannel

Last Modified:

24-Apr-2008 Added note for string names

30-Apr-2007 Modified for src strings

SourcePowerOption Property

Description Enables the source power to be set on individual sweep segments. This property must be set **True** **before** `seg.TestPortPower = value` is sent. Otherwise, the test port power command will be ignored.

VB Syntax `segs.SourcePowerOption = state`

Variable [\(Type\)](#) - Description

segs A Segments collection (**object**)

state (**boolean**)

True - Enables variable TestPortPower to be set segment sweep

False - Disables variable TestPortPower to be set segment sweep

Return Type Boolean

Default False

Examples

```
segs.SourcePowerOption = True 'Write
```

```
powerOption = SourcePowerOption 'Read
```

C++ Syntax HRESULT get_SourcePowerOption(VARIANT_BOOL *pVal)
HRESULT put_SourcePowerOption(VARIANT_BOOL newVal)

Interface ISegments

SourcePowerState Property

Description Turns Source Power ON and OFF.

[See note about source power state with instrument state save and recall.](#)

VB Syntax `app.SourcePowerState = state`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

state (boolean)

False - Turns Source Power OFF

True - Turns Source Power ON

Return Type Boolean

Default True

Examples `app.SourcePowerState = True 'Write`

`pwr = app.SourcePowerState 'Read`

C++ Syntax HRESULT get_SourcePowerState(VARIANT_BOOL *pVal)
HRESULT put_SourcePowerState(VARIANT_BOOL newVal)

Interface IApplication

SourcePullForSParameters Property

Description Enables and disables the use of source pull technique to compute S22 on Noise Figure on Converters. [Learn more.](#)

VB Syntax `nfx.SourcePullForSParameters = value`

Variable [\(Type\)](#) - Description

nfx A [NoiseFigure](#) (**object**)

value (Boolean) Source pull technique state. Choose from:

False - Disable use of source pull technique.

True - Enable use of source pull technique.

Return Type Boolean

Default **False**

Examples

```
nfx.SourcePullForSParameters = true 'Write
sourcePull = nfx.SourcePullForSParameters 'Read
```

C++ Syntax HRESULT get_SourcePullForSParameters (VARIANT_BOOL * Val)
HRESULT put_SourcePullForSParameters (VARIANT_BOOL newVal)

Interface INoiseFigure4

7-Oct-2009 MX New topic

SourceStepAttenuatorStepSize Property

Description	Returns a value indicating the step size of the source attenuator.
VB Syntax	<i>value</i> = <i>cap</i> .SourceStepAttenuatorStepSize (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned value of the attenuator step size.
<i>cap</i>	A Capabilities (object)
<i>n</i>	(Long) - port number to query for the value of the attenuator step size.
Return Type	Double
Default	Not Applicable
Examples	<pre>value = cap.SourceStepAttenuatorStepSize(1)</pre>
C++ Syntax	HRESULT get_SourceStepAttenuatorStepSize(long portNumber, double * stepSize);
Interface	ICapabilities5

Last Modified:

30-Nov-2009 MX New topic

Span Property

Description	Sets or returns the Span time of either Gating or Time Domain transform windows
VB Syntax	<i>object.Span</i> = <i>value</i>
Variable	(Type) - Description
<i>object</i>	(object) As Gating or (object) As Transform
<i>value</i>	(double) - Span time in seconds. Choose any number between: 2*[(number of points-1) / frequency span] and 0
Return Type	Double
Default	20ns
Examples	<pre>Trans.Span = 4.5e-9 'sets the time span of a transform window - Write Gate.Span = 4.5e-9 'sets the Span time of a gating window -Write span = Trans.Span 'Read</pre>
C++ Syntax	HRESULT get_Span(double *pVal) HRESULT put_Span(double newVal)
Interface	ITransform IGating

Read-only

Span Property

Description	Returns the stimulus span of the measurement (stop-start data points). To understand how this property is useful, see IMeasurement2 Interface .
VB Syntax	<i>value</i> = <i>meas</i> . Span
Variable	(Type) - Description
	<i>value</i> (Double) - Variable to store the returned value.
	<i>meas</i> A Measurement (object)
Return Type	Double
Default	Not Applicable
Examples	<pre>Print meas.Span 'prints the span of the measurement</pre>
C++ Syntax	HRESULT get_Span(double * Val);
Interface	IMeasurement2

SParameterCalPorts Property

Description Read the final list of ports that will be fully calibrated by Calibrate All Channels. For the returned list of ports, specify connectors and cal kits for the calibration using the [GuidedCal](#) commands.

Ports to received ONLY a power cal (such as mixer LO ports) will NOT be on the returned list.

For each channel, specify the ports to be calibrated using [CalibrationPorts Property](#)

VB Syntax `ports = calAll.SParameterCalPorts`

Variable [\(Type\)](#) - [Description](#)

`ports` (Variant Array) Ports to be calibrated.

`calAll` A [CalibrateAllChannels](#) (object)

Return Type Variant Array

Default Not Applicable

Examples `ports = calAll.SParameterCalPorts 'returns the ports to be cal'd`

C++ Syntax HRESULT SParameterCalPorts([out,retval] VARIANT* calports);

Interface ICalibrateAllChannels

SSB_BalPortNegative Property

Description With a Single-ended - Single-ended - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT's Balanced Port.

Use [SetSSBPorts Method](#) to set the port mapping for a Single-Ended - Single-Ended - Balanced topology.

VB Syntax `var = balTopology.SSB_BalPortNegative`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTopology.SSB_BalPortNegative` 'Read

C++ Syntax HRESULT get_SSB_BalPortNegative(long *bVal)

Interface IBalancedTopology

SSB_BalPortPositive Property

Description With a Single-ended - Single-ended - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's Balanced Port.

Use [SetSSBPorts Method](#) to set the port mapping for a Single-Ended - Single-Ended - Balanced topology.

VB Syntax `var = balTopology.SSB_BalPortPositive`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTopology.SSB_BalPortPositive` **'Read**

C++ Syntax HRESULT get_SSB_BalPortPositive(long *bVal)

Interface IBalancedTopology

SSB_SEPort1 Property

Description With a Single-ended - Single-ended - Balanced topology, returns the PNA port number that is connected to the DUT's Logical Port 1.

Use [SetSSBPorts Method](#) to set the port mapping for a Single-Ended - Single-Ended - Balanced topology.

VB Syntax *var* = *balTopology*.SSB_SEPort1

Variable [\(Type\)](#) - Description

var (Long Integer) Variable to store the returned value.

balTopology A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTopology.SSB_SEPort1 'Read`

C++ Syntax HRESULT get_SSB_SEPort1(long *bVal)

Interface IBalancedTopology

SSB_SEPort2 Property

Description With a Single-ended - Single-ended - Balanced topology, returns the PNA port number that is connected to the DUT's Logical Port 2.

Use [SetSSBPorts Method](#) to set the port mapping for a Single-Ended - Single-Ended - Balanced topology.

VB Syntax `var = balTopology.SSB_SEPort2`

Variable [\(Type\)](#) - Description

`var` (Long Integer) Variable to store the returned value.

`balTopology` A [BalancedTopology](#) (object)

Return Type Long Integer

Default Not Applicable

Examples `variable = balTopology.SSB_SEPort2` 'Read

C++ Syntax HRESULT get_SSB_SEPort2(long *bVal)

Interface IBalancedTopology

SSBMeasurement Property

Description Sets and returns the measurement for the Single-Ended - Single-Ended - Balanced topology.

VB Syntax *balMeas.SSBMeasurement = value*

Variable [\(Type\)](#) - Description

balMeas A [BalancedMeasurement](#) (**object**)

value (**String**) - Single-ended - Single-ended - Balanced Measurement parameter. Not case sensitive. Choose from:

Sss11	Sss12	Ssd13	Ssc13
Sss21	Sss22	Ssd23	Ssc23
Sds31	Sds32	Sdd33	Sdc33
Scs31	Scs32	Scd33	Sc33
Imb1	Imb2	CMRR1	CMRR2
		(Sds31/Scs31)	(Sds32/Scs32)

Return Type String

Default Sss11

Examples `balMeas.SSBMeasurement = "Sss11" 'Write`

`variable = balMeas.SSBMeasurement 'Read`

C++ Syntax HRESULT get_SSBMeasurement(BSTR *pVal)

HRESULT put_SSBMeasurement(BSTR p newVal)

Interface IBalancedMeasurement

Stage1Coefficients Property

Description Sets and returns the digital filter coefficients of stage1.

VB Syntax *spm4.Stage1Coefficients = value*

Variable [\(Type\)](#) - Description

spm4 A [SignalProcessingModuleFour](#) (object)

value (**Variant Array**) Coefficients. An array of real values.

Return Type Variant

Default Stage dependent.

Examples `spm4.Stage1Coefficients = 0,0.1,0.7,0.7,0.1 'Write`
`mode = spm4.Stage1Coefficients 'Read`

C++ Syntax HRESULT get_Stage1Coefficients(VARIANT* pCoefs);
HRESULT put_Stage1Coefficients(VARIANT pCoefs);

Interface ISignalProcessingModuleFour

Last Modified:

18-Jun-2007 MX New topic

Stage1Frequency Property

Description Sets and returns the Numerically Controlled Oscillator (NCO) frequency of the Stage 1 filter. This command is only used when [FilterMode Property](#) is set to Manual.

VB Syntax *spm4.Stage1Frequency = value*

Variable [\(Type\) - Description](#)

spm4 A [SignalProcessingModuleFour](#) (**object**)

value (**Double**) Stage 1 Frequency. Min value= 0 Hz

Stage 1 Frequency. Min value= 0 Hz

With DSP 4 versions, Max value= 15 MHz.

With DSP 5 versions, Max value = 38 MHz.

[Learn more about DSP versions.](#)

Or programmatically use [MinimumIFFrequency Property](#) and [MaximumIFFrequency Property](#) to determine the range of settable values.

Return Type Double

Default Nominal IF Frequency. [Learn more](#)

Examples

```
spm4.Stage1Frequency = 9E6 'Write
mode = spm4.Stage1Frequency 'Read
```

C++ Syntax HRESULT get_Stage1Frequency(double *val);
 HRESULT put_Stage1Frequency(double val);

Interface ISignalProcessingModuleFour

Last Modified:

26-Aug-2010 Updated for DSP 5
 18-Jun-2007 MX New topic

Stage1MaximumCoefficient Property

Description Returns the maximum value of stage 1 coefficients.

VB Syntax *value* = *spm4*.Stage1MaximumCoefficient

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned Max coefficient.

spm4 A [SignalProcessingModuleFour](#) **(object)**

Default Not Applicable

Examples `mode = spm4.Stage1MaximumCoefficient 'Read`

C++ Syntax HRESULT get_Stage1MaximumCoefficient(long* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage1MaximumCoefficientCount Property

Description Returns the maximum number of coefficients for Stage1.

VB Syntax *value* = *spm4*.Stage1MaximumCoefficientCount

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned Max coefficient count.

spm4 A [SignalProcessingModuleFour](#) **(object)**

Default Not Applicable

Examples `mode = spm4.Stage1MaximumCoefficientCount 'Read`

C++ Syntax HRESULT get_Stage1MaximumCoefficientCount(long* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage1MaximumCoefficientSum Property

Description	Returns the maximum sum of all Stage1 coefficients.
VB Syntax	<i>value</i> = <i>spm4</i> . Stage1MaximumCoefficientSum
Variable	(Type) - Description
<i>value</i>	(__int64* val) Variable to store the returned Max sum of all coefficients.
<i>spm4</i>	A SignalProcessingModuleFour (object)
Default	Not Applicable
Examples	<code>mode = spm4.Stage1MaximumCoefficientSum 'Read</code>
C++ Syntax	HRESULT get_Stage1MaximumCoefficientSum(__int64* val);
Interface	ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage1MinimumCoefficientCount Property

Description Returns the minimum number of coefficients for Stage1

VB Syntax *value* = *spm4*.Stage1MinimumCoefficientCount

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned Min coefficient count.

spm4 A [SignalProcessingModuleFour](#) **(object)**

Default Not Applicable

Examples `mode = spm4.Stage1MinimumCoefficientCount 'Read`

C++ Syntax HRESULT get_Stage1MinimumCoefficientCount(long* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage2Coefficients Property

Description Sets and returns Stage2Coefficients.

Note: Stage2 settings are ignored when using DSP Version 5. [Learn more.](#)

VB Syntax *spm4.Stage2Coefficients = value*

Variable [\(Type\)](#) - Description

spm4 A [SignalProcessingModuleFour](#) (**object**)

value (**VARIANT**) An array of real numbers. Filter coefficients

Return Type Variant

Default Not Applicable

Examples

```
spm4.Stage2Coefficients = 'Write
```

```
mode = spm4.Stage2Coefficients 'Read
```

C++ Syntax HRESULT get_Stage2Coefficients(VARIANT* pCoefs);

HRESULT put_Stage2Coefficients(VARIANT pCoefs);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage2MaximumCoefficient Property

Description Returns the maximum value of stage 2 coefficients.

VB Syntax *value* = *spm4*.Stage2MaximumCoefficient

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned Max coefficient.

spm4 A [SignalProcessingModuleFour](#) **(object)**

Default Not Applicable

Examples `mode = spm4.Stage2MaximumCoefficient 'Read`

C++ Syntax HRESULT get_Stage2MaximumCoefficient(long* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage2MaximumCoefficientCount Property

Description Returns the maximum number of coefficients for Stage2.

Note: Stage2 settings are ignored when using DSP Version 5.

[Learn more.](#)

VB Syntax `value = spm4.Stage2MaximumCoefficientCount`

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned Max coefficient count.

spm4 A [SignalProcessingModuleFour](#) (**object**)

Default Not Applicable

Examples `mode = spm4.Stage2MaximumCoefficientCount 'Read`

C++ Syntax HRESULT get_Stage2MaximumCoefficientCount(long* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage2MaximumCoefficientSum Property

Description Returns the maximum sum of all Stage2 coefficients.

Note: Stage2 settings are ignored when using DSP Version 5.

[Learn more.](#)

VB Syntax `value = spm4.Stage2MaximumCoefficientSum`

Variable [\(Type\) - Description](#)

value (**__int64* val**) Variable to store the returned Max sum of all coefficients.

spm4 A [SignalProcessingModuleFour](#) (**object**)

Default Not Applicable

Examples `mode = spm4.Stage2MaximumCoefficientSum 'Read`

C++ Syntax HRESULT get_Stage2MaximumCoefficientSum(__int64* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage2MinimumCoefficientCount Property

Description Returns the minimum number of coefficients for Stage2.

Note: Stage2 settings are ignored when using DSP Version 5.

[Learn more.](#)

VB Syntax `value = spm4.Stage2MinimumCoefficientCount`

Variable [\(Type\)](#) - Description

value **(Long)** Variable to store the returned Min coefficient count.

spm4 A [SignalProcessingModuleFour](#) (**object**)

Default Not Applicable

Examples `mode = spm4.Stage2MinimumCoefficientCount 'Read`

C++ Syntax HRESULT get_Stage2MinimumCoefficientCount(long* val);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage3FilterType Property

Description Sets and returns the Stage 3 filter type. This command is only used when [FilterMode](#) is set to Manual.

VB Syntax `spm4.Stage3FilterType = value`

Variable [\(Type\)](#) - Description

spm4 A [SignalProcessingModuleFour](#) (object)

value (String) Filter type. Chose from:

- "RECT" Rectangular Window Filter
- "TUKEY" Tukey Filter
- "PWIN" Pulse window filter

Default TUKEY

Examples

```
spm4.Stage3FilterType = "PWIN"  
mode = spm4.Stage3FilterType 'Read'
```

C++ Syntax HRESULT get_Stage3FilterType(BSTR* pFType);
HRESULT put_Stage3FilterType(BSTR GType);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage3FilterTypes Property

Description	Returns a list of strings for the currently supported filter types that can be used for the stage 3 filter. This command is only used when FilterMode is set to False (Manual). See Stage3FilterType for a list of currently supported filter types.
VB Syntax	<i>values</i> = <i>spm4</i> .Stage3FilterTypes
Variable	(Type) - Description
<i>value</i>	(Variant) Variable to store the returned filter types.
<i>spm4</i>	A SignalProcessingModuleFour (object)
Return Type	Variant Array
Default	Not Applicable
Examples	<pre>mode = spm4.Stage3FilterTypes 'Read</pre>
C++ Syntax	HRESULT get_Stage3FilterTypes(VARIANT* pTypes);
Interface	ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage3Parameter Property

Description Sets and returns the Stage 3 filter parameters.

Must first select the filter type using [Stage3FilterType](#) before setting these parameters

Use [Stage3Parameters](#) to return a list of the available parameters for the currently selected filter type.

VB Syntax `spm4.Stage3Parameter(param) = value`

Variable [\(Type\)](#) - Description

spm4 A [SignalProcessingModuleFour](#) (**object**)

param (**String**) Filter parameter. Choose from:

"C" - Tap count (Tukey, RECT, PWIN)

"P" - Period (PWIN ONLY)

"D" - Delay (PWIN ONLY)

"W" - Width (PWIN ONLY)

"R" - Ramp Count (PWIN ONLY)

"M" - Number of times to repeat the user-supplied array for each data point (COEF ONLY)

value (**String**) Parameter Value for the specified stage 3 parameter. Use [Stage3ParameterMaximum](#) and [Stage3ParameterMinimum](#) to return a range of values for the specified parameter.

Default **RECT:** C = 1

PWIN: C=1E6, P=10ms, D=50us, W=50us, R=7

TUKEY: C=1

Examples

```
spm4.Stage3Parameter("C") = 2
```

```
mode = spm4.Stage3Parameter("pwin") 'Read
```

C++ Syntax HRESULT get_Stage3Parameter(BSTR pName, double* pVal);

HRESULT put_Stage3Parameter(BSTR pName, double pVal);

Interface ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage3ParameterMaximum Property

Description	Returns maximum parameter value for the current filter type.
VB Syntax	<i>value</i> = <i>spm4</i> . Stage3ParameterMaximum (<i>parameter</i>)
Variable	(Type) - Description
<i>value</i>	(Variant) Variable to store the maximum parameter value.
<i>spm4</i>	A SignalProcessingModuleFour (object)
<i>parameter</i>	(String) Parameter name. See Stage3Parameter Property for a list of parameters.
Return Type	Double
Default	Not Applicable
Examples	<pre>mode = spm4.Stage3ParameterMaximum ("c") 'Read</pre>
C++ Syntax	HRESULT get_Stage3ParameterMaximum(BSTR pName, double* pVal);
Interface	ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage3ParameterMinimum Property

Description	Returns minimum parameter value for the current filter type.
VB Syntax	<i>value</i> = <i>spm4</i> . Stage3ParameterMinimum (<i>parameter</i>)
Variable	(Type) - Description
<i>value</i>	(Variant) Variable to store the minimum parameter value.
<i>spm4</i>	A SignalProcessingModuleFour (object)
<i>parameter</i>	(String) Parameter name. See Stage3Parameter Property for a list of parameters.
Return Type	Double
Default	Not applicable
Examples	<pre>mode = spm4.Stage3ParameterMinimum ("c") 'Read</pre>
C++ Syntax	HRESULT get_Stage3ParameterMinimum(BSTR pName, double* pVal);
Interface	ISignalProcessingModuleFour

Last Modified:

1-Jan-2007 MX New topic

Stage3Parameters Property

Description	Returns the names of parameters for the current filter type. Use Stage3FilterType Property to set the filter type.
VB Syntax	<i>values</i> = <i>spm4</i> .Stage3Parameters
Variable	(Type) - Description
<i>value</i>	(Variant) Variable to store the returned parameter names.
<i>spm4</i>	A SignalProcessingModuleFour (object)
Return Type	Variant
Default	Not Applicable
Examples	<code>mode = spm4.Stage3Parameters 'Read</code>
C++ Syntax	HRESULT get_Stage3Parameters(VARIANT* pNames);
Interface	ISignalProcessingModuleFour

Last Modified:

18-Jan-2007 MX New topic

StandardDeviation Property

Description Returns the standard deviation of the measurement.
To retrieve all 3 statistics value at the same time, use [meas.GetTraceStatistics](#)

VB Syntax `stdev = meas.StandardDeviation`

Variable [\(Type\)](#) - **Description**

stdev **(single)** - Variable to store standard deviation value

meas A Measurement **(object)**

Return Type Single

Default Not applicable

Examples `stdev = meas.StandardDeviation 'Read`

C++ Syntax HRESULT get_StandardDeviation(float* stdDeviation)

Interface IMeasurement

StandardForClass Property - **Superseded**

Description **Superseded** This command sets a **single** standard to a calibration class. Does NOT set or dictate the order for measuring the standards.

Use [GetStandardForClass](#) and [SetStandardForClass](#). These commands allow up to seven standards to be assigned to a cal class.

VB Syntax *calKit.StandardForClass(class, portNum) = value*

Variable **(Type) - Description**

calKit A CalKit (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

class (**enum NACalClass**) Standard. Choose from:

- 1 - naClassA
- 2 - naClassB
- 3 - naClassC
- 4 - naClassD
- 5 - naClassE
- 6 - naReferenceRatioLine
- 7 - naReferenceRatioThru

SOLT Standards

- 1 - naSOLT_Open
- 2 - naSOLT_Short
- 3 - naSOLT_Load
- 4 - naSOLT_Thru
- 5 - naSOLT_Isolation

TRL Standards

- 1 - naTRL_Reflection
- 2 - naTRL_Line_Reflection
- 3 - naTRL_Line_Tracking
- 4 - naTRL_Thru
- 5 - naTRL_Isolation

portNum (**long**) - The port number the standard will be connected to. For example, you may have a 3.5mm connector designated for port 1, and Type N designated for port 2.

value (**long**) - Calibration class number. Choose a number between **1** and **8**. The *<value>* numbers are associated with the following calibration classes:

<i><value></i>	Class	Description
1	S11A	Reflection standard
2	S11B	Reflection standard
3	S11C	Reflection standard
4	S21T	Thru standard
5	S22A	Reflection standard
6	S22B	Reflection standard
7	S22C	Reflection standard
8	S21T	Thru standard

Return Type Long Integer

Default Not Applicable

Examples
`calKit.StandardForClass(naSOLT_Short, 1) = 1`
`Kclass = calKit.StandardForClass(naSOLT_Short, 1)`

C++ Syntax
HRESULT put_StandardForClass (NACalClass item, long pNum);
HRESULT get_StandardForClass (NACalClass* item, long *pNum);

Interface ICalKit

StartFrequency (Cal Set) Property

Description Returns the start frequency that is stored in the Cal Set.

VB Syntax *value* = *CalSet*.**StartFrequency** (*range*)

Variable [\(Type\)](#) - Description

value **(double)** - returned Start frequency in Hertz.

CalSet [CalSet](#) **(object)**

range **(Long)** Choose: **0** (Source and receiver frequency)

Return Type Double

Default Not Applicable

Examples

```
start = calset.StartFrequency(0) 'Reads the start frequency
stored in the cal set.
```

C++ Syntax HRESULT get_StartFrequency(long range, *pVal)

Interface |CalSet3

Last modified:

25-Jan-2011 Fixed range argument

Nov. 1, 2006 New command - split from ch.StartFreq

StartFrequency Property

Description Sets or returns the start frequency of the channel. (Channel Object)

Sets or returns the start frequency of the segment. (Segment Object)

Sets or returns the start frequency of the FOM Range. (FOMRange Object)

Sets or returns the start frequency of the Power Sensor coverage (GuidedCalibrationPowerSensor Object)

See also [Measurement2](#) interface

VB Syntax *object.StartFrequency = value*

Variable [\(Type\)](#) - Description

object Any of the following:

[Channel](#) (**object**)

[Segment](#) (**object**)

[FOMRange](#) (**object**)

[GuidedCalibrationPowerSensor](#) (**object**)

value (**double**) - Start frequency in Hertz. Choose any number between the **minimum** and **maximum** frequencies of the analyzer.

Return Type Double

Default Channel - Minimum frequency of the analyzer

Segment - 0

FOMRange - Minimum frequency of the analyzer

PowerSensor - Minimum frequency of the analyzer

Examples

```
chan.StartFrequency = 4.5e9 'sets the start frequency of a linear sweep
for the channel object -Write
```

```
startfreq = Chan.StartFrequency 'Read
```

C++ Syntax HRESULT get_StartFrequency(double *pVal)

HRESULT put_StartFrequency(double newVal)

Interface IChannel
ISegment
IFOMRange
IGuidedCalibrationPowerSensor

Last modified:

8-Feb-2011 Added Power Sensor
8-Mar-2007 Added FOMRange
1-Nov-2006 Removed Cal Set object. There is now a new [cs.StartFreq](#)

StartPower Property

Description Sets the start power of the analyzer when [sweep type](#) is set to Power Sweep. Frequency of the measurement is set with chan.[CWFrequency](#).

VB Syntax *object*.**StartPower** = *value*

Variable [\(Type\)](#) - Description

object One of the following:

- [Channel](#) (object)
- [CalSet](#) (object) - Read-only property

value **(double)** - Start Power in dBm.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use [cap.MaximumSourceALCPower](#) and [cap.MinimumSourceALCPower](#)

Auto attenuation is not allowed in Power Sweep.

Return Type Double

Default 0

Examples

```
Chan.StartPower = -10 'Write
strtpwr = Chan.StartPower 'Read
```

C++ Syntax HRESULT get_StartPower(double *pVal)
HRESULT put_StartPower(double newVal)

Interface IChannel

|CalSet3

Last Modified:

7-Jan-2008 Removed FOMRange
8-Mar-2007 Added FOMRange

Start Property

Description	Sets or returns the start time of either Gating or Time Domain transform windows
VB Syntax	<i>object</i> .Start = <i>value</i>
Variable	(Type) - Description
<i>object</i>	(object) As Gating or (object) As Transform
<i>value</i>	(double) - Start time in seconds. Choose any number between: ± (number of points-1) / frequency span
Return Type	Double
Default	-10ns
Examples	<pre>Trans.Start = 4.5e-9 'sets the start time of a transform window -Write Gate.Start = 4.5e-9 'sets the start time of a gating window - Write strt = Trans.Start 'Read</pre>
C++ Syntax	HRESULT get_Start(double *pVal) HRESULT put_Start(double newVal)
Interface	ITransform IGating

Read-only

Start Property

Description	Returns the stimulus value of the first data point for the measurement. To understand how this property is useful, see IMeasurement2 Interface .
VB Syntax	<i>value</i> = <i>meas</i> . Start
Variable	(Type) - Description
<i>value</i>	(Double) - Variable to store the returned value
<i>meas</i>	A Measurement (object)
Return Type	Double
Default	Not Applicable
Examples	<pre>Print meas.Start 'prints the stimulus value of the first data point</pre>
C++ Syntax	HRESULT get_Start (double * Val);
Interface	IMeasurement2

Start Property

Description Sets and returns start DC value for the specified DC source.

VB Syntax *dc.Start(name,port) = value*

Variable [\(Type\)](#) - Description

dc An [DCStimulus](#) (object)

name,port (String) Name of the "DC source, port"

Use [Source Property](#) to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

value (Double) DC Start value. Choose a value within the range of the DC source.

Return Type Double

Default .5

Examples

```
'Set A01 to always ON
dc.Start "A01", 3

'Read Start for MyDCSource,Port 1
dc.Start? "MyDCSource,Port 1"
```

C++ Syntax HRESULT get_Start(BSTR name, VARIANT_BOOL * pValue);
HRESULT put_Start(BSTR name, VARIANT_BOOL newValue);

Interface IDCSstimulus

Last Modified:

21-Feb-2012 MX New topic

StartFrequency Property

Description	Sets and returns the phase reference cal start frequency.
VB Syntax	<i>phasRef.StartFrequency = value</i>
Variable	(Type) - Description
<i>phasRef</i>	A PhaseReferenceCalibration Object
<i>value</i>	Start frequency in Hz. Choose any frequency from 17.5 MHz to the stop frequency of the PNA.
Return Type	Double
Default	17.5e6
Examples	<pre>phase.StartFrequency = 20e6</pre> See example program
C++ Syntax	HRESULT get_StartFrequency(Double* pVals); HRESULT put_StartFrequency(Double pVals);
Interface	IPhaseReferenceCalibration

Last Modified:

3-Apr-2012 MX New topic

StartPhase Property

Description	Write and read the start value of phase sweep. Must also send Sweep Type Property to put the analyzer into phase sweep mode.
VB Syntax	<i>phase</i> .StartPhase(<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>phase</i>	A PhaseControl Object
<i>srcPort</i>	(Long Integer) Source port for which to make phase control settings.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Double) Start phase value in degrees. Choose a value between -360 and 360.
Return Type	Double
Default	0 degrees
Examples	<pre>phase.StartPhase 1 = 60 ' Write value = phase.StartPhase 2 ' Read</pre>
C++ Syntax	HRESULT get_StartPhase(long port, double* pVal); HRESULT put_StartPhase(long port, double newVal);
Interface	IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

StartPowerEx Property

Description Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set [SweepType](#) = `naPowerSweep`, [Coupled](#) = `False` (Off), and [StopPowerEx](#).

VB Syntax `chan.StartPowerEx (srcPort) = value`

Variable [\(Type\)](#) - Description

`chan` A [Channel](#) (object)

`srcPort` (**long integer**) – Source port for which to set the Start power value.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

`value` (**double**) - Start Power in dBm.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use [cap.MaximumSourceALCPower](#) and [cap.MinimumSourceALCPower](#)

Auto attenuation is not allowed in Power Sweep.

Return Type Double

Default -10 dBm

Examples `Chan.StartPowerEx 1 = -10 'Write`

`strtpwr = Chan.StartPowerEx 2 'Read`

C++ Syntax `HRESULT get_StartPowerEx(long port, double *pVal)`
`HRESULT put_StartPowerEx(long port, double newVal)`

Interface `IChannel13`

Last Modified:

23-May-2008 MX New topic

StartRatioedPower Property

Description Write and read the start power ratioed value. Must also set [SweepType](#) to Power.

VB Syntax `phase.StartRatioedPower(srcPort) = value`

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Start power ratio value in dBc. Must be within the allowable range of the PNA.

Return Type Double

Default 0 dBc

Examples

```
phase.StartRatioedPower 1 = -1 ' Write
```

```
value = phase.StartRatioedPower 2 ' Read
```

C++ Syntax

```
HRESULT get_StartRatioedPower(long port, double* pVal);
```

```
HRESULT put_StartRatioedPower(long port, double newVal);
```

Interface IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

State (GPL) Property

Description Enables and disables Global Power Limiting for the specified port.

VB Syntax `gpl.State(port) = bool`

Variable [\(Type\)](#) - Description

gpl A [GlobalPowerLimit](#) (**object**)

port (**Long**) Port number for which power limit state is to be set.

bool (**Boolean**) Choose from:

True - Power Limiting is enabled.

False - Power Limiting is disabled.

Return Type Boolean

Default False

Examples `gpl.State(1) = True 'Write`

`Limit = gpl.State(2) 'Read`

C++ Syntax HRESULT get_State(long port, VARIANT_BOOL *pVal)
HRESULT put_Limit(long port, VARIANT_BOOL newVal)

Interface IGlobalPowerLimit

Last Modified:

10-Aug-2009 MX New topic

State Property

Description Turns an Object ON and OFF.

VB Syntax *object.State* = *value*

Variable [\(Type\)](#) - Description

object Applies to any of the following objects:

[FOM](#)

[Gating](#)

[InterfaceControl](#)

[LimitTest](#)

Port Extension- Superseded. See either:

- [FixturingState Property](#)
- [PortExtState Property](#)

[Segment](#)

[Transform](#)

[Equation](#)

[FIFO](#)

Notes:

- **LimitTest.State** - If using Global Pass/Fail status, trigger the PNA AFTER turning Limit testing ON.
- **Segment.State** - At least ONE segment must be ON or [Sweep Type](#) is automatically set to **Linear**.

value (boolean) -

False - Turns *obj* OFF

True - Turns *obj* ON

Return Type Boolean

Default Depends on the object:

0 - FOM

0 - Gating

0 - InterfaceControl

0 - LimitTest

1 - Segment

0 - Transform

0 - Equation

0 - FIFO

Examples

```
Seg.State = 1 'Turns the segment object ON -Write
```

```
tran = Trans.State 'returns the state of Transform -Read
```

C++ Syntax

```
HRESULT get_State(VARIANT_BOOL *pVal)  
HRESULT put_State(VARIANT_BOOL newVal)
```

State Property

Description Sets and returns the ON / Off state of the specified DC source and port.

VB Syntax *dc.State(name,port) = state*

Variable [\(Type\)](#) - Description

dc An [DCStimulus](#) (object)

name,port (String) Name of the "DC source, port"

Use [Source Property](#) to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

state Boolean. ON / Off state. Choose from:

True - DC source/port enabled.

False - DC source/port disabled.

Return Type Boolean

Default False

Examples

```
'Set A01 to always ON
dc.State "A01",True

'Set MyDCSource to ON when the RF source for Port 1
is ON
dc.State "MyDCSource,Port 1",ON

'Read state for MyDCSource,Port 1
dc.State? "MyDCSource,Port 1"
```

C++ Syntax HRESULT get_State(BSTR name, VARIANT_BOOL * pValue);

HRESULT put_State(BSTR name, VARIANT_BOOL
newValue);

Interface IDCStimulus

21-Feb-2012 MX New topic

State (Rx Leveling) Property

Description	Sets and reads the state of Receiver Leveling for a specific source port.
VB Syntax	<i>RxLevel.State(srcPort) = value</i>
Variable	(Type) - Description
<i>RxLevel</i>	A ReceiverLeveling Object
<i>value</i>	(Boolean) Choose from: True - Receiver leveling ON False - Receiver leveling OFF
<i>srcPort</i>	(Long Integer) Source port for which to set the state of Receiver Leveling. Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
Return Type	Variant Boolean
Default	False
Examples	<pre>rxLevel.State (1) = True ' Write value = rxLevel.State 2' Read</pre>
C++ Syntax	<pre>HRESULT get_State(long port, VARIANT_BOOL* pLevelingState); HRESULT put_State(long port, VARIANT_BOOL LevelingState);</pre>
Interface	IRceiverLevelingConfiguration

Last Modified:

12-Feb-2009 MX New topic

State Property

Description Turns the specified pulse generator ON and OFF.

VB Syntax *pulse.State* (*n*) = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (object)

n (**Integer**) Pulse generator number. Choose from 0 to 4.

Or use [PulseGeneratorID](#) to refer to an external pulse generator.

0 is the generator that pulses the ADC.

value **True** - turns pulse output ON.

False - turns pulse output OFF.

Return Type Boolean

Default False

Examples `pulse.State(1) = True 'Write`

`value = pulse.State(4) 'Read`

C++ Syntax HRESULT get_State(VARIANT_BOOL *pVal);

HRESULT put_State(VARIANT_BOOL newVal);

Interface IPulseGenerator

2-Jan-2007 MX New topic

StatisticsRange Property

Description Sets the User Range number for calculating measurement statistics. Set the start and stop values for a User Range with [UserRangeMin](#) and [UserRangeMax](#).

There are 16 User Ranges per channel. User ranges are applied independently to any measurement.

VB Syntax *meas.StatisticsRange* = *value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**long integer**) - Range Number. Choose any number between 0 and 16

0 is Full Span

1 - 16 are user-defined ranges

Return Type Long Integer

Default 0

Examples

```
meas.StatisticsRange = 2 'Write
```

```
stairange = meas.StatisticsRange 'Read
```

C++ Syntax HRESULT get_StatisticsRange(long* rangeNumber)
HRESULT put_StatisticsRange(long rangeNumber)

Interface IMeasurement

StatusAsString Property

Description Returns a string that describes the result of the last tuning sweeps.

VB Syntax *value* = *embedLO*.**StatusAsString**

Variable [\(Type\)](#) - Description

value **(String)** Variable to store the returned data.

embedLO An [EmbeddedLODiagnostic](#) **(object)**

Return Type **(String)**

Default Not Applicable

Examples `data= embedLO.StatusAsString 'read'`

C++ Syntax HRESULT get_StatusAsString(BSTR* status);

Interface IEmbeddedLODiagnostic

Last Modified:

12-Apr-2007 MX New topic

StepRiseTime Property

Description	Sets or returns the Rise time of the stimulus in Low Pass Step Mode.
VB Syntax	<i>trans</i> .StepRiseTime = <i>value</i>
Variable	(Type) - Description
<i>trans</i>	A Transform (object)
<i>value</i>	(double) - Rise time in seconds. Choose any number between 5.0e-13 and 1.63e-14 .
Return Type	Double
Default	0
Examples	<pre>trans.StepRiseTime = 1.0e-14 'sets the step rise time to 100 psec. -Write</pre> <pre>rt = trans.StepRiseTime 'Read</pre>
C++ Syntax	HRESULT get_StepRiseTime(double *pVal) HRESULT put_StepRiseTime(double newVal)
Interface	ITransform

StepData Property

Description Returns an array of data from the specified tuning sweep.

VB Syntax *value* = *embedLO*.StepData (*n*)

Variable [\(Type\)](#) - Description

value (**Variant Array**) Variable to store the returned data.

embedLO An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.StepData 3 'read`

C++ Syntax HRESULT StepData(long sweep,VARIANT* pArray);

Interface IEmbeddedLODiagnostic

Last Modified:

12-Apr-2007 MX New topic

StepTitle Property

Description Returns the title of the specified tuning sweep.

VB Syntax *value* = *embedLODiag*.**StepTitle** (*n*)

Variable [\(Type\)](#) - Description

value **(String)** Variable to store the returned data.

embedLODiag An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.StepTitle 3 'read'`

C++ Syntax HRESULT StepTitle (long sweep, BSTR * title);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

StimulusValues Property

Description	Returns the specified X-axis FOM frequency range. The array contains one frequency value for each data point.
VB Syntax	<i>value</i> = <i>calSet</i> . StimulusValues (<i>range</i>)
Variable	(Type) - Description
<i>calSet</i>	CalSet (object) - Read-only property
<i>range</i>	(Long) FOM frequency range to read. 0 - returns source frequencies. 1 - returns response frequencies. 2 - returns primary frequencies.
Return Type	1-dimensional variant array
Default	Not Applicable
Examples	<pre>array = CalSet.StimulusValues 'Read</pre>
C++ Syntax	HRESULT get_StimulusValues (long range, VARIANT* vals)
Interface	ICalSet3

Last Modified:

16-Sep-2009 Added 2 - primary
19-Oct-2007 Fixed title and syntax

Stop Property

Description Sets and returns Stop DC value for the specified DC source.

VB Syntax *dc.Stop (name,port) = value*

Variable [\(Type\)](#) - Description

dc An [DCStimulus](#) (object)

name,port (String) Name of the "DC source, port"

Use [Source Property](#) to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

value (Double) DC Stop value. Choose a value within the range of the DC source.

Return Type Double

Default 1

Examples

```
'Set AO1 to always ON
dc.Stop "AO1", 3

'Read Stop for MyDCSource,Port 1
dc.Stop? "MyDCSource,Port 1"
```

C++ Syntax HRESULT get_Stop(BSTR name, VARIANT_BOOL * pValue);
HRESULT put_Stop(BSTR name, VARIANT_BOOL newValue);

Interface IDCSstimulus

Last Modified:

21-Feb-2012 MX New topic

StopFrequency Property

Description Sets or returns the stop frequency of the channel. (Channel Object)

Sets or returns the stop frequency of the segment. (Segment Object)

Sets or returns the stop frequency of the FOM Range. (FOMRange Object)

Sets or returns the stop frequency of the Power Sensor coverage (GuidedCalibrationPowerSensor Object)

Sets or returns the stop frequency of the Phase Reference Calibration.

See also [Measurement2](#) interface.

VB Syntax *object*.StopFrequency = *value*

Variable [\(Type\)](#) - Description

object Any of the following:

[Channel](#) (object)

[Segment](#) (object)

[FOMRange](#) (object)

[GuidedCalibrationPowerSensor](#) (object)

[PhaseReferenceCalibration](#) (object)

value (**double**) - Stop frequency in Hertz. Choose any number between the **minimum** and **maximum** frequencies of the analyzer.

Return Type Double

Default Channel - Maximum frequency of the analyzer.

Segment - 0

FOMRange - Maximum frequency of the analyzer.

GuidedCalibrationPowerSensor - Maximum frequency of the analyzer.

PhaseReferenceCalibration - Maximum frequency of the analyzer.

Examples

```
chan.StopFrequency = 4.5e9 'sets the stop frequency for the channel  
object -Write
```

```
stopfreq = Chan.StopFrequency 'Read
```

C++ Syntax

```
HRESULT get_StopFrequency(double *pVal)
```

```
HRESULT put_StopFrequency(double newVal)
```

Interface

```
IChannel
```

```
ISegment
```

```
IFOMRange
```

```
IGuidedCalibrationPowerSensor
```

Last modified:

- 3-Apr-2012 Added PhaseReferenceCalibration
- 8-Feb-2011 Added GuidedCalibrationPowerSensor
- 8-Mar-2007 Added FOMRange
- 1-Nov-2006 Removed Cal Set object - created cs.stopfreq

StopFrequency (Cal Set) Property

Description	Returns the stop frequency that is stored in the Cal Set.
VB Syntax	<i>value</i> = <i>CalSet</i> . StopFrequency (<i>range</i>)
Variable	(Type) - Description
<i>value</i>	(double) - returned Stop frequency in Hertz.
<i>CalSet</i>	CalSet (object)
<i>range</i>	(Long) Choose: 0 (Source and receiver frequency)
Return Type	Double
Default	Not Applicable
Examples	<pre>stop = calset.StopFrequency(0) 'Reads the stop frequency stored in the cal set.</pre>
C++ Syntax	HRESULT get_StopFrequency(long range, double *pVal)
Interface	CalSet3

Last modified:

25-Jan-2011 Fixed range argument
Nov. 1, 2006 New command - split from ch.StopFreq

StopPower Property

Description Sets the Stop Power of the analyzer when [sweep type](#) is set to Power Sweep. Frequency of the measurement is set with chan.[CWFrequency](#).

VB Syntax *object*.**StopPower** = *value*

Variable [\(Type\)](#) - [Description](#)

object One of the following:

- [Channel](#) (object)
- [CalSet](#) (object) - Read-only property

value **(double)** - Stop Power in dB.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use [cap.MaximumSourceALCPower](#) and [cap.MinimumSourceALCPower](#)

Auto attenuation is not allowed in Power Sweep.

Return Type Double

Default 0

Examples

```
Chan.StopPower = -10 'Write
stppwr = Chan.StopPower 'Read
```

C++ Syntax HRESULT get_StopPower(double *pVal)
HRESULT put_StopPower(double newVal)

Interface IChannel
|CalSet3

Last Modified:

7-Jan-2008 Removed FOMRange
8-Mar-2007 Added FOMRange

Stop Property

Description Sets or returns the Stop time of either Gating or Time Domain transform windows

VB Syntax *object*.**Stop** = *value*

Variable [\(Type\)](#) - Description

object **(object)** As Gating

or

(object) As Transform

value **(double)** - Start time in seconds. Choose any number between:
 \pm **(number of points-1) / frequency span**

Return Type Double

Default 10 ns

Examples

```
Trans.Stop = 4.5e-9 'sets the stop time of a transform window -  
Write  
Gate.Stop = 4.5e-9 'sets the stop time of a gating window -Write  
stp = Trans.Stop 'Read
```

C++ Syntax HRESULT get_Stop(double *pVal)
HRESULT put_Stop(double newVal)

Interface ITransform
IGating

Read- only

Stop Property

Description Returns the stimulus value of the last data point for the measurement. To understand how this property is useful, see [IMeasurement2 Interface](#).

VB Syntax *value* = *meas*.**Stop**

Variable [\(Type\)](#) - Description

value **(Double)** Variable to store the returned value

meas A Measurement **(object)**

Return Type Double

Default Not Applicable

Examples `Print meas.Stop` 'prints the stimulus value of the last data point

C++ Syntax HRESULT get_Stop(double * Val);

Interface IMeasurement2

StopPhase Property

Description	Write and read the stop value of phase sweep. Must also send Sweep Type Property to put the analyzer into phase sweep mode.
VB Syntax	<i>phase</i> . StopPhase (<i>srcPort</i>) = <i>value</i>
Variable	(Type) - Description
<i>phase</i>	A PhaseControl Object
<i>srcPort</i>	(Long Integer) Source port for which to make phase control settings.
	Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port
<i>value</i>	(Double) Stop phase value in degrees. Choose a value between -360 and 360.
Return Type	Double
Default	0 degrees
Examples	<pre>phase.StopPhase 1 = 60 ' Write value = phase.StopPhase 2 ' Read</pre>
C++ Syntax	HRESULT get_StopPhase(long port, double* pVal); HRESULT put_StopPhase(long port, double newVal);
Interface	IPhaseControl

Last Modified:

8-Dec-2010 MX New topic

StopPowerEx Property

Description Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set [SweepType](#) = `naPowerSweep`, [Coupled](#) = `False` (Off), and [StartPowerEx](#).

VB Syntax `chan.StopPowerEx (srcPort) = value`

Variable [\(Type\)](#) - Description

`chan` A [Channel](#) (object)

`srcPort` (**long integer**) – Source port for which to set the Stop power value.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

`value` (**double**) - Stop Power in dBm.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use [cap.MaximumSourceALCPower](#) and [cap.MinimumSourceALCPower](#)

Auto attenuation is not allowed in Power Sweep.

Return Type Double

Default 0 dBm

Examples

```
Chan.StopPowerEx 1 = -10 'Write
stopPwr = Chan.StopPowerEx 2 'Read
```

C++ Syntax `HRESULT get_StopPowerEx(long port, double *pVal)`
`HRESULT put_StopPowerEx(long port, double newVal)`

Interface `IChannel13`

StopRatioedPower Property

Description Write and read the stop power ratioed value. Must also set [SweepType](#) to Power.

VB Syntax *phase*.StopRatioedPower(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

phase A [PhaseControl](#) Object

srcPort (Long Integer) Source port for which to make phase control settings.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Stop power ratio value in dBc. Must be within the allowable range of the PNA.

Return Type Double

Default 0 dBc

Examples

```
phase.StopRatioedPower 1 = -1 ' Write
```

```
value = phase.StopRatioedPower 2 ' Read
```

C++ Syntax

```
HRESULT get_StopRatioedPower(long port, double* pVal);
```

```
HRESULT put_StopRatioedPower(long port, double newVal);
```

Interface IPhaseControl

8-Dec-2010 MX New topic

strPort2Pdeembed_S2PFile Property

Description Sets and returns the 2 port De-embedding .S2P file name for the specified port number. Model is applied when both the file name is specified and **User** is specified using [Port2PdeembedCktModel Property](#).

[Learn more about S2P files.](#)

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture.strPort2Pdeembed_S2PFile(port) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive circuit model.

value (**String**) Full path, file name, and extension (.s2P) of the de-embedding circuit.

Files are typically stored in "c:\users\public\network analyzer\documents

Return Type String

Default Not Applicable

Examples

```
fixture.strPort2Pdeembed_S2PFile(2) = "c:\users\public\network analyzer\documents\myFile.s2p" 'Write
```

```
value = fixture.strPort2Pdeembed_S2PFile(1) 'Read
```

C++ Syntax HRESULT get_strPort2Pdeembed_S2PFile(short port BSTR *bstrFile)

HRESULT put_strPort2Pdeembed_S2PFile(short port BSTR bstrFile)

Interface IFixturing

strPortMatch_S2PFile Property

Description Sets and returns the Port Matching 'S2P' file name for the specified port number. Model is applied when both the file name is specified and **User** is specified using [PortMatchingCktModel Property](#).

[Learn more about S2P files.](#)

Note: This command affects ALL measurements on the channel.

VB Syntax *fixture.strPortMatch_S2PFile(port) = value*

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

port (**Integer**) Port number to receive circuit model.

value (**String**) Full path, file name, and extension (.s2P) of the matching circuit.

Files are typically stored in "c:\users\public\network analyzer\documents".

Return Type String

Default Not Applicable

Examples

```
fixture.strPortMatch_S2PFile(2) = "c:\users\public\network analyzer\documents\myFile.s2p" 'Write
```

```
value = fixture.strPortMatch_S2PFile(1) 'Read
```

C++ Syntax HRESULT get_strPortMatch_S2PFile(short port BSTR *bstrFile)

HRESULT put_strPortMatch_S2PFile(short port BSTR bstrFile)

Interface IFixturing

Last Modified:

13-Nov-2013 Fixed syntax

SubPointTrigger Property

Description Enables / Disables subpoint triggering. When enabled and performing [Point Averaging](#), Each rising edge of P0 triggers a subpoint (one of N acquisitions in an N point average). Must also enable the P0 generator using [pulse.State\(n\)](#).

VB Syntax `pulse.SubPointTrigger(n) = value`

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (object)

n (**Integer**) Pulse generator number. **Must be 0** as this is the generator that triggers the ADC.

value (**Boolean**) Enable or disable SubPointTrigger

- **True** - turns subpoint triggering ON.
- **False** - turns subpoint triggering OFF.

Return Type Boolean

Default False

Examples `pulse.SubPointTrigger(0) = True` **Write**

`bool = pulse.SubPointTrigger(0)` **Read**

C++ Syntax HRESULT get_SubPointTrigger (integer pulse, VARIANT_BOOL* on_off);

HRESULT put_SubPointTrigger (integer pulse, VARIANT_BOOL on_off);

Interface IPulseGenerator2

20-Jul-2009 MX New topic

SupportedGenericParameters Property

Description Returns a list of supported parameters for the specified measurement class.

VB Syntax *value* = *measClassProps*.SupportedGenericParameters

Variable [\(Type\)](#) - Description

value (Variant) - Variable to store the returned array of parameters.

measClassProps A [MeasurementClassProperties](#) (Object)

Return Type Variant array

Default Not Applicable

Examples

```
'Access the MeasurementClassProperties Object

Set app = CreateObject("AgilentPNA835x.Application")

Set cap = app.Capabilities

Set measProps = cap.MeasurementClassProperties ("Swept IMD")

'Read the supported parameters

list=measProps.SupportedGenericParameters

For i = 0 To UBound(list)

    msg = msg & list(i) & vbCrLf

Next

MsgBox msg
```

C++ Syntax HRESULT get_SupportedGenericParameters(Variant *value);

Interface ICapabilities8

Last Modified:

23-May-2011 MX New topic

SupportedParameters Property

Description Returns a list of supported parameters for the specified measurement class.

VB Syntax *value* = *measClassProps*.SupportedParameters

Variable [\(Type\)](#) - Description

value (Variant) - Variable to store the returned array of parameters.

measClassProps A [MeasurementClassProperties](#) (Object)

Return Type Variant array

Default Not Applicable

Examples

```
'Access the MeasurementClassProperties Object

Set app = CreateObject("AgilentPNA835x.Application")

Set cap = app.Capabilities

Set measProps = cap.MeasurementClassProperties ("Swept IMD")

'Read the supported parameters

list=measProps.SupportedParameters

dim i

For i = 0 To UBound(list)

    msg = msg & list(i) & vbCrLf

Next

MsgBox msg
```

C++ Syntax HRESULT get_SupportedParameters(Variant *value);

Interface ICapabilities8

Sweep Delay Property

Description Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to [Dwell Time](#) and the following two External Trigger delays if enabled.

- [TriggerDelay](#) (global scope)
- [ExternalTriggerDelay](#) (channel scope)

VB Syntax *chan.SweepDelay = value*

Variable [\(Type\)](#) - Description

chan [Channel](#) (object)

value (**double**) - Sweep delay in seconds.

Return Type Double

Default 0

Examples

```
chan.SweepDelay = 3e-3 'Write
```

```
swpdelay = chan.SweepDelay 'Read
```

C++ Syntax HRESULT get_SweepDelay(double *pVal)

HRESULT put_SweepDelay(double newVal)

Interface IChannel

Last Modified:

6-Mar-2012 Fixed link

1-Mar-2010 MX New topic

SweepDwell Property

Description Sets and returns the "Dwell Before Sweep" value for an external DC Device which can be configured as either a DC Meter or a DC Source.

VB Syntax `extDC.SweepDwell = value`

Variable [\(Type\)](#) - Description

extDC An [ExternalDCDevice](#) (**object**)

value (**Double**) The dwell time (in seconds) before making a new sweep.

Return Type Double

Default 1 milliseconds

Examples `extDC.SweepDwell = 10e-3 'Write`

`dwell = extDC.SweepDwell 'Read`

C++ Syntax HRESULT get_SweepDwell (double *pValue)

HRESULT put_SweepDwell (double newVal)

Interface IExternalDCDevice

Last Modified:

15-Feb-2012 New topic

SweepEndMode Property

Description Sets and reads the event that will cause the Sweep End line to go to a low state. The line will return to a high state after the appropriate calculations are complete.

Note: This line is connected to the [HANDLER IO connector](#).

VB Syntax *object.SweepEndMode* = *value*

Variable (Type) - Description

object **(object)** - A HandlerIO or AuxIO object

value (enum as NASweepEndMode) Choose from:

0 - naSweep - the line goes low when each sweep is complete

1 - naChannelSweep - the line goes low when all the sweeps for each channel is complete.

2 - naGlobalSweep - the line goes low when all sweeps for all [triggerable](#) channels are complete.

Return Type Long Integer

Default 0 - naSweep

Examples

```
HWAuxIO.PassFailMode = naSweep 'Write
```

```
value = HWAuxIO.PassFailMode 'Read
```

C++ Syntax

```
HRESULT put_SweepEndMode ( tagNASweepEndMode Mode );
```

```
HRESULT get_SweepEndMode ( tagNASweepEndMode* Mode );
```

Interface

```
IHWAuxIO
```

```
IHWMaterialHandlerIO
```

SweepHoldOff Property

Description	Returns a boolean that represents the state of SweepHoldoff line (pin2) of the External Test Set connector.
VB Syntax	<i>value</i> = <i>ExtIO.SweepHoldOff</i>
Variable	(Type) - Description
<i>value</i>	(boolean) - Variable to store the returned data
<i>ExtIO</i>	(object) - An External IO object
Return Type	Boolean
	False - indicates the line is being held at a TTL Low
	True - indicates the line is being held at a TTL High
Default	Not Applicable
Examples	<code>value = ExtIO.SweepHoldOff</code>
C++ Syntax	HRESULT get_SweepHoldOff(VARIANT_BOOL* bValue);
Interface	IHWExternalTestSetIO

SweepOrder Property

Description Sets and returns the order number of IM products to view when [SweepType](#) = NTH is specified. This actually sets the frequency span to [DeltaF](#) * N (this command value).

VB Syntax *ims.SweepOrder = value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Integer) Order number of IM product.

Return Type Long Integer

Default 9

Examples `ims.SweepOrder = 5 'Write`

`value = ims.SweepOrder 'Read`

C++ Syntax HRESULT get_SweepOrder(long *pVal)
HRESULT put_SweepOrder(long newVal)

Interface IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

SweepSpeedMode Property

Description	Sets and returns the sweep speed mode: FastSweep or Normal.
VB Syntax	<i>chan.SweepSpeedMode</i> = <i>value</i>
Variable	(Type) - Description
<i>chan</i>	A Channel (object)
<i>value</i>	(enum as NASweepSpeedMode) - Choose from: 0 - naSweepSpeedModeNormal - Standard PNA sweep mode 1 - naSweepSpeedModeFast - Fast sweep mode
Return Type	Enum
Default	0 - naSweepSpeedModeNormal
Examples	<pre>chan.SweepSpeedMode = naSweepSpeedModeNormal 'Write swpSpeed = chan.SweepSpeedMode 'Read</pre>
C++ Syntax	HRESULT get_SweepSpeedMode(tagNASweepSpeedModes* pVal) HRESULT put_SweepSpeedMode(tagNASweepSpeedModes newVal)
Interface	IChannel14

Last Modified:

26-Aug-2008 MX New topic

SweepGenerationMode Property

Description Sets the method used to generate a sweep: continuous ramp (analog) or discrete steps (stepped).

VB Syntax *object.SweepGenerationMode = value*

Variable [\(Type\)](#) - [Description](#)

object Channel (**object**)

or

CalSet (**object**) - Read-only property

value (enum NASweepGenerationModes) - **Choose either:**

0 - naSteppedSweep - source frequency is CONSTANT during measurement of each displayed point. More accurate than Analog. Dwell time can be set in this mode.

1 - naAnalogSweep - source frequency is continuously RAMPING during measurement of each displayed point. Faster than Stepped. Sweep time (not dwell time) can be set in this mode.

Return Type Long Integer

Default Analog

Examples

```
Chan.SweepGenerationMode = naAnalogSweep 'Write
swpgen = Chan.SweepGenerationMode 'Read
```

C++ Syntax HRESULT get_SweepGenerationMode(tagNASweepGenerationModes* pVal)
HRESULT put_SweepGenerationMode(tagNASweepGenerationModes newVal)

Interface IChannel
|CalSet3

SweepTime Property

Description Sets the Sweep time of the analyzer. If sweep time accuracy is critical, use ONLY the values that are attained using the up and down arrows next to the sweep time entry box.
[See Sweep Time.](#)

VB Syntax *object.SweepTime* = *value*

Variable (Type) - Description

object [Channel](#) (**object**)

or

[Segment](#) (**object**) first set [SweepTimeOption](#) to true.

or

[CalSet](#) (**object**) - Read-only property

value (**double**) - Sweep time in seconds. The maximum sweep time of the PNA is 86400 seconds (1 day).

To set the fastest sweep speed possible, set this value to 0.

Return Type Double

Default 0

Examples

```
chan.SweepTime = 3e-3 'Write
```

```
swptme = chan.SweepTime 'Read
```

C++ Syntax HRESULT get_SweepTime(double *pVal)
HRESULT put_SweepTime(double newVal)

Interface IChannel

CalSet3

ISegment2

SweepTimeOption Property

Description Enables the Sweep time or Dwell time to be set on individual sweep segments. This property must be set True **before** the sweep or dwell time commands are sent. Otherwise, those commands will be ignored.

VB Syntax `segs.SweepTimeOption = state`

Variable [\(Type\)](#) - Description

segs A [Segments](#) collection (**object**)

state (**boolean**)

True - Enables Sweep or Dwell time to be set independently.

False - Disables Sweep or Dwell time from being set independently.

Return Type Boolean

Default False

Examples

```
segs.SweepTimeOption = True 'Write
```

```
timeOption = SweepTimeOption 'Read
```

C++ Syntax HRESULT get_SweepTimeOption(VARIANT_BOOL *pVal)
HRESULT put_SweepTimeOption(VARIANT_BOOL newVal)

Interface ISegments3

9/29/06 MQQ New command

SweepType Property (IMD Opt 087)

Description Sets and returns the type of sweep for a Swept IMD measurement.

See a [list of commands](#) that are relevant for each sweep type.

VB Syntax `imd.SweepType = value`

Variable [\(Type\) - Description](#)

imd A [SweptIMD](#) Object

value (Enum as naSweepTypes) - Choose from:

- **0 - naIMDToneCWSweep** The main tone frequencies (F1 and F2) and power levels (P1 and P2) are held constant. Measurements are taken for the specified number of points.
- **1 - naIMDTonePowerSweep** The main tone frequencies are specified as either F1 and F2, or as FC and DeltaF. These frequencies are held constant while the power of each tone is varied from the Start Power to Stop Power
- **2 - naIMDToneCenterFreqSweep** Maintaining a constant tone spacing (DeltaF) and tone powers (P1 and P2), the center frequency (FC) is swept from Start to Stop, or can also be specified as Center and Span.
- **3 - naIMDDeltaFrequencySweep** The center frequency (FC) is held constant. The tone spacing is increased from Start DeltaF to Stop DeltaF.
- **4 - naIMDToneSegmentSweep** Same as FCenter sweep, except that the center frequencies for the sweep are constructed using the standard [segment sweep commands](#). (NOT valid for IMDx)
- **5 - naLOPowerSweep** All frequencies are fixed while the LO power is swept. (IMDx ONLY)

Return Type Enum

Default 2 - naIMDToneCenterFreqSweep

Examples

```
imd.SweepType = naIMDToneCWSweep 'Write
```

```
swptyp = imd.SweepType 'Read
```

C++ Syntax HRESULT get_SweepType(tagNASweepTypes* pVal)

HRESULT put_SweepType(tagNASweepTypes newVal)

Interface ISweptIMD

27-Mar-2009 Edited for IMDx

19-Aug-2008 MX New topic

SweepType Property (IMSpectrum Opt 087)

Description Sets and returns the type of sweep for an IMSpectrum measurement.

VB Syntax *ims.SweepType = value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Enum as NAIMSSweepType) - Choose from:

- **0 - naIMSLinearSpan** When Tracking is enabled, allows tuning the Response Settings (receiver) to any values within the frequency range of the PNA. When Tracking is NOT enabled also allows setting the Stimulus (sources) to any values within the frequency range or the PNA.
- **1 - naIMSSecondOrderSpan** The receiver is tuned to view the 2nd order products (f2-f1 and f1+f2) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
- **2 - naIMSThirdOrderSpan** The receiver is tuned to view the 3rd order products (2f1 -f2 and 2f2-f1) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
- **3 - naIMSNthOrderSpan** The frequency range is set to N * DeltaF. This algorithm will NOT tune the receivers to see the EVEN order products.

Return Type Enum

Default 3 - naIMSNthOrderSpan

Examples

```
ims.SweepType = naIMSNthOrderSpan 'Write
```

```
swptyp = ims.SweepType 'Read
```

C++ Syntax HRESULT get_SweepType(tagNAIMSSweepType* pVal)
 HRESULT put_SweepType(tagNAIMSSweepType newVal)

Interface IMSpectrum

19-Aug-2008 MX New topic

SweepType Property

Description Sets and returns the type of sweep. First set SweepType, then set sweep parameters such as frequency or power settings.

VB Syntax *object.SweepType = value*

Variable [\(Type\)](#) - Description

object One of the following:

- [Channel](#) (object)
- [FOMRange](#) (object) Must be an [UNCOUPLED](#) range.
- [CalSet](#) (object) - Read-only property

value (enum NASweepTypes) - Choose from:

0 - naLinearSweep

1 - naLogSweep

2 - naPowerSweep

3 - naCWTimeSweep

4 - naSegmentSweep

5 - naPhaseSweep

Note: Sweep type cannot be set to Segment sweep if there are no segments turned ON. A segment is automatically turned ON when a application is created.

Return Type Long Integer

Default naLinearSweep

Examples

```
chan.SweepType = naPowerSweep 'Write
```

```
swptyp = chan.SweepType 'Read
```

C++ Syntax HRESULT get_SweepType(tagNASweepTypes* pVal)

HRESULT put_SweepType(tagNASweepTypes newVal)

Interface IChannel

|CalSet3

IFOMRange

Last Modified:

3-Dec-2010	Added phase sweep
6-May-2010	Added sweep type note.
8-Mar-2007	Added FOMRange

SystemImpedanceZ0 Property

Description Sets and returns the impedance for the analyzer.

VB Syntax `app.SystemImpedanceZ0 = value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (double) Analyzer Impedance. Choose any number between 0 and 1000 ohms.

Return Type Double

Default 50

Examples `app.SystemImpedanceZ0 = 75 'Write`

`z0 = app.SystemImpedanceZ0 'Read`

C++ Syntax HRESULT get_SystemImpedanceZ0(double dSystemZ0)
HRESULT put_SystemImpedanceZ0(double *pdSystemZ0)

Interface IApplication

SystemName Property

Description Returns the computer name of the PNA.

VB Syntax `name = app.SystemName`

Variable [\(Type\)](#) - Description

name (String) Variable to store the returned computer name.

app An [Application](#) (**object**)

Return Type String

Default Not Applicable

Examples `name = app.SystemName`

C++ Syntax HRESULT SystemName(BSTR* computerName)

Interface IApplication

TargetValue Property

Description Sets the target value for the marker when doing Target Searches ([SearchTargetLeft](#), [SearchTarget](#), [SearchTargetRight](#)).

VB Syntax `mark.TargetValue = value`

Variable [\(Type\)](#) - Description

mark A [Marker](#) (**object**)

value (**single**) - Target value. Choose any number between: **-500** and **500**

Return Type Single

Default 0

Examples

```
mark.TargetValue = 10.5 'Write
```

```
target = mark.TargetValue 'Read
```

C++ Syntax HRESULT get_TargetValue(float *pVal)
HRESULT put_TargetValue(float newVal)

Interface IMarker

TestPortPower Property

Description Sets or returns the RF power level for the channel
or
 Sets or returns the RF power level of the segment.

VB Syntax *object*.TestPortPower(*srcPort*) = *value*

Variable [\(Type\)](#) - Description

object A [Channel](#) (**object**) - to set coupled power, use chan.[CouplePorts](#). If CouplePorts = False, then each port power can be set independently. Otherwise, chanTestPortPower (1) = value sets power level at both ports.

or

A [CalSet](#) (**object**)

or

A [Segment](#) (**object**)

srcPort (**long integer**) - Source Port number.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

value (**double**) - RF Power in dBm.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use [cap.MaximumSourceALCPower](#) and [cap.MinimumSourceALCPower](#)

Actual achievable leveled power depends on frequency.

Return Type Double

Default 0

Examples

```
chan.TestPortPower(1) = 5 'sets the port 1 RF power level for the channel object -Write
```

```
powerlev = Chan.TestPortPower(1) 'Read
```

C++ Syntax HRESULT get_TestPortPower(long port, double *pVal)
 HRESULT put_TestPortPower(long port, double newVal)

Interface IChannel
ICalSet3
ISegment

Last Modified:

24-Apr-2008 Added note for string names
30-Apr-2007 Edited for src strings

TestSetType Property

Description	Returns the Test Set Type (model) that was used for the Cal Set.
VB Syntax	<i>TSType</i> = <i>calset</i> . TestSetType
Variable	(Type) - Description
<i>TSType</i>	(String) Variable to store the returned test set model.
<i>calset</i>	A Cal Set object.
Return Type	String
Default	Depends on the test set.
Example	<code>TSType = calset.TestSetType</code>
C++ Syntax	HRESULT get_OutputPorts(BSTR *mapping);
Interface	ICalset5

Last modified:

9/18/06 MQ Added for multiport

Text Property

Description Specifies an equation or expression to be used on the measurement.

VB Syntax *eq.Text* = *eqText*

Variable [\(Type\)](#) - Description

eq [Equation](#) (**object**)

eqText (**String**) - Any valid equation or expression.

Return Type String

Default Not Applicable

Examples `eq.Text = "foo=S11/S21"`

`equation = eq.Text 'Read`

C++ Syntax HRESULT get_Text(BSTR *equation)
HRESULT put_Text(BSTR equation)

Interface IEquation

ThruCalMethod Property - Superseded

Description	This command is replaced by PathThruMethod Property . Sets and returns the method for performing the thru portion of the calibration.
VB Syntax	<i>obj</i> . ThruCalMethod = <i>value</i>
Variable	(Type) - Description
<i>obj</i>	SMCType (object) or VMCType (object)
<i>value</i>	(String) Specifies the Thru method. Case insensitive - include spaces. Choose from: "Default" "Flush Thru" or "FLUSH" "Unknown Thru" or "UNKN" "Adapter Removal" or "ADAP"
Return Type	String
Default	Default
Examples	<pre>SMC.ThruCalMethod = "UNKN"</pre>
C++ Syntax	<pre>HRESULT put_ThruCalMethod(enum NAThruCalMethod thruMethod); HRESULT get_ThruCalMethod(enum NAThruCalMethod *thruMethod);</pre>
Interface	SMCType VMCType

ThruCalMethod Property **Superseded**

Description This command is replaced by PathThruMethod Property .

Sets and returns the method for performing the Cal Method and the THRU portion of the calibration.

VB Syntax *guidedCal* .**ThruCalMethod** = *value*

Variable (Type) - Description

guidedCal GuidedCalibration (object)

value (Enum as NATHruCalMethod) Choose from:

0 - naDefaultCalMethod - allow the PNA to choose the best possible method (from the following) depending on whether the device or ECal module is insertable or non-insertable and given the model number of the PNA. (default selection if omitted.)

1 - naAdapterRemoval - Perform Adapter removal calibration.

2 - naFlushThru - Perform Flush Thru calibration.

3 - naDefinedThru - Perform Defined Thru calibration. If performing an ECal, this is the Thru standard in the ECal module.

4 - naUnknownThru - Perform Unknown Thru calibration.

5 - naSOLT - Perform SOLT calibration

6 - naTRL - Perform TRL calibration

7 - naQSOLT - Perform QSOLT calibration.

Learn more about Cal Methods

Return Type Enum

Default 0 - naDefaultCalMethod

Examples `guided.ThruCalMethod = naDefinedThru`

C++ Syntax HRESULT get_ThruCalMethod(enum NATHruCalMethod *thruMethod);

HRESULT put_ThruCalMethod(enum NATHruCalMethod

thruMethod);

Interface IGuidedCalibration

ThruPortList Property

Description	<p>Note: Available only on PNA releases 5.0 and greater.</p> <p>Note: Do NOT send this command to rely on SmartCal to determine the most accurate Thru port pairs for the cal. You can send the query form of this command to learn the port pairs determined by SmartCal.</p> <p>Sets and returns the Thru connection port pairs for the calibration. Send the query form of this command to learn the Thru pairs determined by SmartCal.</p> <p>See Thru Pairs Sequence to learn how to send this and other Thru commands.</p> <p>Learn more about Thru method and port pairings.</p> <p>See an example of a 4-port guided calibration using COM.</p>
VB Syntax	<code>guidedCal.ThruPortList = t1a, t1b, t2a, t2b, t3a, t3b</code>
Variable	(Type) - Description
<code>guidedCal</code>	GuidedCalibration (object)
<code>t1a, t1b...</code>	(Variant) Port numbers in pairs - a one-dimensional array of Long integers.
	t1a, t1b (Thru1 - port A and port B)
	t2a, t2b (Thru2 - port A and port B)
	t3a, t3b (Thru3 - port A and port B)
Return Type	Variant - a one-dimensional array of Long integers.
Default	The most accurate port pairs for the cal.
Example	<pre>thruList = Array(1,2,1,3,1,4) guided.ThruPortList = thruList</pre> <p>'Sets the following three thru connections for a 4-port calibration: Thru 1 - ports 1 and 2 Thru 2 - ports 1 and 3 Thru 3 - ports 1 and 4</p>
C++ Syntax	<pre>HRESULT get_ThruPortList(VARIANT* portList); HRESULT put_ThruPortList(VARIANT portList);</pre>

Interface IGuidedCalibration

TimeOut Property

Description Sets and returns the Time out value for communication with the external device. An error is returned if communication with the device is not successful within this period of time.

VB Syntax *extDevices*.**TimeOut** = *value*

Variable [\(Type\)](#) - [Description](#)

extDevices An [ExternalDevice](#) (**object**)

value (Double) Time out in milliseconds.

Return Type Double

Default 20000 milliseconds (20 seconds)

Examples `extDevices.TimeOut = 1000 Write`

`value = extDevices.TimeOut 'Read`

C++ Syntax HRESULT get_TimeOut(Double* value);

HRESULT put_TimeOut(Double newVal);

Interface IExternalDevices

31-Jul-2009 MX New topic

Title Property

Description Writes or reads a custom title for the window. Newer entries replace (not append) older entries. Turn the title ON and OFF with [TitleState](#)

VB Syntax `win.Title = string`

Variable [\(Type\)](#) - Description

win A NaWindow (**object**)

string (**long**) - Title limited to 50 characters.

**Return
Type** String

Default Null

Examples `win.Title = "Hello World" 'Write`

`titl = win.Title 'Read`

C++ Syntax HRESULT get_Title(BSTR *title)
HRESULT put_Title(BSTR title)

Interface INAWindow

TitleState Property

Description Turns ON and OFF the window title. Write a window title with [Title](#)

VB Syntax `win.TitleState = state`

Variable [\(Type\)](#) - Description

win A NaWindow (**object**)

state (**boolean**)

True - Title ON

False - Title OFF

Return Type Boolean

Default False

Examples `win.TitleState = True 'Write`

`titlestate = win.TitleState 'Read`

C++ Syntax HRESULT get_TitleState(VARIANT_BOOL* bState)
HRESULT put_TitleState(VARIANT_BOOL bState)

Interface INAWindow

Tolerance Property

Description Sets and returns the tolerance value for leveling sweeps.

VB Syntax *RxLevel.Tolerance(srcPort) = value*

Variable [\(Type\)](#) - Description

RxLevel A [ReceiverLeveling](#) Object

srcPort (Long Integer) Source port for which to set the tolerance value for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

value (Double) Tolerance level in dB.

Return Type (Double)

Default .1 dB

Examples

```
rxLevel.Tolerance (1) = .5 ' Write  
value = rxLevel.Tolerance 2 ' Read
```

C++ Syntax

```
HRESULT get_Tolerance(long port, double* pVal);
```

```
HRESULT put_Tolerance(long port, double newVal);
```

TonePower Property

Description Sets and returns the power level of the Main Tones. Use with IMD sweep types:

- **naIMDToneCWSweep**,
- **naIMDToneCenterFreqSweep**
- **naIMDDeltaFrequencySweep**.

When tone power is coupled, setting either F1 or F2 power sets both.

VB Syntax *object*.**TonePower** (*tone*) = *value*

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IMSpectrum](#) Object

tone (Enum as NAIMDTonePowerID) Choose from:

0 - naIMDF1Power - F1 tone

1 - naIMDF2Power - F2 tone

value (Double) Tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

Return Type Double

Default -20 dBm

Examples

```
imd.TonePower(naIMDF1Power) = 0 'Write
```

```
value = imd.TonePower(naIMDF2Power) 'Read
```

C++ Syntax HRESULT get_TonePower(tagNAIMDTonePowerID naIMDF1, double * pVal);
 HRESULT put_TonePower(tagNAIMDTonePowerID naIMDF1, double newVal);

TonePowerStart Property

Description Sets and returns the start power level of the Main tones. Use with IMD sweep type=
naIMDTonePowerSweep.

When tone power is coupled, setting either F1 or F2 power sets both.

VB Syntax *object*.**TonePowerStart** (*tone*) = *value*

Variable [\(Type\)](#) - Description

object A [SweptIMD](#) or [IIMSpectrum](#) Object

tone (Enum as NAIMDTonePowerID) Choose from:

0 - naIMDF1Power - F1 tone

1 - naIMDF2Power - F2 tone

value (Double) Start power in dBm. Choose a value between +30 dBm and -30 dBm.

Return Type Double

Default -20 dBm

Examples `imd.TonePowerStart(naIMDF1Power) = 0 'Write`

`value = imd.TonePowerStart(naIMDF2Power) 'Read`

C++ Syntax HRESULT get_TonePowerStart(tagNAIMDTonePowerID naIMDF1, double * pVal);
HRESULT put_TonePowerStart(tagNAIMDTonePowerID naIMDF1, double newVal);

TotallIterations Property

Description	Returns the total number of iterations required by the last SMART sweep. Returns number of power points for a 2D sweep.
VB Syntax	<i>iter</i> = <i>gca</i> . TotallIterations
Variable	(Type) - Description
<i>iter</i>	(Integer) Variable to store the returned number of iterations.
<i>gca</i>	A GainCompression (object)
Return Type	Integer
Default	Not Applicable
Examples	<pre>data = gca.TotalIterations</pre>
C++ Syntax	HRESULT get_TotalIterations();
Interface	IGainCompression2

Last Modified:

9-May-2008 MX New topic

TotalNumberOfPoints Property

Description Read the total number of points a complete GCA measurement will generate.

- For 2D modes, this is Frequency * Power points
- For SMART Sweep, this is Frequency points.

The total can NOT exceed the [PNA maximum](#).

See [Frequency](#) and [Power](#) points.

VB Syntax *value* = *gca*.**TotalNumberOfPoints**

Variable [\(Type\)](#) - Description

value (**integer**) Variable to store the returned total number of points

gca A [GainCompression](#) (**object**)

Return Type Integer

Default 5226 (201 * 26)

Example `totPoints = gca.TotalNumberOfPoints 'Read`

C++ Syntax HRESULT get_TotalNumberOfPoints(int* pVal)

Interface IGainCompression

Last Modified:

11-Sep-2007 MX New topic

Touchscreen Property

Description Sets and reads the state of the PNA-X Touchscreen (ON and OFF).
This setting remains until changed again from the front-panel or remote command.

VB Syntax *app*.**Touchscreen** = *state*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

state (boolean)

False (0) - Disables use of Touchscreen

True (1) - Enables use of Touchscreen

Return Type Boolean

False - OFF

True - ON

Default **TRUE** when shipped from factory.

Examples

```
app.Touchscreen = True 'Write  
coupl = app.Touchscreen 'Read
```

C++ Syntax HRESULT put_Touchscreen(VARIANT_BOOL bState)

HRESULT get_Touchscreen(VARIANT_BOOL *bState)

Interface IApplication12

TraceMath Property

Description Performs math operations on the measurement object and the trace stored in memory. (There MUST be a trace stored in Memory to perform math. See [Meas.DataToMemory](#) method.)

VB Syntax *meas.TraceMath = value*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

value (enum **NAMathOperation**) - Choose from:

0 - naDataNormal

1 - naDataMinusMemory

2 - naDataPlusMemory

3 - naDataDivMemory

4 - naDataTimesMemory

Return Type NAMathOperation

Default Normal (0)

Examples

```
meas.TraceMath = naDataMinusMemory 'Write
```

```
mathOperation = meas.TraceMath 'Read
```

C++ Syntax HRESULT get_TraceMath(tagNAMathOperation* pMathOp)
HRESULT put_TraceMath(tagNAMathOperation mathOp)

Interface IMeasurement

TraceMax Property

Description Maximizes (isolates) or restores the active trace in the active window. When TraceMax is ON, the active trace is the **ONLY** trace on the display. All other traces are hidden.

VB Syntax `meas.TraceMax = state`

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

state (boolean) - Choose from:

True - Maximizes / isolates the active trace in the window.

False - Restores other traces to be viewed in the window.

Return Type Boolean

Default False

Examples `meas.TraceMax = True`

`state = meas.TraceMax`

C++ Syntax HRESULT get_TraceMax(VARIANT_BOOL bState)
HRESULT put_TraceMax(VARIANT_BOOL* bState)

Interface IMeasurement10

Last Modified:

26-Aug-2008 MX New topic

TraceTitle Property

Description	Writes and reads data for the trace title area. The trace title is embedded in the trace status field. Learn more about Trace Titles The title is turned ON and OFF using TraceTitleState .
VB Syntax	<i>meas</i> . TraceTitle = <i>value</i>
Variable	(Type) - Description
<i>meas</i>	A Measurement (object)
<i>value</i>	(string) - Title to be displayed. Any characters (no spaces), enclosed with quotes.
Return Type	String
Default	Not Applicable
Examples	<pre>meas.TraceTitle = "My new s11 measurement"</pre> <pre>title = TraceTitle 'Read'</pre>
C++ Syntax	HRESULT get_TraceTitle(BSTR *title); HRESULT put_TraceTitle(BSTR title);
Interface	IMeasurement8

Last Modified:

16-Jan-2007 MX New topic

TraceTitleState Property

Description Turns display of the Trace Title ON or OFF. When turned OFF, the previous trace title returns. Create a trace title using [TraceTitle Property](#)

VB Syntax *meas.TraceTitleState = value*

Variable [\(Type\)](#) - Description

meas A [Measurement \(object\)](#)

value (**boolean**) - Choose from:

True - Turns the trace title ON

False - Turns the trace title OFF

Return Type Boolean

Default False

Examples

```
meas.TraceTitleState = False
```

```
title = TraceTitleState 'Read
```

C++ Syntax HRESULT get_TraceTitleState(VARIANT_BOOL *isTitleON);
HRESULT put_TraceTitleState(VARIANT_BOOL isTitleON);

Interface IMeasurement8

Tracking Property

Description This property, when on, executes the search function ([marker.SearchFunction](#)) every sweep.

In effect, turning Tracking ON is the same as executing one of the immediate, one-time, "Search..." methods (such as [SearchMin](#), [SearchMax](#)) for every sweep.

VB Syntax `mark.Tracking = state`

Variable [\(Type\) - Description](#)

mark A [Marker](#) (object)

state (**boolean**) - Tracking state. Choose from:

False - Tracking OFF

True - Tracking ON

Return Type Boolean

Default False

Examples

```
mark.Tracking = False 'Write
```

```
markTracking = mark.Type 'Read
```

C++ Syntax HRESULT put_Tracking(VARIANT_BOOL bOn)
HRESULT get_Tracking(VARIANT_BOOL * pbOn)

Interface IMarker

TrackingChannel Property

Description Sets and returns the IMD channel number to which the IM Spectrum channel is coupled. Use [TrackingEnable](#) to enable tracking.

VB Syntax *ims.TrackingChannel = value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Integer) Existing IMD channel number to which frequency and power settings are coupled.

Return Type Long Integer

Default First existing IMD channel

Examples

```
ims.TrackingChannel = 1 'Write
```

```
value = ims.TrackingChannel 'Read
```

C++ Syntax HRESULT get_TrackingChannel(long *pVal)
HRESULT put_TrackingChannel(long newVal)

Interface IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

TrackingEnable Property

Description When an IMD channel exists, allows the IM Spectrum frequency and power setting to track (couple with) the IMD channel settings. Use [TrackingChannel](#) to set the channel number to track.

VB Syntax *ims*.**TrackingEnable** = *value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Boolean) Tracking state. Choose from:

True - IM Spectrum frequency and power settings track the IMD channel settings.

False - IM Spectrum frequency and power settings are specified in the IMS channel.

Return Type Boolean

Default False

Examples

```
ims.TrackingEnable = True 'Write
```

```
value = ims.TrackingEnable 'Read
```

C++ Syntax HRESULT get_TrackingEnable(VARIANT_BOOL* bValue)
HRESULT put_TrackingEnable(VARIANT_BOOL newVal)

Interface IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

TrackingManualStepEnable Property

Description Sets and returns the step sweep mode for the IM Spectrum channel.

VB Syntax *ims*.TrackingManualStepEnable = *value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Boolean) Choose from:

False - Automatic Step

True - Manual Step

Return Type Boolean

Default **False** - Automatic Step

Examples `ims.TrackingManualStepEnable = True 'Write`

`value = ims.TrackingManualStepEnable 'Read`

C++ Syntax HRESULT get_TrackingManualStepEnable(VARIANT_BOOL *bVal)
HRESULT put_TrackingManualStepEnable(VARIANT_BOOL newVal)

Interface IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

TrackingStepIndex Property

Description When [TrackingManualStepEnable](#) = True (Manual step), sets and returns the data point number at which the IM spectrum measurement occurs.

VB Syntax *ims.TrackingStepIndex* = *value*

Variable [\(Type\)](#) - Description

ims An [IMSpectrum](#) Object

value (Integer) Existing IMD channel number to which frequency and power settings are coupled.

Return Type Long Integer

Default 1

Examples `ims.TrackingStepIndex = 50 'Write`

`value = ims.TrackingStepIndex 'Read`

C++ Syntax HRESULT get_TrackingStepIndex(long *pVal)
HRESULT put_TrackingStepIndex(long newVal)

Interface IIMSpectrum

Last Modified:

19-Aug-2008 MX New topic

TriggerDelay Property

Description Sets and reads the trigger delay for all measurements (GLOBAL). This delay is only applied while in [app.Source = naTriggerSourceExternal](#) and [trigsetup.Scope = naGlobalTrigger](#) . After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for a channel only, use [ExternalTriggerDelay Property](#).

VB Syntax `app.TriggerDelay = value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value **Double**- Trigger delay value in seconds. Range is from 0 to 107

Return Type Double

Default 0

Examples

```
app.TriggerDelay = .003 'Write
```

```
delay = app.TriggerDelay 'Read
```

C++ Syntax HRESULT get_TriggerDelay(double *delay);

HRESULT put_TriggerDelay(double delay)

Interface IApplication

TriggerInPolarity Property

Description Specifies the polarity of the trigger IN signal.

- **AuxTrigger Object** - Sets the polarity to which the rear-panel AuxTrig IN responds.
- **PulseGenerator Object** - Sets the polarity of trigger to which the internal pulse generators will respond when being externally triggered. **Note:** This feature requires DSP version: **4.0 FPGA:34** or higher. [Learn more](#).

Note: Used on PNA-X ONLY.

VB Syntax *object.TriggerInPolarity = value*

Variable [\(Type\)](#) - Description

object An [AuxTrigger](#) (object) or

A [PulseGenerator](#) (object)

value (**enum NATriggerPolarity**) - Choose from:

naTriggerPositive PNA responds to rising edge or HIGH level

naTriggerNegative PNA responds to falling edge or LOW level.

Set Edge or Level triggering using [TriggerInType Property](#)

Return Type Enum

Default AuxTriggerIn Object - naTriggerNegative

PulseGenerator Object - naTriggerPositive. Also the polarity used when the PNA-X does not have the required DSP hardware

Examples `obj.TriggerInPolarity = naTriggerPositive 'Write`

`value = obj.TriggerInPolarity 'Read the value`

C++ Syntax HRESULT get_TriggerInPolarity(enum NATriggerPolarity *val);
HRESULT put_TriggerInPolarity(enum NATriggerPolarity val);

Interface IAuxTrigger

IPulseGenerator3

9-Dec-2009 Added PulseGenerator Object
5-Sep-2008 Added Note
14-Dec-2006 MX New topic

TriggerInType Property

Description Specifies the type of trigger input being supplied to the PNA.

- **AuxTrigger Object** - Sets the type to which the rear-panel AuxTrig IN responds.
- **PulseGenerator Object** - Sets the type of trigger to which the internal pulse generators will respond when being externally triggered. **Note:** This feature requires DSP version: **4.0 FPGA:34** or higher. [Learn more](#).

Note: Use on PNA-X ONLY.

VB Syntax *obj.TriggerInType = value*

Variable [\(Type\)](#) - Description

obj An [AuxTrigger](#) (object) or

A [PulseGenerator](#) (object)

value (enum NATriggerSignalType) Choose from:

naTriggerEdge PNA responds to the edge (rising or falling) of a signal

naTriggerLevel PNA responds to the level (HIGH or LOW) of a signal

Use [TriggerInPolarity](#) to set Positive or Negative polarity.

Return Type Enum

Default **naTriggerLevel** - Also the type used for the PulseGenerator Object when the PNA-X does not have the required DSP hardware

Examples

```
obj.TriggerInType = naTriggerEdge 'Write
```

```
value = obj.TriggerInType 'Read the value
```

C++ Syntax HRESULT get_TriggerInType(enum NATriggerSignalType *val);
HRESULT put_TriggerInType(enum NATriggerSignalType val);

Interface IAuxTrigger

IPulseGenerator3

9-Dec-2009 Added PulseGenerator obj.
5-Sep-2008 Added Note
14-Dec-2006 MX New topic

TriggerMode (ExtendedProperties) Property

Description Sets and returns the trigger mode for an external source.

VB Syntax `extSource.TriggerMode = value`

Variable [\(Type\)](#) - Description

extSource An [ExternalSource Object](#) (object)

value (enum NAExtDevTriggerMode) - Choose from:

0 - naExtDevTriggerModeCW

1 - naExtDevTriggerModeHW

Return Type Enum

Default **0 - naExtDevTriggerModeCW**

Examples `extSource.TriggerMode = naExtDevTriggerModeCW 'Write`

`tm = extSource.TriggerMode 'Read`

C++ Syntax HRESULT get_TriggerMode (tagNAExtDevTriggerMode *pMode)
HRESULT put_TriggerMode (tagNAExtDevTriggerMode newMode)

Interface IExternalSource

Last Modified:

8-Sep-2009 MX New topic

TriggerOutDuration Property

Description Specifies the width of the output pulse, which is the time that the Aux trigger output will be asserted.

VB Syntax *auxTrig.TriggerOutDuration = value*

Variable [\(Type\)](#) - Description

auxTrig An [AuxTrigger](#) (object)

value (**single**) - Duration value in seconds. Choose a value between 1E-6 and 1.

Return Type Double

Default 1E-6 sec

Examples `auxTrig.TriggerOutDuration = 1e-3 'Write`

`value = auxTrig.TriggerOutDuration 'Read the value`

C++ Syntax HRESULT get_TriggerOutDuration(double *val);
HRESULT put_TriggerOutDuration(double val);

Interface IAuxTrigger

Last Modified:

14-Dec-2006 MX New topic

TriggerOutInterval Property

Description Specifies how often a trigger output signal is sent.

VB Syntax `auxTrig.TriggerOutInterval = value`

Variable [\(Type\)](#) - Description

auxTrig An [AuxTrigger](#) (object)

value (single) - Choose from:

0 - naTriggerModePoint - a single data point is measured with each trigger signal the channel receives. Subsequent trigger signals continue to go to the channel in Point mode until the channel measurements are complete. This is effectively the same as [trigger point mode](#).

1 - naTriggerModeMeasurement - entire traces are swept with a trigger signal. which and how many traces depends on the Scope setting.

Return Type Enum

Default 1 - naTriggerModeMeasurement

Exaamples

```
auxTrig.TriggerOutInterval = naTriggerModeMeasurement 'Write  
value = auxTrig.TriggerOutInterval 'Read the value
```

C++ Syntax HRESULT get_TriggerOutInterval(enum NATriggerMode *val);
HRESULT put_TriggerOutInterval(enum NATriggerMode val);

Interface IAuxTrigger

Last Modified:

14-Dec-2006 MX New topic

TriggerOutPolarity Property

Description Specifies the polarity of the trigger output signal being supplied by the PNA.

VB Syntax `auxTrig.TriggerOutPolarity = value`

Variable [\(Type\)](#) - Description

auxTrig An [AuxTrigger](#) (object)

value (enum **NATriggerPolarity**) - Choose from:

naTriggerPositive PNA sends positive going (active HIGH) pulse.

naTriggerNegative PNA sends negative going (active LOW) pulse.

Return Type Enum

Default

Exaamples `auxTrig.TriggerOutPolarity = naTriggerPositive 'Write`

`value = auxTrig.TriggerOutPolarity 'Read the value`

C++ Syntax `HRESULT get_TriggerOutPolarity(enum NATriggerPolarity *val);`
`HRESULT put_TriggerOutPolarity(enum NATriggerPolarity val);`

Interface IAuxTrigger

Last Modified:

14-Dec-2006 MX New topic

TriggerOutPosition Property

Description Specifies whether the Aux trigger out signal is sent Before or After the acquisition.

VB Syntax `auxTrig.TriggerOutPosition = value`

Variable [\(Type\)](#) - Description

auxTrig An [AuxTrigger](#) (object)

value (enum NATriggerPosition) Choose from:

naTriggerOutBeforeAcquire Use if the external device needs to be triggered before the data is acquired, such as a power meter.

naTriggerOutAfterAcquire Use if the external device needs to be triggered just after data has been acquired, such as an external source. This could be more efficient since it allows the external device to get ready for the next acquisition at the same time as the PNA.

Return Type Enum

Default **naTriggerOutAfterAcquire**

Examples `auxTrig.TriggerOutPosition = naTriggerOutAfterAcquire 'Write`

`value = auxTrig.TriggerOutPosition 'Read the value`

C++ Syntax HRESULT get_TriggerOutPosition(enum NATriggerPosition *val);
HRESULT put_TriggerOutPosition(NATriggerPosition val);

Interface IAuxTrigger

Last Modified:

14-Dec-2006 MX New topic

TriggerOutputEnabled Property - **Superseded**

Description	Use AUX.Enable to enable AUXI/O triggering. Use Trigger Source= External to enable Meas Trig Ready output. Enables the PNA to send trigger signals out the rear-panel TRIGGER OUT connector.
VB Syntax	<i>trigsetup</i> . TriggerOutputEnabled = <i>boolean</i>
Variable	(Type) - Description
<i>trigsetup</i>	A TriggerSetup2 (object)
<i>boolean</i>	Choose from: False - PNA does NOT send output trigger signals. True - PNA sends output trigger signals.
Return Type	Boolean
Default	False
Examples	<pre>trigsetup.TriggerOutputEnabled = True 'Write</pre> <pre>atba = trigsetup.TriggerOutputEnabled 'Read</pre>
C++ Syntax	HRESULT get_TriggerOutputEnabled(BOOL *pVal); HRESULT put_TriggerOutputEnabled(BOOL newVal);
Interface	ITriggerSetup2

Last modified:

13-Apr-2012 Superseded by new commands (9.50)

TriggerPort Property

Description Sets and returns the PNA port through which an external source is to be triggered.

VB Syntax *extSource*.**TriggerPort** = *value*

Variable [\(Type\)](#) - Description

extSource An [ExternalSource Object](#) (object)

value (enum **NAExtDevTriggerPort**) - Choose from:

0 - naExtDevTriggerPortBNC1 (PNA 'C' models)

1 - naExtDevTriggerPortAux1 (PNA-X models)

2 - naExtDevTriggerPortAux2 (PNA-X models)

Return Type Enum

Default For PNA 'C' models - **BNC1**

For PNA-X models - **Aux1**

Examples

```
extSource.TriggerPort = 1 'Write
```

```
trigpt = extSource.TriggerPort 'Read
```

C++ Syntax HRESULT get_TriggerPort (tagNAExtDevTriggerPort *pValue)
HRESULT put_TriggerPort (tagNAExtDevTriggerPort newVal)

Interface IExternalSource

Last Modified:

31-Jul-2009 MX New topic

TuningIFBW Property

Description Set the IF Bandwidth for Broadband and Precise tuning sweeps.

VB Syntax *obj*.**TuningIFBW** = *value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Double**) IF Bandwidth

Return Type (**Double**)

Default 30 kHz

Examples `embedLO.TuningIFBW = 10e3 'write`

`value = embedLO.TuningIFBW 'read`

C++ Syntax HRESULT get_TuningIFBW(double* ifbw);

HRESULT put_TuningIFBW(double ifbw);

Interface IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object

18-Apr-2007 MX New topic

TuningMode Property

Description Sets and returns the method used to determine the embedded LO Frequency.

VB Syntax *obj*.**TuningMode** = *value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Enum as NAEmbeddedLOTuningMode**)

Tuning mode. Choose from:

0 - naEmbeddedLOTuningMode_Broadband_And_Precise

1 - naEmbeddedLOTuningMode_Precise_Only

2 - naEmbeddedLOTuningMode_None

Return Type (**Enum**)

Default 0 - naEmbeddedLOTuningMode_Broadband_And_Precise

Examples `embedLO.TuningMode = naEmbeddedLOTuningMode_None 'write`

`value = embedLO.TuningMode 'read`

C++ Syntax HRESULT get_TuningMode(enum NAEmbeddedLOTuningMode* mode);

HRESULT put_TuningMode(enum NAEmbeddedLOTuningMode mode);

Interface IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object

18-Apr-2007 MX New topic

TuningSweepInterval Property

Description Set how often a tuning sweep is performed.

VB Syntax *obj*.**TuningSweepInterval** = *value*

Variable [\(Type\)](#) - Description

obj An [EmbeddedLO](#) (**object**) or

A [ConverterEmbeddedLO](#) (**object**)

value (**Long**) Tuning sweep interval.

Return Type (**Long**)

Default 1

Examples

```
embedLO.TuningSweepInterval = 3 'write .. tuning is performed  
every third measurement sweep
```

```
value = embedLO.TuningSweepInterval 'read
```

C++ Syntax HRESULT get_TuningSweepInterval(long* interval);

HRESULT put_TuningSweepInterval(long interval);

Interface IEmbeddedLO

Last Modified:

12-Aug-2009 Added ConvEmbedLO object

18-Apr-2007 MX New topic

TwoPointGroupDelayAperture Property

Description Sets the default group delay aperture setting.

VB Syntax *pref*.TwoPointGroupDelayAperture = *value*

Variable [\(Type\)](#) - Description

pref A [Preferences](#) (object)

value (**Boolean**) - Choose from:

True - Set the default group delay aperture setting to two points.

False - Set the default group delay aperture setting to 11 points.

Return Type Boolean

Default False

Examples `pref.TwoPointGroupDelayAperture = True 'Write`

`gda = pref.TwoPointGroupDelayAperture 'Read`

C++ Syntax HRESULT get_TwoPointGroupDelayAperture(VARIANT_BOOL* pVal);
HRESULT put_TwoPointGroupDelayAperture(VARIANT_BOOL pVal);

Interface IPreferences11

Last Modified:

1-Mar-2010 MX New topic

TriggerMode Property

Description These settings determine what EACH signal will trigger.

Note: Setting Point and EverySweep mode forces [Trigger.Scope](#) = `naChannelTrigger`.

VB Syntax `chan.TriggerMode = value`

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

value (enum `NATriggerMode`) - Choose from:

0 - `naTriggerModePoint` - Each Manual or External trigger signal causes one data point to be measured.

1 - `naTriggerModeMeasurement` (**superseded** - still works but replaced with a more descriptive enum)

1 - `naTriggerModeChannel` - Each trigger signal causes **ALL traces** in that channel to be swept.

2 - `naTriggerModeEverySweep` - Each Manual or External trigger signal causes **ALL traces that share a source port** to be swept.

3 - `naTriggerModeTrace` - Allowed ONLY when [PointSweepState](#) is enabled. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously.

Return Type Long Integer

Default **1 - `naTriggerModeChannel`**

Examples `chan.TriggerMode = naTriggerModePoint 'Write`

`trigtyp = chan.TriggerMode 'Read`

C++ Syntax `HRESULT get_TriggerMode (tagNATriggerMode *pMode)`
`HRESULT put_TriggerMode (tagNATriggerMode newMode)`

Interface `IChannel`

6-Nov-2007 Added new sweep mode

TriggerSignal Property - Superseded

Description **Note:** This command has been replaced by [Source](#) Property

Sets or returns the trigger source.

VB Syntax *app*.TriggerSignal = *value*

Variable [\(Type\)](#) - Description

app An Application (**object**)

value (enum NATriggerSignal) - Choose from:

0 - naTriggerInternal - free run

1 - naTriggerExternalPositive - a trigger signal is generated when a TTL high is sensed on the external trigger pin of the Aux IO connector

2 - naTriggerExternalNegative - a trigger signal is generated when a TTL low is sensed on the external trigger pin of the Aux IO connector.

3 - naTriggerManual - manual trigger source; use *app*.[ManualTrigger](#) to send a trigger signal.

4 - naTriggerExternalHigh - a trigger signal is generated when a TTL high is sensed on the external trigger pin of the Aux IO connector

5 - naTriggerExternalLow - a trigger signal is generated when a TTL low is sensed on the external trigger pin of the Aux IO connector

Return Type Long Integer

Default naTriggerInternal

Examples

```
app.TriggerSignal = naTriggerExternalPositive 'Write
trigsig = app.TriggerSignal 'Read
```

C++ Syntax HRESULT get_TriggerSignal(tagNATriggerSignal *pSignal)
 HRESULT put_TriggerSignal(tagNATriggerSignal signal)

Interface IApplication

TriggerType Property - Superseded

Description **Note:** This property has been replaced with [Scope](#) Property.

Sets or returns the trigger type which determines the scope of a trigger signal.

VB Syntax *app.TriggerType = value*

Variable [\(Type\)](#) - Description

app An Application (**object**)

value (**enum NATriggerType**) - Trigger type. Choose from:

0 - naGlobalTrigger - a trigger signal is applied to all triggerable channels

1 - naChannelTrigger - a trigger signal is applied to the current channel. The next trigger signal will be applied to the next channel; not necessarily channel 1-2-3-4.

Return Type Long Integer

Default naGlobalTrigger

Examples

```
app.TriggerType = naGlobalTrigger 'Write
trigtyp = app.TriggerType 'Read
```

C++ Syntax HRESULT get_TriggerType(tagNATriggerType *pTrigger)
HRESULT put_TriggerType(tagNATriggerType trigger)

Interface IApplication

Type (calstd) Property

Description	Sets and Returns the type of calibration standard.
VB Syntax	<i>calstd.Type</i> = <i>value</i>
Variable	(Type) - Description
<i>calstd</i>	A CalStandard (object). Use calKit. GetCalStandard to get a handle to the standard.
<i>value</i>	(enum NACalStandardType) -Choose from: 0 - naOpen 1 - naShort 2 - naLoad 3 - naThru
Return Type	Long Integer
Default	Not Applicable
Examples	<pre>calstd.Type = naOpen 'Write</pre> <pre>standardtype = calstd.Type 'Read</pre>
C++ Syntax	HRESULT get_Type(tagNACalStandardType *pVal) HRESULT put_Type(tagNACalStandardType newVal)
Interface	ICalStandard

Type (testset) Property

Description	Returns the testset model number.
VB Syntax	<i>tset.Type model</i>
Variable	(Type) - Description
<i>model</i>	(String) Variable to return the Test set model
<i>tset</i>	A TestsetControl object.
	Obtained from the ExternalTestsets collection.
Return Type	String
Default	None
Examples	<code>testset.type model</code> See External Testset Program
C++ Syntax	HRESULT get_Type(BSTR *pType);
Interface	ITestsetControl

TZImag Property

Description Sets and Returns the TZImag value (the Imaginary Terminal Impedance value) for the calibration standard. Only applicable when "[Type](#)" is set to **naArbitraryImpedance**.

To set the other resistance values, use [TZReal](#)

VB Syntax `calstd.TZImag = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for TZImag in Ohms

Return Type Single

Default Not Applicable

Examples `calstd.TZImag = 15 'Write the value of TZImag to 15 Ohms`

`imp0 = calstd.TZImag 'Read the value of TZImag`

C++ Syntax HRESULT get_TZImag(float *pVal);
HRESULT put_TZImag(float newVal);

Interface ICalStandard2

TZReal Property

Description Sets and Returns the TZReal value (the real Terminal Impedance value) for the calibration standard. Only applicable when "[Type](#)" is set to **naArbitraryImpedance**.

To set the other resistance values, use [TZImag](#)

VB Syntax `calstd.TZReal = value`

Variable [\(Type\)](#) - Description

calstd A CalStandard (**object**). Use calKit.[GetCalStandard](#) to get a handle to the standard.

value (**single**) - Value for TZReal in Ohms

**Return
Type** Single

Default Not Applicable

Examples `calstd.TZReal = 15 'Write the value of TZReal to 15 Ohms`

`imp0 = calstd.TZReal 'Read the value of TZReal`

C++ Syntax HRESULT get_TZReal(float *pVal);
HRESULT put_TZReal(float newVal);

Interface ICalStandard2

Read-only

UnusedChannelNumbers Property

Description Returns an array of channel numbers that are NOT in use. An unused channel has NO measurements subscribed to it.

VB Syntax *chanNumbers* = *chans*.UnusedChannelNumbers (*NumberOfChannels*)

Variable [\(Type\)](#) - Description

chanNumbers Variable array to store the returned channel numbers

chans A [Channel collection](#) (object)

NumberOfChannels (**Long Integer**) Number of channels that you are requesting.

Return Type One-dimensional array of long integers. The size of the array is specified by the *NumberOfChannels* parameter.

Default Not Applicable

Examples `chanNumbers = chans.UnusedChannelNumbers(5)`

C++ Syntax HRESULT get_UnusedChannelNumbers(long numberRequested, VARIANT* channelNumbers);

Interface IChannels2

USBPowerMeterCatalog Property

Description	Returns the ID string of power meters / sensors that are connected to the PNA USB. Use the list to select a power sensor for a source power cal.
VB Syntax	<i>list</i> = <i>pwrCal</i> . USBPowerMeterCatalog
Variable	(Type) - Description
<i>list</i>	(String) Variable to store the returned list of USB power meters.
<i>pwrCal</i>	(object) – A SourcePowerCalibrator (object)
Return Type	Comma-delimited strings. Two sensor strings are separated by a semicolon.
Default	Not Applicable
Examples	<pre>Set pwrCal = pna.SourcePowerCalibrator list = pwrCal.USBPowerMeterCatalog 'Read</pre>
C++ Syntax	HRESULT get_USBPowerMeterCatalog(BSTR *pUSBList);
Interface	ISourcePowerCalibrator6

Last Modified:

24-Feb-2009 Updated with semicolon
11-Jul-2007 MX New topic

UseCalWindow Property - **Obsolete**

Description Replaced with [Custom Cal Window](#) commands.

Turns Calibration window ON or OFF during a calibration.
[Learn more.](#)

VB Syntax *guidedCal.UseCalWindow = value*

Variable [\(Type\) - Description](#)

guidedCal [GuidedCalibration](#) (object)

value **(Boolean)**

True Show calibration window

False Hide calibration window

Return Type **Boolean**

Default True

Example `guided.UseCalWindow = True`

C++ Syntax HRESULT get_UseCalWindow(VARIANT_BOOL* val);
HRESULT put_UseCalWindow(VARIANT_BOOL newVal);

Interface IGuidedCalibration

Last Modified:

27-Jan-2012 Obsolete
12-Sep-2007 MX New topic

Read-only

UsedChannelNumbers Property

Description	Returns an array of channel numbers that are in use. A used channel has at least one measurement subscribed to it
VB Syntax	<i>chanNumbers</i> = <i>chans</i> .UsedChannelNumbers
Variable	(Type) - Description
<i>chanNumbers</i>	Variable array to store the returned channel numbers
<i>chans</i>	A Channel collection (object)
Return Type	One-dimensional array of long integers
Default	Not Applicable
Examples	<code>chanNumbers = chans.UsedChannelNumbers</code>
C++ Syntax	HRESULT get_UsedChannelNumbers(VARIANT* channelNumbers);
Interface	IChannels2

Read/Write

UseMultipleSensors Property

Description	Enable and disable the use of multiple power sensors during a guided calibration.
VB Syntax	<i>guidPwrSensors.UseMultipleSensors = value</i>
Variable	(Type) - Description
<i>guidPwrSensors</i>	GuidedCalibrationPowerSensors Collection
<i>value</i>	(Boolean)
	True Use multiple power sensors
	False Do NOT use multiple power sensors
Return Type	Boolean
Default	False
Examples	<pre>guidedPwrSensors.UseMultipleSensors = True</pre> <pre>value = guidedPwrSensors.UseMultipleSensors</pre>
C++ Syntax	<pre>HRESULT get_UseMultipleSensors(VARIANT_BOOL* val);</pre> <pre>HRESULT put_UseMultipleSensors(VARIANT_BOOL newVal);</pre>
Interface	IGuidedCalibrationPowerSensors

Last Modified:

8-Feb-2011 New topic

UsePowerLossSegments Property

Description	Specifies if subsequent power readings will use of the loss table. (PowerLossSegments).
VB Syntax	<i>pwrCal.UsePowerLossSegments = value</i>
Variable	(Type) - Description
<i>pwrCal</i>	A SourcePowerCalibrator (object)
	A PowerSensorAsReceiver (Object)
<i>value</i>	(boolean)
	False – Do not use loss table
	True – Use loss table
Return Type	Boolean
Default	False
Examples	<pre>pwrSens.UsePowerLossSegments = True 'Write lossTableState = pwrSens.UsePowerLossSegments 'Read</pre>
C++ Syntax	<pre>HRESULT put_UsePowerLossSegments(VARIANT_BOOL bState); HRESULT get_UsePowerLossSegments(VARIANT_BOOL *bState);</pre>
Interface	ISourcePowerCalibrator IPowerSensorAsReceiver

Last Modified:

25-Aug-2009 MX New topic

UsePowerSensorFrequencyLimits Property

Description	Specifies if subsequent calls to the AcquirePowerReadings method will observe frequency values of the MinimumFrequency and MaximumFrequency properties.
VB Syntax	<i>pwrCal</i> .UsePowerSensorFrequencyLimits = <i>value</i>
Variable	(Type) - Description
<i>pwrCal</i>	(object) – A SourcePowerCalibrator (object)
<i>value</i>	(boolean) - False – Do not use power sensor frequency limits. An acquisition will use just one power sensor for the entire sweep, regardless of frequency. True – Use power sensor frequency limits. A requested acquisition will only succeed for those frequency points which fall between the MinimumFrequency and MaximumFrequency values of that PowerSensor. An acquisition will pause in mid-sweep if the frequency is about to exceed the MaximumFrequency value. When the sweep is paused in this manner, a sensor connected to the other channel input of the power meter can be connected to the measurement port in place of the previous sensor, and then the sweep completed by another call to AcquirePowerReadings. However, the MaximumFrequency specified for the second sensor would need to be sufficient for the sweep to complete.
Return Type	Boolean
Default	False
Examples	<pre>Set powerCalibrator = pna.SourcePowerCalibrator powerCalibrator.UsePowerSensorFrequencyLimits = True 'Write FreqCheck = powerCalibrator.UsePowerSensorFrequencyLimits 'Read</pre>
C++ Syntax	HRESULT put_UsePowerSensorFrequencyLimits(VARIANT_BOOL bState); HRESULT get_UsePowerSensorFrequencyLimits(VARIANT_BOOL *bState);
Interface	ISourcePowerCalibrator

UserCalsetPrefix Property

Description Sets and returns the prefix to be used when saving User Cal Sets that result from the Cal All session. The Meas Class and channel number are appended to this prefix for each calibrated channel.

Use [GeneratedCalsets](#) to read the saved cal set names.

If a Cal Set prefix is NOT set, the cal data for each channel will be saved only to cal registers.

VB Syntax `calAll.UserCalsetPrefix = prefix`

Variable [\(Type\)](#) - Description

`calAll` A [CalibrateAllChannels](#) (object)

`prefix` (String) User CalSet prefix.

Return Type String

Default Not Applicable

Examples `calAll.UserCalsetPrefix = "MyCalSet" 'Set`

`csPrefix = calAll.UserCalsetPrefix 'Returns the CalSet prefix`

C++ Syntax HRESULT get_UserCalsetPrefix (BSTR calsetPrefix);

HRESULT put_UserCalsetPrefix (BSTR* calsetPrefix);

Interface ICalibrateAllChannels

Last modified:

4-Jan-2012 New topic

UserRange Property

Description Assigns the marker to the specified User Range. This restricts the marker's x-axis travel to the User Range span, specified with [Start](#) and [Stop](#) values.

- Each channel has **16** user ranges.
- Markers and trace statistics can be restricted to any user range.
- More than one marker can occupy a user range.
- User ranges can overlap. For example:
 - User range 1: 3 GHz to 5 GHz
 - User range 2: 4 GHz to 6 GHz

Note: User ranges are especially useful in restricting marker searches to specific areas of the measurement.

VB Syntax `mark.UserRange = value`

Variable [\(Type\)](#) - Description

mark A [Marker](#) (object)

value (**long integer**) - User Range. Choose any number between 0 and 16 (0=Full Span)

Return Type Long Integer

Default 0 - Full Span

Examples `mark.UserRange = 1 'Write`

`UseRnge = mark.UserRange 'Read`

C++ Syntax HRESULT get_UserRange(long *pRangeNumber)
HRESULT put_UserRange(long lRangeNumber)

Interface IMarker

UserRangeMax Property

Description **Note:** This property on the Channel Object is superseded by the same property on the Measurement Object.

Sets the stimulus stop value for the specified User Range.

VB Syntax *chan*.**UserRangeMax**(*domainType*,*Rnum*) = *value* - **Superseded**

meas.**UserRangeMax**(*Rnum*) = *value*

mark.**UserRangeMax**(*Rnum*) = *value*

Variable **(Type) - Description**

chan A [Channel](#) (object) - **Superseded**

meas A [Measurement](#) (object)

mark A [Marker](#) (object)

To assign a marker to a User Range, use the [UserRange Property](#).

domainType This argument is no longer required. The domain type is inferred by the measurement or marker.

(enum NADomainType) - Choose from:

0 - naDomainFrequency

1 - naDomainTime

2 - naDomainPower

Rnum (**long integer**) - User Range number. Choose any number between 1 and 16 (0=Full Span)

value (**double**) - Stop value. Choose any number within the full span of the channel.

Return Type Double

Default The current stimulus setting for the channel

Examples

```
mark.UserRangeMax(1) = 3e9 'Write
```

```
meas.UserRangeMax(1) = 3e9 'Write
```

```
UserRngeMax = mark.UserRangeMax(1) 'Read
```

```
UserRngeMax = meas.UserRangeMax(2) 'Read
```

C++ Syntax HRESULT put_UserRangeMax(long rangeNumber, double max Value)

HRESULT get_UserRangeMax(long rangeNumber, double *max Value)

Interface IMeasurement

IMarker

Last Modified:

3-May-2011 Updated for measurement object

UserRangeMin Property

Description Sets the stimulus start value for the specified User Range.

This property uses different arguments for the channel and marker objects.

VB Syntax *chan*.**UserRangeMin**(*domainType*,*range*) = *value*

or

mark.**UserRangeMin**(*range*) = *value*

Variable [\(Type\)](#) - Description

chan A Channel (**object**)

mark A [Marker](#) (**object**)

To assign a marker to a User Range, use the [UserRange Property](#).

domainType **Note:** The Marker object does not require the *domainType* argument.

(**enum NADomainType**) Type of sweep currently implemented on the channel - Choose from:

0 - naDomainFrequency

1 - naDomainTime

2 - naDomainPower

3 - naDomainPhase

range (**long**) - User Range number. Choose any number between **1** and **16** (0=Full Span)

value (**double**) - Start value. Choose any number within the full span of the analyzer

Return Type Double

Default The current stimulus setting for the channel

Examples

```
mark.UserRangeMin(1) = 3e9 'Write
chan.UserRangeMin(naDomainFrequency,1) = 3e9 'Write
```

```
UseRngeMin = mark.UserRangeMin 'Read
```

```
UseRngeMin = chan.UserRangeMin 'Read
```

C++ Syntax HRESULT put_UserRangeMin(tagNADomainType domain, long rangeNumber, double minValue)
HRESULT get_UserRangeMin(tagNADomainType domain, long rangeNumber, double *minValue)

Interface IChannel

Last Modified:

3-May-2011 Updated for phase

UserDescriptionOfPNA Property

Description Sets and reads a description of the PNA used to perform the User Characterization. This description is stored with the characterization in the ECal module.

Set this description before sending [Initialize](#) or the default (empty string) will be used.

VB Syntax *userChar*.UserDescriptionOfPNA = *value*

Variable [\(Type\) - Description](#)

userChar An [ECalUserCharacterizer](#) Object

value (String) Descriptive text, limited to 14 characters maximum.

Return Type String

Default ""(Empty String)

Examples

```
userChar.UserDescriptionOfPNA = "My PNA"
```

C++ Syntax HRESULT get_UserDescriptionOfPNA(BSTR *info);

HRESULT put_UserDescriptionOfPNA(BSTR info);

Interface IECalUserCharacterizer

Last Modified:

2-Nov-2008 New topic (8.33)

UserName Property

Description Sets and reads the description of the person and/or company who is producing the ECal user characterization. This description is stored with the characterization in the ECal module.

Set this description before sending [Initialize](#) or the default (empty string) will be used.

VB Syntax *userChar.UserName* = *value*

Variable [\(Type\)](#) - [Description](#)

userChar An [ECalUserCharacterizer](#) Object

value (String) Descriptive text, limited to 19 characters maximum.

Return Type String

Default "" (Empty String)

Examples

```
userChar.UserName = "John Doe, Acme Inc."
```

C++ Syntax HRESULT get_UserName(BSTR *name);

HRESULT put_UserName(BSTR name);

Interface IECalUserCharacterizer

Last Modified:

2-Nov-2008 New topic (8.33)

UserPresetEnable Property

Description 'Checks' and 'clears' the enable box on the User Preset dialog box. This only affects subsequent Presets from the front panel user interface.

Regardless of the state of the User Preset Enable checkbox, the [app.Preset](#) command will always preset the PNA to the factory preset settings, and [app.UserPreset](#) will always perform a User Preset.

VB Syntax `app.UserPresetEnable = state`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

state (**boolean**) Front Panel User Preset State. Choose from:

False – User Preset OFF

True – User Preset ON

Return Type Boolean

Default False

Examples `app.UserPresetEnable = True 'Write`

`upreset = app.UserPresetEnable 'Read`

C++ Syntax HRESULT get_UserPresetEnable(VARIANT_BOOL *pVal)
HRESULT put_UserPresetEnable(VARIANT_BOOL newVal)

Interface IApplication6

Valid Property

Description	Returns a boolean value to indicate if the current equation on the measurement is valid. For equation processing to occur, the equation must be valid and ON.
VB Syntax	<i>IsValid</i> = <i>eq</i> . Valid
Variable	(Type) - Description
<i>good</i>	(Boolean) Variable to store the returned value.
	True (1) - equation is valid
	False (0) - equation is NOT valid
<i>eq</i>	Equation (object)
Return Type	Boolean
Default	Not Applicable
Examples	<code>IsValid = eq.Valid 'Read</code>
C++ Syntax	HRESULT get_Valid(Boolean *equation)
Interface	IEquation

Last Modified:

18-Jun-2007 New topic

ValidConnectorTypes Property

Description Returns a list of all connector types for which there are calibration kits. Looks for connector types in mechanical cal kits, within PNA disk memory, and within the attached ECal Module memory.

Here are the more common connector types:

W-band waveguide	Type B	1.00 mm female
V-band waveguide	Type A (50) female	1.00 mm male
U-band waveguide	Type A (50) male	1.85 mm male
R-band waveguide	Type F (75) female	1.85 mm female
Q-band waveguide	Type F (75) male	2.92 mm female
K-band waveguide	Type N (75) female	2.92 mm male
P-band waveguide	Type N (75) male	APC 2.4 female
X-band waveguide	Type N (50) female	APC 2.4 male
7-16 female	Type N (50) male	APC 3.5 female
7-16 male		APC 3.5 male
		APC 7

VB Syntax *value* = *obj*.ValidConnectorTypes

Variable [\(Type\) - Description](#)

value (Variant) List of connector types

obj Any of the following:

[ECalUserCharacterizer](#) (object)

[GuidedCalibration](#) (object)

[SMCType](#) (object)

[VMCType](#) (object)

Return Type Variant

Default Not Applicable

Examples `value = SMC.ValidConnectorTypes`

C++ Syntax `HRESULT get_ValidConnectorTypes(VARIANT* connectorTypes);`

Interface IGuidedCalibration

SMCType

VMCType

Last Modified:

23-Feb-2011 Added list

1-Sep-2009 Added ECal User and within disk memory (A.09.00)

Value Property

Description Write or read a value (setting) for the current element.

This command is used to set both RF and IF Path Configuration.

- See [RF Path Configuration \(elements, value\)](#)
- See [IF Path Configuration \(elements,value\)](#)

VB Syntax *pathElement*.**Value** = *value*

Variable [\(Type\)](#) - Description

pathElement A [PathElement](#) (object)

value **(String)** Value for the element. Use *pathElement.Values* to return a list of valid settings for this element.

Return Type String

Default Not Applicable

Examples See Examples:

- [IFPathConfiguration Setup](#)
- [RF PathConfiguration Example](#)

C++ Syntax HRESULT get_Value(BSTR* pValue);

HRESULT put_Value(BSTR value);

Interface IPathElement

Last Modified:

27-Mar-2012 Several edits

14-Dec-2006 MX New topic

Values Property

Description Returns an array of valid settings that can be used with the element object.

See a [list of configurable elements and settings](#) for various PNA models.

VB Syntax *values* = *pathElement*.**Values**

Variable [\(Type\)](#) - [Description](#)

values **(Variant array)** Variable to store the array of valid settings for the element.

pathElement A [PathElement](#) **(object)**

Return Type Variant array

Default Not Applicable

Examples `settings=pathElement.Values`

C++ Syntax HRESULT Values(VARIANT* pValues);

Interface IPathElement

Last Modified:

14-Dec-2006 MX New topic

VelocityFactor Property

Description Sets the velocity factor to be used with Electrical Delay, Port Extensions, and Time Domain marker distance calculations.

VB Syntax `app.VelocityFactor = value`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

value (double) - Velocity factor. Choose a number between: **0** and **10**
(.66 polyethylene dielectric; .7 PTFE dielectric)

Return Type Double

Default 1

Examples `app.VelocityFactor = .66 'Write`

`RelVel = app.VelocityFactor 'Read`

C++ Syntax HRESULT get_VelocityFactor(double *pVal)
HRESULT put_VelocityFactor(double newVal)

Interface IApplication

View Property

Description Sets (or returns) the type of trace displayed on the screen.

VB Syntax `meas.View = value`

Variable [\(Type\)](#) - Description

meas A measurement (**object**)

value (**enum NAView**) - Type of trace. Choose from:

0 - naData

1 - naDataAndMemory

2 - naMemory

3 - naNoTrace

Note: The **naData** trace may reflect the result of a [TraceMath](#) operation.

Return Type NAView

Default naData

Examples `meas.View = naData 'Write`

`trceview = meas.View 'Read`

C++ Syntax HRESULT get_View(tagNAView* pView)
HRESULT put_View(tagNAView newView)

Interface IMeasurement

Visible Property

Description Makes the Network Analyzer application visible or not visible. In the Not Visible state, the analyzer cycle time for making measurements can be significantly faster because the display does not process data.

VB Syntax `app.Visible = state`

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

state (**boolean**)

False - Network Analyzer application **NOT** visible

True - Network Analyzer application **IS** visible

Return Type Boolean

Default True

Examples

```
app.Visible = False 'Write
```

```
vis = app.Visible 'Read
```

C++ Syntax HRESULT get_Visible(VARIANT_BOOL * bVisible)
HRESULT put_Visible(VARIANT_BOOL bVisible)

Interface IApplication

WGCutoffFreq Property

Description Sets or returns the value of the waveguide cut off frequency.

VB Syntax *meas.WGCutoffFreq = value*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

value (**double**) - Frequency in Hertz.

Return Type Double

Default Not Applicable

Examples `Print meas.WGCutoffFreq 'prints the value of the waveguide cut off frequency`

C++ Syntax `HRESULT get_WGCutoffFreq(double *pVal);`
`HRESULT put_WGCutoffFreq(double newVal);`

Interface IMeasurement2

WideBandDectectionState Property

Description Set and read the pulse mode detection method.

VB Syntax *pulseMeas.WideBandDectectionState = bool*

Variable [\(Type\)](#) - Description

pulseMeas A [PulseMeasurementControl](#) (object)

bool **False** - Narrowband mode.

True - Wideband mode

Return Type Boolean

Default Based on pulse width.

Examples `pulse.WideBandDectectionState = True 'Write`

`value = pulse.WideBandDectectionState 'Read`

C++ Syntax HRESULT get_WideBandDectectionState(VARIANT_BOOL *pVal);

HRESULT put_WideBandDectectionState(VARIANT_BOOL newVal);

Interface IPulseMeasurementControl

Last Modified:

11-Mar-2010 New topic

Width Property

Description Sets the pulse width - the amount of time that the pulse is ON.

VB Syntax *pulse*.**Width** (*n*) = *value*

Variable [\(Type\)](#) - Description

pulse A [PulseGenerator](#) (**object**)

n (**Integer**) Pulse generator number. Choose from 0 to 4.

0 is the generator that pulses the ADC.

value (**Double**) Pulse width in seconds. Choose a value from about 33ns to about 70 seconds.

Return Type Double

Default 1e-4 sec

Examples `pulse.Width = 1ms 'Write`

`value = pulse.Width 'Read`

C++ Syntax HRESULT get_Width (integer pulse, double* width);

HRESULT put_Width (integer pulse, double width);

Interface IPulseGenerator

2-Jan-2007 MX New topic

Read-only

WindowNumber Property

Description	Returns the window number. You might use this property to identify a particular window so that you can create a new Measurement in that window.
VB Syntax	<i>value</i> = <i>win</i> . WindowNumber
Variable	(Type) - Description
<i>win</i>	A NAWindow (object)
<i>value</i>	(long integer) - Variable to store the returned window number
Return Type	Long Integer
Default	Not Applicable
Examples	<code>value = app.ActiveNAWindow.WindowNumber</code>
C++ Syntax	HRESULT (long* windowNumber);
Interface	INAWindow

WindowState Property

Description Sets or returns the window setting of Maximized, Minimized, or Normal. To arrange all of the windows, use app.[ArrangeWindows](#).

VB Syntax *object*.WindowState = *value*

Variable [\(Type\)](#) - Description

object An [Application](#) (object) - main window

or

A NaWindow (**object**) - data windows

value (**enum NAWindowStates**) - The window state. Choose from:
0 - naMinimized - Minimizes the window to an Icon on the lower toolbar
1 - naMaximized - Maximizes the window
2 - naNormal - changes the window size to the user defined setting (between Max and Min).

Return Type Long Integer

Default naMaximized

Examples

```
app.WindowState = naMinimized 'changes the Network Analyzer application
window to an icon. -Write
win.WindowState = naNormal 'changes the window defined by the win object
variable to user defined settings. -Write
```

```
winststate = app.WindowState 'Read
```

C++ Syntax HRESULT get_WindowState(tagNAWindowStates *pVal)
 HRESULT put_WindowState(tagNAWindowStates newVal)

Interface INAWindow
 IApplication

XAxisAnnotation Property

Description Returns the X-Axis annotation of the specified tuning sweep.

VB Syntax *value* = *embedLO*.XAxisAnnotation (*n*)

Variable [\(Type\)](#) - Description

value **(String)** Variable to store the returned data.

embedLO An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.XAxisAnnotation 3 'read`

C++ Syntax HRESULT XAxisAnnotation (long sweep, BSTR* annotation);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

XAxisPointSpacing Property

Description Sets X-axis Point Spacing for the displaytraces measured with segment sweeps on the active channel.

VB Syntax *chan.XAxisPointSpacing = value*

Variable [\(Type\)](#) - Description

chan A Channel (**object**)

value (**Enum as naStates**) - Choose from:

0 - naOFF - Turns X-axis Point Spacing OFF

1 - naON - Turns X-axis Point Spacing ON

Return Type Enum

Default 0 - naOFF

Examples `chan.XAxisPointSpacing = naOFF 'Write`

`xspac = chan.XAxisPointSpacing 'Read`

C++ Syntax HRESULT get_XAxisPointSpacing (tagNAStates *pState);
HRESULT put_XAxisPointSpacing (tagNAStates newState);

Interface IChannel2

XAxisStart Property

Description Returns the X-Axis start value of the specified tuning sweep.

VB Syntax *value* = *embedLODiag*.XAxisStart (*n*)

Variable [\(Type\)](#) - Description

value **(Double)** Variable to store the returned data.

embedLODiag An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.XAxisStart 3 'read`

C++ Syntax HRESULT XAxisStart (long sweep, double* start);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

XAxisStop Property

Description Returns the X-Axis stop value of the specified tuning sweep.

VB Syntax *value* = *embedLODiag.XAxisStop* (*n*)

Variable [\(Type\)](#) - Description

value **(Double)** Variable to store the returned data.

embedLODiag An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.XAxisStop 3 'read`

C++ Syntax HRESULT XAxisStop (long sweep, double* start);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

YAxisAnnotation Property

Description Returns the Y-Axis annotation of the specified tuning sweep.

VB Syntax *value* = *embedLO*.YAxisAnnotation (*n*)

Variable [\(Type\)](#) - Description

value **(String)** Variable to store the returned data.

embedLO An [EmbeddedLODiagnostic](#) (**object**)

n (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

Default Not Applicable

Examples `data= embedLO.YAxisAnnotation 3 'read`

C++ Syntax HRESULT YAxisAnnotation (long sweep, BSTR* annotation);

Interface IEmbeddedLODiagnostic

Last Modified:

13-Apr-2007 MX New topic

YScale Property

Description Sets or returns the Y-axis Per-Division value of the active trace.

VB Syntax *trace*.YScale = *value*

Variable [\(Type\)](#) - Description

trace A Trace (**object**)

value (**double**) - Scale /division number. Units and range depend on the current data format.

Return Type Double

Default 10 (db)

Examples `trac.YScale = 5 'Write`

`yscl = trac.YScale 'Read`

C++ Syntax HRESULT get_YScale(double *pVal)
HRESULT put_YScale(double newVal)

Interface ITrace

Z0 Property

Description	Sets and Returns the characteristic impedance for the calibration standard.
VB Syntax	<i>calstd.Z0</i> = <i>value</i>
Variable	(Type) - Description
<i>calstd</i>	A CalStandard (object). Use calKit. GetCalStandard to get a handle to the standard.
<i>value</i>	(single) -Impedance in Ohms
Return Type	Single
Default	Not Applicable
Examples	<pre>calstd.Z0 = 50 'Write impedance = calstd.Z0 'Read</pre>
C++ Syntax	HRESULT get_Z0(float *pVal) HRESULT put_Z0(float newVal)
Interface	ICalStandard

Abort Method

Description	Ends the current measurement sweep on the channel.
VB Syntax	<i>chan</i> .Abort [<i>sync</i>]
Variable	(Type) - Description
<i>chan</i>	(object) - A Channel object
<i>sync</i>	(boolean) - wait (or not) for the analyzer to stop before processing subsequent commands. Optional argument; if unspecified, value is set to False. Choose from: True - synchronize - the analyzer will not process subsequent commands until the current measurement is aborted. False - continue processing commands immediately
Return Type	None
Default	None
Examples	<pre>chan.abort True chan.abort</pre>
C++ Syntax	HRESULT Abort(VARIANT_BOOL bSynchronize);
Interface	IChannel

AbortPowerAcquisition Method

Description	Aborts a source power cal acquisition sweep that is currently in progress.
VB Syntax	<i>powerCalibrator</i> . AbortPowerAcquisition
Variable	(Type) - Description
<i>powerCalibrator</i>	(object) - A SourcePowerCalibrator object
Return Type	None
Default	Not Applicable
Examples	<code>powerCalibrator.AbortPowerAcquisition</code>
C++ Syntax	HRESULT AbortPowerAcquisition();
Interface	ISourcePowerCalibrator

AcquireCalStandard Method - Superseded

Description **Note:** This command has been replaced by [AcquireCalStandard2 Method](#), which provides for acquisition of sliding load standards. All other functionality is identical.

VB Syntax *cal.AcquireCalStandard std[,index]*

Variable **(Type) - Description**

cal A Calibrator (**object**)

std (**enum NACalClass**) Standard to be measured. Choose from:

- 1 - naClassA
- 2 - naClassB
- 3 - naClassC
- 4 - naClassD
- 5 - naClassE
- 6 - naReferenceRatioLine
- 7 - naReferenceRatioThru

SOLT Standards

- 1 - naSOLT_Open
- 2 - naSOLT_Short
- 3 - naSOLT_Load
- 4 - naSOLT_Thru
- 5 - naSOLT_Isolation

TRL Standards

- 1 - naTRL_Reflection
- 2 - naTRL_Line_Reflection
- 3 - naTRL_Line_Tracking
- 4 - naTRL_Thru
- 5 - naTRL_Isolation

index (**long integer**) number of the standard. Optional argument - Used if there is more than one standard required to cover the necessary frequency range. If unspecified, value is set to 1.

Note The behavior has changed with PNA revisions as follows:

- Before 6.01: Accepted 0 and changed it to 1
- 6.01 to 6.04: Did NOT accept 0
- 6.04.11 and higher: Accepts 0 and changes it to 1

Return Type None

Default Not Applicable

Examples `Cal.AcquireCalStandard naSOLT_Thru 'Write`

C++ Syntax HRESULT AcquireCalStandard(tagNACalClass enumClass, short standardNumber)

Interface ICalibrator

Last modified:

10/05/06 Modified Index argument.

AcquireCalStandard2 Method

Description Measures the specified standard from the selected calibration kit. The calibration kit is selected using [app.CalKitType](#).

For 2-port calibration, it is also necessary to specify direction with [AcquisitionDirection](#).

To omit Isolation from a 2-port calibration, do not Acquire a cal standard for naSOLT_Isolation.

For using two sets of standards, see [Simultaneous2PortAcquisition Property](#).

Note: This command replaces [AcquireCalStandard](#). This command provides for the acquisition of a sliding load cal. All other functionality is identical.

VB Syntax `cal.AcquireCalStandard2 std[,index][,slide]`

Variable [\(Type\)](#) - Description

cal A [Calibrator](#) (object)

std (**enum NACalClass**) Standard to be measured. Choose from:

- 1 - naClassA
- 2 - naClassB
- 3 - naClassC
- 4 - naClassD
- 5 - naClassE
- 6 - naReferenceRatioLine
- 7 - naReferenceRatioThru

SOLT Standards

- 1 - naSOLT_Open
- 2 - naSOLT_Short
- 3 - naSOLT_Load
- 4 - naSOLT_Thru
- 5 - naSOLT_Isolation

TRL Standards

- 1 - naTRL_Reflection
- 2 - naTRL_Line_Reflection

- 3 - naTRL_Line_Tracking
- 4 - naTRL_Thru
- 5 - naTRL_Isolation

[index] (**long integer**) Number of the standard. Optional argument - Used if there is more than one standard required to cover the necessary frequency range. If unspecified, value is set to 1.

Note The behavior has changed with PNA revisions as follows:

- Before 6.01: Accepted 0 and changed it to 1
- 6.01 to 6.04: Did NOT accept 0
- 6.04.11 and higher: Accepts 0 and changes it to 1

[slide] (**enum** as NACalStandardSlidingState) Optional argument. State of the sliding load. The slide should be set a minimum of five times. Seven is the maximum that can be stored. Choose from:

0 - **naNotSlidingStd** - not using a sliding load - Default if not specified.

1 - **naSlideIsSet** - slide is set for acquisition

2 - **naSlideIsDone** - this next acquisition will be the last. Calculations will then be performed.

Return Type None

Default Not Applicable

Examples

```
Cal.AcquireCalStandard2 naSOLT_Thru
Cal.AcquireCalStandard2 naSOLT_Thru,2,naNotSlidingStd
'measures the second standard listed in the class of naSOLT_Thru'
```

C++ Syntax HRESULT AcquireCalStandard2(NACalClass enumClass, long standardPosition, NACalStandardSlidingState slidingStandardState)

Interface ICalibrator

Last modified:

10/05/06 Modified Index argument.

AcquireCalConfidenceCheckECALEX Method

Description This method replaces [AcquireCalConfidenceCheckECAL](#)

Transfers confidence data from the specified ECal module into the measurement's memory trace. The data is transferred to the specified S-parameter on the same channel as this Calibrator object.

The characterization within the ECal module that the confidence data will be read from is specified by [ECALCharacterizationEx](#). The default value is 0.

Note: A confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

VB Syntax `cal.AcquireCalConfidenceCheckECALEX Sparam [,ecalModule]`

Variable [\(Type\) - Description](#)

cal A Calibrator (**object**)

Sparam (**String**) S-parameter to transfer confidence data to. This parameter must be present on the same channel as the calibrator object.

ecalModule (**Integer**) – Optional argument. ECal module.

Choose from modules **1** through **8**

Use [IsECALModuleFoundEx](#) to determine the number of modules connected to the PNA

Use [GetECALModuleInfoEx](#) to return the model and serial number of each module.

Return Type None

Default Not applicable

Examples `Cal.AcquireCalConfidenceCheckECALEX "S11", 2`

C++ Syntax `HRESULT AcquireCalConfidenceCheckECALEX(BSTR strParameter, long moduleNumber = 1);`

Interface ICalibrator4

Last Modified:

15-Jun-2010 Added Note

AcquirePowerReadingsEx Method

Description This command replaces [AcquirePowerReadings Method](#)

Initiates a source power cal acquisition.

VB Syntax `powerCalibrator.AcquirePowerReadingsEx calMethod, acqdevice [,sync]`

Variable [\(Type\) - Description](#)

powerCalibrator **(object)** - A [SourcePowerCalibrator](#) object

calMethod **(enum NASourcePowerCalMethod)** Selects the calibration method to be used for the source power cal acquisition.

0 – naPowerMeter Use power meter for all readings.

1 - naPowerMeterAndReceiver Power meter for the first iteration; then use the reference receiver for remaining readings if necessary.

2 - naReceiver Use PNA measurement receiver for all readings.

acqdevice **(String)** The specific acquisition device to be used. NOT case sensitive. Choose from:

If *calMethod* = **naPowerMeter** or **naPowerMeterAndReceiver**, choose from:

- "ASEN" -- Sensor on power meter channel A.
- "BSEN" -- Sensor on power meter channel B.
- To use the sensor that currently corresponds to the frequency of interest, use the value from the [PowerAcquisitionDevice](#) property.

If *calMethod* = **naReceiver**, choose from:

- The receiver names for your specific PNA using either physical receiver notation or [logical receiver notation](#). For example, "a1" or "A".
- Any configured PMAR device name. [Learn more about PMAR Devices. See PMAR commands](#)

[sync] **(boolean)** Optional argument. If not specified, value is set to False. Choose from:

True (1) – The method does not return until this acquisition has completed (the program calling this method is halted while waiting for the method to return).

False (0) – The method initiates an acquisition then returns immediately (while the acquisition still proceeds). The program calling this method can then perform other operations during the acquisition.

Return Type None

Default Not Applicable

Examples `powerCalibrator.AcquirePowerReadingsEx naPowerMeter, "asen", True`

`powerCalibrator.AcquirePowerReadingsEx naReceiver, "b2"`

`powerCalibrator.AcquirePowerReadingsEx naReceiver, "MyPMAR"`

C++ Syntax HRESULT AcquirePowerReadingsEx (tagNASourcePowerCalMethod enumCalMethod, BSTR bstrAcqDevice, VARIANT_BOOL bSync);

Interface ISourcePowerCalibrator4

Last modified:

10-Feb-2011 Added PMAR

9/12/06 MQ New command to accommodate receiver only SPC

AcquireStep Method

Description Acquire the measurement data for the specified step in the calibration process. For an ECal User characterization this measures the ECal module.

Note: Guided Cal allows you to measure standards in any order. [See an example.](#)

VB Syntax *obj.AcquireStep* (*n*)

Variable [\(Type\)](#) - Description

obj Any of the following:

[GuidedCalibration](#) (object)

[SMCType](#) (object)

[VMCType](#) (object)

[ECalUserCharacterizer](#) (object) - Currently, only ONE step is required to measure the ECal module.

n Step number in the calibration process.

Use [GenerateSteps](#) to determine the total number of steps.

Use [GetStepDescription](#) to read the description of each step.

Return Type Not Applicable

Default Not Applicable

Examples `VMC.AcquireStep (3)`

C++ Syntax `HRESULT put_AcquireStep(long step);`

Interface SMCType

VMCType

IGuidedCalibration

IECalUserCharacterizer

4-Nov-2008 Added ECalUserChar object

20-Jan-2007 Added any order note.

Activate Method

Description Makes an object the Active Object. When making a measurement active, the channel and window the measurement is contained in becomes the active channel and active window.

In order to change properties on any of the active objects, you must first have a "handle" to the active object using the **Set** command. For more information, See [Getting a Handle to an Object](#).

You do not have to make an object "Active" to set or read its properties remotely. But an object must be "Active" to change its values from the front panel.

VB Syntax *object*.Activate

Variable [\(Type\)](#) - Description

object [Measurement](#) (**object**)

or

[Marker](#) (**object**)

Return Type Not Applicable

Default Not Applicable

Examples
`meas.Activate`
`mark.Activate`

C++ Syntax HRESULT Activate()

Interface IMeasurement
IMarker

ActivateMarker Method

Description	Makes a marker the Active Marker. Use <code>meas.ActiveMarker</code> to read the number of the active marker.
VB Syntax	<code>meas.ActivateMarker(Mnum)</code>
Variable	(Type) - Description
<i>meas</i>	A Measurement (object)
<i>Mnum</i>	(long integer) - the number of the marker to make active. Choose any marker number from 1 to 9.
Return Type	None
Default	Not Applicable
Examples	<pre>meas.ActivateMarker(1) 'Write</pre>
C++ Syntax	<code>HRESULT ActivateMarker(long lMarkerNumber)</code>
Interface	IMeasurement
Remarks	Use ReferenceMarkerState to control the Reference marker.

ActivateWindow Method

Description Makes a window object the Active Window.

In order to change properties on any of the active objects, you must first have a "handle" to the active object using the **Set** command. For more information, See [Programming the Analyzer Object Model](#).

You do not have to make an object "Active" to set or read its properties remotely. But an object must be "Active" to change its values from the front panel.

VB Syntax `app.ActivateWindow n`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

n (**long**) Number of the window to make active

Return Type Window Object

Default Not Applicable

Examples `app.ActivateWindow 4`

C++ Syntax HRESULT ActivateWindow(long WindowNumber)

Interface IApplication

[See the PNA Object Model](#)

Add (channels) Method

Description	Creates a channel and returns a handle to it. If the channel already exists, it returns the handle to the existing channel.
VB Syntax	<i>chans</i> .Add (<i>item</i>)
Variable	(Type) - Description
<i>chans</i>	A Channel collection (object)
<i>item</i>	(variant) - Channel number.
Return Type	Channel
Default	Not Applicable
Examples	<code>chans.Add 3 'Creates channel 3</code>
C++ Syntax	HRESULT Add(VARIANT numVal, IChannel** pChannel)
Interface	IChannels

Add (measurement) Method

Description Adds a Measurement to the collection.

Note: This command is supported ONLY in a [standard measurement](#) channel.

Measurements can be added to ALL measurement class types using [CreateCustomMeasurementEx Method](#).

VB Syntax `meas.Add channel,param,source[,window]`

meas A [Measurements](#) collection (**object**)

channel (**long**) - Channel number of the new measurement.

param (**string**) - New parameter. Case insensitive.

For S-parameters:

[Any S-parameter that can be measured by your PNA.](#)

Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For Ratioed measurements:

Any two receivers in your PNA separated by "/". For example: "A/R1"

See the [block diagram](#) showing the receivers in YOUR PNA.

For Unratioed (absolute power) measurements:

Any receiver in the PNA. For example: "A"

See the [block diagram](#) showing the receivers in YOUR PNA

With PNA Rev 6.2, **Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an [external test set](#) connected to the PNA. You do not need to know which physical receiver is used for each test port. [Learn more.](#)

For ADC measurements

Any ADC receiver in the PNA followed by a comma, then the source port.

For example: "AI1_2" indicates the Analog Input1 with source port of 2.

[Learn more about ADC receiver measurements.](#)

For Balanced S-parameter measurements:

"*topology:Sabxy*"

topology - Choose from:

- **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

Sabxy -

Where

a - device output (receive) mode

b - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

x - device output (receive) logical port number

y - device input (source) logical port number

For example:"**sbal:sdd42**"

[See an example program](#)

For [Imbalance](#) and [Common Mode Rejection](#) measurements:

"*topology:parameter*" Choose from:

Choose this:	To get this:	
	Topology	Parameter
"SBAL:IMBSB"	single-ended to balanced	imbalance
"SBAL:CMRRSB1"	single-ended to balanced	common mode rejection (Sds21/Scs21)
"SBAL:CMRRSB2"	single-ended to balanced	common mode rejection (Ssd12/Scs12)
"SSB:IMB1SSB"	single-ended / single-ended to balanced	imbalance 1
"SSB:IMB2SSB"	single-ended / single-ended to balanced	imbalance 2
"SSB:CMRRSSB1"	single-ended / single-ended to balanced	common mode rejection (Sds31/Scs31)
"SSB:CMRRSSB2"	single-ended / single-ended to balanced	common mode rejection (Sds32/Scs32)
"BBAL:IMB1BB"	balanced to balanced	imbalance 1
"BBAL:IMB2BB"	balanced to balanced	imbalance 2
"BBAL:CMRRBB"	balanced to balanced	common mode rejection (Sdd21/Scs21)

source **(long integer)** - Source port number; if unspecified, value is set to 1. Only used for non-s-parameter measurements; ignored if s-parameter.

window **(long integer)** - Optional argument. Window number of the new measurement. If unspecified, the S-Parameter will be created in the Active Window. Choose between 1 and the [maximum number of windows allowed on the PNA](#). If unspecified, the measurement will be created in the Active Window.

See also [Traces, Channels, and Windows on the PNA](#)

Return Type None

Default None

Examples `meass.Add 3,"A/R1",1,1 'Adds A/R1 measurement to channel 3 in window 1`

C++ Syntax HRESULT Add(long ChannelNum, BSTR strParameter, long srcPort,
VARIANT_BOOL bNewWindow)

Interface IMeasurements

Last modified:

13-Jan-2012 Added std cha note

9/12/06 MQ Added logical receiver notation and number of windows.

Add (NAWindows) Method

Description	Add a window to the display. Does not add a measurement. The window number must not already exist.
VB Syntax	<code>wins.Add [item]</code>
Variable	(Type) - Description
<i>wins</i>	A NAWindow collection (object)
<i>item</i>	(variant) - Window number. Choose between 1 and the maximum number of windows allowed on the PNA .
	See also Traces, Channels, and Windows on the PNA
Return Type	Object
Default	Not Applicable
Examples	<code>wins.Add 3 'Creates a window number 3</code>
C++ Syntax	HRESULT Add(long windowNumber)
Interface	INAWindows

Last modified:

4-Mar-2009 Removed optional argument
9/12/06 Modified for number of windows

Add (PowerLossSegment) Method

Description	Adds a PowerLossSegment to the PowerLossSegments collection. Also, Adds a PowerLossSegmentPMAR to the PowerLossSegmentsPMAR collection. To ensure predictable results, it is best to remove all segments before defining a new list of segments. For each segment in the collection, do a seg.Remove . Segments and values can also be added using the CharacterizeAdaptor Macro .
VB Syntax	<i>segs</i> .Add (<i>item</i> [<i>size</i>])
Variable	(Type) - Description
<i>segs</i>	A PowerLossSegments collection A PowerLossSegmentsPMAR collection.
<i>item</i>	(variant) - Number of the new segment. If it already exists, a new segment is inserted at the requested position.
<i>size</i>	(long integer) - Optional argument. The number of segments to add, starting with item. If unspecified, value is set to 1. Add up to 9999 segments.
Return Type	None
Default	Not Applicable
Examples	<pre>segs.Add 1, 4 'Adds segments 1,2,3 and 4</pre>
C++ Syntax	HRESULT Add(VARIANT index, long size);
Interface	IPowerLossSegments

Last Modified:

14-May-2012	Increase limit
25-Aug-2009	Added PMAR

Add (PowerSensorCalFactorSegment) Method

Description	Adds a PowerSensorCalFactorSegment to the CalFactorSegments collection. Also Adds a PowerSensorCalFactorSegmentPMAR to the CalFactorSegmentsPMAR collection. To ensure predictable results, it is best to remove all segments before defining a new list of segments. For each segment in the collection, do a seg.Remove .
VB Syntax	<i>segs</i> . Add (<i>item</i> [<i>size</i>])
Variable	(Type) - Description
<i>segs</i>	A CalFactorSegments (collection) or A CalFactorSegmentsPMAR (collection)
<i>item</i>	(variant) - Number of the new segment. If it already exists, a new segment is inserted at the requested position.
<i>size</i>	(long integer) - Optional argument. The number of segments to add, starting with item. If unspecified, value is set to 1.
Return Type	None
Default	Not Applicable
Examples	<pre>segs.Add 1, 4 'Adds segments 1,2,3 and 4</pre>
C++ Syntax	HRESULT Add(VARIANT index, long size);
Interface	ICalFactorSegments ICalFactorSegmentsPMAR

Last Modified:

25-Aug-2009 Added PMAR

Add (segment) Method

Description Adds segments to the Segments collection, but does not turn the segments ON.

VB Syntax *segs.Add* (*item*, [*size*])

segs A [segments](#) collection (**object**)

item (**variant**) Number of the new segment. If it already exists, a new segment is inserted at the requested position.

size (**long integer**) Optional argument. The number of segments to add, starting with *item*. If unspecified, value is set to 1.

Return Type None

Default None

Examples

```
Segs.Add 1, 4 'Adds segments 1,2,3,and 4. (does NOT automatically turn segments ON)
```

C++ Syntax HRESULT Add(VARIANT index, long size);

Interface ISegments

Remarks To ensure predictable results, it is best to remove all segments before defining a segment list. For each segment in the collection, do a [seg.Remove](#).

Add (External Device) Method

Description	Adds an external device to the system. This is the same as clicking the New button and editing the name on the Configure an External Device dialog. Upon creation, all settings on the new device are set to the defaults. The device is not active until set using Ext.Dev.Active .
VB Syntax	<i>extDevices</i> .Add name
Variable	(Type) - Description
<i>extDevices</i>	An ExternalDevices (collection)
<i>name</i>	(String) - Name of the new external device.
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>extDevices.Add 'MySource' 'Creates a new external device'</code>
C++ Syntax	HRESULT Add (BSTR name)
Interface	IExternalDevices

Last Modified:

31-Jul-2009 MX New topic

Add (GuidedPowerSensors) Method

Description Adds a power sensor name and item number to be used during a source power calibration. Use when multiple power sensors are to be used to calibrate the entire frequency span. The Name is used to recognize the sensor in the User Interface.

Item numbers in the [GuidedCalibrationPowerSensors](#) collection are used to refer to the power sensor remotely. Use the [Count Property](#) to return the number of power sensor items that are configured for use on the channel.

The port number to be calibrated is set using the [PerformPowerCalibration Property](#).

[Learn about using multiple power sensors](#)

VB Syntax *sensors.Add* (*name*)

Variable [\(Type\)](#) - Description

sensors A [GuidedCalibrationPowerSensors](#) (collection)

name **(String)** - Name of the power sensor to add. The power sensor must be already configured as a PMAR device using this name. [Learn how to remotely configure a PMAR device.](#)

Return Type Not Applicable

Default Not Applicable

Examples `sensors.Add "pmar2"`

[See Example program](#)

C++ Syntax HRESULT Add(BSTR name);

Interface IGuidedCalibrationPowerSensors

Last Modified:

8-Feb-2011 New topic

Add (Testset) Method

Description Adds a testset to the ExternalTestsets Collection and loads the configuration file.

VB Syntax `testsets.Add (model,address)`

Variable [\(Type\)](#) - Description

testsets An [ExternalTestsets](#) (collection)

model **(String)** Model of the testset to be added, NOT case-sensitive.

There is no COM command to read a list of currently-supported test sets. However, the following SCPI command can be used with the following format:

```
string = SCPIStringParser.Execute ("SENSe:MULTiplexer:CATalog? ")
```

address **(Integer)** Address of the testset to be added.

Return Type Not Applicable

Default Not Applicable

Examples

```
testsets.Add("Z5623AK66",12) ' add Z5623AK66 test at address 12 to testsets collection
```

[See an example program](#)

C++ Syntax HRESULT Add(BSTR typename, long address)

Interface [IExternalTestsets](#)

AddSegment Method

Description	Adds the specified number of segments to the scratch mixer at the index position. All segments are added with default settings.
VB Syntax	<i>conv</i> . AddSegment <i>index,count</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Position at which to add segments. Valid index range is between 1 and the current segment count +1. Using count +1 adds segments to the end of the segment table. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>count</i>	(Long integer) Optional argument. Number of segments to add. If unspecified, 1 segment is added.
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>mxr.AddSegment 1,5 'Adds 5 segments beginning at the first position.</pre> See example program
C++ Syntax	HRESULT AddSegment(long index, long count);
Interface	IConverter5

Last Modified:

26-Oct-2010 New command (A.09.33)

AllowAllEvents Method

Description	Sets event filtering to monitor all events in the analyzer. This is the default setting when subscribing to events. This could slow the measurement speed of the analyzer significantly.
VB Syntax	<code>app.AllowAllEvents</code>
Variable	(Type) - Description <i>app</i> An Application (object)
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>app.AllowAllEvents</code>
C++ Syntax	HRESULT AllowAllEvents()
Interface	IApplication

AllowChannelToSweepDuringCalAcquisition Method

Description Specifies the channel to sweep during a Calibration.

When this command is sent, the *SwpChan* channel is 'flagged' to be swept during calibration. The flag is cleared when the channel is deleted, if the Measurement Class is changed, or if all measurements are deleted from the channel. If the same channel number is recreated, this command must be sent again to sweep the channel during a calibration. The flag is NOT saved with an instrument state.

A Preset or Instrument State Recall deletes the channel.

VB Syntax *calMgr.AllowChannelToSweepDuringCalAcquisition* (*CalChan*, *SwpChan*, *State*)

Variable [\(Type\)](#) - Description

calMgr **(object)** - A [CalManager](#) object

CalChan **(long)** - Channel to be calibrated.

SwpChan **(long)** - The channel to sweep when waiting to measure a standard.

This channel must already exist with at least one measurement in the channel. If this channel is in continuous sweep mode, it must have the same attenuator settings and path configuration (PNA-X only).

state **(Boolean)** - Channel sweep state. Choose from:

True - Sweep the channel during calibration.

False - Do NOT sweep the channel during calibration.

Return Type Not Applicable

Default Not Applicable

Example `calMgr.AllowChannelToSweepDuringCalAcquisition 2,1,True`

[See example using this command](#)

C++ Syntax HRESULT AllowChannelToSweepDuringCalAcquisition (long CalChannel, long SwpChannel, VARIANT_BOOL bVal);

Interface ICalManager5

23-Jan-2009 Added 'if measurements are deleted'.
8-Nov-2007 MX New topic

AllowEventCategory Method

Description Sets event filtering to monitor a category of event.

VB Syntax *app.AllowEventCategory, category, state*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

category Category to monitor. Choose from list in [Working with the Analyzer's Events](#)

state **(boolean)**

True - monitor

False - do not monitor

Return Type Not Applicable

Default Not Applicable

Examples `app.AllowEventCategory`

C++ Syntax HRESULT AllowEventCategory(tagNAEventCategory category, VARIANT_BOOL bAllow)

Interface IApplication

AllowEventMessage Method

Description	Sets event filtering to monitor specific events.
VB Syntax	<i>app.AllowEventMessage event</i>
Variable	(Type) - Description
<i>app</i>	An Application (object)
<i>event</i>	Event to monitor. Refer to list in Working with the Analyzer's Events
<i>state</i>	(boolean) True - monitor False - do not monitor
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>app.AllowEventMessage</code>
C++ Syntax	HRESULT AllowEventMessage(tagNAEventID eventID, VARIANT_BOOL bAllow)
Interface	IApplication

AllowEventSeverity Method

Description	Sets event filtering to monitor levels of severity.
VB Syntax	<i>app.AllowEventSeverity severity,state</i>
Variable	(Type) - Description
<i>app</i>	An Application (object)
<i>severity</i>	(enum naEventSeverity) Choose from:naEventSeverityERROR naEventSeverityINFORMATIONAL naEventSeveritySUCCESS naEventSeverityWARNING
<i>state</i>	(boolean) True - monitor False - do not monitor
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>app.AllowEventSeverity</code>
C++ Syntax	HRESULT AllowEventSeverity(tagNAEventSeverity severity, VARIANT_BOOL bAllow)
Interface	IApplication

Write only

Apply Method

Description	Applies the mixer setup and turns the channel ON. (Performs the same function as the Apply button on the mixer setup dialog box .) Learn about the Scratch and Applied mixer properties
VB Syntax	<i>obj</i> . Apply
Variable	(Type) - Description
<i>obj</i>	A Mixer Interface pointer to the Measurement (object)
	Or
	A Converter Object
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>mxr.Apply</code>
C++ Syntax	HRESULT Apply()
Interface	IMixer3
	IConverter

Last Modified:

2-Feb-2009 Added converter object

ApplyDeltaMatchFromCalSet Method

Description Specifies a Cal Set as a source of delta match correction.

If 'GUID' is not supplied then the Global Delta Match Cal Set is assumed. An error is returned if the specified Cal Set does not meet the following Delta Match criteria. The Global Delta Match Cal can ALWAYS be applied.

- Must have been performed using ECal or as a guided mechanical cal (not Unguided).
- Must have the same start freq, stop freq, and number of points as the channel being calibrated.
- Must calibrate the ports that are required by the TRL or Unknown Thru Cal as indicated by [PortsNeedingDeltaMatch Property](#).

[Learn more about Delta Match calibration.](#)

VB Syntax *guided*.ApplyDeltaMatchFromCalSet [*GUID*]

Variable [\(Type\)](#) - Description

guided [GuidedCalibration](#) (object)

GUID Optional Argument. GUID of the Cal Set to use. If unspecified, the Global Delta Match Cal Set is used.

Return Type Not Applicable

Default Not Applicable

Examples

```
guided.ApplyDeltaMatchFromCalSet "{2B893E7A-971A-11d5-8D6C-00108334AE96}"
```

C++ Syntax HRESULT ApplyDeltaMatchFromCalSet(BSTR calsetGUID);

Interface IGuidedCalibration2

ApplyPowerCorrectionValuesEx Method

Description	<p>This command replaces ApplyPowerCorrectionValues Method.</p> <p>Applies the array of power correction values to the channel memory and turns correction ON. Perform after completing a source power cal acquisition sweep.</p> <p>This command does NOT save the correction values. To save correction values, save an instrument / calibration state (*.cst file) after performing a source power cal.</p> <p>Optionally, as part of the source power calibration, perform calibration of the reference receiver used in the power calibration. Learn more.</p>
VB Syntax	<code>powerCalibrator.ApplyPowerCorrectionValuesEX [rRec]</code>
Variable	(Type) - Description
<code>powerCalibrator</code>	(object) - A SourcePowerCalibrator object
<code>rRec</code>	(Enum as <code>NASourcePowerApplyCorrectionOption</code>) Optional argument. Choose from:
	<p>0 - naSourcePowerApplyCorrectionDefault Do NOT perform and save a calibration of the reference receiver. (Default if not specified).</p> <p>1 - naIncludeReferenceReceiverPowerCal Perform and save a calibration of the reference receiver. The Cal Set, which includes only the reference receiver cal, is saved to the destination specified by RemoteCalStoragePreference.</p>
Return Type	None
Default	Not Applicable
Examples	<pre>powerCalibrator.ApplyPowerCorrectionValuesEX</pre> <pre>powerCalibrator.ApplyPowerCorrectionValuesEX (naIncludeReferenceReceiverPowerCal)</pre>
C++ Syntax	<code>HRESULT ApplyPowerCorrectionValuesEx(enum NASourcePowerApplyCorrectionOption option);</code>
Interface	<code>ISourcePowerCalibrator5</code>

Last Modified:

23-Apr-2007 MX New topic

ApplySourcePowerCorrectionTo Method

Description Copies and applies an existing Source Power Calibration to another channel.

VB Syntax *chan*.**ApplySourcePowerCorrectionTo** (*fromPortNum*, *targetChan*, *targetPortNum*);

Variable [\(Type\)](#) - Description

chan A [Channel](#) (**object**)

fromPortNum (Long) Port number of the existing source power correction.

targetChan (Long) Channel number to which the source power correction will be copied.

targetPortNum (Long) Port number to which the source power correction will be applied.

Return Type Not Applicable

Default Not Applicable

Examples `chan.ApplySourcePowerCorrectionTo 1,2,1`

C++ Syntax HRESULT ApplySourcePowerCalibrationTo (long fromPortNumber, long otherChannelNumber, long portNumber);

Interface IChannel11

Last Modified:

20-Jul-2007 MX New topic

Write only

AssignSourceToRole Method

Description	Assigns a configured source to the specified role. Use chan.RoleDevice for non-converter channels.
VB Syntax	<i>conv</i> . AssignSourceToRole <i>role, source</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>role</i>	(String) Role to which the external source is assigned. Choose from: For IMDX and IMSX, choose from: "RF2" "LO1" "LO2" For all other converter applications, choose from: "LO1" "LO2"
<i>source</i>	(String) Source name from Source Configuration dialog .
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>conv.AssignSourceToRole "LO1", "LO1Name"</pre>
C++ Syntax	HRESULT AssignSourceToRole(BSTR roleID, BSTR deviceName);
Interface	IConverter

Last Modified:

AutoOrient Method

Description Returns the ECal port that is connected to the specified PNA port. A calibration does not have to be in process.

VB Syntax *ecalPortNumber* = *ecal*.**AutoOrient** (*chanNum*, *pnaPort*, *ecalCharNum*)

Variable [\(Type\)](#) - Description

ecalPortNumber (Long) Variable to store the returned ECal port number that is connected to the specified PNA port number. The returned ECal port number is a 1-based number: 1 = Port A, 2 = Port B, 3 = Port C, 4 = Port D.

Zero (0) is returned when the auto-orientation routine is unable to resolve the orientation.

ecal A [ECalModule Object](#) (**object**)

chanNum (Long) Channel number that contains the frequency range that will be calibrated.

pnaPort (Long) PNA port number.

ecalCharNum (Long) User Characterization number that matches the physical adapters/fixtures that are on the ECal module. This aids in determining the orientation of the ECal module.

Choose from:

0 Factory characterization (no adapters - data that was stored in the ECal module by Agilent)

1 User characterization #1

2 User characterization #2

...and so forth up to:

12 User characterization #12

Return Type Long Integer

Default Not Applicable

Examples

```
Dim app As AgilentPNA835x.Application

Set app = CreateObject("AgilentPNA835x.Application",
<analyzerName>)
```

```
Dim pna

pna.Preset

Const chanNum = 1

pna.Channels(chanNum).StopFrequency = 20E9 ' for a 20 GHz ECal
mod

Const pnaPortNumber = 1

Const ecalCharacterizationNum = 0

Dim calMgr

Set calMgr = pna.GetCalManager

Dim ecalPortNumber ' The returned ECal port number is a 1-based
number

' (1 = Port A, 2 = Port B, etc)

ecalPortNumber = calMgr.ECalModules(1).AutoOrient(chanNum,
pnaPortNumber, ecalCharacterizationNum)

MsgBox "ECal port number attached to PNA port 1 = " &
ecalPortNumber
```

[C++ Syntax](#)

HRESULT AutoOrient(long channel, long pnaPortNumber, long
characterization, long *pECalPortNumber);

AutoPortExtMeasure Method

Description	Measures either an OPEN or SHORT standard. When this command is sent, the PNA acquires the measurement with which to set automatic port extensions. Learn more about choosing which standard to measure.
VB Syntax	<i>fixture</i> . AutoPortExtMeasure <i>value</i>
Variable	(Type) - Description
<i>fixture</i>	A Fixturing (object)
<i>value</i>	(Enum as NAAutoPortExtMeasure)
	0 - naAPEM_OPEN - Measure OPEN
	1 - naAPEM_SHORT - Measure SHORT
Return Type	ENUM
Default	Not Applicable
Examples	<code>fixture.AutoPortExtMeasure naAPEM_OPEN</code>
C++ Syntax	HRESULT get_AutoPortExtMeasure(tagNAAutoPortExtMeasure *pVal);
Interface	IFixturing2

AutoPortExtReset Method

Description Clears old port extension delay and loss data in preparation for acquiring new data. Send this command prior to sending a new series of measurements using [AutoPortExtMeasure Method](#). If acquiring both OPEN and SHORT standards, do not send this command between those acquisitions.

VB Syntax *fixture*.AutoPortExtReset

Variable [\(Type\)](#) - Description

fixture A [Fixturing](#) (object)

Return Type Not Applicable

Default Not Applicable

Examples `fixture.AutoPortExtReset`

C++ Syntax HRESULT AutoPortExtReset();

Interface IFixturing2

Autoscale Method

Description	<p>Trace Object - Autoscales only the ONE trace on which Autoscale is being called.</p> <p>NAWindow Object - Scales ALL of the traces to fit in the same window. This is equivalent to "Autoscale All" from the front panel.</p> <p>Autoscale (both trace and window) behaves differently when scale coupling is enabled. How it behaves depends on the scale coupling method. Learn more.</p>
VB Syntax	<i>object</i> .Autoscale
Variable	(Type) - Description
	<i>object</i> Trace (object)
	or
	NAWindow (object)
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>Trac.Autoscale 'Autoscales the trace Win.Autoscale 'Autoscales all the traces in the window -Write</pre>
C++ Syntax	HRESULT AutoScale()
Interface	INAWindow ITrace

Last Modified:

15-Sep-2010 Added links to scale coupling

AveragingRestart Method

Description Clears and restarts averaging of the measurement data.

VB Syntax `chan.AveragingRestart`

Variable [\(Type\)](#) - Description

chan A [Channel](#) (**object**)

Return Type Not Applicable

Default Not Applicable

Examples `chan.AveragingRestart`

C++ Syntax HRESULT AveragingRestart()

Interface IChannel

BuildHybridKit Method

Description Use this method when you have different port connectors. This is a convenient way to combine two kits that match the connectors on your DUT.

VB Syntax `app.BuildHybridKit port1Kit,p1sex,port2Kit,p2sex,adapter,user kit`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

port1Kit (enum **NACalKit**) - Specifies the two kits to be used to build the hybrid kit.

port2Kit Choose from:

naCalKit_85032F_N50
naCalKit_85033E_3_5
naCalKit_85032B_N50
naCalKit_85033D_3_5
naCalKit_85038A_7_16
naCalKit_85052C_3_5_TRL
naCalKit_User7
naCalKit_User8
naCalKit_User9
naCalKit_User10

p1sex (enum **NAPortSex**) - Specifies the sex of the connector at that port. Choose from:

p2sex **naMale**
naFemale
naDon'tCare

adapter (enum **NAAdapter**) - Choose from:

naUserkit - the electrical length of the adapter in the userKit specifications
naZeroLength - no adapter

userKit (enum **NACalKit**) - The Hybrid kit - Choose from the previous list of kits

Return Type Not Applicable

Default Not Applicable

Examples

```
app.BuildHybridKit
naCalKit_85033E_3_5,naMale,naCalKit_85038A_7_16
,naFemale,naUserkit,naCalKit_User8
```

C++ Syntax HRESULT BuildHybridKit/(tagNACalKit port1Kit, tagNAPortSex port1Sex, tagNACalKit port2Kit, tagNAPortSex port2Sex, tagNAAdapter adapter, tagNACalKit userKit)

Interface IApplication

CalculateErrorCoefficients Method

Description This method is the final call in a calibration process. It calculates error-correction terms, turns error-correction ON and saves the error-correction terms to the channel's Cal Register or a User Cal Set.

Do NOT use this command during an ECAL.

Note: The destination (Cal Register or User Cal Set) is determined by the setting of the [RemoteCalStoragePreference](#) property.

VB Syntax *cal*.**CalculateErrorCoefficients**

Variable [\(Type\)](#) - Description

cal [Calibrator](#) (**object**)

Return Type Not Applicable

Default Not Applicable

Examples `Cal.CalculateErrorCoefficients`

C++ Syntax HRESULT CalculateErrorCoefficients()

Interface ICalibrator

Last Modified:

16-Apr-2007 MX Added link to Remote...

Calculate Method

Description Calculates the Input or Output frequencies of the mixer setup, applies the mixer setup to the mixer object, and turns the channel ON.

Note: There is also a [Calculate Method](#) on the Converter Object

VB Syntax *obj.Calculate (port)*

Variable [\(Type\)](#) - Description

obj A [Mixer Interface](#) pointer to the [Measurement](#) (object)

port (enum as MixerCalculation) Port of the mixer for which to calculate start and stop frequencies. Choose from:

enum	1st or only stage requires:	In addition, 2nd stage requires:
0 mixCalculateINPUT	<ul style="list-style-type: none"> • Output Start and Stop frequencies • LO frequency • Output sideband (High or Low) 	<ul style="list-style-type: none"> • IF Start and Stop frequencies • 2nd LO frequency • IF sideband (High or Low)
1 mixCalculateINPUT AndOUTPUT (2 stage mixers ONLY)	NA	<ul style="list-style-type: none"> • IF Start and Stop frequencies • Both LO frequencies
2 mixCalculateOUTPUT	<ul style="list-style-type: none"> • Input Start and Stop frequencies • LO frequency • Output sideband (High or Low) 	<ul style="list-style-type: none"> • IF Start and Stop frequencies • 2nd LO frequency • IF sideband (High or Low)
3 mixCalculateLO1	<ul style="list-style-type: none"> • Input Start and Stop frequencies • Output frequency • Output sideband (High or Low) 	<ul style="list-style-type: none"> • IF Start and Stop frequencies • 2nd LO frequency • IF sideband (High or Low)
4 mixCalculateLO2	NA	<ul style="list-style-type: none"> • Input Start and stop

frequencies

- 1st LO start and stop frequencies
- Output frequency
- IF sideband(High or Low)
- Output sideband(High or Low)

Return Type Not Applicable

Default Not Applicable

Examples `obj.Calculate (mixCalculateOUTPUT)`

C++ Syntax HRESULT Calculate()

Interface IMixer

Last Modified:

2-Feb-2009 Added converter

Calculate Method

Description Calculates the Input or Output frequencies of the mixer setup, applies the mixer setup to the mixer object, and turns the channel ON.

Note: There is also a [Calculate Method](#) on the IMixer Interface.

VB Syntax *obj.Calculate (port)*

Variable [\(Type\) - Description](#)

obj A [Converter Object](#)

port (enum as ConverterCalculation) Port of the mixer for which to calculate start and stop frequencies. Choose from:

enum	1st or only stage requires:	In addition, 2nd stage requires:
0 naCalculateINPUT	<ul style="list-style-type: none"> • Output Start and Stop frequencies • LO frequency • Output sideband (High or Low) 	<ul style="list-style-type: none"> • IF Start and Stop frequencies • 2nd LO frequency • IF sideband (High or Low)
1 naCalculateINPUT AndOUTPUT (2 stage mixers ONLY)	NA	<ul style="list-style-type: none"> • IF Start and Stop frequencies • Both LO frequencies
2 naCalculateOUTPUT	<ul style="list-style-type: none"> • Input Start and Stop frequencies • LO frequency • Output sideband (High or Low) 	<ul style="list-style-type: none"> • IF Start and Stop frequencies • 2nd LO frequency • IF sideband (High or Low)
3 naCalculateLO1	<ul style="list-style-type: none"> • Input Start and Stop frequencies • Output frequency • Output sideband (High or Low) 	<ul style="list-style-type: none"> • IF Start and Stop frequencies • 2nd LO frequency • IF sideband (High or Low)
4 naCalculateLO2	NA	<ul style="list-style-type: none"> • Input Start and stop

frequencies

- 1st LO start and stop frequencies
- Output frequency
- IF sideband(High or Low)
- Output sideband(High or Low)

ChangeParameter Method

Description Changes the parameter of the measurement.

VB Syntax *meas.ChangeParameter(param,src)*

Variable [\(Type\)](#) - Description

meas A [Measurement](#) (object)

param (**string**) - New parameter. Case insensitive.

For [S-parameters](#) and [Applications](#) parameters:

Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For Ratioed receiver measurements:

Any two receivers in your PNA separated by "/". For example: "A/R1"

See the [block diagram](#) showing the receivers in YOUR PNA.

For Unratioed (absolute power) measurements:

Any receiver in the PNA. For example: "A"

See the [block diagram](#) showing the receivers in YOUR PNA

With PNA Rev 6.2, **Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an [external test set](#) connected to the PNA. You do not need to know which physical receiver is used for each test port. [Learn more.](#)

For ADC measurements

Any ADC receiver in the PNA.

For example: "AI1" indicates the Analog Input1.

[Learn more about ADC receiver measurements.](#)

For Balanced S-parameter measurements:

"topology:Sabxy"

topology - Choose from:

- **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

Sabxy -

Where

a - device output (receive) mode

b - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

x - device output (receive) logical port number

y - device input (source) logical port number

For example: "**sbal:sdd42**"

[See an example program](#)

For [Imbalance](#) and [Common Mode Rejection](#) measurements:

"topology:parameter" Choose from:

Choose this:	To get this:	
	Topology	Parameter
"SBAL:IMBSB"	single-ended to balanced	imbalance
"SBAL:CMRRSB1"	single-ended to balanced	common mode rejection (Sds21/Scs21)
"SBAL:CMRRSB2"	single-ended to balanced	common mode rejection (Ssd12/Scs12)
"SSB:IMB1SSB"	single-ended / single-ended to balanced	imbalance 1
"SSB:IMB2SSB"	single-ended / single-ended to balanced	imbalance 2
"SSB:CMRRSSB1"	single-ended / single-ended to balanced	common mode rejection (Sds31/Scs31)
"SSB:CMRRSSB2"	single-ended / single-ended to balanced	common mode rejection (Sds32/Scs32)
"BBAL:IMB1BB"	balanced to balanced	imbalance 1
"BBAL:IMB2BB"	balanced to balanced	imbalance 2
"BBAL:CMRRBB"	balanced to balanced	common mode rejection (Sdd21/Scs21)

src (long integer)

- Ignored if *param* is an S-Parameter
- Source port if *param* is a ratioed or unratioed receiver measurement (including ADC measurements).

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port

number. To learn more see [Remotely Specifying a Source Port](#).

Return Type Not Applicable

Default Not Applicable

Examples

```
meas.ChangeParameter "S11",2 '2 is ignored
```

```
meas.ChangeParameter "VC21",1 '1 is ignored
```

```
meas.ChangeParameter "A/R1",2 '2 is the source port
```

```
meas.ChangeParameter "a1/b1",1 '1 is the source port
```

```
meas.ChangeParameter "R1",2 '2 is the source port
```

```
'to change to a parameter with a string name
dim app
set app = CreateObject("Agilentpna835x.application")
dim capabilities
set capabilities = app.Capabilities
dim portnum
portnum = Capabilities.GetPortNumber("Src2 Out1")
app.activemeasurement.ChangeParameter "A",portnum
```

[C++ Syntax](#) HRESULT ChangeParameter(BSTR parameter, long lPort)

Interface IMeasurement

Last Modified:

24-Apr-2008 Added example for string names
30-Apr-2007 Modified for ADC and src strings

CheckPower Method

Description	Measures power at a specified frequency. Use this method to test power level before and/or after applying a source power calibration.
VB Syntax	<i>pow</i> = <i>pwrCal</i> . CheckPower (<i>device</i> , <i>freq</i> [, <i>unit</i>])
Variable	(Type) - Description
<i>pow</i>	(double) Variable to store power value returned by this method.
<i>pwrCal</i>	A SourcePowerCalibrator (object)
<i>device</i>	(enum NAPowerAcquisitionDevice) The specific sensor on the power meter to be used for the acquisition. Choose from: 0 – naPowerSensor_A 1 – naPowerSensor_B To use the sensor that currently corresponds to the frequency of interest, use the value from the PowerAcquisitionDevice property.
<i>freq</i>	(double) Frequency (Hz) at which the sensor is to read the power.
<i>unit</i>	(enum NAPowerUnit) Optional argument. Choose from: naDBM – Returns the power in dBm.(default) naWATT – Returns the power in Watts.
Return Type	Double
Default	Not Applicable
Examples	<pre>watt = powerCalibrator.CheckPower(naPowerSensor_A, 1E9, naWATT)</pre>
C++ Syntax	HRESULT put_CheckPower(tagNAPowerAcquisitionDevice enumAcqDevice, double dFreq, tagNAPowerUnit enumPowerUnit, double *pdPower);
Interface	ISourcePowerCalibrator2

Clear Method

Description Clears the current diagnostic information.

VB Syntax *embedLO*.Clear

Variable [\(Type\)](#) - Description

*embedLO*Diag An [EmbeddedLODiagnostic](#) (**object**)

Default Not Applicable

Examples `embedLO.Clear 'write`

C++ Syntax HRESULT Clear();

Interface IEmbeddedLODiagnostic

Last Modified:

12-Apr-2007 MX New topic

Clear Method

Description Clears the FIFO data buffer.

VB Syntax *fifo*.Clear

Variable [\(Type\)](#) - Description

fifo A [FIFO](#) (object)

Default Not Applicable

Examples `fifo.Clear 'write`

C++ Syntax HRESULT Clear();

Interface IFIFO

Last Modified:

3-Nov-2008 MX New topic

CloseCalSet Method **Superseded**

Description	<p>This command is no longer necessary. The CalSet.get... and put... commands that required this command have been replaced,</p> <p>Closes read/write access to the Cal Set.</p> <p>See OpenCalSet for an explanation of gaining access to the Cal Set.</p> <p>When you are finished reading and writing data from or to the Cal Set, close the Cal Set. Subsequent read/writes will require a new OpenCal Set call.</p> <p>Reading and writing Cal Set data is performed with the PutStandard, GetStandard, PutErrorTerm, GetErrorTerm method calls. These methods are provided by the ICal Set and ICalData2 interfaces.</p>
VB Syntax	<i>CalSet</i> .CloseCalSet
Variable	(Type) - Description
<i>CalSet</i>	(object) - A Cal Set object
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>CSet.CloseCalSet</code>
C++ Syntax	HRESULT CloseCalSet
Interface	ICalSet

ComputeErrorTerms Method

Description Computes error terms for the caltype specified by a preceding OpenCal Set call.

The Cal Set must first be opened using [OpenCalSet](#). If this call has not been made, the following error is issued:

E_NA_Cal Set_ACCESS_DENIED

The standards data required for the CalType must be available in the Cal Set or this error will be returned: E_NA_STANDARD_NOT_FOUND.

Note: Error term computation requires data for the actual calibration kit standards from the current kit definition. ComputeErrorTerms assumes that the standards were acquired using only one standard per class.

VB Syntax *CalSet*.**ComputeErrorTerms**

Variable [\(Type\)](#) - Description

CalSet **(object)** - A [Cal Set](#) object

Return Type Not Applicable

Default Not Applicable

Examples `CalSet.ComputeErrorTerms`

C++ Syntax HRESULT ComputeErrorTerms()

Interface ICalSet

ConfigEnhancedNB2 Method

Description **Note:** This command replaces [ConfigEnhancedNB Method](#).

This subroutine determines, then returns, the proper configuration for pulsed measurements on the **PNA-X ONLY** using the spectral nulling technique. The configuration returned needs to be sent to the PNA and any other related external equipment.

The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the PNA.

Note: If an error is returned suggesting that nulling has not been found, add a small offset to the PRF (for example, 2.1 MHz instead of 2 MHz) or set *Fixed PRF* to **False**.

VB Syntax *Pulsed*.**ConfigEnhancedNB2** (*PRF*, *BW*, *PhysicalIF*, *NCO*, *ClockFreq*, *Stage1TapArray*, *Stage2TapArray*, *Stage3TapArray*, *FixedPRF*, *GateDelay*, *GateWidth*, *SWGateDelay*, *SWGateWidth*, *SWGateRamp*)

Variable [\(Type\)](#) - **Description**

Pulsed **(interface)** An interface to the agilentpnapulsed.dll application interface.

PRF **(Double)** The Pulse Repetition Frequency.

[out] The pulse repetition frequency that has been optimized for use with the PNA. NOTE: This value may be different from the value requested.

[in] The desired pulse repetition frequency.

BW **(Long)** The PNA IF Bandwidth.

[out] The PNA IF bandwidth that has been optimized for use with the PNA. NOTE: This value may be different from the value requested. Zero (0) is returned if no solution is found for the specified *PRF* and *BW*.

[in] The desired PNA IF bandwidth.

PhysicalIF **(Double)**

[out] Returns physical intermediate frequency.

<i>NCO</i>	(Double)	
		[out] Returns numeric controlled oscillator frequency.
<i>ClockFreq</i>	(Double)	
		[out] Returns the clock frequency (in Hz) of the PNA-X.
<i>Stage1TapArray</i>	(Long array)	
		[out] Returns the stage 1 filter coefficients
<i>Stage2TapArray</i>	(Long array)	
		[out] Returns the stage 2 filter coefficients
<i>Stage3TapArray</i>	(Long array)	
		[out] Returns the stage 3 filter coefficients
<i>FixedPRF</i>	(Boolean)	
		[in]
		<ul style="list-style-type: none"> • 1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting. • 0 (False) Adjust both the PRF and IF Bandwidth values as necessary.
<i>GateDelay</i>	(Double)	
		[in] Highest delay value in seconds used in any of the receiver gates.
<i>GateWidth</i>	(Double)	
		[in] Widest pulse width value in seconds used in any of the receiver gates.
<i>SWGateDelay</i>	(Double)	
		[out] Returns the SW gate delay in seconds.
<i>SWGateWidth</i>	(Double)	
		[out] Returns the SW Gate width in seconds.
<i>SWGateRamp</i>	(Long)	
		[out] Returns the SW Gate ramp
Return Type		Not Applicable
Default		Not Applicable

Example [See an example using this command.](#)

C++ Syntax HRESULT **ConfigEnhancedNB2**(double *pPRF, long *pBW, double *pIF, double *pNCO, double *clock, double *pStg1, double *pStg2, double *pStg3, VARIANT_BOOL fixPRF, double gateDelay, double gateWidth, double *SWgateDelay, double *SWgateWidth, long *SWgateRamp)

ConfigEnhancedNBIFAtten Method

Description	Sets PNA-X receivers to auto gain setting.
VB Syntax	<i>Pulsed</i> . ConfigEnhancedNBIFAtten (<i>PRF</i> , <i>RxWidth</i> , <i>IFAtten</i>)
Variable	(Type) - Description
<i>Pulsed</i>	(interface) An interface to the agilentpnapulsed.dll application interface.
<i>PRF</i>	(Double) [in] The Pulse Repetition Frequency.
<i>RxWidth</i>	(Double) [in] Receiver gate width.
<i>IFAtten</i>	(Long Integer) [out] IF attenuation value.
Return Type	Not Applicable
Default	Not Applicable
Example	See an example using this command.
C++ Syntax	HRESULT ConfigEnhancedNBIFAtten (double *pPRF, double *pWidth, long *pIF)
Interface	AgilentPNAPulsed.Application

Last Modified:

18-Jun-2007 MX New topic

ConfigNarrowBand3 Method

Description **Note:** This method replaces ConfigNarrowBand2 Method. The BW argument now returns 0 if no solution is found for the specified PRF and BW. In addition, adjustments were made to the filter finder algorithm

This subroutine determines, then returns, the proper configuration for pulsed measurements on the PNA using the spectral nulling technique. The configuration returned needs to be sent to the PNA and any other related external equipment such as pulse generators. The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the PNA.

The routine will also return the Sample Rate, Number of Taps, and Offset that must be sent to the PNA to configure it in pulsed mode using the spectral nulling technique.

Although the example below uses COM programming to communicate with the PNA, these commands can be replaced with SCPI equivalents.

Note: The pulsed application may set the offset frequency (option 080) of the PNA to some value other than zero (the default value). If the stop frequency is set to the maximum of the PNA model, then an error message may appear on the PNA stating that the response frequency has exceeded the maximum allowed frequency. To fix this, set the stop frequency to a value that is at least 2 KHz less than the maximum allowed.

For example, if you have a 20 GHz PNA, and the stop frequency is set to 20 GHz, and the error message appears, then set the stop frequency to 19.999998 GHz

VB Syntax *Pulsed*.**ConfigNarrowBand** (*PRF*, *NumTaps*, *BW*, *OffSet*, *SampleRate*, *Precision*, *FixedPRF*, *PG81110*)

Variable [\(Type\)](#) - Description

Pulsed **(interface)** An interface to the agilentpnapulsed.dll application interface.

PRF **(Double)** The Pulse Repetition Frequency.

[out] The pulse repetition frequency that has been optimized for use with the PNA. NOTE: This value may be different from the value requested.

[in] The desired pulse repetition frequency.

NumTaps **(Long)** The number of taps to send to the PNA for pulsed operation.

BW **(Long)** The PNA IF Bandwidth.

[out] The PNA IF bandwidth that has been optimized for use with the PNA.
NOTE: This value may be different from the value requested. Zero (0) is returned if no solution is found for the specified *PRF* and *BW*.

[in] The desired PNA IF bandwidth.

Offset **(Double)** The offset value to send to the PNA for pulsed operation. The offset value is used to adjust the PNA for the two different possible sample rates that may be returned.

SampleRate **(Double)**

[out] The sample rate to send to the PNA for pulsed operation.

[in] Passing a value of 6.2 us will make sure that the offset frequency is not shifted and therefore could be used with converter measurements. Otherwise enter 0.

Precision **(Double)** The precision variables sets the precision that will be used to decrement the PRF when running the configuration routines. This variable can be set to the precision required by the external pulse generators so that the configuration routine will not return a PRF that is not within the precision limits of the pulse generators.

FixedPRF **(Boolean)**

1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting.

0 (False) Adjust both the PRF and IF Bandwidth values as necessary.

PG81110 **(Boolean)**

1 (True) You are using an Agilent 81110 as the pulse generator. This allows increased accuracy in adjustments for offset and PRF.

0 (False) Not using an Agilent 81110.

Return Type Not Applicable

Default Not Applicable

Example Removed example from help file.

C++ Syntax HRESULT ConfigNarrowBand(double *pPRF, long *pNumTaps, long *pBW, double *pOffset, double *pSampleRate, int Precision)

Interface AgilentPNAPulsed.Application

ConfigurationFile Method

Description	Recalls an Interface Control file from the hard drive into the analyzer.
VB Syntax	<i>IntControl</i> . ConfigurationFile (<i>filename</i>)
Variable	(Type) - Description
<i>IntControl</i>	An InterfaceControl (object)
<i>filename</i>	(string) - Full path, file name, and extension (.xml) of the file to recall. Files are typically stored in "c:\users\public\network analyzer\documents"
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>IntControl.ConfigurationFile ("c:\users\public\network analyzer\documents/MySettings.xml ")</code>
C++ Syntax	HRESULT ConfigurationFile(BSTR bstrFile)
Interface	IInterfaceControl

Configurations Property

Description	Returns an array of stored configuration names that can be used with DeleteConfiguration Method and LoadConfiguration Method
VB Syntax	<i>names</i> = <i>pathMgr</i> . Configurations
Variable	(Type) - Description
<i>names</i>	(Variant array) Variable to store the returned configuration names.
<i>pathMgr</i>	PathConfigurationManager (object)
Return Type	Variant array
Default	Not Applicable
Examples	<pre>names = path.Configurations</pre>
C++ Syntax	HRESULT get_Configurations (VARIANT* configurations);
Interface	IPathConfigurationManager

Last Modified:

14-Dec-2006 MX New topic

Configure Method

Description Restarts as an "N-port" PNA using the specified multiport test set.

[See other commands to configure multiport test sets.](#)

VB Syntax `app.Configure (model, address)`

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

model **String** - Model of the test set with which to restart.

Use "**Native**" to restart without a test set.

To see a list of supported test sets, use

address **Integer** - GPIB Address of the test set. Use 0 for native restart.

Return Type Not Applicable

Default Not Applicable

Examples [See an example using this command.](#)

```
app.Configure ("N44xx",18)
```

C++ Syntax HRESULT Configure(BSTR model, long address);

Interface IApplication9

Continuous Method

Description The channel continuously responds to trigger signals.

Note: This command does **NOT** change [TriggerSignal](#) to Continuous.

VB Syntax `chan.Continuous`

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

Return Type Not Applicable

Default Not Applicable

Examples `chan.Continuous`

C++ Syntax HRESULT Continuous()

Interface IChannel

Copy Method

Description Creates a new Cal Set and copies the current Cal Set data into it. Therefore, you now have a clone Cal Set with a different ID. Use this command to manipulate data on a Cal Set without corrupting the original cal data.

VB Syntax *CalSet.Copy*

Variable [\(Type\)](#) - Description

CalSet **(object)** - A [Cal Set](#) object

Return Type Not Applicable

Default Not Applicable

Examples

```
Dim mgr As CalManager
Dim ocalset As CalSet
Dim newcalset As CalSet
Set mgr = pna.GetCalManager
'Create a new (empty) Cal Set.
Set ocalset = mgr.CreateCalSet(1)
ocalset.Description = "original calset"
pna.Channel(1).SelectCalSet ocalset.GetGUID, True

'Launch the cal wizard and allow the user to perform the
calibration.
If pna.LaunchCalWizard(False) Then
'If the Launch returns true then the calibration finished.
ocalset.Save

'Copy the Cal Set to the new one.
Set newcalset = ocalset.Copy
newcalset.Description = "copy of original calset"

Else
'If the cal doesn't finish, delete the old Cal Set
'so it isn't taking up unnecessary memory.
mgr.DeleteCalSet ocalset.GetGUID
End If
```

As a result, the programmer can manipulate the data in the new Cal Set and always revert back to the old Cal Set as needed.

C++ Syntax HRESULT Copy(ICalSet** pCalSet);

Interface ICalSet

CopyFrom Method

Description Copies the mechanical switch and attenuator settings from the specified channel to the calling channel.

To avoid potential conflicts, all port couplings in the calling channel will be turned OFF and all port attenuator settings will be set to manual before copying the switch or attenuator settings. The two channels CAN be of different measurement classes.

Use [CopyToChannel](#) to copy ALL settings from one channel to another.

VB Syntax *pathConfig*.**CopyFrom** (*chanNum*)

Variable [\(Type\)](#) - **Description**

pathConfig A [PathConfiguration](#) (**object**)

chanNum (**long integer**) Channel number to copy to the calling channel.

Return Type None

Default Not Applicable

Examples

```
Dim chan,pathConfig
Set chan = app.ActiveChannel
Set pathConfig = chan.PathConfiguration
pathConfig.CopyFrom 2
```

C++ Syntax HRESULT CopyFrom(long chanNum);

Interface IPathConfiguration2

Last modified:

3-May-2011 New topic

CopyToChannel Method

Description	Copies ALL settings from this channel to the specified channel. Use CopyFrom to copy ONLY the mechanical switch and attenuator settings.
VB Syntax	<i>chan</i> .CopyToChannel(<i>lChanNum</i>)
Variable	(Type) - Description
<i>chan</i>	A Channel (object)
<i>lChanNum</i>	(long integer) – Number of the channel to become a copy of <chan>.
Return Type	None
Default	Not Applicable
Examples	<pre>Dim chan Set chan = PNAapp.ActiveChannel chan.CopyToChannel 2</pre>
C++ Syntax	HRESULT CopyToChannel(long lChanNum);
Interface	IChannel2

Last modified:

3-May-2011 Added copyFrom link

CreateS-Parameter Method

Description	This method creates a new S-Parameter measurement in an existing or new window.
VB Syntax	<code>app.CreateSParameter chan,recvr,source,[window]</code>
Variable	(Type) - Description
<i>app</i>	Application (object)
<i>chan</i>	(long integer) - Channel number of the new measurement
<i>recvr</i>	(long integer) - Port number of the receiver (1 or 2)
<i>source</i>	(long integer) - Port number of the source (1 or 2)
<i>window</i>	(long integer) - Optional argument. Window number of the new measurement. Choose 1 to 4 . If unspecified, the S-Parameter will be created in the Active Window.
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>app.CreateSParameter 1,2,1,1 'Creates a new S21 measurement in channel 1 and New window(1) app.CreateSParameter 1,2,1 'Creates a new S21 measurement in channel 1 and in the active window</pre>
C++ Syntax	HRESULT CreateSParameter(long ChannelNum, long RcvPort, long SrcPort, long windowNumber)
Interface	IApplication

Last Modified:

12-Mar-2014 No longer superseded. Use instead of [Create SParameterEX Method](#)

CreateCalSet Method

Description Creates a new Cal Set.

The new cal set is initialized with the stimulus settings from the channel whose number is passed as the argument to this method. Stimulus settings include frequency, bandwidth, number of points, and so forth.

Use this method when you want to manually upload data to the Cal Set using the returned ICal Set interface handle..

The channel number does not restrict the usage of this Cal Set on any other channel. It simply provides a link to the originating channel so that the stimulus values can be stored in the Cal Set.

Note: Be sure to SAVE the CalSet you are creating. Use [ICalSet::Save](#).

VB Syntax *calMgr*.CreateCalSet (*chan*)

Variable [\(Type\)](#) - Description

calMgr **(object)** - A [CalManager](#) object

chan **(long)** - channel number of the new Cal Set.

Return Type ICal Set Interface

Default Not Applicable

Example `calMgr.CreateCalSet 1`

C++ Syntax HRESULT CreateCalSet(long ChannelNumber, ICal Set** pCal Set);

Interface ICalManager

Write-only

CreateCustomCal Method

Description	Creates a custom cal object.
VB Syntax	<i>calMgr</i> . CreateCustomCal (<i>CalType</i>)
Variable	(Type) - Description
<i>calMgr</i>	Cal Manager (Object)
<i>CalType</i>	(String) Name of the calibration. Choose from: "VMC" or "VectorMixerCal.VMCTYPE" "SMC" or "ScalarMixerCal.SMCTYPE" See Also SMCTYPE Object VMCTYPE Object
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>Dim CalMgr As ICalManager2 Dim SMC As ISMCTYPE Set SMC = CreateCustomCal("SMC")</pre> See SMC and VMC examples using this command.
C++ Syntax	HRESULT CreateCustomCal(BSTR CustomCal)
Interface	ICalManager2

CreateCustomCalEx Method

Description Returns [IGuidedCalibration](#) for the specified channel.

With a handle to the IGuidedCalibration interface, you can query it for the following objects for properties appropriate to the calibration setup for the particular meastype (channel).

IGuidedCalibration interface is used to configure a calibration (specify connectors, cal kits, and so forth). It is also used to access any custom calibration properties required for unique application channels like Noise Figure or Gain Compression. To access these special properties, make this call on the IGuidedCalibration interface:

```
CustomInterface = IGuidedCalibration.CustomCalConfiguration\(\);
```

The interface returned by this call can be used to set and get the custom properties on the following application cal objects:

- [NoiseCal Object](#)
- [GainCompressionCal Object](#)
- [SweptIMDCal Object](#)

Note: Use [CreateCustomCal_Method](#) to create FCA calibration objects.

VB Syntax *calmgr*.**CreateCustomCalEx** (*chan*)

Variable [\(Type\)](#) - **Description**

calMgr [Cal Manager](#) (**Object**)

chan (**long integer**) Channel number in which to create the Cal object.

Return Type [IGuidedCalibration](#)

Default Not Applicable

Examples

```
Dim guidedcal
Set guidedcal = CalManager.CreateCustomCalEx(1)
```

29-May-2007 MN New topic

CreateCustomMeasurementEx Method

Description Creates a new custom measurement or a new 'standard' S-Parameter measurement.

VB Syntax *app.CreateCustomMeasurementEx chanNum,MeasClass,MeasName [,window]*

Variable (Type) - Description

app **(object)** - An [Application](#) object

chanNum **(long)** -Channel number used by the new measurement; can exist or be a new channel.

MeasClass **(string)** - Measurement class of the new custom measurement object. The Measurement Class must be installed and registered on the PNA.

Choose from the following:

- "Standard"
- "Vector Mixer/Converter"
- "Scalar Mixer/Converter"
- "Gain Compression"
- "Gain Compression Converters"
- "Noise Figure Cold Source"
- "Noise Figure Converters"
- "Swept IMD"
- "IM Spectrum"
- "Swept IMD Converters"
- "IM Spectrum Converters"

MeasName **(variant)** Measurement names to create:

Meas Class	Measurement Name	Description
Vector Mixer/Converter	"S11"	Learn about VMC parameters
	"VC21"	
	"S22"	

<p>Scalar Mixer/Converter</p>	<p>"S11" Learn about SMC parameters</p> <p>"SC21"</p> <p>"SC12"</p> <p>"S22"</p> <p>"Ipwr"</p> <p>"RevIPwr"</p> <p>"Opwr"</p> <p>"RevOPwr"</p>
<p>Gain Compression</p> <p>Learn more</p> <p>Gain Compression Converters</p> <p>Learn more</p>	<p>GCA and GCX:</p> <p>"CompIn21" Input power at the compression point.</p> <p>"CompOut21" Output power at the compression point.</p> <p>"CompGain21" Gain at the compression point.</p> <p>"CompS11" Input Match at the compression point</p> <p>"RefS21" Linear Gain</p> <p>"DeltaGain21" CompGain21 -Linear Gain</p> <p>"S11", "S21", "S12", "S22" Standard S-parameters; measured at port 1 and port 2</p> <p>GCX - All Gain Compression parameters (except S21 and S12) plus the following:</p> <p>"S11"</p> <p>"SC21"</p> <p>"SC12"</p> <p>"S22"</p> <p>"Ipwr"</p> <p>"RevIPwr"</p> <p>"Opwr"</p> <p>"RevOPwr"</p> <p>Mixer parameters</p>

Noise Figure Cold Source

[Learn more](#)

Noise Figure Converters

[Learn more](#)

Noise Figure AND NFX:	
"NF"	Noise figure
"ENR"	Validate noise source measurements.
"T-Eff"	Effective noise temperature.
"DUTRNP" "DUTRNPI"	DUT noise power ratio. (Noise power expressed in Kelvin divided by 290).
"SYSRNP" "SYSRNPI"	System noise power ratio
"DUTNPD" "DUTNPDI"	DUT noise power density. (Noise power expressed in dBm/Hz).
"SYSNPD" "SYSNPDI"	System noise power density.
"OvrRng" (Opt 029 Only)	Indication that the noise receiver is being over powered.
"T-Rcvr" (Opt 029 Only)	Temperature reading (in Kelvin) of the noise receiver board.
Noise Figure ONLY - NOT NFX:	
"S11", "S21", "S12", "S22"	Standard S-parameters; measured with the port1 and port2 noise switches set for noise mode.
"A_1", "A_2" ...and so forth. "GammaOpt" "Rn" "NFMin"	Unratioed parameters; with notation: "receiver, source port" Optimum Complex Reflection Coefficient Noise Resistance Minimum noise figure that occurs at GammaOpt

	<p>NFX ONLY:</p> <p>"S11"</p> <p>"SC21"</p> <p>"SC12"</p> <p>"S22"</p> <p>"Ipwr" Mixer parameters</p> <p>"RevIPwr"</p> <p>"Opwr"</p> <p>"RevOPwr"</p> <hr/> <p>"ALO1", "BLO1" ...and so forth. Test port receiver at LO1 frequency</p> <hr/> <p>"R1_1", "B_2" ..and so forth. Unratioed parameters with notation: "receiver_source port"</p>
<p>Swept IMD</p> <p>Swept IMD Converters</p> <p>Learn more</p>	<p>There are over 150 possible Swept IMD parameters, too many to list here.</p> <p>Build the parameters with the Swept IMD Parameter dialog, then copy the parameter name to the remote command.</p> <p>The following are a few example parameters:</p> <p>"PwrMainLo" Absolute power of the Low tone at the DUT output.</p> <hr/> <p>"IM3" Power of the third product relative to the average power of the f1 and f2 tones measured at the DUT output.</p> <hr/> <p>"OIP3" Theoretical power level at which the third product will be the same power level as</p>

		the average of the main tones at the output of the DUT.
IM Spectrum Learn more	"Output"	View signals OUT of the DUT and into PNA port 2 (B receiver).
	"Input"	View signals IN to the DUT (R1 receiver).
	"Reflection"	View signals reflected off the DUT input and back into PNA port 1 (A receiver)
IMx Spectrum Converters Learn more	"Output"	View signals OUT of the DUT and into PNA port 2 (B receiver)

window **(long)** Optional argument. Number of the window the new custom measurement will be placed in. Choose between 1 and the [maximum number of windows allowed on the PNA](#).. If unspecified, the measurement is placed in the active window.

Return Type IMeasurement

Default Not Applicable

Examples

```
'To create a scalar mixer measurement in channel 2:
Dim MyMeas as Agilent835x.Measurement
Set MyMeas = app.CreateCustomMeasurementEx (2, "Scalar
Mixer/Converter", "SC21")
```

```
'To create a vector mixer measurement in channel 2:
Dim MyMeas as Agilent835x.Measurement
Set MyMeas = app.CreateCustomMeasurementEx (2, "Vector
Mixer/Converter", "VC21")
```

C++ Syntax HRESULT put_CreateCustomMeasurementEx (long ChannelNum, BSTR guid, VARIANT initData, long windowNumber, IMeasurement** ppMeasurement);

Interface IApplication3

14-Sep-2012	Fixed unratioed notation
27-Sep-2011	Added Opt 029 Only
2-Mar-2010	Fixed IM spectrum converters
29-Oct-2009	Added NFX
23-Feb-2009	Added IMD Converters and Noise Figure I
18-Sep-2008	Added IMD and IM Spectrum
8-Nov-2007	Updated for NF and GCA

CreateMeasurement Method

Description	Creates a new measurement.
VB Syntax	<i>app</i> .CreateMeasurement <i>chanNum,param,lPort[,window]</i>
Variable	(Type) - Description
<i>app</i>	Application (object)
<i>chanNum</i>	(long) - Channel number of the new measurement; can exist or be a new channel
<i>param</i>	(string) - New parameter. Case insensitive.

For S-parameters:

[Any S-parameter that can be measured by your PNA.](#)

Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For Ratioed measurements:

Any two receivers in your PNA separated by "/". For example: "A/R1"

See the [block diagram](#) showing the receivers in YOUR PNA.

For Unratioed (absolute power) measurements:

Any receiver in the PNA. For example: "A"

See the [block diagram](#) showing the receivers in YOUR PNA

With PNA Rev 6.2, **Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an [external test set](#) connected to the PNA. You do not need to know which physical receiver is used for each test port. [Learn more.](#)

For ADC measurements

Any ADC receiver in the PNA.

For example: "AI1" indicates the Analog Input1.

[Learn more about ADC receiver measurements.](#)

For Balanced S-parameter measurements:

"topology:Sabxy"

topology - Choose from:

- **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

Sabxy -

Where

a - device output (receive) mode

b - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

x - device output (receive) logical port number

y - device input (source) logical port number

For example: "**sbal:sdd42**"

[See an example program](#)

For [Imbalance](#) and [Common Mode Rejection](#) measurements:

"topology:parameter" Choose from:

Choose this:	To get this:	
	Topology	Parameter
"SBAL:IMBSB"	single-ended to balanced	imbalance
"SBAL:CMRRSB1"	single-ended to balanced	common mode rejection (Sds21/Scs21)
"SBAL:CMRRSB2"	single-ended to balanced	common mode rejection (Ssd12/Scs12)
"SSB:IMB1SSB"	single-ended / single-ended to balanced	imbalance 1
"SSB:IMB2SSB"	single-ended / single-ended to balanced	imbalance 2
"SSB:CMRRSSB1"	single-ended / single-ended to balanced	common mode rejection (Sds31/Scs31)
"SSB:CMRRSSB2"	single-ended / single-ended to balanced	common mode rejection (Sds32/Scs32)
"BBAL:IMB1BB"	balanced to balanced	imbalance 1
"BBAL:IMB2BB"	balanced to balanced	imbalance 2
"BBAL:CMRRBB"	balanced to balanced	common mode rejection (Sdd21/Scs21)

lPort (long)

- Ignored if *param* is an S-Parameter, balanced, imbalance, or CMRR parameter.
- Source port if *param* is ratioed or unratioed (including [ADC](#)) measurements.
- Use 0 for [N5264A](#).

Note: If the port is defined by a string name, such as an external source, a

balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

window **(long)** Optional argument. Window number of the new measurement. Choose between 1 and the [maximum number of windows allowed on the PNA..](#) If unspecified, the measurement will be created in the Active Window.

See also [Traces, Channels, and Windows on the PNA](#)

Return Type Not Applicable

Default Not Applicable

Examples `app.CreateMeasurement(1, "A/R1", 1, 0)`

`app.CreateMeasurement(1, "a1/b1", 1, 0)`

`app.CreateMeasurement(1, "bba1:Sdd21", 1)`

`app.CreateMeasurement(1, "AI2", 2)`

`app.CreateMeasurement(1, "R1", 0) ' for N5264A`

C++ Syntax HRESULT CreateMeasurement(long ChannelNum, BSTR strParameter, long lPort, long windowNumber)

Interface IApplication

Last modified:

23-Oct-2008 Added support for N5264A
24-Apr-2008 Clarify ports with string names
23-Jul-2007 Added source port link
25-Apr-2007 Updated for ADC measurements.
12-Sept-2006 MQ Updated for logical receiver notation.

DataToMemory Method

Description	Stores the active measurement data into memory creating a memory trace. The memory can then be displayed or used in calculations with the measurement data.
VB Syntax	<code>meas.DataToMemory</code>
Variable	(Type) - Description
<code>meas</code>	A Measurement (object)
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>meas.DataToMemory</code>
C++ Syntax	HRESULT DataToMemory()
Interface	IMeasurement

Deembed Method

Description De-embeds a fixture from an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the fixture removed.

When the new Cal Set is applied to a channel, the effects of the fixturing are removed from the measurement data. Do NOT enable fixturing. The effects of the fixture are removed when the new Cal Set is selected and correction is turned ON.

VB Syntax `calMgr.Deembed (cs1,cs2,s2p,port, compPwr,extrap)`

Variable [\(Type\)](#) - Description

`calMgr` **(object)** - A [CalManager](#) object

`cs1` (String) Name of an existing Cal Set which resides on the PNA.

`cs2` (String) Name of new Cal Set which contains updated error terms with fixture de-embedded.

`s2p` (String) Name of the S2P file which characterizes the adapter/fixture.

`port` (Long Integer) Port number from which fixture will be de-embedded.

`compPwr` (Boolean)

True - When the Cal Set contains a power correction array for the fixture port, that array will be compensated for the fixture loss.

Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.

False - Do not compensate for loss in source power through the fixture.

`extrap` (Boolean)

True - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.

False - Extrapolation is NOT performed (default setting).

Return Type Not Applicable

Default Not Applicable

Example

```
calMgr.Deembed
"MyCalSet", "MyNewCalSet", "Fixture.s2p", 1, True, True
```

C++ Syntax HRESULT Deembed (BSTR srcSet, BSTR destSet,BSTR s2p, long port,
BOOL compPwr, BOOL extrap);

Interface ICalManager8

Last Modified:

25-Jan-2011 MX New topic

Delete Method

Description	Deletes the measurement.
VB Syntax	<i>meas.Delete</i>
Variable	(Type) - Description
<i>meas</i>	The Measurement object to delete (object)
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>meas.Delete</code>
C++ Syntax	HRESULT Delete()
Interface	IMeasurement

DeleteMarker Method

Description Deletes a marker from the measurement.

VB Syntax *meas.DeleteMarker(Mnum)*

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

Mnum (**long**) - Any existing marker number in the measurement

Return Type Not Applicable

Default Not Applicable

Examples `meas.DeleteMarker(1)`

C++ Syntax HRESULT DeleteMarker(long lMarkerNumber)

Interface IMeasurement

DeleteAllMarkers Method

Description	Deletes all of the markers from the measurement.
VB Syntax	<i>meas</i> .DeleteAllMarkers
Variable	(Type) - Description
<i>meas</i>	(object) - The Measurement object from which markers will be deleted.
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>meas.DeleteAllMarkers</code>
C++ Syntax	HRESULT DeleteAllMarkers()
Interface	IMeasurement

DeleteAllSegments Method

Description Removes all segments from the [scratch mixer](#).

VB Syntax *conv*.DeleteAllSegments()

Variable [\(Type\)](#) - Description

conv A [Converter Object](#)

Return Type Not Applicable

Default Not Applicable

Examples `mxr.DeleteAllSegments()`

[See example program](#)

C++ Syntax HRESULT DeleteAllSegments()

Interface IConverter5

Last Modified:

26-Oct-2010 New command (A.09.33)

DeleteCalSet Method

Description Deletes a Cal Set from the set of available Cal Sets. This method immediately updates the Cal Set file on the hard drive. If the Cal Set is currently being used by a channel or does not exist, this request will be denied and an error is returned.

Using the [Cal Sets collection](#) is a convenient way to manage Cal Sets.

VB Syntax *calMgr.DeleteCalSet (calset)*

Variable [\(Type\)](#) - Description

calMgr **(object)** - A [CalManager](#) object

calset **(string)** - Cal Set to be deleted. Specify the Cal Set by **GUID** or **Name**. Use [EnumerateCalSets](#) to list the available Cal Sets by name.

Return Type Not Applicable

Default Not Applicable

Example

```
Set pna=CreateObject("AgilentPNA835x.Application")
Set cmgr = pna.GetCalManager
cmgr.DeleteCalSet ("MyCalSet")
```

C++ Syntax HRESULT DeleteCalSet(BSTR strCalset);

Interface ICalManager

Last Modified:

6-Mar-2008 Added Name argument

DeleteConfiguration Method

Description	Deletes the specified configuration name from the PNA. The factory configurations cannot be deleted. This is the only method of programmatically distinguishing a factory configuration from a user-named configuration.
VB Syntax	<i>pathMgr.DeleteConfiguration name</i>
Variable	(Type) - Description
<i>pathMgr</i>	PathConfigurationManager (object)
<i>name</i>	(String) Configuration name to be deleted.
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>path.DeleteConfiguration "myMixer"</code>
C++ Syntax	HRESULT StoreConfiguration (long channelNum, BSTR configName);
Interface	IPathConfigurationManager

Last Modified:

14-Dec-2006 MX New topic

DeleteSegment Method

Description	Removes the specified number of segments from the scratch mixer starting at the index position.
VB Syntax	<i>conv</i> .DeleteSegment <i>index</i> , <i>count</i>
Variable	(Type) - Description
<i>conv</i>	A Converter Object
<i>index</i>	(Long integer) Position at which to start removing segments. Valid index range is between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer .
<i>count</i>	(Long integer) Optional argument. Number of segments to remove. If unspecified, 1 segment is removed.
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>mxr.DeleteSegment 1,5 'Removes 5 segments beginning at the first position.</pre> See example program
C++ Syntax	HRESULT DeleteSegment(long index, long count);
Interface	IConverter5

Last Modified:

26-Oct-2010 New command (A.09.33)

DeleteShortCut Method

Description Removes a macro from the list of macros in the analyzer. Does not remove the file.

Note: There are always 25 macro positions. They do not have to be sequential. For example, you can have number 7 but not numbers 1 to 6.

VB Syntax `app.DeleteShortCut item`

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

item (**long integer**) number of the macro to be deleted.

Return Type Not Applicable

Default Not Applicable

Examples `app.DeleteShortCut 2`

C++ Syntax HRESULT DeleteShortcut(long Number)

Interface IApplication

Last Modified:

29-Apr-2013 Updated to 25 macros

DisallowAllEvents Method

Description Sets event filtering to monitor NO eventst.

VB Syntax *app*.**DisallowAllEvents**

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

**Return
Type** Not Applicable

Default Not Applicable

Examples `app.DisallowAllEvents`

C++ Syntax HRESULT DisallowAllEvents()

Interface IApplication

Write only

DiscardChanges Method

Description	Cancels changes that have been made to the Converter setup and reverts to the previously-saved setup. Same as the Cancel button on the mixer setup dialog box .
VB Syntax	<i>conv</i> . DiscardChanges
Variable	(Type) - Description
<i>conv</i>	A Converter Object
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>conv.DiscardChanges</code>
C++ Syntax	HRESULT DiscardChanges();
Interface	IConverter

Last Modified:

2-Feb-2009 New topic

DisplayNAWindowDuringCalAcquisition Method

Description	<p>Set the 'show' state of the window to be displayed during a calibration.</p> <p>When this command is sent, the specified window is 'flagged' to be shown during calibration. The flag is cleared when the window is closed. A Preset or Instrument State Recall also closes the window. If the same window number is reopened, this command must be sent again to show the window during a calibration. The flag is NOT saved with an instrument state.</p> <p>Send this command for each additional window to show during a calibration.</p>
VB Syntax	<code>calMgr.DisplayNAWindowDuringCalAcquisition (winNum, State)</code>
Variable	(Type) - Description
<code>calMgr</code>	(object) - A CalManager object
<code>winNum</code>	(long) - Window number to show during a calibration. The calibration window will also be shown with this window.
	The window must already be created.
	Use NaWindows.count or app.WindowNumber to read existing window numbers.
<code>state</code>	(Boolean) Window state. Choose from:
	True - Show the specified window during calibration.
	False - Do NOT show the specified window during calibration.
Return Type	Not Applicable
Default	Not Applicable
Example	<pre>calMgr.DisplayNAWindowDuringCalAcquisition 2,True</pre>
	See example using this command
C++ Syntax	<code>HRESULT DisplayNAWindowDuringCalAcquisition(long WinNum, VARIANT_BOOL bVal);</code>
Interface	ICalManager5

28-Jan-2009 Removed 'Read'
8-Nov-2007 MX New topic

DisplayOnlyCalWindowDuringCalAcquisition Method

Description	Clears the flags for windows to be shown during calibrations other than the Cal Window. To flag a window to be shown see DisplayNAWindowDuringCalAcquisition
VB Syntax	<i>calMgr</i> . DisplayOnlyCalWindowDuringCalAcquisition
Variable	(Type) - Description
	<i>calMgr</i> (object) - A CalManager object
Return Type	Not Applicable
Default	Not Applicable
Example	<pre>calMgr.DisplayOnlyCalWindowDuringCalAcquisition</pre> See example using this command
C++ Syntax	HRESULT DisplayOnlyCalWindowDuringCalAcquisition()
Interface	ICalManager5

Last Modified:

8-Nov-2007 MX New topic

DoPrint Method

Description Prints the screen to the default Printer.

VB Syntax *app*.DoPrint

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

Return Type Not Applicable

Default Not Applicable

Examples `app.DoPrint`

C++ Syntax HRESULT DoPrint()

Interface IApplication

DoECAL1PortEx Method

Description This method replaces [DoECAL1Port Method](#).

Does a 1-Port calibration using an ECAL module. You must first have a 1-port measurement active to perform the calibration.

The characterization within the ECal module that will be used for the calibration is specified by [ECALCharacterizationEx](#). The default value is 0.

VB Syntax *cal.DoECAL1PortEx [port][,module]*

Variable [\(Type\) - Description](#)

cal A Calibrator (**object**)

port (**long integer**) Optional argument - Port number to calibrate. Choose from:
1 - Calibrate port 1 (default if unspecified)
2 - Calibrate port 2

module (**long integer**) Optional argument. ECal module.

Choose from modules **1** through **8**

Use [IsECALModuleFoundEx](#) to determine the number of modules connected to the PNA

Use [GetECALModuleInfoEx](#) to returns the model and serial number of each module.

Return Type None

Default Not Applicable

Examples `cal.DoECAL1PortEx, 2, 2`

C++ Syntax HRESULT DoECAL1PortEx(long port, long moduleNumber = 1);

Interface ICalibrator4

DoECAL2PortEx Method

Description This method replaces [DoECAL2Port Method](#).

Does a 2-port calibration using an ECal module.

2-port refers to the number of ports to calibrate; NOT to the number of ECal module ports.

You must first have a measurement active to perform the calibration.

The characterization within the ECal module that will be used for the calibration is specified by [ECalCharacterizationEx](#). The default value is 0.

VB Syntax `cal.DoECAL2PortEx [portA][,portB][,module]`

Variable [\(Type\)](#) - Description

cal A Calibrator (**object**)

portA (**long integer**) Optional argument - Number of the receive port to calibrate.
Choose from:

- 1 - Calibrate port 1 (default, if unspecified)
- 2 - Calibrate port 2
- 3 - Calibrate port 3

And so forth for all available PNA / test set ports.

portB (**long integer**) Optional argument - Number of the source port to calibrate.
Choose from:

- 1 - Calibrate port 1
- 2 - Calibrate port 2 (default, if unspecified)
- 3 - Calibrate port 3

And so forth for all available PNA / test set ports.

module (**long integer**) Optional argument. ECal module.

Choose from modules **1** through **8**

Use [IsECALModuleFoundEx](#) to determine the number of modules connected to the PNA

Use [GetECALModuleInfoEx](#) to returns the model and serial number of each module.

Return Type None

Default Not Applicable

Examples `cal.DoECAL2PortEx,1,2,3`

C++ Syntax HRESULT DoECAL2PortEx(long portA = 1, long portB =2, long moduleNumber = 1);

Interface ICalibrator4

Last Modified:

1-Jan-2007 Corrected Port B default

DoneCalConfidenceCheckECAL Method

Description Concludes the Confidence Check and sets the ECal module back into the idle state.

VB Syntax *cal*.DoneCalConfidenceCheckECAL

Variable [\(Type\)](#) - Description

cal A Calibrator (**object**)

Return Type None

Default None

Examples *cal*.DoneCalConfidenceCheckECAL

C++ Syntax HRESULT DoneCalConfidenceCheckECAL();

Interface ICalibrator

DoReceiverPowerCal Method

Description	<p>Note: This command replaces DataToDivisor, LogMagnitudeOffset, Normalization, InterpolateNormalization.</p> <p>Immediately performs a receiver power calibration. The connection to the receiver must be in place when this command is sent.</p> <p>A Receiver Power Cal requires that the active measurement be an Unratioed power measurement.</p>
VB Syntax	<code>cal.DoReceiverPowerCal(param, srcPort [,pwrOffset])</code>
Variable	(Type) - Description
<i>cal</i>	A Calibrator (object)
<i>param</i>	(string) – Receiver to be calibrated. Choose any receiver in your PNA. See a block diagram of your PNA.
	<p>With PNA Rev 6.2, receivers can also be referred to using logical receiver notation. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more.</p>
<i>srcPort</i>	(long integer) – Number of the port which will supply source power to the receiver during this cal.
	<p>Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.</p>
<i>pwrOffset</i>	(double) – Optional argument. Offset value in dB. Adjusts a receiver power cal to account for components or adapters that are added between the source port and receiver while performing this cal. Specify loss as a negative number; and gain as a positive number.
Return Type	None
Default	Not Applicable
Examples	<code>cal.DoReceiverPowerCal "B", 1, -10</code>
C++ Syntax	HRESULT DoReceiverPowerCal(BSTR parameter, long lSrcPort, double dPowerOffset);

Interface ICalibrator5

Last Modified:

24-Apr-2008	Added note for string names
30-Apr-2007	Edited for src strings

DoResponseCal Method

Description	Performs and immediately applies a Response cal. Same as selecting Normalize from the Unguided Cal - Measure Standards page. Learn more.
VB Syntax	<i>cal</i> .DoResponseCal (<i>measParam</i>),(<i>SourcePort</i>)
Variable	(Type) - Description
<i>cal</i>	A Calibrator (object)
<i>measParam</i>	(String) Measurement parameter to correct. It is NOT necessary for this measurement to be present.
<i>SourcePort</i>	(long integer) Source port number to calibrate. Optional for S-parameter measurements. Choose from: 0 - N5264A Measurement Receiver (no source ports). 1 - Calibrate port 1 2 - Calibrate port 2 (default, if unspecified) 3 - Calibrate port 3 And so forth for all available PNA / test set ports.
Return Type	None
Default	Not Applicable
Examples	<pre>cal.DoResponseCal "A/R",1</pre>
C++ Syntax	HRESULT DoResponseCal(BSTR param, long SourcePort);
Interface	ICalibrator9

Last Modified:

26-Oct-2009 MX New topic

Embed Method

Description Embeds a fixture (usually a matching network) into an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the matching network included in the correction data.

When the new Cal Set is applied to a channel, the effects of the fixture are included in the measurement data. Do NOT enable fixturing. The effects of the matching network are included when the new Cal Set is selected and correction is turned ON.

VB Syntax *calMgr*.**Embed** (*cs1,cs2,s2p,port, compPwr,extrap*)

Variable **(Type) - Description**

calMgr **(object)** - A [CalManager](#) object

cs1 (String) Name of an existing Cal Set which resides on the PNA.

cs2 (String) Name of new Cal Set which contains updated error terms with fixture embedded.

s2p (String) Name of the S2P file which characterizes the adapter/fixture.

port (Long Integer) Port number from which fixture will be embedded.

compPwr (Boolean)

True - Increase the source power to compensate for the loss through the fixture. The result is that the specified power level will be correct at the DUT input.

Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.

False - Do not compensate for loss in source power through the matching network.

extrap (Boolean)

True - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.

False - Extrapolation is NOT performed (default setting).

Return Type Not Applicable

Default Not Applicable

Example `calMgr.Embed "MyCalSet", "MyNewCalSet", "Fixture.s2p", 1, True, True`

C++ Syntax HRESULT Embed (BSTR srcSet, BSTR destSet, BSTR s2p, long port, BOOL compPwr, BOOL extrap);

Interface ICalManager8

EnumerateCalSets Method

Description Returns an array of Cal Set names being stored on the PNA.

VB Syntax *value* = *calMgr*.EnumerateCalSets

Variable [\(Type\)](#) - Description

value **(variant)** - Variable to store the returned Cal Set names

calMgr **(object)** - A [CalManager](#) object

Return Type VARIANT array

Default Not Applicable

Example

```
Dim pna
set
pna=CreateObject("AgilentPNA835x.Application")

Dim catalog
catalog=pna.getcalmanager.EnumerateCalSets
for i=lbound(catalog) to Ubound(catalog)
wscript.echo catalog(i)
next
```

C++ Syntax HRESULT EnumerateCalSets(VARIANT* names);

Interface ICalManager4

EnumerateItems Method

Description Returns a list of all name-value pairs (items) in the Cal Set.

See Also

[Item Property](#) (Learn about Name-Value pairs.)

[RemoveItem Method](#)

VB Syntax *names* = *CalSet*.**EnumerateItems**

Variable [\(Type\)](#) - Description

names (Variant array) List of string names.

CalSet **(object)** - A [CalSet](#) object

Return Type Variant

Default Not Applicable

Examples [See example](#)

C++ Syntax HRESULT EnumerateItems (VARIANT* itemNames);

Interface ICalSet6

Last Modified:

24-Sep-2010 MX New topic

Execute Method

Description Allows the use of COM to send a SCPI command.

This method can be used with :SYST:ERR? to convert scpi errors into text.

[See an example](#) of how to return error information when using the [Parse method](#).

Note: The SCPIStringParser Methods can NOT be used with [SCPI Status Reporting](#). However, the *OPC? will work.

VB Syntax Scpi.Execute (*SCPI_Command*)

Variable [\(Type\)](#) - Description

scpi A [ScpiStringParser](#) (**Object**)

SCPI_Command (**String**) - Any valid SCPI command

Return Type String

Default Not Applicable

Examples

```
Dim scpi As ScpiStringParser
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:PRES");
ErrorString = scpi.Execute("SYST:ERRor?");
```

C++ Syntax Execute(BSTR SCPI_Command, BSTR * pQueryResponse);

Interface IScpiStringParser2

Last Modified:

27-Apr-2009 Added note

ExecuteShortcut Method

Description	Executes a Macro (shortcut) stored in the analyzer. Use app.getShortcut to list existing macros. Use app. putShortcut to associate the macro number with the file.
VB Syntax	<i>app.ExecuteShortcut index</i>
Variable	(Type) - Description
<i>app</i>	An Application (object)
<i>index</i>	(long integer) - Number of the macro stored in the analyzer.
Return Type	Not Applicable
Default	Not Applicable
Examples	<code>app.ExecuteShortcut 1</code>
C++ Syntax	HRESULT ExecuteShortcut(long index)
Interface	IApplication

Read only

Exists Method

Description	Returns whether or not the specified Cal Set exists on the PNA.
VB Syntax	<i>calsets</i> . Exists (<i>string</i>)
Variable	(Type) - Description
<i>calsets</i>	A Calsets (collection)
<i>string</i>	(String) Name or GUID of the Cal Set enclosed in quotes.
Return Type	Boolean
	True - Cal Set exists
	False - Cal Set does NOT exist
Default	Not Applicable
Examples	<pre>dim check check=calsets.Exists "MyCalset" or check=calsets.Exists "7C4EEA5E-40D2-4D70-A048-33BFFE704163"</pre>
C++ Syntax	HRESULT Exists(BSTR nameOrGuid, VARIANT_BOOL * exists)
Interface	ICalSets2

Write-only

GenerateGlobalDeltaMatchSequence Method

Description	Initiates a global delta match calibration. Learn more about Delta match calibration. See example of a complete Delta Match calibration.
VB Syntax	<i>numSteps</i> = <i>guided</i> . GenerateGlobalDeltaMatchSequence <i>conn</i> , <i>cKit</i>
Variable	(Type) - Description
<i>numSteps</i>	Long Integer - Variable to store the returned number of connection steps required by the Global Delta Match Cal.
<i>guided</i>	GuidedCalibration (object)
<i>conn</i>	String Connector Type for port 1.
<i>cKit</i>	String Cal Kit for all ports.
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>guided.GenerateGlobalDeltaMatchSequence "APC 3.5 female", "85052B"</pre>
C++ Syntax	HRESULT GenerateGlobalDeltaMatchSequence(BSTR port_1_conn, BSTR cal_kit, long *num_steps);
Interface	IGuidedCalibration2

GenerateErrorTerms Method

Description Generates the error terms for the specified calibration type, stores the error terms in a Cal Set, saves the Cal Set, and returns the Cal Set GUID.

If ALL the data for the cal type has NOT been acquired an error message is returned.

Note: The manner in which the calibration is assigned to a Cal Set (Cal Register or User Cal Set) is determined by the setting of [RemoteCalStoragePreference](#).

VB Syntax *value* = *obj*.**GenerateErrorTerms**

Variable [\(Type\)](#) - Description

value (String) - Variable to store the returned GUID or error message.

obj Any of the following:

[GuidedCalibration](#) (object)

[SMCType](#) (object)

[VMCType](#) (object)

Return Type String

Default Not Applicable

Examples `string = SMC.GenerateErrorTerms`

C++ Syntax HRESULT GenerateErrorTerms(BSTR* calsetGUID);

Interface IGuidedCalibration

SMCType

VMCType

Last Modified:

28-Jan-2009 Fixed C++ Syntax

GenerateSteps Method

Description	Returns the number of steps required to complete the calibration. For an ECal User Characterization this generate steps for the ECal User Characterization process. The channel must already be calibrated using the same, or greater number of PNA ports as the ECal module. Also, the PNA ports must begin with Port 1 and use sequential port numbers. After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete a User Characterization calibration.
VB Syntax	<i>value</i> = <i>obj</i> . GenerateSteps
Variable	(Type) - Description
<i>value</i>	(long) - Variable to store the returned number of steps
<i>obj</i>	Any of the following: GuidedCalibration (object) SMCType (object) VMCType (object) ECalUserCharacterizer (object)
Return Type	Long
Default	Not Applicable
Examples	<code>value = SMC.GenerateSteps</code>
C++ Syntax	HRESULT put_GenerateSteps(long* steps);
Interface	IGuidedCalibration SMCType VMCType IECalUserCharacterizer

4-Nov-2008 Added ECal object

GetAllSegments Method

Description Downloads a segment table from the PNA.

VB Syntax *segdata* = Segs.**GetAllSegments**

Variable [\(Type\)](#) - Description

segs A [Segments](#) (**Collection**)

segdata (Variant) A 2-dimensional array of Segment data:

- Dimension 0 is the number of elements in each segment.
- Dimension 1 is the number of segments that will be used.

All elements in the returned array are Variant. The type inside each Variant will be as is listed below.

The returned array will contain values for all elements regardless of the settings of [IFBandwidthOption](#), [SweepTimeOption](#), [SourcePowerOption](#) and [CouplePorts](#) properties. Ignore the values for the properties that are set to false.

The following is a list of dimension 0 elements for each segment:

- 0 = Segment state (Boolean True or False)
- 1 = Number of Points in this segment (Integer)
- 2 = Start Freq (Double)
- 3 = Stop Freq (Double)
- 4 = IFBW (Double)
- 5 = Dwell Time (Double)
- 6 + N = Power (Double) where N is the number of source ports of the PNA. For example, with a 4-port, 1-source PNA, indices 6 through 9 correspond to the per-segment power levels for Ports 1 to 4. Use [SourcePortCount Property](#) and [SourcePortNames Property](#) to see the available source ports for the PNA.

Return Type Variant, containing an array.

Default Not Applicable

Examples [See a VB example using this command](#)

[C++ Syntax](#) HRESULT GetAllSegments (VARIANT *pSegments);

[Interface](#) ISegments5

GetAuxIO Method

Description This method returns the [IAuxIO](#) interface.

VB Syntax *app*.GetAuxIO

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

Return Type IHWAuxIO

Default Not Applicable

Example

```
Dim app As AgilentPNA835x.Application
Dim aux As HWAuxIO
Set aux = app.GetAuxIO
```

C++ Syntax HRESULT GetAuxIO (IHWAuxIO **pAux);

Interface IApplication

GetCalStandard Method

Description Returns a handle to a calibration standard for modifying its definitions. To select a standard for performing a calibration (use Calibrator.[AcquireCalStandard](#)).

VB Syntax *calkit*.GetCalStandard(*index*)

Variable [\(Type\)](#) - Description

calkit A calKit (**object**)

index (**long**) - Number of calibration standard. Choose **1** to **30**; (there are 30 cal standards in every kit).

Return Type calStandard

Default Not Applicable

Examples

```
Dim short As CalStandard
Set short = calKit.getCalStandard(1)
short.label = "myShort"
```

C++ Syntax HRESULT GetCalStandard(long standardNumber, ICalStandard **pCalStd)

Interface ICalKit

Read-only

GetCalKitTypeString Method

Description Returns ECal module model number and serial number based on the index number of the attached ECal modules.

VB Syntax *ECalID* = *cal*.**GetCalKitTypeString** (*module*)

Variable [\(Type\)](#) - Description

ECalID **(string)** - variable to store the returned ECal module ID information.

cal A [Calibrator](#) **(object)**

module **(long integer)** ECal module.

Choose from modules **1** through **8**

Use [IsECALModuleFoundEx](#) to determine the number of modules connected to the PNA

Return Type String

Default Not Applicable

Examples `info = cal.GetCalKitTypeString(2)`

Example return string:

```
"N4691-60003 ECal 01234"
```

C++ Syntax HRESULT GetCalKitTypeString(long moduleNumber, BSTR* info);

Interface ICalibrator8

Last Modified:

GetCompatibleCalKits Method

Description **Note:** This command replaces [CompatibleCalKits Property](#)

Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the PNA, and all user characterizations stored in PNA disk memory.

For ECal modules, the returned list includes the serial numbers.

See the [ECalUserCharacterizer Object](#).

Use items in the list to select the kit to be used with the [CalKitType Property](#)

VB Syntax *value* = *guidCal*.**GetCompatibleCalKits** (*connectorType*)

Variable **(Type) - Description**

value (Variant) - Variable to store the returned list of cal kits. One-dimensional array of string values.

guidCal A [GuidedCalibration](#) (object)

connectorType (String) Connector type for which compatible cal kits will be returned.

Use [ValidConnectorType](#) to return a list of connector type strings.

Use [ConnectorType](#) to set the connector type for each port to be calibrated.

Return Type Variant – Containing one-dimensional array of strings.

Default Not Applicable

Examples

```
Dim kits As Variant
kits = guidedCal.GetCompatibleCalKits "Type N (50) male"
```

C++ Syntax HRESULT GetCompatibleCalKits(BSTR connector, VARIANT* Kits);

Interface IGuidedCalibration5

17-Feb-2011 Edited connector type argument

25-Aug-2009 MX New topic

GetCalManager Method

Description This method returns the [ICalManager](#) interface.

VB Syntax *app*.GetCalManager()

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

Return Type ICalManager*

Default Not Applicable

Example

```
dim app as AgilentPNA835x.Application
dim mgr as CalManager
set mgr = app.GetCalManager()
```

C++ Syntax HRESULT GetCalManager(ICalManager
**mgr);

Interface IApplication

Last Modified:

30-Jan-2008 Added parenthesis

Get CalSetByGUID Method

Description Requests a Cal Set by GUID. Returns an ICal Set interface.

VB Syntax *calMgr*.**GetCalSetByGUID** (*GUID*)

Variable [\(Type\)](#) - Description

calMgr **(object)** - A CalManager object

GUID **(string)** - GUID of the Cal Set being requested.

Return Type Interface object

Default Not Applicable

Example `calMgr.GetCalSetByGUID (2B893E7A-971A-11d5-8D6C-00108334AE96)`

C++ Syntax HRESULT GetCalSetByGUID(BSTR* strGUID, ICal Set* pCalSet);

Interface ICalManager

GetCalSetCatalog Method - Superseded

Description	This method is replaced with EnumerateCalSets Returns a string containing a list of comma-separated GUIDs in the following format: {FD6F863E-9719-11d5-8D6C-00108334AE96}, {1B03B2CE-971A-11d5-8D6C-00108334AE96}, {2B893E7A-971A-11d5-8D6C-00108334AE96}
VB Syntax	<i>value</i> = <i>calMgr</i> . GetCalSetCatalog
Variable	(Type) - Description
<i>value</i>	(string) - Variable to store the returned GUID list
<i>calMgr</i>	(object) - A CalManager object
Return Type	String
Default	Not Applicable
Example	<pre>value = calMgr.GetCalSetCatalog</pre>
C++ Syntax	HRESULT GetCalSetCatalog(BSTR);
Interface	ICalManager

Last Modified:

6-Mar-2008 Superseded

GetCalSetUsageInfo Method

Description Returns a string identifying the Cal Set currently in use by the specified channel.

This method identifies the Cal Set being used by returning its GUID.

This method also identifies the "Error Term set" within the Cal Set.

Error term sets are identified by integers, with set 0 belonging to the original (non-interpolated) terms. As stimulus values for a channel are changed causing interpolation to be required, a new Error Term set is constructed within the Cal Set to hold the interpolated Error Terms. The sets are sequentially numbered 1, 2, 3, and so forth. These Error Term sets are destroyed when they are no longer being used.

If there is no Cal Set in use for the given channel, the <GUID> argument is set to the empty string.

VB Syntax *calMgr*.**GetCalSetUsageInfo** *chan*, *GUID*, *setNumber*

Variable [\(Type\) - Description](#)

calMgr **(object)** - A CalManager object

chan **(long)** - channel of the Cal Set being requested

GUID **(string)** - variable to store the GUID of the Cal Set being requested. If there is no Cal Set in use for the given channel, the <GUID> argument is set to the empty string.

setNumber **(long)** - variable to store the error term ID being requested. If the returned argument is greater than 0, the set is being interpolated.

Return Type String, Long Integer

Default Not Applicable

Example `calMgr.GetCalSetUsageInfo 1, GUID, EtermID`

C++ Syntax HRESULT GetCalSetUsageInfo (long lChannel, BSTR* CalSetGUID, long* etermSetID);

Interface ICalManager

13-May-2011 Removed parens

GetCalTypes Method

Description Returns a list of available calibration types known to the PNA. The Standard CalTypes are the same on all PNA's, but the Custom CalTypes are not necessarily the same. They are dependent on the custom measurement in the PNA. [Learn more about applying Cal Types.](#)

See also [CalibrationTypeID](#) to apply a Cal Type containing in a Cal Set.

VB Syntax `v = mgr.GetCalTypes`

Variable [\(Type\)](#) - Description

mgr A [CalManager](#) (**Object**)

v Name/GuidPair that contains the calibration type name and associated GUID for each cal type known to the PNA.

Return Type (**variant**) Two dimensional array.

Default Not Applicable

Examples `v = CalManager.GetCalTypes`

C++ Syntax HRESULT GetCalTypes(VARIANT * NameGuidPair)

Interface ICalManager2

GetComplex Method

Description	Retrieves complex data from the specified location. See also getNAComplex , getData , and getPairedData Methods
VB Syntax	<i>measData</i> . getComplex <i>location</i> , <i>numPts</i> , <i>real</i> () , <i>imag</i> ()
Variable	(Type) - Description
<i>measData</i>	An IArrayTransfer interface which supports the Measurement object
<i>location</i>	(enum NADataStore - IArrayTransfer) - Where the data you want is residing. Choose from: 0 - naRawData 1 - naCorrectedData 2 - naMeasResult 3 - naRawMemory 4 - naMemoryResult 5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method .
<i>numPts</i>	(long integer) - Number of data points requested [out] - specifies number of data elements returned [in] - specifies the data being requested or the capacity of the arrays
<i>real</i>	(single) - Array to store the real values
<i>imag</i>	(single) - Array to store the imaginary values
Return Type	Single
Default	Not Applicable
Examples	<pre>Dim real(201) AS Single Dim imag(201) AS Single Dim pts as Integer Dim measData As IArrayTransfer Set measData = app.ActiveMeasurement measData.getComplex naCorrectedData, pts, real(0), imag(0)</pre>
C++ Syntax	IArrayTransfer - HRESULT getComplex(tagNADataStore DataStore, long* pNumValues, float* pReal, float* pImag)

Interface IArrayTransfer

GetConnectedPhaseReferences Method

Description	Reads the ID strings of the phase references that are currently connected to the PNA USB.
VB Syntax	<i>refs</i> = <i>phaseRef</i> .GetConnectedPhaseReferences
Variable	(Type) - Description
<i>phaseRef</i>	A PhaseReferenceCalibration (object)
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>ref= phaseRef.GetConnectedPhaseReferences()</pre> See example program
C++ Syntax	HRESULT GetConnectedPhaseReferences()
Interface	IPhaseReferenceCalibration

Last modified:

3-Apr-2012 New topic

GetConverter Method

Description This method returns a handle to a [Converter](#) object.

VB Syntax *chan*.GetConverter()

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

Return Type IConverter

Default Not Applicable

Example

```
Dim app as AgilentPNA835x.Application

Set app =
CreateObject("AgilentPNA835x.Application")

Dim chan As IChannel

Set chan = app.ActiveChannel

Dim convert

Set convert = chan.GetConverter()
```

C++ Syntax HRESULT GetConverter(IConverter **obj);

Interface IChannel

Last Modified:

2-Feb-2009 New topic

getDataByString Method

Description Retrieves variant data from the specified location in your choice of formats.

The PNA returns complex trace data which is ratioed if required by the measurement parameter, such as S11 or A/B. Otherwise it is raw receiver data, such as A or B.

Equation Editor Notes:

- When equation editor is active on a trace in a standard S-parameter channel, GetData returns the data from the parameter on the trace that was measured last. For example, for the equation "S22 + S33 + S11", then S33 is the last measured parameter because it uses source port 3.
- In [applications](#), if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.
- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

VB Syntax *data = meas.getDataByString location, format*

Variable [\(Type\)](#) - Description

data **(variant)** - Array to store the data.

meas **(object)** - A Measurement object

location **(string)** – Name of the buffer to be read. Choose from:

"naRawData"

"naCorrectedData"

"naMeasResult"

"naRawMemory"

"naMemoryResult"

"naDivisor" - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using [DataToDivisor Method](#).

See [Data Access Map](#)

format (**enum NADataFormat**) - Format in which you would like the data. It does not have to be the displayed format. Choose from:

- 0 - naDataFormat_LinMag
- 1 - naDataFormat_LogMag
- 2 - naDataFormat_Phase
- 3 - naDataFormat_Polar
- 4 - naDataFormat_Smith
- 5 - naDataFormat_Delay
- 6 - naDataFormat_Real
- 7 - naDataFormat_Imaginary
- 8 - naDataFormat_SWR
- 9 - naDataFormat_PhaseUnwrapped
- 10 - naDataFormat_InverseSmith
- 11 - naDataFormat_Kelvin
- 12 - naDataFormat_Fahrenheit
- 13 - naDataFormat_Centigrade

[Learn more about Data Format.](#)

* Specify **Smith** or **Polar** formats to obtain complex data pairs, which require a two-dimensional array **varData (numpts, 2)** to accommodate both real and imaginary data.

All scalar formats return a single dimension **varData(numpts)**.

Return Type Variant array

Default Not Applicable

Examples `meas.getDataByString "naMeasResult", naDataFormat_Phase`

C++ Syntax HRESULT getDataByString(BSTR location, tagDataFormat dataFormat, VARIANT * pData);

Interface IMeasurement

Last Modified:

11-Jun-

Corrected example

GetData Method

Description Retrieves variant data from the specified location in your choice of formats. To get smoothed data from any of the specified locations, the format must be the same as the displayed format.

The PNA returns complex trace data which is ratioed if required by the measurement parameter, such as S11 or A/B. Otherwise it is raw receiver data, such as A or B.

This method returns a variant which is less efficient than methods available on the [IArrayTransfer interface](#).

If you plan to **Put** this data back into analyzer, [putDataComplex](#) (variant data) method requires complex, two-dimensional data. Therefore, request the data in **Polar** format.

Equation Editor Notes:

- When equation editor is active on a trace in a standard S-parameter channel, GetData returns the data from the parameter on the trace that was measured last. For example, for the equation "S22 + S33 + S11", then S33 is the last measured parameter because it uses source port 3.
- In [applications](#), if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.
- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

VB Syntax *data = meas.GetData location, format*

Variable [\(Type\) - Description](#)

data Variant array to store the data.

meas A Measurement (**object**)

location (**enum NADataStore**) - Where the data you want is residing. See [Data Access Map](#). Choose from:

0 - naRawData

1 - naCorrectedData

2 - naMeasResult

3 - naRawMemory

4 - naMemoryResult

5 - naDivisor When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using [DataToDivisor Method](#).

format (**enum NADataFormat**) - Format in which you would like the data. It does not have to be the displayed format. Choose from:

0 - naDataFormat_LinMag

1 - naDataFormat_LogMag

2 - naDataFormat_Phase

3 - naDataFormat_Polar*

4 - naDataFormat_Smith*

5 - naDataFormat_Delay

6 - naDataFormat_Real

7 - naDataFormat_Imaginary

8 - naDataFormat_SWR

9 - naDataFormat_PhaseUnwrapped

10 - naDataFormat_InverseSmith

11 - naDataFormat_Kelvin

12 - naDataFormat_Fahrenheit

13 - naDataFormat_Centigrade

[Learn more about Data Format.](#)

* **Specify Smith or Polar** formats to obtain complex data pairs, which require a two-dimensional array **varData (numpts, 2)** to accommodate both real and imaginary data.

All scalar formats return a single dimension **varData(numpts)**.

naDataFormat_Phase and **naDataFormat_PhaseUnwrapped** returns degrees. However, [putDataScalar](#) method accepts data in radians (not degrees) and displays in degrees.

Return Type Variant array - automatically dimensioned to the size of the data

Default Not Applicable

Examples

```
Dim varData As Variant
varData = meas.GetData(naMeasResult,naDataFormat_Phase)
'Print Data
For i = 0 to chan.NumberOfPoints-1
  Print varData(i)
Next i
```

[See a C# example.](#)

C++ Syntax HRESULT getData(tagNADataStore DataStore, tagDataFormat DataFormat, VARIANT *pData)

Interface IMeasurement

GetECALModuleInfoEx Method

Description	<p>This property replaces Get ECALModuleInfo Method.</p> <p>Returns the following information about the connected ECAL module: model number, serial number, connector type, calibration date, min and max frequency.</p> <p>The characterization within the ECal module that this information will be read from is specified by ECALCharacterizationEx. The default value is 0.</p>
VB Syntax	<i>moduleInfo</i> = <i>cal</i> . GetECALModuleInfoEx (<i>module</i>)
Variable	(Type) - Description
<i>moduleInfo</i>	(string) - variable to store the module information
<i>cal</i>	A Calibrator (object)
<i>module</i>	(long integer) ECal module.
	Choose from modules 1 through 8
	Use IsECALModuleFoundEx to determine the number of modules connected to the PNA
Return Type	String
Default	Not Applicable
Examples	<pre>info = cal.GetECALModuleInfoEx(2)</pre>
	Example return string:
	<pre>ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002</pre>
C++ Syntax	<code>HRESULT GetECALModuleInfoEx(long moduleNumber, BSTR* info);</code>
Interface	ICalibrator4

GetEcalUserCharacterizer Method

Description This method returns a handle to an [ECalUserCharacterizer](#) object.

VB Syntax *calMgr*.GetEcalUserCharacterizer()

Variable [\(Type\)](#) - Description

calMgr A [CalManager Object](#) (**object**)

Return Type IEcalUserCharacterizer

Default Not Applicable

Example

```
Dim mgr as ICalManager
Set mgr = app.GetCalManager
Dim ecalCharacterizer
Set ecalCharacterizer =
mgr.GetEcalUserCharacterizer()
```

C++ Syntax HRESULT GetEcalUserCharacterizer(IEcalUserCharacterizer
**obj);

Interface ICalManager6

GetENRData Method

Description	Read the ENR calibration data from PNA memory.
VB Syntax	<i>vData</i> = <i>enr</i> . GetENRData ()
Variable	(Type) - Description
<i>vData</i>	Variable to store the returned ENR data. Frequency value in Hz, followed by corresponding ENR value in dB.
<i>enr</i>	An ENRFile (object)
Return Type	Variant Array
Default	Not Applicable
Examples	See example program
C++ Syntax	HRESULT GetENRData (VARIANT vdata);
Interface	IENRFile

Last Modified:

2-Aug-2007 MX New topic

GetErrorCorrection Method

Description Reads the error correction state for the channel.

Use [ErrorCorrection Property](#) to set this value.

When this command returns true, some measurements on the channel MAY not have error correction ON. This is because the Cal Set currently in place may not contain the appropriate calibration data. To read the error correction state for a measurement, use [Error Correction Property](#).

VB Syntax *chan*.GetErrorCorrection (*boolean*)

Variable [\(Type\)](#) - Description

chan A [Channel](#) (**object**)

boolean (**boolean**) Variable to store the returned value.

False - Error correction has been set OFF

True - Error correction has been set ON

Return Type Boolean

Default [About Error Correction](#)

Examples `chan.GetErrorCorrection(value)`

C++ Syntax HRESULT GetErrorCorrection (VARIANT_BOOL *bState)

Interface IChannel8

GetErrorTerm Method - Superseded

Description **Note:** This command is replaced by [Get ErrorTermByString_Method](#)

Retrieves error term data that is used for error correction. The data is complex pairs. Memory for the returned Variant is allocated by the server. The server returns a variant containing a two-dimensional safe Array.

This method returns a variant which is less efficient than [getErrorTermComplex](#) on the ICalData interface.

Note: When performing an ECal, send [SetCalInfoEx Method](#) BEFORE calling GetErrorTerm method.

[Learn about reading and writing Calibration data.](#)

VB Syntax `data = cal.getErrorTerm term, rcv, src`

Variable [\(Type\)](#) - Description

<i>data</i>	Variant array to store the data.
<i>cal</i>	A Calibrator (object)
<i>term</i>	(enum As NaErrorTerm). Choose from: naErrorTerm_Directivity_Isolation naErrorTerm_Match naErrorTerm_Tracking
<i>rcv</i>	(long integer) - Receiver Port
<i>src</i>	(long integer) - Source Port

To get this	Specify these parameters:		
Error Term	<i>term</i>	<i>rcv</i>	<i>src</i>
Fwd Directivity	naET_Directivity Isolation	1	1
Rev Directivity	naET_Directivity Isolation	2	2
Fwd Isolation	naET_Directivity Isolation	2	1
Rev Isolation	naET_Directivity Isolation	1	2
Fwd Source Match	naErrorTerm_Match	1	1
Rev Source Match	naErrorTerm_Match	2	2
Fwd Load Match	naErrorTerm_Match	2	1
Rev Load Match	naErrorTerm_Match	1	2
Fwd Reflection Tracking	naErrorTerm_Tracking	1	1
Rev Reflection Tracking	naErrorTerm_Tracking	2	2
Fwd Trans Tracking	naErrorTerm_Tracking	2	1
Rev Trans Tracking	naErrorTerm_Tracking	1	2

Return Type Variant

Default Not Applicable

Examples

```
Dim varError As Variant
varError = cal.getErrorTerm(naErrorTerm_Tracking,2,1)
```

C++ Syntax HRESULT getErrorTerm(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, VARIANT* pData)

Interface ICalibrator

GetErrorTerm Method **Superseded**

Description	<p>This command has been replaced with GetErrorTermByString</p> <p>Returns error term data from the Cal Set. The returned data is complex pairs.</p> <p>Learn more about Reading and Writing Cal Data</p> <p>See examples of Reading and Writing Cal Set Data</p>
VB Syntax	<i>data</i> = <i>calSet</i> . getErrorTerm (<i>setNumber</i> , <i>term</i> , <i>rcv</i> , <i>src</i>)
Variable	(Type) - Description
<i>data</i>	(Variant) Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.
	Note: See also getErrorTermComplex on the ICalData2 interface to avoid using the variant data type.
<i>calSet</i>	A Cal Set (object)
<i>setNumber</i>	(Long) There can be more than one set of error terms in a Cal Set. <ul style="list-style-type: none"> • SetNumber 0 contains the original set of error terms for a Cal Set. • SetNumbers > 0 contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. Learn about Interpolation. • To determine the SetNumber in use by a channel, see GetCalSetUsageInfo
<i>term</i>	(enum As NaErrorTerm2). Choose from: <ul style="list-style-type: none"> 0 - naET_Directivity (rcv = src) 1 - naET_SourceMatch (rcv = src) 2 - naET_ReflectionTracking (rcv = src) 3 - naET_TransmissionTracking (rcv ≠ src) 4 - naET_LoadMatch (rcv ≠ src) 5 - naET_Isolation (rcv ≠ src)
<i>rcv</i>	(Long) - Receiver Port
<i>src</i>	(Long) - Source Port

Return Type Variant

Default Not Applicable

Examples

```
Dim varError As Variant  
varError = CalSet.getErrorTerm(0,naET_TransmissionTracking,2,1)
```

C++ Syntax HRESULT getErrorTerm(long setID, tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, VARIANT* pData)

Interface ICalSet

GetErrorTermByString Method

Description Returns error term data from the Cal Set by specifying the string name of the error term.

- Learn more about [Reading and Writing Cal Data](#)
- See examples of [Reading](#) and [Writing](#) Cal Set Data
- See [GetCalSetUsageInfo](#) to determine the setNumber.

VB Syntax `pdata = calset.GetErrorTermByString(setNumber, errorTerm)`

Variable [\(Type\)](#) - Description

pdata **(Variant)** Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.

Note: See also [getErrorTermComplexByString](#) on the ICalData3 interface to avoid using the variant data type.

calset A [Cal Set](#) **(object)**

setNumber **(Long)** Set number of the required Cal Set data.

See [GetCalSetUsageInfo](#) to determine the setNumber.

- SetNumber **0** contains the original "master" set of error terms for a Cal Set.
- SetNumbers **> 0** refers to the PNA channel number that contains the error terms. When retrieving channel error terms, Correction must be ON.

New beginning PNA Rev 7.2: The channel error term data contains [interpolation](#), [fixturing](#), and [port extension](#) data if each is ON.

- For Balanced Measurements, interpolation, fixturing, and port extensions can be ON independently.
- For Standard S-parameters, to get port extension data, both fixturing and port extensions must be ON.

errorTerm **(String)** The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see [GetErrorTermList2](#).

Return Type Variant

Default Not Applicable

Examples [See an Example](#)

C++ Syntax HRESULT GetErrorTermByString (long SetNumber, BSTR bufferName, VARIANT* pdata);

Interface ICalSet2

GetErrorTermComplex Method **Superseded**

Description	<p>This command has been replaced by GetErrorTermComplexByString</p> <p>Retrieves error term data from the error correction buffer. The data is in complex pairs.</p> <p>Note: When performing an ECal, send SetCalInfoEx Method BEFORE calling GetErrorTermComplex method.</p> <p>Learn more about reading and writing Cal Data using COM.</p> <p>This method exists on a non-default interface. If you cannot access this method, use the GetErrorTerm Method on ICalibrator.</p>
VB Syntax	<i>eData</i> .GetErrorTermComplex <i>term</i> , <i>rcv</i> , <i>src</i> , <i>numPts</i> , <i>real</i> (<i></i>), <i>imag</i> (<i></i>)
Variable	(Type) - Description
<i>eData</i>	An ICalData pointer to the Calibrator object
<i>term</i>	(enum NAErrorTerm) - The error term to be retrieved. Choose from: <ul style="list-style-type: none"> • naErrorTerm_Directivity_Isolation • naErrorTerm_Match • naErrorTerm_Tracking
<i>rcv</i>	(long integer) - Receiver Port
<i>src</i>	(long integer) - Source Port
<i>numPts</i>	(long integer) - on input, max number of data points to return; on output: indicates the actual number of data points returned.
<i>real</i> (<i></i>)	(single) - array to accept the real part of the error-term. One-dimensional for the number of data points.
<i>imag</i> (<i></i>)	(single) - array to accept the imaginary part of the error-term. One-dimensional for the number of data points.

	To get this	Specify these parameters:		
	Error Term	<i>term</i>	<i>rcv</i>	<i>src</i>
	Fwd Directivity	naET_Directivity Isolation	1	1
	Rev Directivity	naET_Directivity Isolation	2	2
	Fwd Isolation	naET_Directivity Isolation	2	1
	Rev Isolation	naET_Directivity Isolation	1	2
	Fwd Source Match	naErrorTerm_Match	1	1
	Rev Source Match	naErrorTerm_Match	2	2
	Fwd Load Match	naErrorTerm_Match	2	1
	Rev Load Match	naErrorTerm_Match	1	2
	Fwd Reflection Tracking	naErrorTerm_Tracking	1	1
	Rev Reflection Tracking	naErrorTerm_Tracking	2	2
	Fwd Trans Tracking	naErrorTerm_Tracking	2	1
	Rev Trans Tracking	naErrorTerm_Tracking	1	2
Return Type	Single			
Default	Not Applicable			
Examples	<pre> ReDim rel(numpts) ReDim img(numpts) Dim eData As ICalData Set eData = chan.Calibrator eData.getErrorTermComplex naErrorTerm_Directivity_Isolation, 1, 1, 201, rel(0), img(0) </pre>			
C++ Syntax	HRESULT raw_getErrorTermComplex(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)			
Interface	ICalData			

GetErrorTermComplex Method **Superseded**

Description This command is [replaced](#) with [Get ErrorTermComplexByString](#)

Returns error term data from the Cal Set. The data is in complex pairs.

Learn more about [Reading and Writing Cal Data](#)

See examples of [Reading](#) and [Writing](#) Cal Set Data

Note: This method exists on a non-default interface. If you cannot access this method, use the [GetErrorTerm](#) Method on ICal Set.

VB Syntax `iCalData2.GetErrorTermComplex setNumber, term, rcv, src, numPts, real(), imag()`

Variable [\(Type\) - Description](#)

iCalData2 An [ICalData2](#) pointer to the Cal Set object

setNumber **(Long)** There can be more than one set of error terms in a Cal Set.

- setNumber **0** contains the original set of error terms for a Cal Set.
- setNumbers **> 0** contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. [Learn about Interpolation.](#)
- To determine the setNumber in use by a channel, see [GetCalSetUsageInfo](#)

term **(enum NAErrorTerm2)** - The error term to be retrieved. Choose from:

- 0 - naET_Directivity
- 1 - naET_SourceMatch
- 2 - naET_ReflectionTracking
- 3 - naET_TransmissionTracking
- 4 - naET_LoadMatch
- 5 - naET_Isolation

rcv **(Long)** - Receiver Port

src **(Long)** - Source Port

numPts **(Long)** An In/Out parameter.

On the way **in**, you specify the **max** number of values being requested.

On the way **out**, the PNA returns number of values actually returned.

real() **(single)** - array to accept the **real** part of the error-term. One-dimensional for the number of data points.

imag() **(single)** - array to accept the **imaginary** part of the error-term. One-dimensional for the number of data points.

Return Type Single

Default Not Applicable

Examples

```
dim numpts as long
numpts = ActiveChannel.NumberOfPoints
ReDim r(numpts) ' real part
ReDim i(numpts) ' imaginary part
Dim CalSet as CalSet
set CalSet = pna.GetCalManager.GetCal SetByGUID( txtGUID )
Dim eData As ICalData2
Set eData = CalSet
eData.getErrorTermComplex 0, naET_LoadMatch, 1, 2, numpts,
r(0),i (0)
```

C++ Syntax HRESULT getErrorTermComplex(long setID, tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)

Interface ICalData2

GetErrorTermComplexByString Method

Description Returns error term data from the Cal Set by specifying the string name.

Learn more about [Reading and Writing Cal Data](#)

See examples of [Reading](#) and [Writing](#) Cal Set Data

Note: This method exists on a non-default interface. If you cannot access this method, use [GetErrorTermByString](#)

VB Syntax *ICalData3*.**GetErrorTermComplexByString** *setNumber*, *errorTerm*, *numPoints*, *real(0)*, *imag(0)*

Variable [\(Type\)](#) - [Description](#)

ICalData3 An ICalData3 pointer to a [CalSet](#) (Object)

setNumber **(Long)** There can be more than one set of error terms in a Cal Set.

- *setNumber* **0** contains the original set of error terms for a Cal Set.
- *setNumbers* **> 0** contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. [Learn about Interpolation.](#)
- To determine the *setNumber* in use by a channel, see [GetCalSetUsageInfo](#)

errorTerm **(String)** The string name of error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)".

For a list error term string names, use [Get ErrorTermList2](#)

numPoints **(Long)** An In/Out parameter.

On the way **in**, you specify the **max** number of values being requested.

On the way **out**, the PNA returns number of values actually returned.

real **(Single)** The real component of the complex data.

imag **(Single)** The imaginary component of the complex data.

Return Type Single

Default Not Applicable

Examples [See example](#)

C++ Syntax HRESULT GetErrorTermComplexByString(long etermSetID, BSTR
bufferName, long* lnumPoints, single* real, single* imag);

Interface ICalData3

GetErrorTermList Method **Superseded**

Description	<p>Note: This command is replaced by CalSet.getErrorTermList2</p> <p>Returns the list of Error Terms contained in this Cal Set for the CalType specified in the OpenCal Set method. Learn more about reading and writing Cal Data using COM.</p> <p>The list is a comma separated, textual representation of the error terms with the term name followed by the port path in parentheses: Term (n, n), Term (m,n)</p> <p>Before calling this method you must open the Cal Set with OpenCal Set. If the Cal set is not open, this method returns E_NA_Cal Set_ACCESS_DENIED.</p> <p>Use StringToNAErrorTerm2 to convert the list entrees to values that can be used with GetErrorTerm and PutErrorTerm.</p> <p>Note: The port path designation (m n) indicates the ports that contribute to the error being compensated. Directivity, source match and reflection tracking are single port characteristics, designated in this list by (n n) where n equals the port being characterized. Other terms characterize the interaction between ports. For example, the load match term is describing the match at port (m) while looking into port (n). Thus the notation (m n) indicates the two ports that contribute to the loadmatch error.</p>
VB Syntax	<i>CalSet</i> . GetErrorTermList (SetID, count, strList)
Variable	(Type) - Description
<i>CalSet</i>	(object) - A Cal Set object
<i>SetID</i>	(long) - specifies the error term set to query. Use 0 for the master set.
<i>count</i>	(long) - the number of error terms in the returned list
<i>strList</i>	(string) - comma separated list of error terms found in Cal Set
Return Type	Not Applicable
Default	Not Applicable
Examples	<pre>dim count as Integer dim list as string OpenCalSet (naCalType_TwoPortSOLT 1, 2) GetErrorTermList(0, count, list)</pre>

```
CloseCalSet( )
```

Assuming the cal set contained the full set of error terms for this two-port Cal, the returned list would be:

```
"Directivity(1 1),SourceMatch(1 1),ReflectionTracking(1  
1),TransmissionTracking(2 1),LoadMatch(2 1),Isolation(2  
1),Directivity(2 2),SourceMatch(2 2),ReflectionTracking(2  
2),TransmissionTracking(1 2),LoadMatch(1 2),Isolation(1 2)"
```

[C++ Syntax](#) HRESULT GetErrorTermList (long etermSetID, long* count, BSTR* strList);

[Interface](#) ICalSet

GetErrorTermList2 Method

Description Returns a list of error terms names found in the Cal Set containing the specified prefix.

Learn more about [Reading and Writing Cal Data](#)

See examples of [Reading](#) and [Writing](#) Cal Set Data

VB Syntax *list* = *CalSet*.**GetErrorTermList2**(*setNumber*, *calTypePrefix*)

Variable [\(Type\) - Description](#)

list **(Variant)** Variant containing a string array of error term names.

CalSet **(object)** - A [CalSet](#) object

setNumber **(Long)** There can be more than one set of error terms in a Cal Set.

- *setNumber* **0** contains the original set of error terms for a Cal Set.
- *setNumbers* **> 0** contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. [Learn about Interpolation.](#)
- To determine the *setNumber* in use by a channel, see [GetCalSetUsageInfo](#)

caltypePrefix **(String)** The string used to identify Cal Set data as belonging to a specific Cal Type. This string is used as a filter so that only the error term names of interest are returned. If the prefix is empty, all terms are returned.

An example prefix for a two port cal on ports 2 and 3 might be: "Full 2 Port Cal (2,3)".

Return Type Variant

Default Not Applicable

Examples [See an Example](#)

C++ Syntax HRESULT GetErrorTermList2 (long SetNumber, BSTR caltypePrefix, VARIANT* list)

Interface ICalSet2

GetErrorTermStimulus Method

Description Returns the stimulus values over which the specific error term was acquired. For example, with mixer channels, you may get a different set of values for Directivity at the input port versus Directivity at the output port.

- Learn more about [Reading and Writing Cal Data](#)
- See examples of [Reading](#) and [Writing](#) Cal Set Data
- See [GetCalSetUsageInfo](#) to determine the setNumber.
- See [PutErrorTermStimulus Method](#).

VB Syntax `pdata = calset.GetErrorTermStimulus(setNumber, bufferName)`

Variable [\(Type\)](#) - Description

pdata **(Variant)** The PNA will allocate the memory for the returned variant. The data is returned as a SafeArray of Variant elements. Each element is of VarType double.

calset A [Cal Set](#) **(object)**

setNumber **(Long)** Set number of the required Cal Set data.

See [GetCalSetUsageInfo](#) to determine the setNumber.

- SetNumber **0** contains the original "master" set of error terms for a Cal Set.
- SetNumbers **> 0** refers to the PNA channel number that contains the error terms. When retrieving channel error terms, Correction must be ON. The channel error term data **may** be [interpolated](#) and **may** also be [compensating for a fixture](#) if that feature is on.
 - For Balanced Measurements, interpolation, fixturing, and port extensions can be ON independently.
 - For Standard S-parameters, to get port extension data, both fixturing and port extensions must be ON.

bufferName **(String)** The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see [GetErrorTermList2](#).

Return Type Variant

Default Not Applicable

Examples The sequence is:

```
complexData = calset1.GetErrorTermByString(0, BufferName)
```

```
frequencyData = calset1.GetErrorTermStimulus(0, BufferName)
```

```
// manipulate complex data here
```

```
Calset2.PutErrorTermByString(BufferName, manipulatedComplexData)
```

```
Calset2.PutErrorTermStimulus(BufferName, frequencyData);
```

[See an Example](#)

C++ Syntax HRESULT GetErrorTermStimulus (long SetNumber, BSTR bufferName, VARIANT* pdata);

Interface ICalSet7

Write-only

GetExtendedCalInterface Method

Description Returns an interface that exposes the properties of Noise Calibration.

VB Syntax *Cal2*.**GetExtendedCalInterface** (*interface*)

Variable [\(Type\) - Description](#)

Cal2 An ICalibrate2 (**object**)

interface (object) Returns a handle to the specified interface. Choose from '

"NoiseCal"

Return Type

Default

Example

```
dim noiseCal
dim noiseCalExtensions
set noiseCal= Get Calmanager?.CreateCustomCalEx("NoiseCal")
set noiseCalExtensions =
noiseCal.GetExtendedCalInterface("INoiseCal")
```

C++ Syntax HRESULT GetExtendedCalInterface();

Interface ICalibrate2

Last Modified:

29-May-2007 MN New topic

Get ExternalTestSetIO Method

Description This method returns the [IExternalTestSetIO](#) interface.

VB Syntax *app*.GetExternalTestSetIO

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

Return Type IHWExternalTestSetIO

Default Not Applicable

Example

```
Dim app As AgilentPNA835x.Application
Dim ets As HWExternalTestSetIO
Set ets = app.GetExternalTestSetIO
```

C++ Syntax HRESULT GetExternalTestSetIO (IHWExternalTestSetIO
**ptestset);

Interface IApplication

GetFilterStatistics Method

Description Returns all four Filter Statistics resulting from a [SearchFilterBandwidth](#). To retrieve individual filter statistics, use [meas.FilterCF](#), [meas.FilterBW](#), [meas.FilterLoss](#), [meas.FilterQ](#) properties.

VB Syntax `meas.GetFilterStatistics cf,bw,loss,q`

Variable [\(Type\)](#) - Description

`meas` A Measurement (**object**)

`cf,bw,loss,q` Dimensioned variables to store the returned values

Return Type **(double)** `cf`
(single) `bw,loss,q`

Default Not Applicable

Examples

```
'Dimension variables
Dim cf as Double
Dim bw as Single
Dim loss as Single
Dim q as Single

meas.GetFilterStatistics cf,bw,loss,q
```

C++ Syntax HRESULT GetFilterStatistics(double* centerFreq, float* bw, float* loss, float* quality)

Interface IMeasurement

GetGuid Method

Description Returns a string containing the GUID identifying this Cal Set. Each Cal Set is assigned a GUID (global unique ID). GUIDs are used to retrieve and select Cal Sets on the PNA. Learn more about [reading and writing Cal Data using COM](#).

VB Syntax *value* = *CalSet*.**GetGuid**

Variable [\(Type\)](#) - Description

value **(string)** - Variable to store the returned GUID

CalSet **(object)** - A Cal Set object

Return Type String

Default Not Applicable

Examples `guid = CalSet.GetGuid 'Read`

C++ Syntax HRESULT GetGUID(BSTR* pGUIDString);

Interface ICalSet

InputVoltageEX Property

Description	This command replaces get InputVoltage Method Reads the ADC voltage from the specified location.
VB Syntax	<code>volts = AuxIO.InputVoltageEX loc</code>
Variable	(Type) - Description
<i>volts</i>	(double) - variable to store the return value
<i>AuxIO</i>	(object) - A Hardware Auxiliary Input / Output object
<i>loc</i>	(Long) Location from which to read data. For PNA-X models: , reads ADC voltages from the Power I/O connector . Choose from: <ol style="list-style-type: none"> 1 Reads voltage on Analog In 1 port (pin 7). 2 Reads voltage on Analog In 2 port (pin 8). 3 Reads voltage on GndSens (pin 6). 4 Reads voltage on Analog Out 1 port (pin 3). 5 Reads voltage on Analog Out 2 port (pin 4). For all other PNA models: <ol style="list-style-type: none"> 1 Reads voltage on the Analog IN (pin 14) of the AUX IO connector. 4 Reads voltage on Analog Out 1 port (pin 3). 5 Reads voltage on Analog Out 2 port (pin 2).
Return Type	Double
Default	Not Applicable
Examples	<pre>Dim aux as HWAuxIO Set aux = PNA.getAuxIO volts = aux.InputVoltageEX 1 'for PNA-X, read voltage on PowerI/O pin 7 'for all other models, reads voltage on Aux I/O Analog In (pin 14)</pre>
C++ Syntax	HRESULT get_InputVoltageEX (long muxLoc, double* vtVoltage);

Interface HWAuxIO2

get_Input1 Method

Description	<p>Reads a hardware latch that captures high to low transitions on Input1 of the Material Handler IO. Reading the latch causes it to reset and is ready for the next transition. The hardware latch is only capable of capturing one transition per query. Additional transitions are ignored until after the next query.</p> <p>Momentarily driving Input1 high, then low, causes a transition to be detected and latched.</p>
VB Syntax	<pre><i>inp1</i> = handlerIo.get_Input1</pre>
Variable	(Type) - Description
<i>inp1</i>	(variant) - A variable to store the return value
<i>handlerIo</i>	(object) - A HandlerIO object
Return Type	Variant -
	0 - a high to low transition occurred at Input1 since the last time it was queried.
	1 - no high to low transition occurred.
Default	Not Applicable
Examples	<pre>input1 = handlerIo.get_Input1 'Read</pre>
C++ Syntax	HRESULT get_Input1 (VARIANT* Data);
Interface	IHWMaterialHandlerIO

GetIPConfigurationStruct Method

Description	Returns an NA_IPConfiguration data structure which contains information about the current status of the PNA's computer networking configuration. This is the same set of information that is returned in a single string by the LANConfiguration property.
VB Syntax	<i>value</i> = <i>app</i> .GetIPConfigurationStruct
Variable	(Type) - Description
<i>value</i>	(NA_IPConfiguration) Variable to receive the PNA IP (LAN) configuration information.
<i>app</i>	An Application (object)
Return Type	NA_IPConfiguration
Default	Not Applicable

Examples

```
Dim networkConfigInfo As NA_IPConfiguration
networkConfigInfo = app.GetIPConfigurationStruct()

MsgBox "Host name = " & networkConfigInfo.HostName

MsgBox "Domain name = " & networkConfigInfo.DomainName

MsgBox "IP address = " & networkConfigInfo.IPAddress

If Not networkConfigInfo.DHCPEnabled Then
    MsgBox "IP address is static"
Else
    MsgBox "IP address is dynamic"
End If

MsgBox "Subnet mask = " & networkConfigInfo.SubNet

MsgBox "Gateway = " & networkConfigInfo.DefaultGateway

MsgBox "Primary DNS server = " & networkConfigInfo.DNSServer1

MsgBox "Secondary DNS server = " & networkConfigInfo.DNSServer2

MsgBox "First suffix in DNS suffix search order = " &
networkConfigInfo.DNSSuffix1

MsgBox "Second suffix in DNS suffix search order = " &
networkConfigInfo.DNSSuffix2

MsgBox "Primary WINS server = " &
```

```
networkConfigInfo.PrimaryWINSServer  
  
MsgBox "Secondary WINS server = " &  
networkConfigInfo.SecondaryWINSServer  
  
MsgBox "Network adapter device ID = " &  
networkConfigInfo.DeviceID  
  
MsgBox "Description of network adapter = " &  
networkConfigInfo.Description  
  
MsgBox "MAC address = " & networkConfigInfo.MacAddress
```

C++ Syntax HRESULT GetIPConfigurationStruct (tagNA_IPConfiguration * pIPConfig);

Interface IApplication14

GetIsolationPaths Method

Description Gets the list of paths (port pairings) for which isolation standards will be measured during calibration.

VB Syntax *value* = *obj*.**GetIsolationPaths**

Variable [\(Type\)](#) - **Description**

value (Variant) - Variable to store the returned port paths in pairs. One-dimensional array of Long Integers.

obj Any of the following:

[GuidedCalibration](#) (object)

Return Type Variant – Containing one-dimensional array of Long Integers.

Default No port pairs (empty Variant variable)

Examples

```
pathList = guidedCal.GetIsolationPaths
'displaying the paths separated by commas,
'with a dash (-) between the pair of port numbers comprising
each path

For i = LBound(portList) To UBound(portList) Step 2
    msg = msg + CStr(portList(i)) + "-" + CStr(portList(i+1))
    If i+1 < UBound(portList) Then msg = msg + ","
Next
MsgBox msg, 0, "List of isolation paths"
```

C++ Syntax HRESULT GetIsolationPaths(VARIANT* pathList);

Interface IGuidedCalibration

GetLibraryFunctions Method

Description	Returns the functions in an imported (loaded) DLL.
VB Syntax	<i>functions</i> = <i>equation</i> . GetLibraryFunctions <i>location</i>
Variable	(Type) - Description
<i>functions</i>	(variant) - Array to store the returned functions.
<i>equation</i>	A MeasurementEquation object
<i>location</i>	(string) – Full path and filename of the *.dll to be read.
Return Type	Variant array
Default	Not Applicable
Examples	<pre>functions=equation.GetLibraryFunctions "C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll"</pre>
C++ Syntax	HRESULT GetLibraryFunctions(BSTR filename, BSTR* functionList);
Interface	IMeasurementEquation2

Get MaterialHandlerIO Method

Description This method returns the [MaterialHandlerIO](#) interface.

VB Syntax *app*.**GetMaterialHandlerIO**

Variable [\(Type\)](#) - Description

app An [Application](#) (**object**)

Return Type IHWMaterialHandlerIO

Default Not Applicable

Example

```
Dim app As AgilentPNA835x.Application
Dim hand As HWMaterialHandlerIO
Set hand = app.GetMaterialHandlerIO
```

C++ Syntax HRESULT GetMaterialHandlerIO (IHWMaterialHandlerIO
**phand);

Interface IApplication

GetNAComplex Method

Description	Retrieves complex data from the specified location. See also getComplex and getData Method.
VB Syntax	<i>measData</i> .getNAComplex <i>location</i> , <i>numPts</i> , <i>data</i>
Variable	(Type) - Description
<i>measData</i>	An IArrayTransfer interface which supports the Measurement object
<i>location</i>	(enum NADataStore) - Where the data you want is residing. Choose from: 0 - naRawData 1 - naCorrectedData 2 - naMeasResult 3 - naRawMemory 4 - naMemoryResult 5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method .
<i>numPts</i>	(long integer) - Number of data points requested [out] - specifies number of data elements returned [in] - specifies the data being requested or the capacity of the <i>dComplex</i> array
<i>data</i>	(NAComplex) - A one-dimensional array of NaComplex to store the data.
Return Type	NAComplex
Default	Not Applicable
Examples	<pre>Dim dComplex(201) AS NaComplex Dim measData As IArrayTransfer Dim pts as Long Set measData = app.ActiveMeasurement measData.getNAComplex naCorrectedData, pts, dComplex(0)</pre>
Notes	The data is stored as Real and Imaginary (Re and Im) members of the NaComplex user defined type. You can access each number individually by iterating through the array. <pre>For i = 0 to NumPts-1 dReal (i) = dcomplex (i).Re dImag (i) = dcomplex (i).Im</pre>

Next i

C++ Syntax HRESULT getNAComplex(tagNADataStore DataStore, long* pNumValues, TsComplex* pComplex)

Interface IArrayTransfer

GetNumberOfGroups Method

Description	Returns the number of groups a channel has yet to acquire. To set the number of groups for a channel, use Number Of Groups Method
VB Syntax	<i>value</i> = <i>chan</i> .GetNumberOfGroups
Variable	(Type) - Description
<i>value</i>	(Long Integer) - Number of groups
<i>chan</i>	Channel (object)
Return Type	(Long Integer)
Default	Not Applicable
Examples	<code>groups = chan.GetNumberOfGroups 'Read</code>
C++ Syntax	HRESULT GetNumberOfGroups(long* numberOfGroups);
Interface	IChannel3

get_Output Method

Description [Type 1 and Type2 configurations](#): Returns the last value written to the selected output pin.

[Type3 configuration](#): Returns the current state of the selected output pin. If an Input1 trigger occurs, the state may not be the same value as was written.

All configurations: Data is written using [put_Output](#) Method.

VB Syntax `data = handlerIo.get_Output (pin)`

Variable [\(Type\) - Description](#)

data **(variant)** - A variable to store the return value. The returned value will be one of the following:

0 - TTL Low

1 - TTL High

handlerIo **(object)** - A HandlerIO object

pin **(enum as NAMatHandlerOutput)** - output to read. Choose from:

naOutput1 (0)

naOutput1User (1)

naOutput2 (2)

naOutput2User (3)

[Learn about User Output](#)

Return Type Variant

Default Not Applicable

Examples `data = handlerIo.get_Output (naOutput1)`

C++ Syntax `HRESULT get_Output (tagNAMatHandlerOutput Output, VARIANT* Data);`

Interface IHWMaterialHandlerIO

Read-only

get_OutputVoltage Method

Description **E836x and PNA-L:** Reads voltages on the DAC/Analog Output 1|2 of the Auxiliary IO connector.

PNA-X: Reads voltage on the [Power I/O connector](#) AnalogOut1|2.

VB Syntax *volts* = *AuxIO*.get_OutputVoltage (*output*)

Variable [\(Type\)](#) - Description

volts **(double)** - variable to store the return value

AuxIO **(object)** - A Hardware Auxiliary Input / Output object

output **(variant)** Number of the output DAC from which to read voltage. Choose from:

1 Output 1 (Aux I/O pin 3) and (Power I/O pin 3)

2 Output 2 (Aux I/O pin 2) and (Power I/O pin 4)

Return Type Double

Default Not Applicable

Examples

```
Dim aux as HWAuxIO
Set aux = PNA.getAuxIO
volts = aux.get_OutputVoltage(1)
'read voltage from Analog Out 1 (Aux I/O pin3) or (Power I/O pin 3)
```

C++ Syntax HRESULT get_OutputVoltage(VARIANT Output, double* Voltage);

Interface IHWAuxIO

Last Modified:

10-Jul-2007 Added PNA-X capability

get OutputVoltageMode Method

Description	This command returns the mode of the selected "Analog Out" line on the Power I/O connector . The modes give the user the option to have the requested voltage applied immediately or not until the sweep is done. To set the mode, use put_OutputVoltageMode Method .
VB Syntax	<i>mode</i> = <i>auxIo</i> . get_OutputVoltageMode (<i>output</i>)
Variable	(Type) - Description
<i>mode</i>	(enum NAOutputVoltageMode) - variable to store the returned mode.
	naWaitEOS - While in this mode any voltage changes sent to the selected analog out will only get applied to the output between sweeps.
	naNoWait - While in this mode any voltage changes sent to the selected analog out will occur right away without waiting until the end of a sweep, the voltage gets applied immediately.
<i>auxIo</i>	(object) - A Hardware Auxiliary Input / Output object
<i>output</i>	(double) Analog Output. Choose from 1 or 2
Return Type	enum as NAOutputVoltageMode
Default	naWaitEOS
Examples	<pre>vOutMode = auxIo.get_OutputVoltageMode (1)</pre>
C++ Syntax	HRESULT get_OutputVoltageMode(VARIANT Output, tagNAOutputVoltageMode* pMode);
Interface	IHWAuxIO

Last Modified:

10-Jul-2007 Added PNA-X capability

GetPairedData Method

Description Retrieves pairs of data from the specified location.

Note: This method exists on a non-default interface. If you cannot access this method, use the [Get Data Method](#) on IMeasurement.

VB Syntax `measData.getPairedData location, format, numPts, d1, d2`

Variable (Type) - Description

measData An IArrayTransfer interface which supports the Measurement object

location (**enum NADataStore**) - Where the data you want is residing. Choose from:

0 - naRawData

1 - naCorrectedData

2 - naMeasResult

3 - naRawMemory

4 - naMemoryResult

5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using [DataToDivisor Method](#).

See [Data Access Map](#)

format (**enum NAPairedDataFormat**) - Format in which you would like the Paired data. Choose from:

0 -naLogMagPhase - Log magnitude and phase

1 -naLinMagPhase - Linear magnitude and phase

2 -naRealImaginary - Real and Imaginary

Note: Selecting **naRealImaginary** format is the same as using the [getComplex](#) method

numPts (**long integer**) - Number of data points requested

[out] - specifies number of data elements returned

[in] - specifies the data being requested or the capacity of the *dPaired* array

d1 (**single**) - Array to store the magnitude / real values

d2 (single) - Array to store the phase / imaginary values

Return Type Two Single arrays

Default Not Applicable

Examples

```
Dim logm() As Single
Dim phase() As Single
Public measData As IArrayTransfer
Set measData = app.ActiveMeasurement
Dim numpts As Long
numPoints = app.ActiveChannel.NumberOfPoints
ReDim logm(numPoints)
ReDim phase(numPoints)

measData.getPairedData naCorrectedData, naLogMagPhase,
numPoints, logm(0), phase(0)

Print values(0), values(1)
```

C++ Syntax HRESULT getPairedData(tagNADataStore DataStore,
tagNAPairedDataFormat PairFormat, long* pNumValues, float* pReal, float*
pImag)

Interface IArrayTransfer

get_Port Method

Description Returns the value from the specified "readable" port.

VB Syntax `data = handlerIo.get_Port (port)`

Variable [\(Type\) - Description](#)

data (**variant**) - A variable to store the return value. The following table shows what the returned data represents:

Port	MSB.....LSB 8.....0
C	C3...C0
D	D3...D0
E	D3...D0 + C3...C0

handlerIo (**object**) - A HandlerIO object

port (**enum as NAMatHandlerPort**) - port to get data from. Choose from:

naPortC - (2)

naPortD - (3)

naPortE - (4)

Note: Reading data from the Write-only ports (A,B,F,G,H) will return an error. Ports C and D must be put in Read mode before reading from C, D, or E using [PortMode Property](#).

Return Type Variant

Default 0

Examples `data = handlerIo.get_Port(naPortC)`

C++ Syntax `HRESULT get_Port (tagNAMatHandlerPort Port, VARIANT* Data);`

Interface IHWMaterialHandlerIO

Read-only

get_PortCData Method

Description Reads a 4-bit value from Port C of the Aux I/O connector (pins 22-25) and the Material Handler IO (pins 21-24 Anritsu) - (pins 22-25 Avantest).

Note: These lines are connected to both the Handler IO and Aux IO in the PNA.

VB Syntax *value* = *AuxIO*.get_PortCData

Variable [\(Type\)](#) - Description

value **(variant)** - Variable to store the returned data

AuxIO **(object)** - A Hardware Auxiliary Input / Output object

Return Type Integer

Default None

Examples `value = auxIo.get_PortCData 'Reading a value of 15 when in Positive Logic indicates Port C lines C0, C1, C2, C3 are High. If in Negative Logic they are Low.'`

C++ Syntax HRESULT get_PortCData(VARIANT* Data);

Interface IHWAuxIO

GetPortNumber Method

Description Returns the port number that is associated with the specified port name. These numbers are used with several commands to specify a PNA port.

To learn more, see [Remotely Specifying a Source Port](#).

VB Syntax *value* = *object*.**GetPortNumber** (*portName*)

Variable (Type) - Description

value **(Long)** - Variable to store the returned Port Number integer value.

object A [Channel](#) **(object)** - always more complete than capabilities object.

A [Capabilities](#) **(object)** - use when a channel is not available

portName **(String)** Name of the PNA port.

- Use [SourcePortNames Property](#) to return a list of PNA port (string) names.
- If an external source is selected, specify the external source name that is used in the [Select an External Source dialog](#).

Return Type Long Integer

Default Not Applicable

Examples `value = chan.GetPortNumber ("Src2 Out1") 'Read`

C++ Syntax HRESULT GetPortNumber(BSTR name, long *number);

Interface IChannel13

ICapabilities4

Last Modified:

12-Oct-2009	Added parens
23-May-2008	Added channel object
24-Apr-2008	Fixed example
30-Apr-2007	Edited for Ext Source Control

GetRaw2DData Method

Description Returns raw data at all frequency and power data points for **any** GCA sweep. Previously 2D sweep only.

- When using SMART sweep, ALL data is returned including ALL background iteration sweeps. Use [TotalIterations](#) to determine the number of iteration sweeps. The number of data points that are returned is always the number of frequency points times the number of iteration sweeps.
- When using 2D sweeps, ALL data is returned. The number of data points returned / freq may vary. [Learn more.](#)

Use the standard "[get data](#)" commands to return just the displayed data results (not the background sweeps).

A compression parameter must be present. [Learn more.](#)

VB Syntax `data = gca.GetRaw2DData location, format, param`

Variable [\(Type\)](#) - Description

data Variant array in which to store returned measurement data.

gca A [GainCompression](#) (**object**)

location (enum NADataStore) - Where the data you want is residing. Choose from:

0 - naRawData

1 - naCorrectedData

format (enum NADataFormat) - Format in which you would like the data. It does not have to be the displayed format. Choose from:

0 - naDataFormat_LinMag

1 - naDataFormat_LogMag

2 - naDataFormat_Phase

3 - naDataFormat_Polar*

4 - naDataFormat_Smith*

5 - naDataFormat_Delay -- **Not valid for this command.**

6 - naDataFormat_Real

7 - naDataFormat_Imaginary

8 - naDataFormat_SWR

9 - naDataFormat_PhaseUnwrapped

10 - naDataFormat_InverseSmith

[Learn more about Data Format.](#)

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-dimensional array varData (numpts, 2) to accommodate both real and imaginary data.

All scalar formats return a single dimension varData(numpts).

naDataFormat_Phase and naDataFormat_PhaseUnwrapped returns degrees.

param **(String)** Parameter of data to return. Not case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. [Learn more.](#)

Choose from:

- **"pin"** - (CompIn21) Input power at the compression point.
- **"pout"** - (CompOut21) Output power at the compression point.
- **"gain"** - (CompGain21) Device gain (S21) at the compression point.
- **"inputmatch"** - (CompS11) Input match at the compression point.
- **"DeltaGain"** - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). [Learn more.](#)
- **"AI1"** and **"AI2"** - ADC measurements at the specified compression level. [Learn more.](#)

Return Type Variant Array

Default Not Applicable

Examples `data = gca.GetRaw2DData naRawData, naDataFormat_Real, "pin"`

C++ Syntax HRESULT GetRaw2DData(tagNADataStore location, tagNADataFormat format, BSTR data_name, VARIANT* pData);

Interface IGainCompression

GetDataIm Method

- Description** For a specified data point, returns the imaginary part of the specified Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.
- For SMART sweep, the number of data points that are returned is always going to be the number of iteration sweeps. Use `IterationSweeps` to determine the number of iteration sweeps.
 - For 2D sweeps, the number of data points returned / freq may vary. [Learn more.](#)

VB Syntax `data = gca.GetDataIm stim, dPoint, param`

Variable (Type) - Description

`data` Variant array in which to store returned measurement data.

`gca` A [GainCompression](#) (object)

`stim` (**NAGCAIndexSelect**)

- **naFrequencySelect** - for the specified frequency data point, returns all of the measured data for each power stimulus.
- **naPowerSelect** - for the specified power data point, returns all of the measured data for each frequency stimulus.

`dPoint` Data point (Frequency or Power) for which data is returned.

`param` Parameter of data to return. Not case-sensitive. Choose from:

- **"pin"** - input power at each data point.
- **"pout"** - output power at each data point.
- **"gain"** - device gain (S21) at each data point.
- **"inputmatch"** - input match (S11) at each data point.
- **"DeltaGain"** - Measured Gain (watts) / Ref Gain (watts). [Learn more.](#)
- **"AI1"** and **"AI2"** - ADC measurements at the specified compression level. [Learn more.](#)

Return Type Variant Array

Default Not Applicable

Examples For the fifth frequency data point, returns 'Power Output' imaginary (phase) data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

```
data = gca.GetDataIm naFrequencySelect, 5, "pout"
```

For the 30th stimulus power data point, returns 'Power Output' imaginary (phase) data from all frequency stimulus values. If there are 201 frequency sweep points, 201 values are returned.

```
data = gca.GetDataIm naPowerSelect, 30, "pout"
```

Note: For 2D sweeps, the number of data points returned / freq may vary.

[Learn more.](#)

C++ Syntax HRESULT GetDataIm(tagNAGCAIndexSelect index_select, int index, BSTR data_name, VARIANT* pData);

Interface IGainCompression

12-May-2008	Edited for any GCA sweep
22-Oct-2007	MX New topic

GetDataRe Method

Description Reads the REAL part of the data acquired from **any** GCA sweep. Previously 2D sweep only.

Note: For 2D sweeps, the number of data points returned / freq may vary.
[Learn more.](#)

VB Syntax `data = gca.GetDataRe stim, dPoint, param`

Variable [\(Type\)](#) - Description

data Variant array in which to store returned measurement data.

gca A [GainCompression](#) (object)

stim (NAGCAIndexSelect)

- **naFrequencySelect** - for the specified frequency data point, returns all of the measured data for each power stimulus.
- **naPowerSelect** - for the specified power data point, returns all of the measured data for each frequency stimulus.

dPoint Data point (Frequency or Power) for which data is returned.

param Parameter of data to return. Not case-sensitive. Choose from:

- **"pin"** - input power at each data point.
- **"pout"** - output power at each data point.
- **"gain"** - device gain (S21) at each data point.
- **"inputmatch"** - input match (S11) at each data point.
- **"DeltaGain"** - Measured Gain (watts) / Ref Gain (watts). [Learn more.](#)
- **"AI1"** and **"AI2"** - ADC measurements at the specified compression level. [Learn more.](#)

Return Type Variant Array

Default Not Applicable

Examples For the fifth frequency data point, returns 'Power Output' REAL data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

```
data = gca.GetDataRe naFrequencySelect, 5, "pout"
```

For the 30th stimulus power data point, returns 'Power Output' REAL data from all frequency stimulus values. If there are 201 frequency sweep points, 201 values are returned.

```
data = gca.GetDataRe naPowerSelect, 30, "pout"
```

Note: For 2D sweeps, the number of data points returned / freq may vary.
[Learn more.](#)

C++ Syntax HRESULT GetDataRe(tagNAGCAIndexSelect index_select, int index, BSTR data_name, VARIANT* pData);

Interface IGainCompression

GetRxLevelingConfiguration Method

Description This method returns a handle to a [RxLevelingConfiguration](#) object.

VB Syntax *chan*.**GetRxLevelingConfiguration()**

Variable [\(Type\)](#) - Description

chan A [Channel](#) (object)

Return Type IRxLevelingConfiguration

Default Not Applicable

Example

```
dim app as AgilentPNA835x.Application
dim mgr as RxLevelingConfiguration
set mgr = app.GetRxLevelingConfiguration()
```

C++ Syntax HRESULT GetRxLevelingConfiguration(IRxLevelingConfiguration
**mgr);

Interface IChannel17

Last Modified:

3-Mar-2009 MX New topic

GetSourceByRole Method

Description Returns the name of a source that is assigned to the specified role.

Note: For non-converter channels, use [chan.RoleDevice](#)

VB Syntax *source* = *conv*.**GetSourceByRole** (*role*)

Variable [\(Type\)](#) - Description

source (String) Source name, from [Source Configuration dialog](#), that is assigned to the specified role.

conv A [Converter Object](#)

role (String) Role for which the source name will be returned. Use [GetSourceRoles](#) for a list of valid roles.

Return Type Not Applicable

Default Not Applicable

Examples `RF2Source = conv.GetSourceByRole ("RF2")`

C++ Syntax HRESULT GetSourceByRole(BSTR roleID, BSTR deviceName);

Interface IConverter

Last Modified:

3-Jan-2012 Remove superseded (thx SW)

3-May-2011 superseded

2-Feb-2009 New topic

Read only

GetSourceRoles Method

Description Returns the defined role names ("RF2", "LO1").

Note: For non-converter channels, use [chan.RoleDevice](#)

VB Syntax *roles* = *conv*.**GetSourceRoles** ()

Variable [\(Type\)](#) - Description

roles (Variant array) Variable to store returned list of valid roles.

conv A [Converter Object](#)

Return Type Variant

Default Not Applicable

Examples `roles = conv.GetSourceRoles()`

C++ Syntax HRESULT GetSourceRoles(VARIANT* roles);

Interface IConverter

Last Modified:

3-Jan-2012 Remove superseded

3-May-2011 Superseded

3-Feb-2009 New topic

GetReferenceMarker Method

Description Returns a handle to the reference marker.

VB Syntax *meas*.**GetReferenceMarker**

Variable [\(Type\)](#) - Description

meas A Measurement (**object**)

Return Type Object

Default Not Applicable

Examples `meas.GetReferenceMarker`

C++ Syntax HRESULT GetReferenceMarker(IMarker**
refMarker)

Interface IMeasurement

GetRequiredEtermNames

Description Returns an array of strings specifying the error terms required by the caltype's correction algorithm in order to correct the specified parameter.

This function interrogates a specific caltype (caltypeGUID) for the list of error terms it would need in order to correct the specified parameter. All the standard S Parameter calibration types embed port specifiers in the error term name. The specific port information is gleaned from the passed parameter.

For example, to query the error term requirements specific to a two port cal on ports 1 and 3, issue this with a parameter of S13 or S31. The buffer names returned will be formatted in this way:

Full 1 Port SOLT(1,3):TransmissionTracking(3,1)

VB Syntax **EtermNames = GetRequiredEtermNames**(CalTypeGUID As String, Parameter As String)

Variable **(Type) - Description**

caltypeGUID: [in] the GUID of the desired calibration type

parameter [in] string specifying the parameter to be corrected

EtermNames [out] array of strings containing the error term names.

Note: In C++ Allocated by server. Must be freed by caller using SysFreeString.

Return Type Not Applicable

Default Not Applicable

Examples enames = GetRequiredEtermNames(ctGUID, Parm)

C++ Syntax HRESULT GetRequiredEtermNames(BSTR caltypeGUID, BSTR parameter, VARIANT* EtermNames)

Interface ICalManager2

GetScalar Method

Description Retrieves scalar data (ONE number per data point) from the specified location.

Note: This method exists on a non-default interface. If you cannot access this method, use the [Get Data](#) Method on IMeasurement.

VB Syntax `measData.getScalar location, format, numPts, data`

Variable (Type) - Description

measData An IArrayTransfer interface which supports the Measurement object

location (**enum NADataStore**) - Where the data you want is residing. Choose from:

0 - naRawData

1 - naCorrectedData

2 - naMeasResult

3 - naRawMemory

4 - naMemoryResult

5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using [DataToDivisor Method](#).

format (**enum NADataFormat**) - Format in which you would like the data. Choose from:

0 - naDataFormat_LinMag

1 - naDataFormat_LogMag

2 - naDataFormat_Phase

3 - naDataFormat_Polar

4 - naDataFormat_Smith

5 - naDataFormat_Delay

6 - naDataFormat_Real

7 - naDataFormat_Imaginary

- 8 - naDataFormat_SWR
- 9 - naDataFormat_PhaseUnwrapped
- 10 - naDataFormat_InverseSmith
- 11 - naDataFormat_Kelvin
- 12 - naDataFormat_Fahrenheit
- 13 - naDataFormat_Centigrade

Note: Polar, Smith, and Inverse Smith are invalid formats for this command. See [Get Complex Method](#).

[Learn more about Data Format](#).

numPts (**long integer**) - Number of data points requested
 [out] - specifies number of data elements returned
 [in] - specifies the data being requested or the capacity of the *dScalar* array

data (**single**) - Array to store the scalar data.

Return Type Single

Default Not Applicable

Examples

```
Dim dScalar() As Single
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
Dim numpts as Long
numpts = app.ActiveChannel.NumberOfPoints
ReDim dScalar(numPoints)

measData.getScalar naCorrectedData, naDataFormat_LogMag, numpts,
dScalar(0)
Print dScalar(0), dScalar(1)
```

C++ Syntax HRESULT getScalar(tagNADataStore DataStore, tagNADataFormat DataFormat, long* pNumValues, float* pVals)

Interface IArrayTransfer

Last Modified:

1-Oct-2007 Added temperature formats

GetShortcut Method

Description From the index (line number in the user interface) returns the Title, Path, and optional argument strings, of the specified Macro (shortcut). Use this method to list the titles and paths of macros in the analyzer.

VB Syntax *app.GetShortcut index, title, path, arguments*

Variable [\(Type\)](#) - Description

app An [Application](#) (object)

index (**long**) - Number of the macro. Use a number between **1** and **25**.

title (**string**) - **Title** of the specified macro. (Appears in the softkey label)

path (**string**) - Pathname of the specified macro.

arguments (**string**) - Arguments for the specified macro

Return Type String

Default Not Applicable

Example

```
Dim t As String
Dim p As String
Dim arg As String
Dim i As Integer
For i = 1 to 25
    app.GetShortcut i,t,p,arg
    Print t,p
Next
```

C++ Syntax HRESULT GetShortcut(long Number, BSTR* title, BSTR* pathname, BSTR* arguments)

Interface IApplication

Remarks Shortcuts can also be defined and accessed using the macro key on the front panel. However, the benefit of this feature is primarily for the interactive user

Last Modified:

29-Apr-2013 Updated to 25 total

GetSnPData Method **Superseded**

Description	Note: this command is replaced by Get SnpDataWithSpecifiedPorts Method . Reads SnP data from the selected measurement. Learn more about SnP that is returned from the PNA.
VB Syntax	<i>data = meas.GetSnPData type</i>
Variable	(Type) - Description
<i>data</i>	Variant array to store the data.
<i>meas</i>	A Measurement (object)
<i>type</i>	(string) - Type of SnP data to return. If unspecified, <n> is set to 2. Choose from: "S1P" returns 1-Port data for the active measurement if the active measurement is a reflection parameter such as S11 or S22. The behavior is UNDEFINED if the active measurement is a transmission parameter such as an S21. "S2P" returns data for the current 2-port measurement (4 S-parameters). "S3P" returns data for the current 3 port measurement (9 S-parameters). Valid only on instruments with 3 ports or more. "S4P" returns data for the current 4 port measurement (16 S-parameters). Valid only on instruments with 4 ports or more. SnP data can be output using several data formatting options. See SnPFormat Property
Return Type	Variant - 3 dimensional array. <ul style="list-style-type: none">• First dimension size is number of parameters returned.• Second dimension size is number of points in the channel• Third dimension size is 2 (real,imaginary)

For example:

Data(0,5,1) returns the imaginary value of the fifth data point of S11 (if the s2p

request includes port #1)

Default Not Applicable

Examples `snp = meas.GetSnPData("s1p")`

C++ Syntax HRESULT GetSnPData(BSTR snptype, VARIANT * response)

Interface IMeasurement3

Last Modified:

27-Sep-2012 Added return 1-port detail

14-Nov-2008 Added returned data detail

GetSnPDataWithSpecifiedPorts Method

Description	<p>Note: This command replaces Get SnPData. This command is more explicit regarding the data to be returned, and works for PNAs with multiport test sets.</p> <p>Reads SnP data for the measurement by specifying the PNA port numbers. Learn more about SnP that is returned from the PNA.</p>
VB Syntax	<code>data = meas.GetSnPDataWithSpecifiedPorts ports</code>
Variable	(Type) - Description
<i>data</i>	(Variant) array to store the data.
<i>meas</i>	A Measurement (object)
<i>ports</i>	(Variant Array) One-dimensional array containing the list of port numbers for which data is required.
Return Type	Variant - 3 dimensional array.
	<ul style="list-style-type: none">• First dimension size is number of parameters returned.• Second dimension size is number of points in the channel• Third dimension size is 2; format of the data is specified with SnPFormat Property.

For example:

Data(0,5,1) returns the imaginary part of the fifth data point of S11 (if the s2p request includes port #1)

Default Not Applicable

Example `'This VBScript example can be pasted into a notepad file and run on the PNA as a macro. Learn how.`

```
Dim pna
Dim meas
Dim param
Dim point
Dim snp
Dim ports

'List the port numbers for required data
```

```

ports = Array(3,4)

Set pna = CreateObject("AgilentPna835x.application")

Set meas = pna.ActiveMeasurement

'limit amount of data to display

set chan=pna.ActiveChannel

chan.NumberOfPoints=2

snp = meas.GetSnpDataWithSpecifiedPorts (ports)

' returns a 3 dimensional array

' snp(param,point,data pair)

'-----

' show me the data

For param = LBound(snp, 1) To UBound(snp, 1)

  MsgBox ("Parameter: " & (param + 1))

  For point = LBound(snp, 2) To UBound(snp, 2)

    MsgBox "Point:" & (point + 1) & " " & snp(param, point, 0) &
    "," & snp(param, point, 1)

  Next

Next

```

C++ Syntax HRESULT GetSnpDataWithSpecifiedPorts(VARIANT portsToMeasure,VARIANT* response);

Interface IMeasurement7

Last modified:

13-Jun-2011 Fixed data format
13-Nov-2008 Added detail to return type
9/18/06 MQ Added for multiport

getSourcePowerCalDataEx Method

Description **Note:** This method replaces [getSourcePowerCalData Method](#)

Retrieves (as variant data type) source power calibration data, if it exists, from the channel.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the [Get X-Axis Values](#) command to return the X-axis values in the displayed order.

Note: This method returns a variant which is less efficient than methods available on the ISourcePowerCalData interface

VB Syntax `data = chan.getSourcePowerCalDataEx (buffer, srcPort)`

Variable **(Type) - Description**

data **(variant)** – Array to store the data.

chan **(object)** – A [Channel](#) object

buffer **(enum NASourcePowerCalBuffer)** - The requested source power cal data buffer.

0 - naCorrectionValues Last iteration of Cal data

1 - naPriorIterationCorrectionValues Prior iteration of Cal data. This argument can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits.

The following formula can be used to determine the power reading (in dB):

Power reading = Target power at the source port + specified power cal offset value + 'prior' iteration corr value – actual power corr value.

The "actual" value in this equation is returned with **naCorrectionValues**.

srcPort **(long integer)** – The source port for which calibration data is being requested.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

Return Type Variant array – automatically dimensioned to the size of the data.

Default Not Applicable

Examples

```
Dim varData As Variant
Const port1 As Long = 1
varData = chan.getSourcePowerCalDataEx (naCorrectionValues,
port1)
'Print the data
For i = 0 to chan.NumberOfPoints - 1
Print varData(i)
Next i
```

C++ Syntax

HRESULT getSourcePowerCalDataEx(tagNASourcePowerCalBuffer
bufSelect, long sourcePort, VARIANT *pData);

Interface IChannel4

Last Modified:

March 17, 2010	Added Prior argument
24-Apr-2008	Added note for string names
27-Jun-2007	Updated for PNA-X source port names

getSourcePowerCalDataScalarEx Method

Description	<p>Note: This method replaces getSourcePowerCalDataScalar Method</p> <p>Retrieves (as scalar values) source power calibration data, if it exists, from this channel.</p> <p>If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the Get X-Axis Values2 command to return the X-axis values in the displayed order.</p> <p>Note: This method exists on a non-default interface. If you cannot access this method, use the getSourcePowerCalDataEx Method on IChannel4.</p>
VB Syntax	<i>chanData</i> . getSourcePowerCalDataScalarEx <i>buffer</i> , <i>srcPort</i> , <i>numValues</i> , <i>data</i>
Variable	(Type) - Description
<i>chanData</i>	(interface) – An ISourcePowerCalData2 interface on the Channel object.
<i>buffer</i>	(enum NASourcePowerCalBuffer) - The requested source power cal data buffer.
	<p>0 - naCorrectionValues Last iteration of Cal data.</p> <p>1 - naPriorIterationCorrectionValues Prior iteration of Cal data. This argument can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits.</p> <p>The following formula can be used to determine the power reading (in dB):</p> <p>Power reading = Target power at the source port + specified power cal offset value + 'prior' iteration corr value – actual power corr value.</p> <p>The "actual" value in this equation is returned with naCorrectionValues.</p>
<i>srcPort</i>	(long integer) – The source port for which calibration data is being requested.
	<p>Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.</p>
<i>numValues</i>	(long integer) – Number of data values.

[out] – specifies number of data values returned.

[in] – specifies number of values being requested (this must not be larger than the capacity of the data array).

data (**single**) – Array to store the data.

Return Type Single

Default Not Applicable

Examples

```
Dim numValues As Long
Dim scalarCalValues() As Single
Dim chanData As ISourcePowerCalData2
Const port1 As Long = 1
numValues = app.ActiveChannel.NumberOfPoints
ReDim scalarCalValues(numValues)
Set chanData = app.ActiveChannel

chanData.getSourcePowerCalDataScalarEx naCorrectionValues,
port1, numValues, scalarCalValues(0)

'Print the data
For i = 0 to numValues - 1
Print scalarCalValues(i)
Next I
```

C++ Syntax HRESULT getSourcePowerCalDataScalarEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, long *pNumValues, float *pData);

Interface ISourcePowerCalData2

Last Modified:

GetStandard Method **Superseded**

Description This command has been replaced with [Get StandardByString](#)

Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about [Reading and Writing Cal Data](#)

See examples of [Reading](#) and [Writing](#) Cal Set Data

VB Syntax `data = CalSet.getStandard (standard, rcv, src)`

Variable [\(Type\)](#) - Description

data **(Variant)** Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.

Note: See also [getStandardComplex](#) on the ICalData2 interface to avoid using the variant data type.

CalSet **A Cal Set (object)**

standard **(enum NACalClass)** Standard data to be read. Choose from:

- 1 - naClassA
- 2 - naClassB
- 3 - naClassC
- 4 - naClassD
- 5 - naClassE
- 6 - naReferenceRatioLine
- 7 - naReferenceRatioThru

SOLT Standards

- 1 - naSOLT_Open
- 2 - naSOLT_Short
- 3 - naSOLT_Load
- 4 - naSOLT_Thru
- 5 - naSOLT_Isolation

TRL Standards

- 1 - naTRL_Reflection
- 2 - naTRL_Line_Reflection

3 - naTRL_Line_Tracking

4 - naTRL_Thru

5 - naTRL_Isolation

rcv (long) - Receiver Port

src (long) - Source Port

Return Type (variant)

Default Not Applicable

Examples

```
Dim varStd As Variant
Dim varStd2 As Variant

Cal Set.OpenCalSet( naCalType_TwoPortSOLT, 1, 2)
varStd = CalSet.getStandard(naSOLT_Thru,2,1)
varStd2 = Cal Set.getStandard(naSOLT_Thru,1,2)
Cal Set.CloseCalSet( )
```

C++ Syntax HRESULT getStandard(tagNACalClass stdclass, long ReceivePort, long SourcePort, VARIANT* pData)

Interface ICalSet

GetStandardByString Method

Description Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about [Reading and Writing Cal Data](#)

See examples of [Reading](#) and [Writing](#) Cal Set Data

VB Syntax `data = calSet.GetStandardByString(stdName)`

Variable [\(Type\) - Description](#)

data **(Variant)** Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.

Note: See also [Get StandardComplexByString](#) on the ICalData2 interface to avoid using the variant data type.

calSet A [CalSet \(Object\)](#)

stdName **(String)** The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".

Return Type Variant

Default Not Applicable

Examples See an [example](#)

C++ Syntax HRESULT GetStandardByString(BSTR bufferName, VARIANT* pdata)

Interface ICalSet2

GetStandardComplex Method **Superseded**

Description This command is [replaced](#) with [Get StandardComplexByString](#)

Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about [Reading and Writing Cal Data](#)

See examples of [Reading](#) and [Writing](#) Cal Set Data

Note: This method exists on a non-default interface. If you cannot access this method, use the [GetStandard](#) Method on ICal Set

VB Syntax `ICalData2.getStandardComplex class, rcv, src, numPts, real(), imag()`

Variable (Type) - Description

ICalData2 An [ICalData2](#) pointer to the Cal Set object

class (**enum NACalClass**) Standard data to be read. Choose from:

- 1 - naClassA
- 2 - naClassB
- 3 - naClassC
- 4 - naClassD
- 5 - naClassE
- 6 - naReferenceRatioLine
- 7 - naReferenceRatioThru

SOLT Standards

- 1 - naSOLT_Open
- 2 - naSOLT_Short
- 3 - naSOLT_Load
- 4 - naSOLT_Thru
- 5 - naSOLT_Isolation

TRL Standards

- 1 - naTRL_Reflection
- 2 - naTRL_Line_Reflection
- 3 - naTRL_Line_Tracking
- 4 - naTRL_Thru

5 - naTRL_Isolation

rcv (**long**) - Receiver Port

src (**long**) - Source Port

numPts (**Long**) An In/Out parameter.

On the way **in**, you specify the **max** number of values being requested.

On the way **out**, the PNA returns number of values actually returned.

real() (**single**) - array to accept the real part of the calibration data. One-dimensional for the number of data points.

imag() (**single**) - array to accept the imaginary part of the calibration data. One-dimensional for the number of data points.

Return Type (**single**)

Default Not Applicable

Examples

```
Dim numpts as long
numpts = ActiveChannel.NumberOfPoints
ReDim r(numpts) ' real part
ReDim i(numpts) ' imaginary part
Dim Cal Set as Cal Set
set Cal Set = pna.GetCalManager.GetCal SetByGUID( txtGUID )
Dim sData As ICalData2
Set sData = Cal Set
sdata.getStandardComplex naSOLT_Open, 1, 1, numpts, r(0), i(0)
```

C++ Syntax HRESULT getStandardComplex(tagNACalClass stdclass, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)

Interface ICalData2

GetStandardComplexByString Method

Description	Returns standard acquisition data from the Cal Set. Learn more about Reading and Writing Cal Data See examples of Reading and Writing Cal Set Data
VB Syntax	<i>ICalData3</i> . GetStandardComplexByString <i>stdName</i> , <i>InumPoints</i> , <i>real(0)</i> , <i>imag(0)</i>
Variable	(Type) - Description
<i>ICalData3</i>	An ICalData3 pointer to a CalSet (Object)
<i>stdName</i>	(String) The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".
<i>InumPoints</i>	(Long) An In/Out parameter. On the way in , you specify the max number of values being requested. On the way out , the PNA returns number of values actually returned.
<i>real</i>	(Single) The real component of the complex data.
<i>imag</i>	(Single) The imaginary component of the complex data.
Return Value	Single
Default	Not Applicable
Examples	See example
C++ Syntax	HRESULT GetStandardComplexByString(BSTR bufferName, long* InumPoints, float* real, float* imag);
Interface	ICalData3

GetStandardsList Method **Superseded**

Description **Note:** This command is replaced by [CalSet.getStandardList2](#).

Returns the list of Standards contained in this Cal Set for the CalType specified in the [OpenCal Set](#) method. Learn more about [reading and writing Cal Data using COM](#).

The list is a comma separated, textual representation of the error terms with the term name followed by the port path in parentheses.

Standard (n, n),
Standard (m, n)

Before calling this method you must open the Cal Set with [OpenCal Set](#). If the Cal Set is not open, this method returns E_NA_Cal Set_ACCESS_DENIED.

Use [StringToNACalClass](#) to convert the list entrees to values that can be used with [GetStandard](#) and [PutStandard](#).

Note: The port path designation (m n) indicates the receive and source ports for the measurement. Shorts, opens and loads are single port devices, designated in this list by (n n) where n equals the port to which the device is connected. These devices are all characterized by reflection measurements. The dual port thru device is characterized by both transmission and reflection measurements in order to compensate for load match and tracking terms. The notation (n n) indicates the reflection measurement for this device. The notation (m n) indicates the transmission measurement, where the source and receive ports are different.

VB Syntax *CalSet*.**GetStandardsList** (*count*, *list*)

Variable [\(Type\)](#) - Description

CalSet **(object)** - A Cal Set object

count **(long [out])** - indicates the number of items returned in the list

list **(string)** - Variable to store the returned Comma separated list of items.

Return Type String

Default Not Applicable

Examples

```
dim count as Integer
dim list as string
OpenCalSet (naCalType_TwoPortSOLT, 1, 2)
GetStandardsList( count, list)
CloseCalSet( )
```

Assuming the Cal Set contained the full set of standards for this two port cal, the returned list would be:

```
"Open(1 1),
Short(1 1),
Load(1 1),
Thru(1 1),
Isolation(2 1),
Open(2 2),
Short(2 2),
Load(2 2),
Thru(2 2),
Isolation(1 2)
Thru(2 1),
Thru(1 2)"
```

C++ Syntax HRESULT GetStandardsList(long* count, BSTR* list);

Interface ICalSet

GetStandardList2 Method

Description	Returns a list of standards contained by this Cal Set for the specified Cal Type.
VB Syntax	<i>list</i> = <i>calset</i> . GetStandardList2 (<i>calType</i>)
Variable	(Type) - Description
<i>calset</i>	(object) - A CalSet object
<i>list</i>	(Variant) Variant containing a string array of standards for the specified calType.
<i>calType</i>	(String) The string used to identify Cal Set data as belonging to a specific Cal Type. This string is used as a filter so that only the standard names of interest are returned. If the prefix is empty, all names are returned. An example prefix for a two port cal on ports 2 and 3 might be: "Full 2 Port Cal (2,3)".
Return Type	Variant
Default	Not Applicable
Examples	See an example
C++ Syntax	HRESULT GetStandardList2 (BSTR caltype, VARIANT* list)
Interface	ICalSet2

GetStandardsForClass Method

Description Get the calibration standard numbers for a specified calibration class. To set the calibration number use [SetStandardsForClass Method](#)

VB Syntax *calkit*.**GetStandardsForClass** (*calclassorder*, *std1*, *std2*, *std3*, *std4*, *std5*, *std6*, *std7*)

Variable [\(Type\)](#) - Description

calKit A CalKit (**object**)

calclassorder (**enum NA CalClassOrder**) Choose from:

- 0 - naRefl_1_S11
- 1 - naRefl_2_S11
- 2 - naRefl_3_S11
- 3 - naTran_1_S21
- 4 - naRefl_1_S22
- 5 - naRefl_2_S22
- 6 - naRefl_3_S22
- 7 - naTran_1_S12
- 8 - naRefl_1_S33
- 9 - naRefl_2_S33
- 10 - naRefl_3_S33
- 11 - naTran_1_S32
- 12 - naTran_1_S23
- 13 - naTran_1_S31
- 14 - naTran_1_S13
- 15 - naTRL_T
- 16 - naTRL_R
- 17 - naTRL_L

std1...std7 (**long**) Calibration Standard Number. Nominal values from **1** through **30**. **0** indicates that a standard number has not been selected.

Return Type Not applicable

Default Not applicable

Examples `calkit.GetStandardsForClass naRef1_3_S11, std1, std2, std3, std4, std5, std6, std7`

C++ Syntax HRESULT GetStandardsForClass(NACalClassOrder calclassorder, long std1, long std2, long std3, long std4, long std5, long std6, long std7)

Interface ICalKit

Read-only

GetStepDescription Method

Description	Returns the description of the specified step in the calibration process. For an ECal User Characterization this returns the description of the specified step in the ECal User Characterization process.
VB Syntax	<i>value</i> = <i>obj</i> . GetStepDescription (<i>n</i>)
Variable	(Type) - Description
<i>value</i>	(string) - Variable to store the returned number of steps.
<i>obj</i>	Any of the following: GuidedCalibration (object) SMCType (object) VMCType (object) ECalUserCharacterizer (object)
<i>n</i>	(Long) Step in the process. Use GenerateSteps to determine the total number of steps.
Return Type	String
Default	Not Applicable
Examples	<pre>value = SMC.GetStepDescription(5)</pre>
C++ Syntax	HRESULT get_GetStepDescription(long step, BSTR* str);
Interface	IGuidedCalibration SMCType VMCType IECalUserCharacterizer

Last Modified:

4-Nov-2008 Added ECal object

GetSupportedALCModes Method

Description Returns the valid ALC Modes for the PNA.

See [ALCLevelingMode](#) for a list of supported ALC Modes.

VB Syntax *value* = *chan*.**GetSupportedALCModes** (*sourcePort*)

Variable [\(Type\)](#) - Description

value Variant Array variable to store the returned valid ALC Modes.

chan **(object)** - A [Channel](#) object

sourcePort **(long integer)** - Source port.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use [chan.getPortNumber](#) to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

Return Type Variant array

Default Not Applicable

Examples

```
modes = chan.GetSupportedALCModes(4) 'Read
```

C++ Syntax HRESULT GetSupportedALCModes(long port, VARIANT * ALCModes);

Interface IChannel9

Last Modified:

22-Apr-2010	Fixed C++syntax and interface (9)
24-Apr-2008	Added note for string names

16-Jan-2007	MX New topic

GetTestResult Method

Description Returns the result of limit line testing. There are three ways to use this command:

- If neither optional parameter is specified, limit results for ALL data is returned.
- If one parameter is specified (*start*), the limit result for that data point is returned.
- If both parameters are specified, limit results are returned beginning with *start*, and ending with (*start+size*)-1

Note: In 'strongly-typed' languages such as C#, all parameters must be specified.

VB Syntax `testRes = limts.GetTestResult [start,size]`

Variable [\(Type\) - Description](#)

testRes **(enum NALimitTestResult)** - A dimensioned variable to store test results. If a limit line is not tested, a PASS is returned.

0 - naLimitTestResult_None

1 - naLimitTestResult_Fail

2 - naLimitTestResult_Pass

limts A LimitTest (**object**)

start (**long**) - Optional argument. A start data point number to return limit test results.

size (**long**) - Optional argument. Number of data points from *start* to return limit test results.

Return Type Long Integer

Default Not Applicable

Examples

```
Dim testRes As NALimitTestResult
testRes = limts.GetTestResult
Select Case testRes

Case 1
Print "Fails"

Case 2
Print "Pass"

End Select
```
